Problem:    Setting 'compatible' in test influences following tests.
Solution:   Turn 'compatible' off again.
Files:      src/testdir/test_backspace_opt.vim

Patch 7.4.1573
Problem:    Tests get stuck at the more prompt.
Solution:   Move the backspace test out of test_alot.
Files:      src/testdir/test_alot.vim, src/testdir/Make_all.mak

Patch 7.4.1574
Problem:    ":undo 0" does not work. (Florent Fayolle)
Solution:   Make it undo all the way. (closes #688)
Files:      src/undo.c, src/testdir/test_undolevels.vim,
            src/testdir/test_ex_undo.vim, src/testdir/test_alot.vim

Patch 7.4.1575
Problem:    Using wrong size for struct.
Solution:   Use the size for wide API. (Ken Takata)
Files:      src/gui_w32.c

Patch 7.4.1576
Problem:    Write error of viminfo file is not handled properly. (Christian
            Neukirchen)
Solution:   Check the return value of fclose(). (closes #682)
Files:      src/ex_cmds.c

Patch 7.4.1577
Problem:    Cannot pass "dict.Myfunc" around as a partial.
Solution:   Create a partial when expected.
```

```
Files:      src/eval.c, src/testdir/test_partial.vim

Patch 7.4.1578
Problem:    There is no way to invoke a function later or periodically.
Solution:   Add timer support.
Files:      src/eval.c, src/ex_cmds2.c, src/screen.c, src/ex_docmd.c,
            src/feature.h, src/gui.c, src/proto/eval.pro,
            src/proto/ex_cmds2.pro, src/proto/screen.pro, src/structs.h,
            src/version.c, src/testdir/test_alot.vim,
            src/testdir/test_timers.vim, runtime/doc/eval.txt

Patch 7.4.1579 (after 7.4.1578)
Problem:    Missing changes in channel.c
Solution:   Include the changes.
Files:      src/channel.c

Patch 7.4.1580
Problem:    Crash when using function reference. (Luchr)
Solution:   Set initial refcount. (Ken Takata, closes #690)
Files:      src/eval.c, src/testdir/test_partial.vim

Patch 7.4.1581
Problem:    Using ":call dict.func()" where the function is a partial does
            not work.  Using "dict.func()" where the function does not take a
            Dictionary does not work.
Solution:   Handle partial properly in ":call". (Yasuhiro Matsumoto)
Files:      src/eval.c, src/testdir/test_partial.vim, src/testdir/test55.ok

Patch 7.4.1582
Problem:    Get E923 when using function(dict.func, [], dict). (Kent Sibilev)
            Storing a function with a dict in a variable drops the dict if the
            function is script-local.
Solution:   Translate the function name.  Use dict arg if present.
Files:      src/eval.c, src/testdir/test_partial.vim

Patch 7.4.1583
Problem:    Warning for uninitialized variable.
Solution:   Initialize it. (Dominique)
Files:      src/ex_cmds2.c

Patch 7.4.1584
Problem:    Timers don't work for Win32 console.
Solution:   Add check_due_timer() in WaitForChar().
Files:      src/os_win32.c

Patch 7.4.1585
Problem:    Partial is not recognized everywhere.
Solution:   Check for partial in trans_function_name(). (Yasuhiro Matsumoto)
            Add a test.
Files:      src/eval.c, src/testdir/test_partial.vim

Patch 7.4.1586
Problem:    Nesting partials doesn't work.
Solution:   Append arguments. (Ken Takata)
```

```
Files:      src/eval.c, src/testdir/test_partial.vim

Patch 7.4.1587
Problem:    Compiler warnings with 64 bit compiler.
Solution:   Add type casts. (Mike Williams)
Files:      src/ex_cmds2.c

Patch 7.4.1588
Problem:    Old style test for quickfix.
Solution:   Turn test 96 into a new style test.
Files:      src/testdir/Make_all.mak, src/testdir/test96.in,
            src/testdir/test96.ok, src/testdir/test_quickfix.vim

Patch 7.4.1589
Problem:    Combining dict and args with partial doesn't always work.
Solution:   Use the arguments from the partial.
Files:      src/eval.c, src/testdir/test_partial.vim

Patch 7.4.1590
Problem:    Warning for shadowed variable. (Christian Brabandt)
Solution:   Move the variable into a local block.
Files:      src/eval.c

Patch 7.4.1591
Problem:    The quickfix title is truncated.
Solution:   Save the command before it is truncated. (Anton Lindqvist)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 7.4.1592
Problem:    Quickfix code using memory after being freed. (Dominique Pelle)
Solution:   Detect that the window was closed. (Hirohito Higashi)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 7.4.1593
Problem:    Using channel timeout instead of request timeout. (Coverity)
Solution:   Remove the extra assignment.
Files:      src/channel.c

Patch 7.4.1594
Problem:    Timers don't work on Unix.
Solution:   Add missing code.
Files:      src/os_unix.c

Patch 7.4.1595
Problem:    Not checking for failed open(). (Coverity)
Solution:   Check file descriptor not being negative.
Files:      src/os_unix.c

Patch 7.4.1596
Problem:    Memory leak. (Coverity)
Solution:   Free the pattern.
Files:      src/ex_cmds2.c

Patch 7.4.1597
```

```
Problem:    Memory leak when out of memory. (Coverity)
Solution:   Free the name.
Files:      src/eval.c

Patch 7.4.1598
Problem:    When starting the GUI fails a swap file is left behind. (Joerg
            Plate)
Solution:   Preserve files before exiting. (closes #692)
Files:      src/main.c, src/gui.c

Patch 7.4.1599
Problem:    No link to Coverity.
Solution:   Add Coverity badge in README.
Files:      README.md

Patch 7.4.1600
Problem:    libs directory is not useful.
Solution:   Remove arp.library, it was only for very old Amiga versions.
Files:      libs/arp.library, Filelist

Patch 7.4.1601
Problem:    README files take a lot of space in the top directory.
Solution:   Move most of them to "READMEdir".
Files:      Filelist, Makefile, README.txt.info, README_ami.txt,
            README_ami.txt.info, README_amibin.txt, README_amibin.txt.info,
            README_amisrc.txt, README_amisrc.txt.info, README_bindos.txt,
            README_dos.txt, README_extra.txt, README_mac.txt, README_ole.txt,
            README_os2.txt, README_os390.txt, README_src.txt,
            README_srcdos.txt, README_unix.txt, README_vms.txt,
            README_w32s.txt, READMEdir/README.txt.info,
            READMEdir/README_ami.txt, READMEdir/README_ami.txt.info,
            READMEdir/README_amibin.txt, READMEdir/README_amibin.txt.info,
            READMEdir/README_amisrc.txt, READMEdir/README_amisrc.txt.info,
            READMEdir/README_bindos.txt, READMEdir/README_dos.txt,
            READMEdir/README_extra.txt, READMEdir/README_mac.txt,
            READMEdir/README_ole.txt, READMEdir/README_os2.txt,
            READMEdir/README_os390.txt, READMEdir/README_src.txt,
            READMEdir/README_srcdos.txt, READMEdir/README_unix.txt,
            READMEdir/README_vms.txt, READMEdir/README_w32s.txt,

Patch 7.4.1602
Problem:    Info files take space in the top directory.
Solution:   Move them to "READMEdir".
Files:      Filelist, src.info, Contents.info, runtime.info, vimdir.info,
            Vim.info, Xxd.info, READMEdir/src.info, READMEdir/Contents.info,
            READMEdir/runtime.info, READMEdir/vimdir.info, READMEdir/Vim.info,
            READMEdir/Xxd.info

Patch 7.4.1603
Problem:    Timer with an ":echo" command messes up display.
Solution:   Redraw depending on the mode. (Hirohito Higashi)  Avoid the more
            prompt being used recursively.
Files:      src/screen.c, src/message.c
```

```
Patch 7.4.1604
Problem:    Although emoji characters are ambiguous width, best is to treat
            them as full width.
Solution:   Update the Unicode character tables. Add the 'emoji' options.
            (Yasuhiro Matsumoto)
Files:      runtime/doc/options.txt, runtime/optwin.vim,
            runtime/tools/unicode.vim, src/mbyte.c, src/option.c, src/option.h

Patch 7.4.1605
Problem:    Catching exception that won't be thrown.
Solution:   Remove try/catch.
Files:      src/testdir/test55.in

Patch 7.4.1606
Problem:    Having type() handle a Funcref that is or isn't a partial
            differently causes problems for existing scripts.
Solution:   Make type() return the same value. (Thinca)
Files:      src/eval.c, src/testdir/test_viml.vim

Patch 7.4.1607
Problem:    Comparing a function that exists on two dicts is not backwards
            compatible. (Thinca)
Solution:   Only compare the function, not what the partial adds.
Files:      src/eval.c, src/testdir/test_alot.vim, src/testdir/test_expr.vim

Patch 7.4.1608
Problem:    string() doesn't handle a partial.
Solution:   Make a string from a partial.
Files:      src/eval.c, src/testdir/test_partial.vim

Patch 7.4.1609
Problem:    Contents file is only for Amiga distro.
Solution:   Move it to "README dir".  Update some info.
Files:      Filelist, Contents, README dir/Contents

Patch 7.4.1610
Problem:    Compiler warnings for non-virtual destructor.
Solution:   Mark the classes final. (Ken Takata)
Files:      src/Make_cyg_ming.mak, src/gui_dwrite.cpp, src/if_ole.cpp

Patch 7.4.1611
Problem:    The versplit feature makes the code unnecessary complicated.
Solution:   Remove FEAT_VERTSPLIT, always support vertical splits when
            FEAT_WINDOWS is defined.
Files:      src/buffer.c, src/charset.c, src/eval.c, src/ex_cmds.c,
            src/ex_docmd.c, src/ex_getln.c, src/gui.c, src/if_lua.c,
            src/if_mzsch.c, src/if_ruby.c, src/main.c, src/misc1.c,
            src/misc2.c, src/move.c, src/normal.c, src/option.c,
            src/quickfix.c, src/screen.c, src/syntax.c, src/term.c, src/ui.c,
            src/window.c, src/globals.h, src/gui.h, src/if_py_both.h,
            src/option.h, src/structs.h, src/term.h
            src/feature.h, src/vim.h, src/version.c

Patch 7.4.1612 (after 7.4.1611)
```

```
Problem:    Can't build with small features.
Solution:   Move code and #ifdefs.
Files:      src/ex_getln.c

Patch 7.4.1613 (after 7.4.1612)
Problem:    Still can't build with small features.
Solution:   Adjust #ifdefs.
Files:      src/ex_getln.c

Patch 7.4.1614
Problem:    Still quickfix test in old style.
Solution:   Turn test 10 into a new style test.
Files:      src/testdir/Make_all.mak, src/testdir/Make_vms.mms,
            src/testdir/main.aap, src/testdir/test10.in,
            src/testdir/test10.ok, src/testdir/test_quickfix.vim,
            src/testdir/test10a.in, src/testdir/test10a.ok

Patch 7.4.1615
Problem:    Build fails with tiny features.
Solution:   Adjust #ifdefs.
Files:      src/normal.c, src/window.c

Patch 7.4.1616
Problem:    Malformed channel request causes a hang.
Solution:   Drop malformed message. (Damien)
Files:      src/channel.c, src/testdir/test_channel.vim,
            src/testdir/test_channel.py

Patch 7.4.1617
Problem:    When a JSON message is split it isn't decoded.
Solution:   Wait a short time for the rest of the message to arrive.
Files:      src/channel.c, src/json.c, src/structs.h,
            src/testdir/test_channel.vim, src/testdir/test_channel.py

Patch 7.4.1618
Problem:    Starting job with output to buffer changes options in the current
            buffer.
Solution:   Set "curbuf" earlier. (Yasuhiro Matsumoto)
Files:      src/channel.c

Patch 7.4.1619
Problem:    When 'fileformats' is set in the vimrc it applies to new buffers
            but not the initial buffer.
Solution:   Set 'fileformat' when starting up. (Mike Williams)
Files:      src/option.c

Patch 7.4.1620
Problem:    Emoji characters are not considered as a kind of word character.
Solution:   Give emoji characters a word class number. (Yasuhiro Matsumoto)
Files:      src/mbyte.c

Patch 7.4.1621
Problem:    Channel test doesn't work with Python 2.6.
Solution:   Add number in formatting placeholder. (Wiredool)
```

```
Files:      src/testdir/test_channel.py

Patch 7.4.1622
Problem:    Channel demo doesn't work with Python 2.6.
Solution:   Add number in formatting placeholder
Files:      runtime/tools/demoserver.py

Patch 7.4.1623
Problem:    All Channels share the message ID, it keeps getting bigger.
Solution:   Use a message ID per channel.
Files:      src/channel.c, src/proto/channel.pro, src/structs.h

Patch 7.4.1624
Problem:    Can't get info about a channel.
Solution:   Add ch_info().
Files:      src/eval.c, src/channel.c, src/proto/channel.pro,
            src/testdir/test_channel.vim, runtime/doc/eval.txt

Patch 7.4.1625
Problem:    Trying to close file descriptor that isn't open.
Solution:   Check for negative number.
Files:      src/os_unix.c

Patch 7.4.1626 (after 7.4.1624)
Problem:    Missing changes to structs.
Solution:   Include the changes.
Files:      src/structs.h

Patch 7.4.1627
Problem:    Channel out_cb and err_cb are not tested.
Solution:   Add a test.
Files:      src/testdir/test_channel.vim

Patch 7.4.1628
Problem:    64-bit Compiler warning.
Solution:   Change type of variable. (Mike Williams)
Files:      src/channel.c

Patch 7.4.1629
Problem:    Handling emoji characters as full width has problems with
            backwards compatibility.
Solution:   Remove ambiguous and double width characters from the emoji table.
            Use a separate table for the character class.
            (partly by Yasuhiro Matsumoto)
Files:      runtime/tools/unicode.vim, src/mbyte.c

Patch 7.4.1630
Problem:    Unicode table for double width is outdated.
Solution:   Update to the latest Unicode standard.
Files:      src/mbyte.c

Patch 7.4.1631
Problem:    Compiler doesn't understand switch on all enum values. (Tony
            Mechelynck)
```

```
Solution:   Initialize variable.
Files:      src/channel.c

Patch 7.4.1632
Problem:    List of test targets is outdated.
Solution:   Update to current list of test targets.
Files:      src/Makefile

Patch 7.4.1633
Problem:    If the help tags file was removed "make install" fails. (Tony
            Mechelynck)
Solution:   Only try moving the file if it exists.
Files:      src/Makefile

Patch 7.4.1634
Problem:    Vertical movement after CTRL-A ends up in the wrong column.
            (Urtica Dioica)
Solution:   Set curswant when appropriate. (Hirohito Higashi)
Files:      src/ops.c, src/testdir/test_increment.vim

Patch 7.4.1635
Problem:    Channel test is a bit flaky.
Solution:   Remove 'DETACH' if it's there.
Files:      src/testdir/test_channel.vim

Patch 7.4.1636
Problem:    When 'F' is in 'shortmess' the prompt for the encryption key isn't
            displayed. (Toothpik)
Solution:   Reset msg_silent.
Files:      src/ex_getln.c

Patch 7.4.1637
Problem:    Can't build with older MinGW compiler.
Solution:   Change option from c++11 to gnu++11. (Ken Takata)
Files:      src/Make_cyg_ming.mak

Patch 7.4.1638
Problem:    When binding a function to a dict the reference count is wrong.
Solution:   Decrement dict reference count, only reference the function when
            actually making a copy. (Ken Takata)
Files:      src/eval.c, src/testdir/test_partial.vim

Patch 7.4.1639
Problem:    Invoking garbage collection may cause a double free.
Solution:   Don't free the dict in a partial when recursive is FALSE.
Files:      src/eval.c

Patch 7.4.1640
Problem:    Crash when an autocommand changes a quickfix list. (Dominique)
Solution:   Check whether an entry is still valid. (Yegappan Lakshmanan,
            Hirohito Higashi)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 7.4.1641
```

```
Problem:    Using unterminated string.
Solution:   Add NUL before calling vim_strsave_shellescape(). (James McCoy)
Files:      src/eval.c, src/testdir/test105.in, src/testdir/test105.ok

Patch 7.4.1642
Problem:    Handling emoji characters as full width has problems with
            backwards compatibility.
Solution:   Only put characters in the 1f000 range in the emoji table.
Files:      runtime/tools/unicode.vim, src/mbyte.c

Patch 7.4.1643 (after 7.4.1641)
Problem:    Terminating file name has side effects.
Solution:   Restore the character. (mostly by James McCoy, closes #713)
Files:      src/eval.c, src/testdir/test105.in, src/testdir/test105.ok

Patch 7.4.1644
Problem:    Using string() on a partial that exists in the dictionary it binds
            results in an error. (Nikolai Pavlov)
Solution:   Make string() not fail on a recursively nested structure. (Ken
            Takata)
Files:      src/eval.c, src/testdir/test_partial.vim

Patch 7.4.1645
Problem:    When a dict contains a partial it can't be redefined as a
            function. (Nikolai Pavlov)
Solution:   Remove the partial when overwriting with a function.
Files:      src/eval.c, src/testdir/test_partial.vim

Patch 7.4.1646
Problem:    Using Python vim.bindeval() on a partial doesn't work. (Nikolai
            Pavlov)
Solution:   Add VAR_PARTIAL support in Python.
Files:      src/if_py_both.h, src/testdir/test_partial.vim

Patch 7.4.1647
Problem:    Using freed memory after setqflist() and ":caddbuffer".  (Dominique)
Solution:   Set qf_ptr when adding the first item to the quickfix list.
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 7.4.1648
Problem:    Compiler has a problem copying a string into di_key[]. (Yegappan
            Lakshmanan)
Solution:   Add dictitem16_T.
Files:      src/structs.h, src/eval.c

Patch 7.4.1649
Problem:    The matchit plugin needs to be copied to be used.
Solution:   Put the matchit plugin in an optional package.
Files:      Filelist, runtime/macros/matchit.vim, runtime/macros/matchit.txt,
            runtime/macros/README.txt, src/Makefile,
            runtime/pack/dist/opt/matchit/plugin/matchit.vim,
            runtime/pack/dist/opt/matchit/doc/matchit.txt,
            runtime/pack/dist/opt/matchit/doc/tags,
            runtime/doc/usr_05.txt, runtime/doc/usr_toc.txt
```

Patch 7.4.1650
Problem: Quickfix test fails.
Solution: Accept any number of matches.
Files: src/testdir/test_quickfix.vim

Patch 7.4.1651
Problem: Some dead (MSDOS) code remains.
Solution: Remove the unused lines. (Ken Takata)
Files: src/misc1.c

Patch 7.4.1652
Problem: Old style test for fnamemodify().
Solution: Turn it into a new style test.
Files: src/testdir/test105.in, src/testdir/test105.ok,
            src/testdir/test_fnamemodify.vim, src/testdir/test_alot.vim,
            src/testdir/Make_all.mak

Patch 7.4.1653 (after 7.4.1649)
Problem: Users who loaded matchit.vim manually have to change their
            startup. (Gary Johnson)
Solution: Add a file in the old location that loads the package.
Files: runtime/macros/matchit.vim, Filelist

Patch 7.4.1654
Problem: Crash when using expand('%:S') in a buffer without a name.
Solution: Don't set a NUL. (James McCoy, closes #714)
Files: src/eval.c, src/testdir/test_fnamemodify.vim

Patch 7.4.1655
Problem: remote_expr() hangs. (Ramel)
Solution: Check for messages in the waiting loop.
Files: src/if_xcmdsrv.c

Patch 7.4.1656
Problem: Crash when using partial with a timer.
Solution: Increment partial reference count. (Hirohito Higashi)
Files: src/eval.c, src/testdir/test_timers.vim

Patch 7.4.1657
Problem: On Unix in a terminal: channel messages are not handled right away.
            (Jackson Alves de Aquino)
Solution: Break the loop for timers when something was received.
Files: src/os_unix.c

Patch 7.4.1658
Problem: A plugin does not know when VimEnter autocommands were already
            triggered.
Solution: Add the v:vim_did_enter variable.
Files: src/eval.c, src/main.c, src/vim.h, src/testdir/test_autocmd.vim,
            src/testdir/test_alot.vim, runtime/doc/autocmd.txt,
            runtime/doc/eval.txt

Patch 7.4.1659 (after 7.4.1657)

```
Problem:    Compiler warning for argument type. (Manuel Ortega)
Solution:   Remove "&".
Files:      src/os_unix.c

Patch 7.4.1660
Problem:    has('patch-7.4.1') doesn't work.
Solution:   Fix off-by-one error. (Thinca)
Files:      src/eval.c, src/testdir/test_expr.vim, src/testdir/test60.in,
            src/testdir/test60.ok

Patch 7.4.1661
Problem:    No test for special characters in channel eval command.
Solution:   Testing sending and receiving text with special characters.
Files:      src/testdir/test_channel.vim, src/testdir/test_channel.py

Patch 7.4.1662
Problem:    No test for an invalid Ex command on a channel.
Solution:   Test handling an invalid command gracefully.  Avoid getting an
            error message, do write it to the channel log.
Files:      src/channel.c, src/testdir/test_channel.vim,
            src/testdir/test_channel.py

Patch 7.4.1663
Problem:    In tests it's often useful to check if a pattern matches.
Solution:   Add assert_match().
Files:      src/eval.c, src/testdir/test_assert.vim,
            src/testdir/test_channel.vim, runtime/doc/eval.txt

Patch 7.4.1664
Problem:    Crash in :cgetexpr.
Solution:   Check for NULL pointer. (Dominique) Add a test.
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 7.4.1665
Problem:    Crash when calling job_start() with a NULL string. (Dominique)
Solution:   Check for an invalid argument.
Files:      src/channel.c, src/testdir/test_channel.vim

Patch 7.4.1666
Problem:    When reading JSON from a channel all readahead is used.
Solution:   Use the fill function to reduce overhead.
Files:      src/channel.c, src/json.c, src/structs.h

Patch 7.4.1667
Problem:    Win32: waiting on a pipe with fixed sleep time.
Solution:   Start with a short delay and increase it when looping.
Files:      src/channel.c

Patch 7.4.1668
Problem:    channel_get_all() does multiple allocations.
Solution:   Compute the size and allocate once.
Files:      src/channel.c

Patch 7.4.1669
```

```
Problem:    When writing buffer lines to a pipe Vim may block.
Solution:   Avoid blocking, write more lines later.
Files:      src/channel.c, src/misc2.c, src/os_unix.c, src/structs.h,
            src/vim.h, src/proto/channel.pro, src/testdir/test_channel.vim

Patch 7.4.1670
Problem:    Completion doesn't work well for a variable containing "#".
Solution:   Recognize the "#". (Watiko)
Files:      src/eval.c

Patch 7.4.1671
Problem:    When help exists in multiple languages, adding @ab while "ab" is
            the default help language is unnecessary.
Solution:   Leave out "@ab" when not needed. (Ken Takata)
Files:      src/ex_getln.c

Patch 7.4.1672
Problem:    The Dvorak support is a bit difficult to install.
Solution:   Turn it into an optional package.
Files:      runtime/macros/dvorak, runtime/macros/README.txt,
            runtime/pack/dist/opt/dvorak/plugin/dvorak.vim,
            runtime/pack/dist/opt/dvorak/dvorak/enable.vim,
            runtime/pack/dist/opt/dvorak/dvorak/disable.vim

Patch 7.4.1673
Problem:    The justify plugin has to be copied or sourced to be used.
Solution:   Turn it into a package.
Files:      runtime/macros/justify.vim, runtime/macros/README.txt,
            runtime/pack/dist/opt/justify/plugin/justify.vim, Filelist

Patch 7.4.1674
Problem:    The editexisting plugin has to be copied or sourced to be used.
Solution:   Turn it into a package.
Files:      runtime/macros/editexisting.vim, runtime/macros/README.txt,
            runtime/pack/dist/opt/editexisting/plugin/editexisting.vim,
            Filelist

Patch 7.4.1675
Problem:    The swapmous plugin has to be copied or sourced to be used.
Solution:   Turn it into the swapmouse package.
Files:      runtime/macros/swapmous.vim, runtime/macros/README.txt,
            runtime/pack/dist/opt/swapmouse/plugin/swapmouse.vim, Filelist

Patch 7.4.1676
Problem:    The shellmenu plugin has to be copied or sourced to be used.
Solution:   Turn it into a package.
Files:      runtime/macros/shellmenu.vim, runtime/macros/README.txt,
            runtime/pack/dist/opt/shellmenu/plugin/shellmenu.vim, Filelist

Patch 7.4.1677
Problem:    A reference to the removed file_select plugin remains.
Solution:   Remove it.
Files:      runtime/macros/README.txt
```

```
Patch 7.4.1678
Problem:    Warning for unused argument.
Solution:   Add UNUSED. (Dominique Pelle)
Files:      src/if_mzsch.c

Patch 7.4.1679
Problem:    Coverity: copying value of v_lock without initializing it.
Solution:   Init v_lock in rettv_list_alloc() and rettv_dict_alloc().
Files:      src/eval.c

Patch 7.4.1680
Problem:    Coverity warns for not checking name length (false positive).
Solution:   Only copy the characters we know are there.
Files:      src/channel.c

Patch 7.4.1681
Problem:    Coverity warns for fixed size buffer length (false positive).
Solution:   Add a check for the name length.
Files:      src/eval.c

Patch 7.4.1682
Problem:    Coverity: no check for NULL.
Solution:   Add check for invalid argument to assert_match().
Files:      src/eval.c

Patch 7.4.1683
Problem:    Generated .bat files do not support --nofork.
Solution:   Add check for --nofork.  Also add "setlocal". (Kevin Cantú,
            closes #659)
Files:      src/dosinst.c

Patch 7.4.1684
Problem:    README text is slightly outdated.
Solution:   Mention the README_dir directory.
Files:      README.md, README.txt

Patch 7.4.1685
Problem:    There is no easy way to get all the information about a match.
Solution:   Add matchstrpos(). (Ozaki Kiichi)
Files:      runtime/doc/eval.txt, runtime/doc/usr_41.txt, src/eval.c,
            src/testdir/test_alot.vim, src/testdir/test_matchstrpos.vim

Patch 7.4.1686
Problem:    When running tests $HOME/.viminfo is written. (James McCoy)
Solution:   Add 'nviminfo' to the 'viminfo' option. (closes #722)
Files:      src/testdir/test_backspace_opt.vim, src/testdir/test_viminfo.vim,
            src/testdir/runtest.vim.

Patch 7.4.1687
Problem:    The channel close_cb option does not work.
Solution:   Use jo_close_partial instead of jo_err_partial. (Damien)
Files:      src/channel.c, src/testdir/test_channel.vim

Patch 7.4.1688
```

```
Problem:    MzScheme does not support partial.
Solution:   Add minimal partial support. (Ken Takata)
Files:      src/if_mzsch.c

Patch 7.4.1689
Problem:    Ruby interface has inconsistent coding style.
Solution:   Fix the coding style. (Ken Takata)
Files:      src/if_ruby.c

Patch 7.4.1690
Problem:    Can't compile with the conceal feature but without multi-byte.
Solution:   Adjust #ifdef. (Owen Leibman)
Files:      src/eval.c, src/window.c

Patch 7.4.1691
Problem:    When switching to a new buffer and an autocommand applies syntax
            highlighting an ml_get error may occur.
Solution:   Check "syn_buf" against the buffer in the window. (Alexander von
            Buddenbrock, closes #676)
Files:      src/syntax.c

Patch 7.4.1692
Problem:    feedkeys('i', 'x') gets stuck, waits for a character to be typed.
Solution:   Behave like ":normal". (Yasuhiro Matsumoto)
Files:      src/eval.c, src/testdir/test_feedkeys.vim

Patch 7.4.1693
Problem:    Building the Perl interface gives compiler warnings.
Solution:   Remove a pragma. Add noreturn attributes. (Damien)
Files:      src/if_perl.xs

Patch 7.4.1694
Problem:    Win32 gvim doesn't work with "dvorakj" input method.
Solution:   Wait for QS_ALLINPUT instead of QS_ALLEVENTS. (Yukihiro Nakadaira)
Files:      src/gui_w32.c

Patch 7.4.1695
Problem:    ":syn reset" clears the effect ":syn iskeyword". (James McCoy)
Solution:   Remove clearing the syntax keywords.
Files:      src/syntax.c

Patch 7.4.1696
Problem:    When using :stopinsert in a silent mapping the "INSERT" message
            isn't cleared. (Coacher)
Solution:   Always clear the message. (Christian Brabandt, closes #718)
Files:      src/ex_docmd.c, src/proto/screen.pro, src/screen.c

Patch 7.4.1697
Problem:    Display problems when the 'ambiwidth' and 'emoji' options are not
            set properly or the terminal doesn't behave as expected.
Solution:   After drawing an ambiguous width character always position the
            cursor.
Files:      src/mbyte.c, src/screen.c, src/proto/mbyte.pro
```

```
Patch 7.4.1698
Problem:    Two tests fail when running tests with MinGW. (Michael Soyka)
Solution:   Convert test_getcwd.ok test_wordcount.ok to unix fileformat.
Files:      src/testdir/Make_ming.mak

Patch 7.4.1699
Problem:    :packadd does not work the same when used early or late.
Solution:   Always load plugins matching "plugin/**/*.vim".
Files:      src/ex_cmds2.c, src/testdir/test_packadd.vim

Patch 7.4.1700
Problem:    Equivalence classes are not properly tested.
Solution:   Add tests for multi-byte and latin1. Fix an error. (Owen Leibman)
Files:      src/regexp.c, src/testdir/Make_all.mak,
            src/testdir/test_alot_latin.vim, src/testdir/test_alot_utf8.vim,
            src/testdir/test_regexp_latin.vim,
            src/testdir/test_regexp_utf8.vim

Patch 7.4.1701
Problem:    Equivalence classes still tested in old style tests.
Solution:   Remove the duplicate.
Files:      src/testdir/test44.in, src/testdir/test44.ok,
            src/testdir/test99.in, src/testdir/test99.ok

Patch 7.4.1702
Problem:    Using freed memory when parsing 'printoptions' fails.
Solution:   Save the old options and restore them in case of an error.
            (Dominique)
Files:      src/hardcopy.c, src/testdir/test_hardcopy.vim

Patch 7.4.1703
Problem:    Can't assert for not equal and not matching.
Solution:   Add assert_notmatch() and assert_notequal().
Files:      src/eval.c, runtime/doc/eval.txt, src/testdir/test_assert.vim

Patch 7.4.1704
Problem:    Using freed memory with "wincmd p". (Dominique Pelle)
Solution:   Also clear "prevwin" in other tab pages.
Files:      src/window.c

Patch 7.4.1705
Problem:    The 'guifont' option does not allow for a quality setting.
Solution:   Add the "q" item, supported on MS-Windows. (Yasuhiro Matsumoto)
Files:      runtime/doc/options.txt, src/gui_w32.c, src/os_mswin.c,
            src/proto/os_mswin.pro

Patch 7.4.1706
Problem:    Old style function declaration breaks build.
Solution:   Remove __ARGS().
Files:      src/proto/os_mswin.pro

Patch 7.4.1707
Problem:    Cannot use empty dictionary key, even though it can be useful.
Solution:   Allow using an empty dictionary key.
```

```
Files:      src/hashtab.c, src/eval.c, src/testdir/test_expr.vim

Patch 7.4.1708
Problem:    New regexp engine does not work properly with EBCDIC.
Solution:   Define equivalence class characters. (Owen Leibman)
Files:      src/regexp_nfa.c

Patch 7.4.1709
Problem:    Mistake in #ifdef.
Solution:   Change PROOF_QUALITY to DRAFT_QUALITY. (Ken Takata)
Files:      src/os_mswin.c

Patch 7.4.1710
Problem:    Not all output of an external command is read.
Solution:   Avoid timing out when the process has exited. (closes #681)
Files:      src/os_unix.c

Patch 7.4.1711
Problem:    When using try/catch in 'statusline' it is still considered an
            error and the status line will be disabled.
Solution:   Check did_emsg instead of called_emsg. (haya14busa, closes #729)
Files:      src/screen.c, src/testdir/test_statusline.vim,
            src/testdir/test_alot.vim

Patch 7.4.1712
Problem:    For plugins in packages, plugin authors need to take care of all
            dependencies.
Solution:   When loading "start" packages and for :packloadall, first add all
            directories to 'runtimepath' before sourcing plugins.
Files:      src/ex_cmds2.c, src/testdir/test_packadd.vim

Patch 7.4.1713
Problem:    GTK GUI doesn't work on Wayland.
Solution:   Specify that only the X11 backend is allowed. (Simon McVittie)
Files:      src/gui_gtk_x11.c

Patch 7.4.1714
Problem:    Non-GUI specific settings in the gvimrc_example file.
Solution:   Move some settings to the vimrc_example file.  Remove setting
            'hlsearch' again. (suggested by Hirohito Higashi)
Files:      runtime/vimrc_example.vim, runtime/gvimrc_example.vim

Patch 7.4.1715
Problem:    Double free when a partial is in a cycle with a list or dict.
            (Nikolai Pavlov)
Solution:   Do not free a nested list or dict used by the partial.
Files:      src/eval.c, src/testdir/test_partial.vim

Patch 7.4.1716
Problem:    'autochdir' doesn't work for the first file. (Rob Hoelz)
Solution:   Call DO_AUTOCHDIR after startup. (Christian Brabandt, closes #704)
Files:      src/main.c

Patch 7.4.1717
```

```
Problem:    Leaking memory when opening a channel fails.
Solution:   Unreference partials in job options.
Files:      src/eval.c, src/channel.c, src/proto/channel.pro,
            src/testdir/test_channel.vim

Patch 7.4.1718
Problem:    Coverity: not using return value of set_ref_in_item().
Solution:   Use the return value.
Files:      src/eval.c

Patch 7.4.1719
Problem:    Leaking memory when there is a cycle involving a job and a
            partial.
Solution:   Add a copyID to job and channel.  Set references in items referred
            by them.  Go through all jobs and channels to find unreferenced
            items.  Also, decrement reference counts when garbage collecting.
Files:      src/eval.c, src/channel.c, src/netbeans.c, src/globals.h,
            src/ops.c, src/regexp.c, src/tag.c, src/proto/channel.pro,
            src/proto/eval.pro, src/testdir/test_partial.vim, src/structs.h

Patch 7.4.1720
Problem:    Tests fail without the job feature.
Solution:   Skip tests when the job feature is not present.
Files:      src/testdir/test_partial.vim

Patch 7.4.1721
Problem:    The vimtbar files are unused.
Solution:   Remove them. (Ken Takata)
Files:      src/vimtbar.dll, src/vimtbar.h, src/vimtbar.lib, Filelist

Patch 7.4.1722
Problem:    Crash when calling garbagecollect() after starting a job.
Solution:   Set the copyID on job and channel. (Hirohito Higashi, Ozaki
            Kiichi)
Files:      src/eval.c

Patch 7.4.1723
Problem:    When using try/catch in 'tabline' it is still considered an
            error and the tabline will be disabled.
Solution:   Check did_emsg instead of called_emsg. (haya14busa, closes #746)
Files:      src/screen.c, src/testdir/test_tabline.vim,
            src/testdir/test_alot.vim

Patch 7.4.1724 (after 7.4.1723)
Problem:    Tabline test fails in GUI.
Solution:   Remove 'e' from 'guioptions'.
Files:      src/testdir/test_tabline.vim

Patch 7.4.1725
Problem:    Compiler errors for non-ANSI compilers.
Solution:   Remove // comment.  Remove comma at end of enum. (Michael Jarvis)
Files:      src/eval.c

Patch 7.4.1726
```

```
Problem:    ANSI compiler complains about string length.
Solution:   Split long string in two parts. (Michael Jarvis)
Files:      src/ex_cmds.c

Patch 7.4.1727
Problem:    Cannot detect a crash in tests when caused by garbagecollect().
Solution:   Add garbagecollect_for_testing().  Do not free a job if is still
            useful.
Files:      src/channel.c, src/eval.c, src/getchar.c, src/main.c, src/vim.h,
            src/proto/eval.pro, src/testdir/runtest.vim,
            src/testdir/test_channel.vim, runtime/doc/eval.txt

Patch 7.4.1728
Problem:    The help for functions require a space after the "(".
Solution:   Make CTRL-] on a function name ignore the arguments. (Hirohito
            Higashi)
Files:      src/ex_cmds.c, src/testdir/test_help_tagjump.vim,
            runtime/doc/eval.txt

Patch 7.4.1729
Problem:    The Perl interface cannot use 'print' operator for writing
            directly in standard IO.
Solution:   Add a minimal implementation of PerlIO Layer feature and try to
            use it for STDOUT/STDERR. (Damien)
Files:      src/if_perl.xs, src/testdir/test_perl.vim

Patch 7.4.1730
Problem:    It is not easy to get a character out of a string.
Solution:   Add strgetchar() and strcharpart().
Files:      src/eval.c, src/testdir/test_expr.vim

Patch 7.4.1731
Problem:    Python: turns partial into simple funcref.
Solution:   Use partials like partials. (Nikolai Pavlov, closes #734)
Files:      runtime/doc/if_pyth.txt, src/eval.c, src/if_py_both.h,
            src/if_python.c, src/if_python3.c, src/proto/eval.pro,
            src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.4.1732
Problem:    Folds may close when using autocomplete. (Anmol Sethi)
Solution:   Increment/decrement disable_fold. (Christian Brabandt, closes
            #643)
Files:      src/edit.c, src/fold.c, src/globals.h

Patch 7.4.1733
Problem:    "make install" doesn't know about cross-compiling. (Christian
            Neukirchen)
Solution:   Add CROSS_COMPILING. (closes #740)
Files:      src/configure.in, src/auto/configure, src/config.mk.in,
            src/Makefile

Patch 7.4.1734 (after 7.4.1730)
Problem:    Test fails when not using utf-8.
```

```
Solution:   Split test in regular and utf-8 part.
Files:      src/testdir/test_expr.vim, src/testdir/test_expr_utf8.vim,
            src/testdir/test_alot_utf8.vim

Patch 7.4.1735
Problem:    It is not possible to only see part of the message history.  It is
            not possible to clear messages.
Solution:   Add a count to ":messages" and a clear argument. (Yasuhiro
            Matsumoto)
Files:      runtime/doc/message.txt, src/ex_cmds.h, src/message.c,
            src/testdir/test_messages.vim, src/testdir/test_alot.vim

Patch 7.4.1736 (after 7.4.1731)
Problem:    Unused variable.
Solution:   Remove it. (Yasuhiro Matsumoto)
Files:      src/if_py_both.h

Patch 7.4.1737
Problem:    Argument marked as unused is used.
Solution:   Remove UNUSED.
Files:      src/message.c

Patch 7.4.1738
Problem:    Count for ":messages" depends on number of lines.
Solution:   Add ADDR_OTHER address type.
Files:      src/ex_cmds.h

Patch 7.4.1739
Problem:    Messages test fails on MS-Windows.
Solution:   Adjust the asserts.  Skip the "messages maintainer" line if not
            showing all messages.
Files:      src/message.c, src/testdir/test_messages.vim

Patch 7.4.1740
Problem:    syn-cchar defined with matchadd() does not appear if there are no
            other syntax definitions which matches buffer text.
Solution:   Check for startcol. (Ozaki Kiichi, haya14busa, closes #757)
Files:      src/screen.c, src/testdir/Make_all.mak,
            src/testdir/test_alot_utf8.vim, src/testdir/test_match_conceal.in,
            src/testdir/test_match_conceal.ok,
            src/testdir/test_matchadd_conceal.vim,
            src/testdir/test_matchadd_conceal_utf8.vim,
            src/testdir/test_undolevels.vim

Patch 7.4.1741
Problem:    Not testing utf-8 characters.
Solution:   Move the right asserts to the test_expr_utf8 test.
Files:      src/testdir/test_expr.vim, src/testdir/test_expr_utf8.vim

Patch 7.4.1742
Problem:    strgetchar() does not work correctly.
Solution:   use mb_cptr2len().  Add a test. (Naruhiko Nishino)
Files:      src/eval.c, src/testdir/test_expr_utf8.vim
```

Patch 7.4.1743
Problem: Clang warns for uninitialized variable. (Michael Jarvis)
Solution: Initialize it.
Files: src/if_py_both.h

Patch 7.4.1744
Problem: Python: Converting a sequence may leak memory.
Solution: Decrement a reference. (Nikolai Pavlov)
Files: src/if_py_both.h

Patch 7.4.1745
Problem: README file is not clear about where to get Vim.
Solution: Add links to github, releases and the Windows installer.
            (Suggested by Christian Brabandt)
Files: README.md, README.txt

Patch 7.4.1746
Problem: Memory leak in Perl.
Solution: Decrement the reference count. Add a test. (Damien)
Files: src/if_perl.xs, src/testdir/test_perl.vim

Patch 7.4.1747
Problem: Coverity: missing check for NULL pointer.
Solution: Check for out of memory.
Files: src/if_py_both.h

Patch 7.4.1748
Problem: "gD" does not find match in first column of first line. (Gary
            Johnson)
Solution: Accept match at the cursor.
Files: src/normal.c, src/testdir/test_goto.vim, src/testdir/test_alot.vim

Patch 7.4.1749
Problem: When using GTK 3.20 there are a few warnings.
Solution: Use new functions when available. (Kazunobu Kuriyama)
Files: src/gui_beval.c src/gui_gtk_x11.c

Patch 7.4.1750
Problem: When a buffer gets updated while in command line mode, the screen
            may be messed up.
Solution: Postpone the redraw when the screen is scrolled.
Files: src/channel.c

Patch 7.4.1751
Problem: Crash when 'tagstack' is off. (Dominique Pelle)
Solution: Fix it. (Hirohito Higashi)
Files: src/tag.c, src/testdir/test_alot.vim, src/testdir/test_tagjump.vim

Patch 7.4.1752
Problem: When adding to the quickfix list the current position is reset.
Solution: Do not reset the position when not needed. (Yegappan Lakshmanan)
Files: src/quickfix.c, src/testdir/test_quickfix.vim

Patch 7.4.1753

```
Problem:    "noinsert" in 'completeopt' is sometimes ignored.
Solution:   Set the variables when the 'completeopt' was set. (Ozaki Kiichi)
Files:      src/edit.c, src/option.c, src/proto/edit.pro

Patch 7.4.1754
Problem:    When 'filetype' was set and reloading a buffer which does not
            cause it to be set, the syntax isn't loaded. (KillTheMule)
Solution:   Remember whether the FileType event was fired and fire it if not.
            (Anton Lindqvist, closes #747)
Files:      src/fileio.c, src/testdir/test_syntax.vim

Patch 7.4.1755
Problem:    When using getreg() on a non-existing register a NULL list is
            returned. (Bjorn Linse)
Solution:   Allocate an empty list. Add a test.
Files:      src/eval.c, src/testdir/test_expr.vim

Patch 7.4.1756
Problem:    "dll" options are not expanded.
Solution:   Expand environment variables. (Ozaki Kiichi)
Files:      src/option.c, src/testdir/test_alot.vim,
            src/testdir/test_expand_dllpath.vim

Patch 7.4.1757
Problem:    When using complete() it may set 'modified' even though nothing
            was inserted.
Solution:   Use Down/Up instead of Next/Previous match. (Shougo Matsu, closes
            #745)
Files:      src/edit.c

Patch 7.4.1758
Problem:    Triggering CursorHoldI when in CTRL-X mode causes problems.
Solution:   Do not trigger CursorHoldI in CTRL-X mode. Add "!" flag to
            feedkeys() (test with that didn't work though).
Files:      src/edit.c, src/eval.c

Patch 7.4.1759
Problem:    When using feedkeys() in a timer the inserted characters are not
            used right away.
Solution:   Break the wait loop when characters have been added to typebuf.
            use this for testing CursorHoldI.
Files:      src/gui.c, src/os_win32.c, src/os_unix.c,
            src/testdir/test_autocmd.vim

Patch 7.4.1760 (after 7.4.1759)
Problem:    Compiler warning for unused variable.
Solution:   Add #ifdef. (John Marriott)
Files:      src/os_win32.c

Patch 7.4.1761
Problem:    Coverity complains about ignoring return value.
Solution:   Add "(void)" to get rid of the warning.
Files:      src/eval.c
```

```
Patch 7.4.1762
Problem:    Coverity: useless assignments.
Solution:   Remove them.
Files:      src/search.c

Patch 7.4.1763
Problem:    Coverity: useless assignment.
Solution:   Add #if 0.
Files:      src/spell.c

Patch 7.4.1764
Problem:    C++ style comment. (Ken Takata)
Solution:   Finish the work started here: don't call perror() when stderr
            isn't working.
Files:      src/os_unix.c

Patch 7.4.1765
Problem:    Undo options are not together in the options window.
Solution:   Put them together.  (Gary Johnson)
Files:      runtime/optwin.vim

Patch 7.4.1766
Problem:    Building instructions for MS-Windows are outdated.
Solution:   Mention setting SDK_INCLUDE_DIR. (Ben Franklin, closes #771)  Move
            outdated instructions further down.
Files:      src/INSTALLpc.txt

Patch 7.4.1767
Problem:    When installing Vim on a GTK system the icon cache is not updated.
Solution:   Update the GTK icon cache when possible. (Kazunobu Kuriyama)
Files:      src/Makefile, src/configure.in, src/config.mk.in,
            src/auto/configure

Patch 7.4.1768
Problem:    Arguments of setqflist() are not checked properly.
Solution:   Add better checks, add a test. (Nikolai Pavlov, Hirohito Higashi,
            closes #661)
Files:      src/eval.c, src/testdir/test_quickfix.vim

Patch 7.4.1769
Problem:    No "closed", "errors" and "encoding" attribute on Python output.
Solution:   Add attributes and more tests. (Roland Puntaier, closes #622)
Files:      src/if_py_both.h, src/if_python.c, src/if_python3.c,
            src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.4.1770
Problem:    Cannot use true color in the terminal.
Solution:   Add the 'guicolors' option. (Nikolai Pavlov)
Files:      runtime/doc/options.txt, runtime/doc/term.txt,
            runtime/doc/various.txt, src/auto/configure, src/config.h.in,
            src/configure.in, src/eval.c, src/globals.h, src/hardcopy.c,
            src/option.c, src/option.h, src/proto/term.pro, src/screen.c,
            src/structs.h, src/syntax.c, src/term.c, src/term.h,
```

```
            src/version.c, src/vim.h

Patch 7.4.1771 (after 7.4.1768)
Problem:    Warning for unused variable.
Solution:   Add #ifdef. (John Marriott)
Files:      src/eval.c

Patch 7.4.1772 (after 7.4.1767)
Problem:    Installation fails when $GTK_UPDATE_ICON_CACHE is empty.
Solution:   Add quotes. (Kazunobu Kuriyama)
Files:      src/Makefile

Patch 7.4.1773 (after 7.4.1770)
Problem:    Compiler warnings. (Dominique Pelle)
Solution:   Add UNUSED. Add type cast. Avoid a buffer overflow.
Files:      src/syntax.c, src/term.c

Patch 7.4.1774 (after 7.4.1770)
Problem:    Cterm true color feature has warnings.
Solution:   Add type casts.
Files:      src/screen.c, src/syntax.c, src/term.c

Patch 7.4.1775
Problem:    The rgb.txt file is not installed.
Solution:   Install the file. (Christian Brabandt)
Files:      src/Makefile

Patch 7.4.1776
Problem:    Using wrong buffer length.
Solution:   use the right name. (Kazunobu Kuriyama)
Files:      src/term.c

Patch 7.4.1777
Problem:    Newly added features can escape the sandbox.
Solution:   Add checks for restricted and secure. (Yasuhiro Matsumoto)
Files:      src/eval.c

Patch 7.4.1778
Problem:    When using the term truecolor feature, the t_8f and t_8b termcap
            options are not set by default.
Solution:   Move the values to before BT_EXTRA_KEYS. (Christian Brabandt)
Files:      src/term.c

Patch 7.4.1779
Problem:    Using negative index in strcharpart(). (Yegappan Lakshmanan)
Solution:   Assume single byte when using a negative index.
Files:      src/eval.c

Patch 7.4.1780
Problem:    Warnings reported by cppcheck.
Solution:   Fix the warnings. (Dominique Pelle)
Files:      src/ex_cmds2.c, src/json.c, src/misc1.c, src/ops.c,
            src/regexp_nfa.c
```

```
Patch 7.4.1781
Problem:    synIDattr() does not respect 'guicolors'.
Solution:   Change the condition for the mode. (Christian Brabandt)
Files:      src/eval.c

Patch 7.4.1782
Problem:    strcharpart() does not work properly with some multi-byte
            characters.
Solution:   Use mb_cptr2len() instead of mb_char2len(). (Hirohito Higashi)
Files:      src/eval.c, src/testdir/test_expr_utf8.vim

Patch 7.4.1783
Problem:    The old regexp engine doesn't handle character classes correctly.
            (Manuel Ortega)
Solution:   Use regmbc() instead of regc().  Add a test.
Files:      src/regexp.c, src/testdir/test_regexp_utf8.vim

Patch 7.4.1784
Problem:    The termtruecolor feature is enabled differently from many other
            features.
Solution:   Enable the termtruecolor feature for the big build, not through
            configure.
Files:      src/configure.in, src/config.h.in, src/auto/configure,
            src/feature.h

Patch 7.4.1785 (after 7.4.1783)
Problem:    Regexp test fails on windows.
Solution:   set 'isprint' to the right value for testing.
Files:      src/testdir/test_regexp_utf8.vim

Patch 7.4.1786
Problem:    Compiled-in colors do not match rgb.txt.
Solution:   Use the rgb.txt colors. (Kazunobu Kuriyama)
Files:      src/term.c

Patch 7.4.1787
Problem:    When a job ends the close callback is invoked before other
            callbacks. On Windows the close callback is not called.
Solution:   First invoke out/err callbacks before the close callback.
            Make the close callback work on Windows.
Files:      src/channel.c, src/proto/channel.pro,
            src/testdir/test_channel.vim, src/testdir/test_channel_pipe.py

Patch 7.4.1788
Problem:    NSIS script is missing packages.
Solution:   Add the missing directories. (Ken Takata)
Files:      nsis/gvim.nsi

Patch 7.4.1789
Problem:    Cannot use ch_read() in the close callback.
Solution:   Do not discard the channel if there is readahead.  Do not discard
            readahead if there is a close callback.
Files:      src/eval.c, src/channel.c, src/proto/channel.pro,
            src/testdir/test_channel.vim
```

Patch 7.4.1790
Problem: Leading white space in a job command matters. (Andrew Stewart)
Solution: Skip leading white space.
Files: src/os_unix.c

Patch 7.4.1791
Problem: Channel could be garbage collected too early.
Solution: Don't free a channel or remove it from a job when it is still
            useful.
Files: src/channel.c

Patch 7.4.1792
Problem: Color name decoding is implemented several times.
Solution: Move it to term.c. (Christian Brabandt)
Files: src/gui_mac.c, src/gui_photon.c, src/gui_w32.c,
            src/proto/term.pro, src/term.c

Patch 7.4.1793
Problem: Some character classes may differ between systems. On OS/X the
            regexp test fails.
Solution: Make this less dependent on the system. (idea by Kazunobu Kuriyama)
Files: src/regexp.c, src/regexp_nfa.c

Patch 7.4.1794 (after 7.4.1792)
Problem: Can't build on MS-Windows.
Solution: Add missing declaration.
Files: src/gui_w32.c

Patch 7.4.1795
Problem: Compiler warning for redefining RGB. (John Marriott)
Solution: Rename it to TORGB.
Files: src/term.c

Patch 7.4.1796 (after 7.4.1795)
Problem: Colors are wrong on MS-Windows. (Christian Robinson)
Solution: Use existing RGB macro if it exists. (Ken Takata)
Files: src/term.c

Patch 7.4.1797
Problem: Warning from Windows 64 bit compiler.
Solution: Change int to size_t. (Mike Williams)
Files: src/term.c

Patch 7.4.1798
Problem: Still compiler warning for unused return value. (Charles Campbell)
Solution: Assign to ignoredp.
Files: src/term.c

Patch 7.4.1799
Problem: 'guicolors' is a confusing option name.
Solution: Use 'termguicolors' instead. (Hirohito Higashi, Ken Takata)
Files: runtime/doc/options.txt, runtime/doc/term.txt,
            runtime/doc/various.txt, runtime/syntax/dircolors.vim, src/eval.c,

```
            src/feature.h, src/globals.h, src/hardcopy.c, src/option.c,
            src/option.h, src/proto/term.pro, src/screen.c, src/structs.h,
            src/syntax.c, src/term.c, src/version.c, src/vim.h

Patch 7.4.1800 (after 7.4.1799)
Problem:    Unnecessary #ifdef.
Solution:   Just use USE_24BIT. (Ken Takata)
Files:      src/syntax.c

Patch 7.4.1801
Problem:    Make uninstall leaves file behind.
Solution:   Delete rgb.txt. (Kazunobu Kuriyama)
Files:      src/Makefile

Patch 7.4.1802
Problem:    Quickfix doesn't handle long lines well, they are split.
Solution:   Drop characters after a limit. (Anton Lindqvist)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim,
            src/testdir/samples/quickfix.txt

Patch 7.4.1803
Problem:    GTK3 doesn't handle menu separators properly.
Solution:   Use gtk_separator_menu_item_new(). (Kazunobu Kuriyama)
Files:      src/gui_gtk.c

Patch 7.4.1804
Problem:    Can't use Vim as MANPAGER.
Solution:   Add manpager.vim. (Enno Nagel, closes #491)
Files:      runtime/doc/filetype.txt, runtime/plugin/manpager.vim

Patch 7.4.1805
Problem:    Running tests in shadow dir fails.
Solution:   Link the samples directory
Files:      src/Makefile

Patch 7.4.1806
Problem:    'termguicolors' option missing from the options window.
Solution:   Add the entry.
Files:      runtime/optwin.vim

Patch 7.4.1807
Problem:    Test_out_close_cb sometimes fails.
Solution:   Always write DETACH to out, not err.
Files:      src/channel.c, src/testdir/test_channel.vim

Patch 7.4.1808 (after 7.4.1806)
Problem:    Using wrong feature name to check for 'termguicolors'.
Solution:   Use the right feature name. (Ken Takata)
Files:      runtime/optwin.vim

Patch 7.4.1809 (after 7.4.1808)
Problem:    Using wrong short option name for 'termguicolors'.
Solution:   Use the option name.
Files:      runtime/optwin.vim
```

```
Patch 7.4.1810
Problem:    Sending DETACH after a channel was closed isn't useful.
Solution:   Only add DETACH for a netbeans channel.
Files:      src/channel.c, src/testdir/test_channel.vim

Patch 7.4.1811
Problem:    Netbeans channel gets garbage collected.
Solution:   Set reference in nb_channel.
Files:      src/eval.c, src/netbeans.c, src/proto/netbeans.pro

Patch 7.4.1812
Problem:    Failure on startup with Athena and Motif.
Solution:   Check for INVALCOLOR. (Kazunobu Kuriyama)
Files:      src/syntax.c, src/vim.h

Patch 7.4.1813
Problem:    Memory access error when running test_quickfix.
Solution:   Allocate one more byte. (Yegappan Lakshmanan)
Files:      src/quickfix.c

Patch 7.4.1814
Problem:    A channel may be garbage collected while it's still being used by
            a job. (James McCoy)
Solution:   Mark the channel as used if the job is still used.  Do the same
            for channels that are still used.
Files:      src/eval.c, src/channel.c, src/proto/channel.pro

Patch 7.4.1815
Problem:    Compiler warnings for unused variables. (Ajit Thakkar)
Solution:   Add a dummy initialization. (Yasuhiro Matsumoto)
Files:      src/quickfix.c

Patch 7.4.1816
Problem:    Looping over a null list throws an error.
Solution:   Skip over the for loop.
Files:      src/eval.c, src/testdir/test_expr.vim

Patch 7.4.1817
Problem:    The screen is not updated if a callback is invoked when closing a
            channel.
Solution:   Invoke redraw_after_callback().
Files:      src/channel.c

Patch 7.4.1818
Problem:    Help completion adds @en to all matches except the first one.
Solution:   Remove "break", go over all items.
Files:      src/ex_getln.c

Patch 7.4.1819
Problem:    Compiler warnings when sprintf() is a macro.
Solution:   Don't interrupt sprintf() with an #ifdef. (Michael Jarvis,
            closes #788)
Files:      src/fileio.c, src/tag.c, src/term.c
```

Patch 7.4.1820
Problem: Removing language from help tags too often.
Solution: Only remove @en when not needed. (Hirohito Higashi)
Files: src/ex_getln.c, src/testdir/test_help_tagjump.vim

Patch 7.4.1821 (after 7.4.1820)
Problem: Test fails on MS-Windows.
Solution: Sort the completion results.
Files: src/testdir/test_help_tagjump.vim

Patch 7.4.1822
Problem: Redirecting stdout of a channel to "null" doesn't work. (Nicola)
Solution: Correct the file descriptor number.
Files: src/os_unix.c

Patch 7.4.1823
Problem: Warning from 64 bit compiler.
Solution: Add type cast. (Mike Williams)
Files: src/quickfix.c

Patch 7.4.1824
Problem: When a job is no longer referenced and does not have an exit
            callback the process may hang around in defunct state. (Nicola)
Solution: Call job_status() if the job is running and won't get freed
            because it might still be useful.
Files: src/channel.c

Patch 7.4.1825
Problem: When job writes to buffer nothing is written. (Nicola)
Solution: Do not discard a channel before writing is done.
Files: src/channel.c

Patch 7.4.1826
Problem: Callbacks are invoked when it's not safe. (Andrew Stewart)
Solution: When a channel is to be closed don't invoke callbacks right away,
            wait for a safe moment.
Files: src/structs.h, src/channel.c

Patch 7.4.1827
Problem: No error when invoking a callback when it's not safe.
Solution: Add an error message. Avoid the error when freeing a channel.
Files: src/structs.h, src/channel.c

Patch 7.4.1828
Problem: May try to access buffer that's already freed.
Solution: When freeing a buffer remove it from any channel.
Files: src/buffer.c, src/channel.c, src/proto/channel.pro

Patch 7.4.1829 (after 7.4.1828)
Problem: No message on channel log when buffer was freed.
Solution: Log a message.
Files: src/channel.c

```
Patch 7.4.1830
Problem:    non-antialiased misnamed.
Solution:   Use NONANTIALIASED and NONANTIALIASED_QUALITY. (Kim Brouer,
            closes #793)
Files:      src/os_mswin.c, runtime/doc/options.txt

Patch 7.4.1831
Problem:    When timer_stop() is called with a string there is no proper error
            message.
Solution:   Require getting a number. (Bjorn Linse)
Files:      src/eval.c

Patch 7.4.1832
Problem:    Memory leak in debug commands.
Solution:   Free memory before overwriting the pointer. (hint by Justin Keyes)
Files:      src/ex_cmds2.c

Patch 7.4.1833
Problem:    Cannot use an Ex command for 'keywordprg'.
Solution:   Accept an Ex command. (Nelo-Thara Wallus)
Files:      src/normal.c, runtime/doc/options.txt

Patch 7.4.1834
Problem:    Possible crash when conceal is active.
Solution:   Check for the screen to be valid when redrawing a line.
Files:      src/screen.c

Patch 7.4.1835
Problem:    When splitting and closing a window the status height changes.
Solution:   Compute the frame height correctly. (Hirohito Higashi)
Files:      src/window.c, src/testdir/test_alot.vim,
            src/testdir/test_window_cmd.vim

Patch 7.4.1836
Problem:    When using a partial on a dictionary it always gets bound to that
            dictionary.
Solution:   Make a difference between binding a function to a dictionary
            explicitly or automatically.
Files:      src/structs.h, src/eval.c, src/testdir/test_partial.vim,
            runtime/doc/eval.txt

Patch 7.4.1837
Problem:    The BufUnload event is triggered twice, when :bunload is used with
            `bufhidden` set to `unload` or `delete`.
Solution:   Do not trigger the event when ml_mfp is NULL. (Hirohito Higashi)
Files:      src/buffer.c, src/testdir/test_autocmd.vim

Patch 7.4.1838
Problem:    Functions specifically for testing do not sort together.
Solution:   Rename garbagecollect_for_testing() to test_garbagecollect_now().
            Add test_null_list(), test_null_dict(), etc.
Files:      src/eval.c, src/testdir/test_expr.vim,
            src/testdir/test_channel.vim, runtime/doc/eval.txt
```

Patch 7.4.1839
Problem: Cannot get the items stored in a partial.
Solution: Support using get() on a partial.
Files: src/eval.c, src/testdir/test_partial.vim, runtime/doc/eval.txt

Patch 7.4.1840
Problem: When using packages an "after" directory cannot be used.
Solution: Add the "after" directory of the package to 'runtimepath' if it
            exists.
Files: src/ex_cmds2.c, src/testdir/test_packadd.vim

Patch 7.4.1841
Problem: The code to reallocate the buffer used for quickfix is repeated.
Solution: Move the code to a function. (Yegappan Lakshmanan, closes #831)
Files: src/quickfix.c, src/testdir/test_quickfix.vim

Patch 7.4.1842 (after 7.4.1839)
Problem: get() works for Partial but not for Funcref.
Solution: Accept Funcref. Also return the function itself. (Nikolai Pavlov)
Files: src/eval.c, src/testdir/test_partial.vim, runtime/doc/eval.txt

Patch 7.4.1843
Problem: Tests involving Python are flaky.
Solution: Set the pt_auto field. Add tests. (Nikolai Pavlov)
Files: runtime/doc/if_pyth.txt, src/if_py_both.h, src/testdir/test86.in,
            src/testdir/test86.ok, src/testdir/test87.in,
            src/testdir/test87.ok

Patch 7.4.1844
Problem: Using old function name in comment. More functions should start
            with test_.
Solution: Rename function in comment. (Hirohito Higashi) Rename
            disable_char_avail_for_testing() to test_disable_char_avail().
            And alloc_fail() to test_alloc_fail().
Files: src/eval.c, src/getchar.c, src/testdir/runtest.vim,
            src/testdir/test_cursor_func.vim, src/testdir/test_quickfix.vim,
            runtime/doc/eval.txt

Patch 7.4.1845
Problem: Mentioning NetBeans when reading from channel. (Ramel Eshed)
Solution: Make the text more generic.
Files: src/channel.c

Patch 7.4.1846
Problem: Ubsan detects a multiplication overflow.
Solution: Don't use orig_mouse_time when it's zero. (Dominique Pelle)
Files: src/term.c

Patch 7.4.1847
Problem: Getting an item from a NULL dict crashes. Setting a register to a
            NULL list crashes. (Nikolai Pavlov, issue #768) Comparing a NULL
            dict with a NULL dict fails.
Solution: Properly check for NULL.
Files: src/eval.c, src/testdir/test_expr.vim

Patch 7.4.1848
Problem: Can't build with Strawberry Perl 5.24.
Solution: Define S_SvREFCNT_dec() if needed. (Damien, Ken Takata)
Files: src/if_perl.xs

Patch 7.4.1849
Problem: Still trying to read from channel that is going to be closed.
            (Ramel Eshed)
Solution: Check if ch_to_be_closed is set.
Files: src/channel.c

Patch 7.4.1850
Problem: GUI freezes when using a job. (Shougo Matsu)
Solution: Unregister the channel when there is an input error.
Files: src/channel.c

Patch 7.4.1851
Problem: test_syn_attr fails when using the GUI. (Dominique Pelle)
Solution: Escape the font name properly.
Files: src/testdir/test_syn_attr.vim

Patch 7.4.1852
Problem: Unix: Cannot run all tests with the GUI.
Solution: Add the "testgui" target.
Files: src/Makefile, src/testdir/Makefile

Patch 7.4.1853
Problem: Crash when job and channel are in the same dict while using
            partials. (Luc Hermitte)
Solution: Do not decrement the channel reference count too early.
Files: src/channel.c

Patch 7.4.1854
Problem: When setting 'termguicolors' the Ignore highlighting doesn't work.
            (Charles Campbell)
Solution: Handle the color names "fg" and "bg" when the GUI isn't running
            and no colors are specified, fall back to black and white.
Files: src/syntax.c

Patch 7.4.1855
Problem: Valgrind reports memory leak for job that is not freed.
Solution: Free all jobs on exit. Add test for failing job.
Files: src/channel.c, src/misc2.c, src/proto/channel.pro,
            src/testdir/test_partial.vim

Patch 7.4.1856 (after 7.4.1855)
Problem: failing job test fails on MS-Windows.
Solution: Expect "fail" status instead of "dead".
Files: src/testdir/test_partial.vim

Patch 7.4.1857
Problem: When a channel appends to a buffer that is 'nomodifiable' there is
            an error but appending is done anyway.

Solution: Add the 'modifiable' option. Refuse to write to a 'nomodifiable'
            when the value is 1.
Files: src/structs.h, src/channel.c, src/testdir/test_channel.vim,
            runtime/doc/channel.txt

Patch 7.4.1858
Problem: When a channel writes to a buffer it doesn't find a buffer by the
            short name but re-uses it anyway.
Solution: Find buffer also by the short name.
Files: src/channel.c, src/buffer.c, src/vim.h

Patch 7.4.1859
Problem: Cannot use a function reference for "exit_cb".
Solution: Use get_callback(). (Yegappan Lakshmanan)
Files: src/channel.c, src/structs.h

Patch 7.4.1860
Problem: Using a partial for timer_start() may cause a crash.
Solution: Set the copyID in timer objects. (Ozaki Kiichi)
Files: src/testdir/test_timers.vim, src/eval.c, src/ex_cmds2.c,
            src/proto/ex_cmds2.pro

Patch 7.4.1861
Problem: Compiler warnings with 64 bit compiler.
Solution: Change int to size_t. (Mike Williams)
Files: src/ex_cmds2.c

Patch 7.4.1862
Problem: string() with repeated argument does not give a result usable by
            eval().
Solution: Refactor echo_string and tv2string(), moving the common part to
            echo_string_core(). (Ken Takata)
Files: src/eval.c, src/testdir/test_viml.vim, src/testdir/test86.ok,
            src/testdir/test87.ok

Patch 7.4.1863
Problem: Compiler warnings on Win64.
Solution: Adjust types, add type casts. (Ken Takata)
Files: src/if_mzsch.c, src/if_perl.xs, src/if_ruby.c, src/version.c

Patch 7.4.1864
Problem: Python: encoding error with Python 2.
Solution: Use "getcwdu" instead of "getcwd". (Ken Takata)
Files: src/if_py_both.h

Patch 7.4.1865
Problem: Memory leaks in test49. (Dominique Pelle)
Solution: Use NULL instead of an empty string.
Files: src/eval.c

Patch 7.4.1866
Problem: Invalid memory access when exiting with EXITFREE defined.
            (Dominique Pelle)
Solution: Set "really_exiting" and skip error messages.

```
Files:      src/misc2.c, src/eval.c

Patch 7.4.1867
Problem:    Memory leak in test_matchstrpos.
Solution:   Free the string before overwriting. (Yegappan Lakshmanan)
Files:      src/eval.c

Patch 7.4.1868
Problem:    Setting really_exiting causes memory leaks to be reported.
Solution:   Add the in_free_all_mem flag.
Files:      src/globals.h, src/misc2.c, src/eval.c

Patch 7.4.1869
Problem:    Can't build with old version of Perl.
Solution:   Define PERLIO_FUNCS_DECL. (Tom G. Christensen)
Files:      src/if_perl.xs

Patch 7.4.1870 (after 7.4.1863)
Problem:    One more Win64 compiler warning.
Solution:   Change declared argument type. (Ken Takata)
Files:      src/if_mzsch.c

Patch 7.4.1871
Problem:    Appending to the quickfix list while the quickfix window is open
            is very slow.
Solution:   Do not delete all the lines, only append the new ones.  Avoid
            using a window while updating the list. (closes #841)
Files:      src/quickfix.c

Patch 7.4.1872
Problem:    Still build problem with old version of Perl.
Solution:   Also define SvREFCNT_inc_void_NN if needed. (Tom G. Christensen)
Files:      src/if_perl.xs

Patch 7.4.1873
Problem:    When a callback adds a timer the GUI doesn't use it until later.
            (Ramel Eshed)
Solution:   Return early if a callback adds a timer.
Files:      src/ex_cmds2.c, src/gui_gtk_x11.c, src/gui_w32.c, src/gui_x11.c,
            src/globals.h

Patch 7.4.1874
Problem:    Unused variable in Win32 code.
Solution:   Remove it. (Mike Williams)
Files:      src/gui_w32.c

Patch 7.4.1875
Problem:    Comparing functions and partials doesn't work well.
Solution:   Add tests. (Nikolai Pavlov)  Compare the dict and arguments in the
            partial. (closes #813)
Files:      src/eval.c, src/testdir/test_partial.vim

Patch 7.4.1876
Problem:    Typing "k" at the hit-enter prompt has no effect.
```

```
Solution:   Don't assume recursive use of the prompt if a character was typed.
            (Hirohito Higashi)
Files:      src/message.c

Patch 7.4.1877
Problem:    No test for invoking "close_cb" when writing to a buffer.
Solution:   Add using close_cb to a test case.
Files:      src/testdir/test_channel.vim

Patch 7.4.1878
Problem:    Whether a job has exited isn't detected until a character is
            typed.  After calling exit_cb the cursor is in the wrong place.
Solution:   Don't wait forever for a character to be typed when there is a
            pending job.  Update the screen if needed after calling exit_cb.
Files:      src/os_unix.c, src/channel.c, src/proto/channel.pro

Patch 7.4.1879 (after 7.4.1877)
Problem:    Channel test is flaky.
Solution:   Wait for close_cb to be invoked.
Files:      src/testdir/test_channel.vim

Patch 7.4.1880
Problem:    MS-Windows console build defaults to not having +channel.
Solution:   Include the channel feature if building with huge features.
Files:      src/Make_mvc.mak

Patch 7.4.1881
Problem:    Appending to a long quickfix list is slow.
Solution:   Add qf_last.
Files:      src/quickfix.c

Patch 7.4.1882
Problem:    Check for line break at end of line wrong. (Dominique Pelle)
Solution:   Correct the logic.
Files:      src/quickfix.c

Patch 7.4.1883
Problem:    Cppcheck found 2 incorrect printf formats.
Solution:   Use %ld and %lx. (Dominique Pelle)
Files:      src/VisVim/Commands.cpp, src/gui_mac.c

Patch 7.4.1884
Problem:    Updating marks in a quickfix list is very slow when the list is
            long.
Solution:   Only update marks if the buffer has a quickfix entry.
Files:      src/structs.h, src/quickfix.c

Patch 7.4.1885
Problem:    MinGW console build defaults to not having +channel.
Solution:   Include the channel feature if building with huge features. (Ken
            Takata)
Files:      src/Make_cyg_ming.mak

Patch 7.4.1886
```

```
Problem:    When waiting for a character is interrupted by receiving channel
            data and the first character of a mapping was typed, the mapping
            times out. (Ramel Eshed)
Solution:   When dealing with channel data don't return from mch_inchar().
Files:      src/getchar.c, src/proto/getchar.pro, src/os_unix.c

Patch 7.4.1887
Problem:    When receiving channel data 'updatetime' is not respected.
Solution:   Recompute the waiting time after being interrupted.
Files:      src/os_unix.c

Patch 7.4.1888
Problem:    Wrong computation of remaining wait time in RealWaitForChar()
Solution:   Remember the original waiting time.
Files:      src/os_unix.c

Patch 7.4.1889
Problem:    When umask is set to 0177 Vim can't create temp files. (Lcd)
Solution:   Also correct umask when using mkdtemp().
Files:      src/fileio.c

Patch 7.4.1890
Problem:    GUI: When channel data is received the cursor blinking is
            interrupted.  (Ramel Eshed)
Solution:   Don't update the cursor when it is blinking.
Files:      src/screen.c, src/gui_gtk_x11.c, src/proto/gui_gtk_x11.pro,
            src/gui_mac.c, src/proto/gui_mac.pro, src/gui_photon.c,
            src/proto/gui_photon.pro, src/gui_w32.c, src/proto/gui_w32.pro,
            src/gui_x11.c, src/proto/gui_x11.pro

Patch 7.4.1891
Problem:    Channel reading very long lines is slow.
Solution:   Collapse multiple buffers until a NL is found.
Files:      src/channel.c, src/netbeans.c, src/proto/channel.pro,
            src/structs.h

Patch 7.4.1892
Problem:    balloon eval only gets the window number, not the ID.
Solution:   Add v:beval_winid.
Files:      src/eval.c, src/gui_beval.c, src/vim.h

Patch 7.4.1893
Problem:    Cannot easily get the window ID for a buffer.
Solution:   Add bufwinid().
Files:      src/eval.c, runtime/doc/eval.txt

Patch 7.4.1894
Problem:    Cannot get the window ID for a mouse click.
Solution:   Add v:mouse_winid.
Files:      src/eval.c, src/vim.h, runtime/doc/eval.txt

Patch 7.4.1895
Problem:    Cannot use a window ID where a window number is expected.
Solution:   Add LOWEST_WIN_ID, so that the window ID can be used where a
```

```
            number is expected.
Files:      src/window.c, src/eval.c, src/vim.h, runtime/doc/eval.txt,
            src/testdir/test_window_id.vim

Patch 7.4.1896
Problem:    Invoking mark_adjust() when adding a new line below the last line
            is pointless.
Solution:   Skip calling mark_adjust() when appending below the last line.
Files:      src/misc1.c, src/ops.c

Patch 7.4.1897
Problem:    Various typos, long lines and style mistakes.
Solution:   Fix the typos, wrap lines, improve style.
Files:      src/buffer.c, src/ex_docmd.c, src/getchar.c, src/option.c,
            src/main.aap, src/testdir/README.txt,
            src/testdir/test_reltime.vim, src/testdir/test_tagjump.vim,
            src/INSTALL, src/config.aap.in, src/if_mzsch.c

Patch 7.4.1898
Problem:    User commands don't support modifiers.
Solution:   Add the <mods> item. (Yegappan Lakshmanan, closes #829)
Files:      runtime/doc/map.txt, src/ex_docmd.c, src/testdir/Make_all.mak,
            src/testdir/test_usercommands.vim

Patch 7.4.1899
Problem:    GTK 3: cursor blinking doesn't work well.
Solution:   Instead of gui_gtk_window_clear() use gui_mch_clear_block().
            (Kazunobu Kuriyama)
Files:      src/gui_gtk_x11.c

Patch 7.4.1900
Problem:    Using CTRL-] in the help on "{address}." doesn't work.
Solution:   Recognize an item in {}. (Hirohito Higashi, closes #814)
Files:      src/ex_cmds.c, src/testdir/test_help_tagjump.vim

Patch 7.4.1901
Problem:    Win32: the "Disabled" menu items would appear enabled.
Solution:   Use submenu_id if there is a parent. (Shane Harper, closes #834)
Files:      src/gui_w32.c

Patch 7.4.1902
Problem:    No test for collapsing buffers for a channel.  Some text is lost.
Solution:   Add a simple test.  Set rq_buflen correctly.
Files:      src/channel.c, src/testdir/test_channel.vim,
            src/testdir/test_channel_pipe.py

Patch 7.4.1903
Problem:    When writing viminfo merging current history with history in
            viminfo may drop recent history entries.
Solution:   Add new format for viminfo lines, use it for history entries.  Use
            a timestamp for ordering the entries. Add test_settime().
            Add the viminfo version.  Does not do merging on timestamp yet.
Files:      src/eval.c, src/ex_getln.c, src/ex_cmds.c, src/structs.h,
            src/globals.h, src/proto/ex_cmds.pro, src/proto/ex_getln.pro,
```

```
            src/testdir/test_viminfo.vim

Patch 7.4.1904 (after 7.4.1903)
Problem:    Build fails.
Solution:   Add missing changes.
Files:      src/vim.h

Patch 7.4.1905 (after 7.4.1903)
Problem:    Some compilers can't handle a double semicolon.
Solution:   Remove one semicolon.
Files:      src/ex_cmds.c

Patch 7.4.1906
Problem:    Collapsing channel buffers and searching for NL does not work
            properly. (Xavier de Gaye, Ramel Eshed)
Solution:   Do not assume the buffer contains a NUL or not.  Change NUL bytes
            to NL to avoid the string is truncated.
Files:      src/channel.c, src/netbeans.c, src/proto/channel.pro

Patch 7.4.1907
Problem:    Warnings from 64 bit compiler.
Solution:   Change type to size_t. (Mike Williams)
Files:      src/ex_cmds.c

Patch 7.4.1908
Problem:    Netbeans uses uninitialized pointer and freed memory.
Solution:   Set "buffer" at the right place (hint by Ken Takata)
Files:      src/netbeans.c

Patch 7.4.1909
Problem:    Doubled semicolons.
Solution:   Reduce to one. (Dominique Pelle)
Files:      src/dosinst.c, src/fold.c, src/gui_gtk_x11.c, src/gui_w32.c,
            src/main.c, src/misc2.c

Patch 7.4.1910
Problem:    Tests using external command to delete directory.
Solution:   Use delete().
Files:      src/testdir/test17.in, src/testdir/test73.in,
            src/testdir/test_getcwd.in

Patch 7.4.1911
Problem:    Recent history lines may be lost when exiting Vim.
Solution:   Merge history using the timestamp.
Files:      src/ex_getln.c, src/ex_cmds.c, src/vim.h, src/proto/ex_getln.pro,
            src/testdir/test_viminfo.vim

Patch 7.4.1912
Problem:    No test for using setqflist() on an older quickfix list.
Solution:   Add a couple of tests.
Files:      src/testdir/test_quickfix.vim

Patch 7.4.1913
Problem:    When ":doautocmd" is used modelines are used even when no
```

            autocommands were executed. (Daniel Hahler)
Solution: Skip processing modelines. (closes #854)
Files: src/fileio.c, src/ex_cmds.c, src/ex_docmd.c, src/proto/fileio.pro

Patch 7.4.1914
Problem: Executing autocommands while using the signal stack has a high
            chance of crashing Vim.
Solution: Don't invoke autocommands when on the signal stack.
Files: src/os_unix.c

Patch 7.4.1915
Problem: The effect of the PopupMenu autocommand isn't directly visible.
Solution: Call gui_update_menus() before displaying the popup menu. (Shane
            Harper, closes #855)
Files: src/menu.c

Patch 7.4.1916 (after 7.4.1906)
Problem: No proper test for what 7.4.1906 fixes.
Solution: Add a test for reading many lines.
Files: src/testdir/test_channel.vim

Patch 7.4.1917
Problem: History lines read from viminfo in different encoding than when
            writing are not converted.
Solution: Convert the history lines.
Files: src/ex_cmds.c, src/testdir/test_viminfo.vim

Patch 7.4.1918
Problem: Not enough testing for parsing viminfo lines.
Solution: Add test with viminfo lines in bad syntax. Fix memory leak.
Files: src/ex_cmds.c, src/ex_getln.c, src/testdir/test_viminfo.vim

Patch 7.4.1919
Problem: Register contents is not merged when writing viminfo.
Solution: Use timestamps for register contents.
Files: src/ops.c, src/ex_getln.c, src/ex_cmds.c, src/proto/ex_cmds.pro,
            src/proto/ex_getln.pro, src/proto/ops.pro, src/vim.h

Patch 7.4.1920 (after 7.4.1919)
Problem: Missing test changes.
Solution: Update viminfo test.
Files: src/testdir/test_viminfo.vim

Patch 7.4.1921 (after 7.4.1919)
Problem: vim_time() not included when needed.
Solution: Adjust #ifdef.
Files: src/ex_cmds.c

Patch 7.4.1922
Problem: Ruby 2.4.0 unifies Fixnum and Bignum into Integer.
Solution: Use rb_cInteger. (Weiyong Mao)
Files: src/if_ruby.c

Patch 7.4.1923

Problem: Command line editing is not tested much.
Solution: Add tests for expanding the file name and 'wildmenu'.
Files: src/testdir/test_cmdline.vim, src/testdir/Make_all.mak

Patch 7.4.1924
Problem: Missing "void" for functions without argument.
Solution: Add "void". (Hirohito Higashi)
Files: src/channel.c, src/edit.c, src/ex_cmds2.c, src/ops.c, src/screen.c

Patch 7.4.1925
Problem: Viminfo does not merge file marks properly.
Solution: Use a timestamp. Add the :clearjumps command.
Files: src/mark.c, src/ex_cmds.c, src/ex_docmd.c, src/proto/mark.pro,
            src/structs.h, src/vim.h, src/ex_cmds.h,
            src/testdir/test_viminfo.vim

Patch 7.4.1926
Problem: Possible crash with many history items.
Solution: Avoid the index going past the last item.
Files: src/ex_getln.c

Patch 7.4.1927
Problem: Compiler warning for signed/unsigned.
Solution: Add type cast.
Files: src/if_mzsch.c

Patch 7.4.1928
Problem: Overwriting pointer argument.
Solution: Assign to what it points to. (Dominique Pelle)
Files: src/fileio.c

Patch 7.4.1929
Problem: Inconsistent indenting and weird name.
Solution: Fix indent, make name all upper case. (Ken Takata)
Files: src/if_ruby.c

Patch 7.4.1930
Problem: Can't build without +spell but with +quickfix. (Charles)
Solution: Add better #ifdef around ml_append_buf(). (closes #864)
Files: src/memline.c

Patch 7.4.1931
Problem: Using both old and new style file mark lines from viminfo.
Solution: Skip the old style lines if the viminfo file was written with a
            Vim version that supports the new style.
Files: src/ex_cmds.c

Patch 7.4.1932
Problem: When writing viminfo the jumplist is not merged with the one in
            the viminfo file.
Solution: Merge based on timestamp.
Files: src/mark.c, src/testdir/test_viminfo.vim

Patch 7.4.1933

Problem: Compiler warning about uninitialized variable. (Yegappan)
Solution: Give it a dummy value.
Files: src/ex_getln.c

Patch 7.4.1934
Problem: New style tests not executed with MinGW compiler.
Solution: Add new style test support. (Yegappan Lakshmanan)
Files: src/testdir/Make_ming.mak

Patch 7.4.1935
Problem: When using the GUI search/replace a second match right after the
            replacement is skipped.
Solution: Add the SEARCH_START flag. (Mleddy)
Files: src/gui.c

Patch 7.4.1936
Problem: Off-by-one error in bounds check. (Coverity)
Solution: Check register number properly.
Files: src/ops.c

Patch 7.4.1937
Problem: No test for directory stack in quickfix.
Solution: Add a test. (Yegappan Lakshmanan)
Files: src/testdir/test_quickfix.vim

Patch 7.4.1938
Problem: When writing viminfo numbered marks were duplicated.
Solution: Check for duplicates between current numbered marks and the ones
            read from viminfo.
Files: src/mark.c

Patch 7.4.1939
Problem: Memory access error when reading viminfo. (Dominique Pelle)
Solution: Correct index in jumplist when at the end.
Files: src/mark.c, src/testdir/test_viminfo.vim

Patch 7.4.1940
Problem: "gd" hangs in some situations. (Eric Biggers)
Solution: Remove the SEARCH_START flag when looping. Add a test.
Files: src/normal.c, src/testdir/test_goto.vim

Patch 7.4.1941
Problem: Not all quickfix tests are also done with the location lists.
Solution: Test more quickfix code. Use user commands instead of "exe".
            (Yegappan Lakshmanan)
Files: src/testdir/test_quickfix.vim

Patch 7.4.1942
Problem: Background is not drawn properly when 'termguicolors' is set.
Solution: Check cterm_normal_bg_color. (Jacob Niehus, closes #805)
Files: src/screen.c

Patch 7.4.1943
Problem: Coverity warns for unreachable code.

```
Solution:   Remove the code that won't do anything.
Files:      src/mark.c

Patch 7.4.1944
Problem:    Win32: Cannot compile with XPM feature using VC2015
Solution:   Add XPM libraries compiled with VC2015, and enable to build
            gvim.exe which supports XPM using VC2015. (Ken Takata)
Files:      src/Make_mvc.mak, src/xpm/x64/lib-vc14/libXpm.lib,
            src/xpm/x86/lib-vc14/libXpm.lib

Patch 7.4.1945
Problem:    The Man plugin doesn't work that well.
Solution:   Use "g:ft_man_open_mode" to be able open man pages in vert split
            or separate tab. Set nomodifiable for buffer with man content. Add
            a test. (Andrey Starodubtsev, closes #873)
Files:      runtime/ftplugin/man.vim, src/testdir/test_man.vim,
            src/testdir/Make_all.mak

Patch 7.4.1946 (after 7.4.1944)
Problem:    File list does not include new XPM libraries.
Solution:   Add the file list entries.
Files:      Filelist

Patch 7.4.1947
Problem:    Viminfo continuation line with wrong length isn't skipped. (Marius
            Gedminas)
Solution:   Skip a line when encountering an error, but not two lines.
Files:      src/ex_cmds.c

Patch 7.4.1948
Problem:    Using Ctrl-A with double-byte encoding may result in garbled text.
Solution:   Skip to the start of a character. (Hirohito Higashi)
Files:      src/ops.c

Patch 7.4.1949
Problem:    Minor problems with the quickfix code.
Solution:   Fix the problems. (Yegappan Lakshmanan)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 7.4.1950
Problem:    Quickfix long lines test not executed for buffer.
Solution:   Call the function to test long lines. (Yegappan Lakshmanan)
Files:      src/testdir/test_quickfix.vim

Patch 7.4.1951
Problem:    Ruby test is old style.
Solution:   Convert to a new style test. (Ken Takata)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/test_ruby.in,
            src/testdir/test_ruby.ok, src/testdir/test_ruby.vim

Patch 7.4.1952
Problem:    Cscope interface does not support finding assignments.
Solution:   Add the "a" command. (ppettina, closes #882)
Files:      runtime/doc/if_cscop.txt, src/if_cscope.c
```

```
Patch 7.4.1953
Problem:    Not all parts of the quickfix code are tested.
Solution:   Add more tests. (Yegappan Lakshmanan)
Files:      src/testdir/samples/quickfix.txt,
            src/testdir/test_quickfix.vim

Patch 7.4.1954 (after 7.4.1948)
Problem:    No test for what 7.4.1948 fixes.
Solution:   Add a test. (Hirohito Higashi, closes #880)
Files:      src/Makefile, src/testdir/Make_all.mak,
            src/testdir/test_increment_dbcs.vim

Patch 7.4.1955
Problem:    Using 32-bit Perl with 64-bit time_t causes memory corruption.
            (Christian Brabandt)
Solution:   Use time_T instead of time_t for global variables. (Ken Takata)
Files:      src/ex_cmds.c, src/globals.h, src/misc2.c, src/proto/ex_cmds.pro,
            src/proto/misc2.pro, src/structs.h, src/vim.h

Patch 7.4.1956
Problem:    When using CTRL-W f and pressing "q" at the ATTENTION dialog the
            newly opened window is not closed.
Solution:   Close the window and go back to the original one. (Norio Takagi,
            Hirohito Higashi)
Files:      src/window.c, src/testdir/test_window_cmd.vim

Patch 7.4.1957
Problem:    Perl interface has obsolete workaround.
Solution:   Remove the workaround added by 7.3.623. (Ken Takata)
Files:      src/if_perl.xs

Patch 7.4.1958
Problem:    Perl interface preprocessor statements not nicely indented.
Solution:   Improve the indenting. (Ken Takata)
Files:      src/if_perl.xs

Patch 7.4.1959
Problem:    Crash when running test_channel.vim on Windows.
Solution:   Check for NULL pointer result from FormatMessage(). (Christian
            Brabandt)
Files:      src/channel.c

Patch 7.4.1960
Problem:    Unicode standard 9 was released.
Solution:   Update the character property tables. (Christian Brabandt)
Files:      src/mbyte.c

Patch 7.4.1961
Problem:    When 'insertmode' is reset while doing completion the popup menu
            remains even though Vim is in Normal mode.
Solution:   Ignore stop_insert_mode when the popup menu is visible.  Don't set
            stop_insert_mode when 'insertmode' was already off. (Christian
            Brabandt)
```

```
Files:      src/edit.c, src/option.c, src/Makefile, src/testdir/test_alot.vim,
            src/testdir/test_popup.vim

Patch 7.4.1962
Problem:    Two test files for increment/decrement.
Solution:   Move the old style test into the new style test. (Hirohito
            Higashi, closes #881)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/main.aap,
            src/testdir/test35.in, src/testdir/test35.ok,
            src/testdir/test_increment.vim

Patch 7.4.1963
Problem:    Running Win32 Vim in mintty does not work.
Solution:   Detect mintty and give a helpful error message. (Ken Takata)
Files:      src/Make_cyg_ming.mak, src/Make_mvc.mak, src/iscygpty.c,
            src/iscygpty.h, src/main.c, Filelist

Patch 7.4.1964
Problem:    The quickfix init function is too big.
Solution:   Factor out parsing 'errorformat' to a separate function. (Yegappan
            Lakshmanan)
Files:      src/quickfix.c

Patch 7.4.1965
Problem:    When using a job in raw mode to append to a buffer garbage
            characters are added.
Solution:   Do not replace the trailing NUL with a NL. (Ozaki Kiichi)
Files:      src/channel.c, src/testdir/test_channel.vim

Patch 7.4.1966
Problem:    Coverity reports a resource leak.
Solution:   Close "fd" also when bailing out.
Files:      src/quickfix.c

Patch 7.4.1967
Problem:    Falling back from NFA to old regexp engine does not work properly.
            (fritzophrenic)
Solution:   Do not restore nfa_match. (Christian Brabandt, closes #867)
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.4.1968
Problem:    Invalid memory access with "\<C-">.
Solution:   Do not recognize this as a special character. (Dominique Pelle)
Files:      src/misc2.c, src/testdir/test_expr.vim

Patch 7.4.1969
Problem:    When the netbeans channel is closed consuming the buffer may cause
            a crash.
Solution:   Check for nb_channel not to be NULL. (Xavier de Gaye)
Files:      src/netbeans.c

Patch 7.4.1970
Problem:    Using ":insert" in an empty buffer sets the jump mark. (Ingo
            Karkat)
```

```
Solution:   Don't adjust marks when replacing the empty line in an empty
            buffer. (closes #892)
Files:      src/ex_cmds.c, src/testdir/test_jumps.vim,
            src/testdir/test_alot.vim

Patch 7.4.1971
Problem:    It is not easy to see unrecognized error lines below the current
            error position.
Solution:   Add ":clist +count".
Files:      src/quickfix.c, runtime/doc/quickfix.txt

Patch 7.4.1972
Problem:    On Solaris select() does not work as expected when there is
            typeahead.
Solution:   Add ICANON when sleeping. (Ozaki Kiichi)
Files:      src/os_unix.c

Patch 7.4.1973
Problem:    On MS-Windows the package directory may be added at the end
            because of forward/backward slash differences. (Matthew
            Desjardins)
Solution:   Ignore slash differences.
Files:      src/ex_cmds2.c

Patch 7.4.1974
Problem:    GUI has a problem with some termcodes.
Solution:   Handle negative numbers. (Kazunobu Kuriyama)
Files:      src/gui.c

Patch 7.4.1975
Problem:    On MS-Windows large files (> 2Gbyte) cause problems.
Solution:   Use "off_T" instead of "off_t".  Use "stat_T" instead of "struct
            stat".  Use 64 bit system functions if available.  (Ken Takata)
Files:      src/Makefile, src/buffer.c, src/diff.c, src/eval.c, src/ex_cmds.c,
            src/ex_cmds2.c, src/fileio.c, src/gui.c, src/gui_at_fs.c,
            src/if_cscope.c, src/main.c, src/memfile.c, src/memline.c,
            src/misc1.c, src/misc2.c, src/netbeans.c, src/os_mswin.c,
            src/os_win32.c, src/proto/fileio.pro, src/proto/memline.pro,
            src/proto/os_mswin.pro, src/pty.c, src/quickfix.c, src/spell.c,
            src/structs.h, src/tag.c, src/testdir/Make_all.mak,
            src/testdir/test_largefile.vim, src/testdir/test_stat.vim,
            src/undo.c, src/vim.h

Patch 7.4.1976
Problem:    Number variables are not 64 bits while they could be.
Solution:   Add the num64 feature. (Ken Takata, Yasuhiro Matsumoto)
Files:      runtime/doc/eval.txt, runtime/doc/various.txt,
            src/Make_cyg_ming.mak, src/Make_mvc.mak, src/charset.c,
            src/eval.c, src/ex_cmds.c, src/ex_getln.c, src/feature.h,
            src/fileio.c, src/fold.c, src/json.c, src/message.c, src/misc1.c,
            src/misc2.c, src/ops.c, src/option.c, src/proto/charset.pro,
            src/proto/eval.pro, src/quickfix.c, src/structs.h,
            src/testdir/test_viml.vim, src/version.c
```

```
Patch 7.4.1977
Problem:    With 64 bit changes don't need three calls to sprintf().
Solution:   Simplify the code, use vim_snprintf(). (Ken Takata)
Files:      src/fileio.c

Patch 7.4.1978 (after 7.4.1975)
Problem:    Large file test does not delete its output.
Solution:   Delete the output. Check size properly when possible. (Ken Takata)
Files:      src/testdir/test_largefile.vim

Patch 7.4.1979 (after 7.4.1976)
Problem:    Getting value of binary option is wrong. (Kent Sibilev)
Solution:   Fix type cast.  Add a test.
Files:      src/option.c, src/testdir/test_expr.vim

Patch 7.4.1980
Problem:    'errorformat' is parsed for every call to ":caddexpr".  Can't add
            to two location lists asynchronously.
Solution:   Keep the previously parsed data when appropriate. (mostly by
            Yegappan Lakshmanan)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 7.4.1981
Problem:    No testing for Farsi code.
Solution:   Add a minimal test.  Clean up Farsi code.
Files:      src/farsi.c, src/Makefile, src/charset.c, src/normal.c,
            src/proto/main.pro, src/testdir/Make_all.mak,
            src/testdir/test_farsi.vim

Patch 7.4.1982
Problem:    Viminfo file contains duplicate change marks.
Solution:   Drop duplicate marks.
Files:      src/mark.c

Patch 7.4.1983
Problem:    farsi.c and arabic.c are included in a strange way.
Solution:   Build them like other files.
Files:      src/main.c, src/farsi.c, src/arabic.c, src/proto.h,
            src/proto/main.pro, src/proto/farsi.pro, src/proto/arabic.pro,
            src/Makefile, src/Make_bc5.mak, src/Make_cyg_ming.mak,
            src/Make_dice.mak, src/Make_ivc.mak, src/Make_manx.mak,
            src/Make_morph.mak, src/Make_mvc.mak, src/Make_sas.mak,
            Filelist

Patch 7.4.1984
Problem:    Not all quickfix features are tested.
Solution:   Add a few more tests. (Yegappan Lakshmanan)
Files:      src/testdir/test_quickfix.vim

Patch 7.4.1985 (after 7.4.1983)
Problem:    Missing changes in VMS build file.
Solution:   Use the right file name.
Files:      src/Make_vms.mms
```

```
Patch 7.4.1986
Problem:    Compiler warns for loss of data.
Solution:   Use size_t instead of int. (Christian Brabandt)
Files:      src/ex_cmds2.c

Patch 7.4.1987
Problem:    When copying unrecognized lines for viminfo, end up with useless
            continuation lines.
Solution:   Skip continuation lines.
Files:      src/ex_cmds.c

Patch 7.4.1988
Problem:    When updating viminfo with file marks there is no time order.
Solution:   Remember the time when a buffer was last used, store marks for
            the most recently used buffers.
Files:      src/buffer.c, src/structs.h, src/mark.c, src/main.c,
            src/ex_cmds.c, src/proto/mark.pro, src/testdir/test_viminfo.vim

Patch 7.4.1989
Problem:    filter() and map() only accept a string argument.
Solution:   Implement using a Funcref argument (Yasuhiro Matsumoto, Ken
            Takata)
Files:      runtime/doc/eval.txt, src/Makefile, src/eval.c,
            src/testdir/test_alot.vim, src/testdir/test_filter_map.vim,
            src/testdir/test_partial.vim

Patch 7.4.1990 (after 7.4.1952)
Problem:    Cscope items are not sorted.
Solution:   Put the new "a" command first. (Ken Takata)
Files:      src/if_cscope.c

Patch 7.4.1991
Problem:    glob() does not add a symbolic link when there are no wildcards.
Solution:   Remove the call to mch_getperm().
Files:      src/misc1.c

Patch 7.4.1992
Problem:    Values for true and false can be confusing.
Solution:   Update the documentation.  Add a test.  Make v:true evaluate to
            TRUE for a non-zero-arg.
Files:      runtime/doc/eval.txt, src/eval.c, src/Makefile,
            src/testdir/test_true_false.vim, src/testdir/test_alot.vim

Patch 7.4.1993
Problem:    Not all TRUE and FALSE arguments are tested.
Solution:   Add a few more tests.
Files:      src/testdir/test_true_false.vim

Patch 7.4.1994 (after 7.4.1993)
Problem:    True-false test fails.
Solution:   Filter the dict to only keep the value that matters.
Files:      src/testdir/test_true_false.vim

Patch 7.4.1995
```

```
Problem:    GUI: cursor drawn in wrong place if a timer callback causes a
            screen update. (David Samvelyan)
Solution:   Also redraw the cursor when it's blinking and on.
Files:      src/gui_gtk_x11.c, src/gui_mac.c, src/gui_photon.c, src/gui_w32.c,
            src/gui_x11.c, src/screen.c, src/proto/gui_gtk_x11.pro,
            src/proto/gui_mac.pro, src/proto/gui_photon.pro,
            src/proto/gui_w32.pro, src/proto/gui_x11.pro

Patch 7.4.1996
Problem:    Capturing the output of a command takes a few commands.
Solution:   Add evalcmd().
Files:      src/eval.c, runtime/doc/eval.txt, src/testdir/test_alot.vim,
            src/Makefile, src/testdir/test_evalcmd.vim

Patch 7.4.1997
Problem:    Cannot easily scroll the quickfix window.
Solution:   Add ":cbottom".
Files:      src/ex_cmds.h, src/quickfix.c, src/proto/quickfix.pro,
            src/ex_docmd.c, src/testdir/test_quickfix.vim,
            runtime/doc/quickfix.txt

Patch 7.4.1998
Problem:    When writing buffer lines to a job there is no NL to NUL
            conversion.
Solution:   Make it work symmetrical with writing lines from a job into a
            buffer.
Files:      src/channel.c, src/proto/channel.pro, src/netbeans.c

Patch 7.4.1999
Problem:    evalcmd() doesn't work recursively.
Solution:   Use redir_evalcmd instead of redir_vname.
Files:      src/message.c, src/eval.c, src/globals.h, src/proto/eval.pro,
            src/testdir/test_evalcmd.vim

Patch 7.4.2000 (after 7.4.1999)
Problem:    Evalcmd test fails.
Solution:   Add missing piece.
Files:      src/ex_docmd.c

Patch 7.4.2001 (after 7.4.2000)
Problem:    Tiny build fails. (Tony Mechelynck)
Solution:   Add #ifdef.
Files:      src/ex_docmd.c

Patch 7.4.2002
Problem:    Crash when passing number to filter() or map().
Solution:   Convert to a string. (Ozaki Kiichi)
Files:      src/eval.c, src/testdir/test_filter_map.vim

Patch 7.4.2003
Problem:    Still cursor flickering when a callback updates the screen. (David
            Samvelyan)
Solution:   Put the cursor in the right position after updating the screen.
Files:      src/screen.c
```

```
Patch 7.4.2004
Problem:    GUI: cursor displayed in the wrong position.
Solution:   Correct screen_cur_col and screen_cur_row.
Files:      src/screen.c

Patch 7.4.2005
Problem:    After using evalcmd() message output is in the wrong position.
            (Christian Brabandt)
Solution:   Reset msg_col.
Files:      src/eval.c

Patch 7.4.2006
Problem:    Crash when using tabnext in BufUnload autocmd. (Norio Takagi)
Solution:   First check that the current buffer is the right one. (Hirohito
            Higashi)
Files:      src/buffer.c, src/testdir/test_autocmd.vim

Patch 7.4.2007
Problem:    Running the tests leaves a viminfo file behind.
Solution:   Make the viminfo option empty.
Files:      src/testdir/runtest.vim

Patch 7.4.2008
Problem:    evalcmd() has a confusing name.
Solution:   Rename to execute().  Make silent optional.  Support a list of
            commands.
Files:      src/eval.c, src/ex_docmd.c, src/message.c, src/globals.h,
            src/proto/eval.pro, src/Makefile, src/testdir/test_evalcmd.vim,
            src/testdir/test_execute_func.vim, src/testdir/test_alot.vim,
            runtime/doc/eval.txt

Patch 7.4.2009 (after 7.4.2008)
Problem:    Messages test fails.
Solution:   Don't set redir_execute before returning.  Add missing version
            number.
Files:      src/eval.c

Patch 7.4.2010
Problem:    There is a :cbottom command but no :lbottom command.
Solution:   Add :lbottom. (Yegappan Lakshmanan)
Files:      runtime/doc/index.txt, runtime/doc/quickfix.txt, src/ex_cmds.h,
            src/quickfix.c, src/testdir/test_quickfix.vim

Patch 7.4.2011
Problem:    It is not easy to get a list of command arguments.
Solution:   Add getcompletion(). (Yegappan Lakshmanan)
Files:      runtime/doc/eval.txt, src/eval.c, src/ex_docmd.c,
            src/proto/ex_docmd.pro, src/testdir/test_cmdline.vim

Patch 7.4.2012 (after 7.4.2011)
Problem:    Test for getcompletion() does not pass on all systems.
Solution:   Only test what is supported.
Files:      src/testdir/test_cmdline.vim
```

```
Patch 7.4.2013
Problem:    Using "noinsert" in 'completeopt' breaks redo.
Solution:   Set compl_curr_match. (Shougo Matsu, closes #874)
Files:      src/edit.c, src/testdir/test_popup.vim

Patch 7.4.2014
Problem:    Using "noinsert" in 'completeopt' does not insert match.
Solution:   Set compl_enter_selects. (Shougo Matsu, closes #875)
Files:      src/edit.c, src/testdir/test_popup.vim

Patch 7.4.2015
Problem:    When a file gets a name when writing it 'acd' is not effective.
            (Dan Church)
Solution:   Invoke DO_AUTOCHDIR after writing the file. (Allen Haim, closes
            #777, closes #803)  Add test_autochdir() to enable 'acd' before
            "starting" is reset.
Files:      src/ex_cmds.c, src/buffer.c, src/eval.c, src/globals.h,
            src/Makefile, src/testdir/test_autochdir.vim,
            src/testdir/Make_all.mak

Patch 7.4.2016
Problem:    Warning from MinGW about _WIN32_WINNT redefined. (John Marriott)
Solution:   First undefine it. (Ken Takata)
Files:      src/Make_cyg_ming.mak

Patch 7.4.2017
Problem:    When there are many errors adding them to the quickfix list takes
            a long time.
Solution:   Add BLN_NOOPT.  Don't call buf_valid() in buf_copy_options().
            Remember the last file name used.  When going through the buffer
            list start from the end of the list.  Only call buf_valid() when
            autocommands were executed.
Files:      src/buffer.c, src/option.c, src/quickfix.c, src/vim.h

Patch 7.4.2018
Problem:    buf_valid() can be slow when there are many buffers.
Solution:   Add bufref_valid(), only go through the buffer list when a buffer
            was freed.
Files:      src/structs.h, src/buffer.c, src/quickfix.c, src/proto/buffer.pro

Patch 7.4.2019
Problem:    When ignoring case utf_fold() may consume a lot of time.
Solution:   Optimize for ASCII.
Files:      src/mbyte.c

Patch 7.4.2020
Problem:    Can't build without +autocmd feature.
Solution:   Adjust #ifdefs.
Files:      src/buffer.c

Patch 7.4.2021
Problem:    Still too many buf_valid() calls.
Solution:   Make au_new_curbuf a bufref.  Use bufref_valid() in more places.
```

```
Files:      src/ex_cmds.c, src/buffer.c, src/globals.h

Patch 7.4.2022
Problem:    Warnings from 64 bit compiler.
Solution:   Add type casts. (Mike Williams)
Files:      src/eval.c

Patch 7.4.2023
Problem:    buflist_findname_stat() may find a dummy buffer.
Solution:   Set the BF_DUMMY flag after loading a dummy buffer.  Start
            finding buffers from the end of the list.
Files:      src/quickfix.c, src/buffer.c

Patch 7.4.2024
Problem:    More buf_valid() calls can be optimized.
Solution:   Use bufref_valid() instead.
Files:      src/buffer.c, src/ex_cmds.c, src/structs.h, src/channel.c,
            src/diff.c, src/eval.c, src/ex_cmds2.c, src/ex_docmd.c,
            src/ex_getln.c, src/fileio.c, src/main.c, src/misc2.c,
            src/netbeans.c, src/quickfix.c, src/spell.c, src/term.c,
            src/if_py_both.h, src/window.c, src/proto/buffer.pro,
            src/proto/window.pro

Patch 7.4.2025
Problem:    The cursor blinking stops or is irregular when receiving date over
            a channel and writing it in a buffer, and when updating the status
            line. (Ramel Eshed)
Solution:   Make it a bit better by flushing GUI output.  Don't redraw the
            cursor after updating the screen if the blink state is off.
Files:      src/gui_gtk_x11.c, src/screen.c

Patch 7.4.2026
Problem:    Reference counting for callbacks isn't right.
Solution:   Add free_callback(). (Ken Takata)  Fix reference count.
Files:      src/channel.c, src/eval.c, src/ex_cmds2.c, src/proto/eval.pro

Patch 7.4.2027
Problem:    Can't build with +eval but without +menu.
Solution:   Add #ifdef. (John Marriott)
Files:      src/eval.c

Patch 7.4.2028
Problem:    cppcheck warns for using index before limits check.
Solution:   Swap the expressions. (Dominique Pelle)
Files:      src/mbyte.c

Patch 7.4.2029
Problem:    printf() does not work with 64 bit numbers.
Solution:   use the "L" length modifier. (Ken Takata)
Files:      src/message.c, src/testdir/test_expr.vim

Patch 7.4.2030
Problem:    ARCH must be set properly when using MinGW.
Solution:   Detect the default value of ARCH from the current compiler. (Ken
```

            Takata)
Files: src/Make_cyg_ming.mak

Patch 7.4.2031
Problem: The list_lbr_utf8 test fails if ~/.vim/syntax/c.vim sets
            'textwidth' to a non-zero value. (Oyvind A. Holm)
Solution: Add a setup.vim file that sets 'runtimepath' and $HOME to a safe
            value. (partly by Christian Brabandt, closes #912)
Files: src/testdir/setup.vim, src/testdir/amiga.vim, src/testdir/dos.vim,
            src/testdir/unix.vim, src/testdir/vms.vim, src/testdir/runtest.vim

Patch 7.4.2032 (after 7.4.2030)
Problem: Build fails with 64 bit MinGW. (Axel Bender)
Solution: Handle dash vs. underscore. (Ken Takata, Hirohito Higashi)
Files: src/Make_cyg_ming.mak

Patch 7.4.2033
Problem: 'cscopequickfix' option does not accept new value "a".
Solution: Adjust list of command characters. (Ken Takata)
Files: src/option.h, src/Makefile, src/testdir/test_cscope.vim,
            src/testdir/Make_all.mak

Patch 7.4.2034 (after 7.4.2032)
Problem: Build fails with some version of MinGW. (illusorypan)
Solution: Recognize mingw32. (Ken Takata, closes #921)
Files: src/Make_cyg_ming.mak

Patch 7.4.2035
Problem: On Solaris with ZFS the ACL may get removed.
Solution: Always restore the ACL for Solaris ZFS. (Danek Duvall)
Files: src/fileio.c

Patch 7.4.2036
Problem: Looking up a buffer by number is slow if there are many.
Solution: Use a hashtab.
Files: src/structs.h, src/buffer.c

Patch 7.4.2037 (after 7.4.2036)
Problem: Small build fails.
Solution: Adjust #ifdefs.
Files: src/hashtab.c

Patch 7.4.2038 (after 7.4.2036)
Problem: Small build still fails.
Solution: Adjust more #ifdefs.
Files: src/globals.h, src/buffer.c

Patch 7.4.2039
Problem: The Netbeans integration is not tested.
Solution: Add a first Netbeans test.
Files: src/testdir/test_netbeans.vim, src/testdir/test_netbeans.py,
            src/testdir/Make_all.mak, src/Makefile,
            src/testdir/test_channel.vim, src/testdir/shared.vim

```
Patch 7.4.2040
Problem:    New files missing from distribution.
Solution:   Add new test scripts.
Files:      Filelist

Patch 7.4.2041
Problem:    Netbeans file authentication not tested.
Solution:   Add a test.
Files:      src/testdir/test_netbeans.vim

Patch 7.4.2042
Problem:    GTK: display updating is not done properly and can be slow.
Solution:   Use gdk_display_flush() instead of gdk_display_sync(). Don't call
            gdk_window_process_updates().  (Kazunobu Kuriyama)
Files:      src/gui_gtk_x11.c

Patch 7.4.2043
Problem:    setbuvfar() causes a screen redraw.
Solution:   Only use aucmd_prepbuf() for options.
Files:      src/eval.c

Patch 7.4.2044
Problem:    filter() and map() either require a string or defining a function.
Solution:   Support lambda, a short way to define a function that evaluates an
            expression. (Yasuhiro Matsumoto, Ken Takata)
Files:      runtime/doc/eval.txt, src/eval.c, src/testdir/test_alot.vim,
            src/Makefile, src/testdir/test_channel.vim,
            src/testdir/test_lambda.vim

Patch 7.4.2045
Problem:    Memory leak when using a function callback.
Solution:   Don't save the function name when it's in the partial.
Files:      src/channel.c

Patch 7.4.2046
Problem:    The qf_init_ext() function is too big.
Solution:   Refactor it. (Yegappan Lakshmanan)
Files:      src/quickfix.c

Patch 7.4.2047
Problem:    Compiler warning for initializing a struct.
Solution:   Initialize in another way. (Anton Lindqvist)
Files:      src/quickfix.c

Patch 7.4.2048
Problem:    There is still code and help for unsupported systems.
Solution:   Remove the code and text. (Hirohito Higashi)
Files:      runtime/doc/eval.txt, runtime/lang/menu_sk_sk.vim,
            runtime/menu.vim, runtime/optwin.vim, src/Make_bc5.mak,
            src/ex_docmd.c, src/feature.h, src/fileio.c, src/globals.h,
            src/main.c, src/memfile.c, src/memline.c, src/misc1.c,
            src/misc2.c, src/option.c, src/option.h, src/os_unix.c,
            src/os_unix.h, src/proto.h, src/term.c, src/undo.c, src/version.c,
            src/vim.h, src/xxd/xxd.c
```

```
Patch 7.4.2049
Problem:    There is no way to get a list of the error lists.
Solution:   Add ":chistory" and ":lhistory".
Files:      src/ex_cmds.h, src/quickfix.c, src/ex_docmd.c, src/message.c,
            src/proto/quickfix.pro, src/testdir/test_quickfix.vim

Patch 7.4.2050
Problem:    When using ":vimgrep" may end up with duplicate buffers.
Solution:   When adding an error list entry pass the buffer number if possible.
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 7.4.2051
Problem:    No proper testing of trunc_string().
Solution:   Add a unittest for message.c.
Files:      src/Makefile, src/message.c, src/message_test.c, src/main.c,
            src/proto/main.pro, src/structs.h

Patch 7.4.2052
Problem:    Coverage report is messed up by the unittests.
Solution:   Add a separate test target for script tests.  Use that when
            collecting coverage information.
Files:      src/Makefile

Patch 7.4.2053
Problem:    Can't run scripttests in the top directory.
Solution:   Add targets to the top Makefile.
Files:      Makefile

Patch 7.4.2054 (after 7.4.2048)
Problem:    Wrong part of #ifdef removed.
Solution:   Use the right part. (Hirohito Higashi)
Files:      src/os_unix.c

Patch 7.4.2055
Problem:    eval.c is too big
Solution:   Move Dictionary functions to dict.c
Files:      src/eval.c, src/dict.c, src/vim.h, src/globals.h,
            src/proto/eval.pro, src/proto/dict.pro, src/Makefile, Filelist

Patch 7.4.2056 (after 7.4.2055)
Problem:    Build fails.
Solution:   Add missing changes.
Files:      src/proto.h

Patch 7.4.2057
Problem:    eval.c is too big.
Solution:   Move List functions to list.c
Files:      src/eval.c, src/dict.c, src/list.c, src/proto.h, src/Makefile,
            src/globals.h, src/proto/eval.pro, src/proto/list.pro, Filelist

Patch 7.4.2058
Problem:    eval.c is too big.
Solution:   Move user functions to userfunc.c
```

```
Files:      src/userfunc.c, src/eval.c, src/vim.h, src/globals.h,
            src/structs.h, src/proto.h, src/Makefile, src/proto/eval.pro,
            src/proto/userfunc.pro, Filelist

Patch 7.4.2059
Problem:    Non-Unix builds fail.
Solution:   Update Makefiles for new files.
Files:      src/Make_bc5.mak, src/Make_cyg_ming.mak, src/Make_dice.mak,
            src/Make_ivc.mak, src/Make_manx.mak, src/Make_morph.mak,
            src/Make_mvc.mak, src/Make_sas.mak

Patch 7.4.2060 (after 7.4.2059)
Problem:    Wrong file name.
Solution:   Fix typo.
Files:      src/Make_mvc.mak

Patch 7.4.2061
Problem:    qf_init_ext() is too big.
Solution:   Move code to qf_parse_line() (Yegappan Lakshmanan)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 7.4.2062
Problem:    Using dummy variable to compute struct member offset.
Solution:   Use offsetof().
Files:      src/globals.h, src/macros.h, src/vim.h, src/spell.c

Patch 7.4.2063
Problem:    eval.c is still too big.
Solution:   Split off internal functions to evalfunc.c.
Files:      src/eval.c, src/evalfunc.c, src/list.c, src/proto.h,
            src/globals.h, src/vim.h, src/proto/eval.pro,
            src/proto/evalfunc.pro, src/proto/list.pro, src/Makefile, Filelist,
            src/Make_bc5.mak, src/Make_cyg_ming.mak, src/Make_dice.mak,
            src/Make_ivc.mak, src/Make_manx.mak, src/Make_morph.mak,
            src/Make_mvc.mak, src/Make_sas.mak

Patch 7.4.2064
Problem:    Coverity warns for possible buffer overflow.
Solution:   Use vim_strcat() instead of strcat().
Files:      src/quickfix.c

Patch 7.4.2065
Problem:    Compiler warns for uninitialized variable. (John Marriott)
Solution:   Set lnum to the right value.
Files:      src/evalfunc.c

Patch 7.4.2066
Problem:    getcompletion() not well tested.
Solution:   Add more testing.
Files:      src/testdir/test_cmdline.vim

Patch 7.4.2067
Problem:    Compiler warning for char/char_u conversion. (Tony Mechelynck)
            Inefficient code.
```

```
Solution:   Use more lines to fill with spaces. (Nikolai Pavlov) Add type cast.
Files:      src/quickfix.c

Patch 7.4.2068
Problem:    Not all arguments of trunc_string() are tested.  Memory access
            error when running the message tests.
Solution:   Add another test case. (Yegappan Lakshmanan)  Make it easy to run
            unittests with valgrind.  Fix the access error.
Files:      src/message.c, src/message_test.c, src/Makefile

Patch 7.4.2069
Problem:    spell.c is too big.
Solution:   Split it in spell file handling and spell checking.
Files:      src/spell.c, src/spellfile.c, src/spell.h, src/Makefile,
            src/proto/spell.pro, src/proto/spellfile.pro, src/proto.h
            Filelist, src/Make_bc5.mak, src/Make_cyg_ming.mak,
            src/Make_dice.mak, src/Make_ivc.mak, src/Make_manx.mak,
            src/Make_morph.mak, src/Make_mvc.mak, src/Make_sas.mak

Patch 7.4.2070 (after 7.4.2069)
Problem:    Missing change to include file.
Solution:   Include the spell header file.
Files:      src/vim.h

Patch 7.4.2071
Problem:    The return value of type() is difficult to use.
Solution:   Define v:t_ constants. (Ken Takata)
Files:      runtime/doc/eval.txt, src/eval.c, src/evalfunc.c,
            src/testdir/test_channel.vim, src/testdir/test_viml.vim, src/vim.h

Patch 7.4.2072
Problem:    substitute() does not support a Funcref argument.
Solution:   Support a Funcref like it supports  a string starting with "\=".
Files:      src/evalfunc.c, src/regexp.c, src/eval.c, src/proto/eval.pro,
            src/proto/regexp.pro, src/testdir/test_expr.vim

Patch 7.4.2073
Problem:    rgb.txt is read for every color name.
Solution:   Load rgb.txt once. (Christian Brabandt)  Add a test.
Files:      runtime/rgb.txt, src/term.c, src/testdir/test_syn_attr.vim

Patch 7.4.2074
Problem:    One more place using a dummy variable.
Solution:   Use offsetof(). (Ken Takata)
Files:      src/userfunc.c

Patch 7.4.2075
Problem:    No autocommand event to initialize a window or tab page.
Solution:   Add WinNew and TabNew events. (partly by Felipe Morales)
Files:      src/fileio.c, src/window.c, src/vim.h,
            src/testdir/test_autocmd.vim, runtime/doc/autocmd.txt

Patch 7.4.2076
Problem:    Syntax error when dict has '>' key.
```

```
Solution:   Check for endchar. (Ken Takata)
Files:      src/userfunc.c, src/testdir/test_lambda.vim

Patch 7.4.2077
Problem:    Cannot update 'tabline' when a tab was closed.
Solution:   Add the TabClosed autocmd event. (partly by Felipe Morales)
Files:      src/fileio.c, src/window.c, src/vim.h,
            src/testdir/test_autocmd.vim, runtime/doc/autocmd.txt

Patch 7.4.2078
Problem:    Running checks in po directory fails.
Solution:   Add colors used in syntax.c to the builtin color table.
Files:      src/term.c

Patch 7.4.2079
Problem:    Netbeans test fails on non-Unix systems.
Solution:   Only do the permission check on Unix systems.
Files:      src/testdir/test_netbeans.vim

Patch 7.4.2080
Problem:    When using PERROR() on some systems assert_fails() does not see
            the error.
Solution:   Make PERROR() always report the error.
Files:      src/vim.h, src/message.c, src/proto/message.pro

Patch 7.4.2081
Problem:    Line numbers in the error list are not always adjusted.
Solution:   Set b_has_qf_entry properly. (Yegappan Lakshmanan)
Files:      src/quickfix.c, src/structs.h, src/testdir/test_quickfix.vim

Patch 7.4.2082
Problem:    Not much test coverage for digraphs.
Solution:   Add a new style digraph test. (Christian Brabandt)
Files:      src/Makefile, src/testdir/test_alot.vim,
            src/testdir/test_digraph.vim

Patch 7.4.2083
Problem:    Coverity complains about not restoring a value.
Solution:   Restore the value, although it's not really needed.  Change return
            to jump to cleanup, might leak memory.
Files:      src/userfunc.c

Patch 7.4.2084
Problem:    New digraph test makes testing hang.
Solution:   Don't set "nocp".
Files:      src/testdir/test_digraph.vim

Patch 7.4.2085
Problem:    Digraph tests fails on some systems.
Solution:   Run it separately and set 'encoding' early.
Files:      src/testdir/Make_all.mak, src/testdir/test_alot.vim,
            src/testdir/test_digraph.vim

Patch 7.4.2086
```

```
Problem:    Using the system default encoding makes tests unpredictable.
Solution:   Always use utf-8 or latin1 in the new style tests.  Remove setting
            encoding and scriptencoding where it is not needed.
Files:      src/testdir/runtest.vim, src/testdir/test_channel.vim,
            src/testdir/test_digraph.vim, src/testdir/test_expand_dllpath.vim,
            src/testdir/test_expr_utf8.vim, src/testdir/test_json.vim,
            src/testdir/test_matchadd_conceal_utf8.vim,
            src/testdir/test_regexp_utf8.vim, src/testdir/test_visual.vim,
            src/testdir/test_alot_utf8.vim,

Patch 7.4.2087
Problem:    Digraph code test coverage is still low.
Solution:   Add more tests. (Christian Brabandt)
Files:      src/testdir/test_digraph.vim

Patch 7.4.2088 (after 7.4.2087)
Problem:    Keymap test fails with normal features.
Solution:   Bail out if the keymap feature is not supported.
Files:      src/testdir/test_digraph.vim

Patch 7.4.2089
Problem:    Color handling of X11 GUIs is too complicated.
Solution:   Simplify the code.  Use RGBA where appropriate. (Kazunobu
            Kuriyama)
Files:      src/gui.h, src/gui_beval.c, src/gui_gtk_x11.c, src/netbeans.c

Patch 7.4.2090
Problem:    Using submatch() in a lambda passed to substitute() is verbose.
Solution:   Use a static list and pass it as an optional argument to the
            function.  Fix memory leak.
Files:      src/structs.h, src/list.c, src/userfunc.c, src/channel.c,
            src/eval.c, src/evalfunc.c, src/ex_cmds2.c, src/regexp.c,
            src/proto/list.pro, src/proto/userfunc.pro,
            src/testdir/test_expr.vim, runtime/doc/eval.txt

Patch 7.4.2091
Problem:    Coverity reports a resource leak when out of memory.
Solution:   Close the file before returning.
Files:      src/term.c

Patch 7.4.2092
Problem:    GTK 3 build fails with older GTK version.
Solution:   Check the pango version. (Kazunobu Kuriyama)
Files:      src/gui_beval.c

Patch 7.4.2093
Problem:    Netbeans test fails once in a while.  Leaving log file behind.
Solution:   Add it to the list of flaky tests.  Disable logfile.
Files:      src/testdir/runtest.vim, src/testdir/test_channel.vim

Patch 7.4.2094
Problem:    The color allocation in X11 is overly complicated.
Solution:   Remove find_closest_color(), XAllocColor() already does this.
            (Kazunobu Kuriyama)
```

```
Files:      src/gui_x11.c

Patch 7.4.2095
Problem:    Man test fails when run with the GUI.
Solution:   Adjust for different behavior of GUI.  Add assert_inrange().
Files:      src/eval.c, src/evalfunc.c, src/proto/eval.pro,
            src/testdir/test_assert.vim, src/testdir/test_man.vim,
            runtime/doc/eval.txt

Patch 7.4.2096
Problem:    Lambda functions show up with completion.
Solution:   Don't show lambda functions. (Ken Takata)
Files:      src/userfunc.c, src/testdir/test_cmdline.vim

Patch 7.4.2097
Problem:    Warning from 64 bit compiler.
Solution:   use size_t instead of int. (Mike Williams)
Files:      src/message.c

Patch 7.4.2098
Problem:    Text object tests are old style.
Solution:   Turn them into new style tests. (James McCoy, closes #941)
Files:      src/testdir/Make_all.mak, src/testdir/test_textobjects.in,
            src/testdir/test_textobjects.ok, src/testdir/test_textobjects.vim,
            src/Makefile

Patch 7.4.2099
Problem:    When a keymap is active only "(lang)" is displayed. (Ilya
            Dogolazky)
Solution:   Show the keymap name. (Dmitri Vereshchagin, closes #933)
Files:      src/buffer.c, src/proto/screen.pro, src/screen.c

Patch 7.4.2100
Problem:    "cgn" and "dgn" do not work correctly with a single character
            match and the replacement includes the searched pattern. (John
            Beckett)
Solution:   If the match is found in the wrong column try in the next column.
            Turn the test into new style. (Christian Brabandt)
Files:      src/search.c, src/testdir/Make_all.mak, src/Makefile,
            src/testdir/test53.in, src/testdir/test53.ok,
            src/testdir/test_gn.vim

Patch 7.4.2101
Problem:    Looping over windows, buffers and tab pages is inconsistent.
Solution:   Use FOR_ALL_ macros everywhere. (Yegappan Lakshmanan)
Files:      src/buffer.c, src/diff.c, src/edit.c, src/eval.c, src/evalfunc.c,
            src/ex_cmds.c, src/ex_cmds2.c, src/ex_docmd.c, src/fileio.c,
            src/globals.h, src/gui.c, src/gui_mac.c, src/if_lua.c,
            src/if_mzsch.c, src/if_perl.xs, src/if_ruby.c, src/if_tcl.c,
            src/main.c, src/mark.c, src/memfile.c, src/memline.c, src/misc1.c,
            src/move.c, src/netbeans.c, src/normal.c, src/option.c,
            src/quickfix.c, src/screen.c, src/spell.c, src/term.c,
            src/window.c, src/workshop.c
```

```
Patch 7.4.2102 (after 7.4.2101)
Problem:    Tiny build with GUI fails.
Solution:   Revert one FOR_ALL_ change.
Files:      src/gui.c

Patch 7.4.2103
Problem:    Can't have "augroup END" right after ":au!".
Solution:   Check for the bar character before the command argument.
Files:      src/fileio.c, src/testdir/test_autocmd.vim,
            runtime/doc/autocmd.txt

Patch 7.4.2104
Problem:    Code duplication when unreferencing a function.
Solution:   De-duplicate.
Files:      src/userfunc.c

Patch 7.4.2105
Problem:    Configure reports default features to be "normal" while it is
            "huge".
Solution:   Change the default text.  Build with newer autoconf.
Files:      src/configure.in, src/auto/configure

Patch 7.4.2106
Problem:    Clang warns about missing field in initializer.
Solution:   Define COMMA and use it.  (Kazunobu Kuriyama)
Files:      src/ex_cmds.c, src/globals.h, src/vim.h

Patch 7.4.2107 (after 7.4.2106)
Problem:    Misplaced equal sign.
Solution:   Remove it.
Files:      src/globals.h

Patch 7.4.2108
Problem:    Netbeans test is flaky.
Solution:   Wait for the cursor to be positioned.
Files:      src/testdir/test_netbeans.vim

Patch 7.4.2109
Problem:    Setting 'display' to "lastline" is a drastic change, while
            omitting it results in lots of "@" lines.
Solution:   Add "truncate" to show "@@@" for a truncated line.
Files:      src/option.h, src/screen.c, runtime/doc/options.txt

Patch 7.4.2110
Problem:    When there is an CmdUndefined autocmd then the error for a missing
            command is E464 instead of E492. (Manuel Ortega)
Solution:   Don't let the pointer be NULL.
Files:      src/ex_docmd.c, src/testdir/test_usercommands.vim

Patch 7.4.2111
Problem:    Defaults are very conservative.
Solution:   Move settings from vimrc_example.vim to defaults.vim.  Load
            defaults.vim if no .vimrc was found.
Files:      src/main.c, src/version.c, src/os_amiga.h, src/os_dos.h,
```

```
            src/os_mac.h, src/os_unix.h, src/feature.h, src/Makefile,
            runtime/vimrc_example.vim, runtime/defaults.vim,
            runtime/evim.vim, Filelist, runtime/doc/starting.txt

Patch 7.4.2112
Problem:    getcompletion(.., 'dir') returns a match with trailing "*" when
            there are no matches. (Chdiza)
Solution:   Return an empty list when there are no matches.  Add a trailing
            slash to directories. (Yegappan Lakshmanan)  Add tests for no
            matches. (closes #947)
Files:      src/evalfunc.c, src/testdir/test_cmdline.vim

Patch 7.4.2113
Problem:    Test for undo is flaky.
Solution:   Turn it into a new style test.  Use test_settime() to avoid
            flakyness.
Files:      src/Makefile, src/undo.c, src/testdir/test61.in,
            src/testdir/test61.ok, src/testdir/test_undo.vim,
            src/testdir/test_undolevels.vim, src/testdir/Make_all.mak,
            src/testdir/test_alot.vim

Patch 7.4.2114
Problem:    Tiny build fails.
Solution:   Always include vim_time().
Files:      src/ex_cmds.c

Patch 7.4.2115
Problem:    Loading defaults.vim with -C argument.
Solution:   Don't load the defaults script with -C argument.  Test sourcing
            the defaults script.  Set 'display' to "truncate".
Files:      src/main.c, src/Makefile, runtime/defaults.vim,
            src/testdir/test_startup.vim, src/testdir/Make_all.mak

Patch 7.4.2116
Problem:    The default vimrc for Windows is very conservative.
Solution:   Use the defaults.vim in the Windows installer.
Files:      src/dosinst.c

Patch 7.4.2117
Problem:    Deleting an augroup that still has autocmds does not give a
            warning.  The next defined augroup takes its place.
Solution:   Give a warning and prevent the index being used for another group
            name.
Files:      src/fileio.c, src/testdir/test_autocmd.vim

Patch 7.4.2118
Problem:    Mac: can't build with tiny features.
Solution:   Don't define FEAT_CLIPBOARD unconditionally. (Kazunobu Kuriyama)
Files:      src/vim.h

Patch 7.4.2119
Problem:    Closures are not supported.
Solution:   Capture variables in lambdas from the outer scope. (Yasuhiro
            Matsumoto, Ken Takata)
```

```
Files:      runtime/doc/eval.txt, src/eval.c, src/ex_cmds2.c, src/globals.h,
            src/proto/eval.pro, src/proto/userfunc.pro,
            src/testdir/test_lambda.vim, src/userfunc.c

Patch 7.4.2120
Problem:    User defined functions can't be a closure.
Solution:   Add the "closure" argument. Allow using :unlet on a bound
            variable. (Yasuhiro Matsumoto, Ken Takata)
Files:      runtime/doc/eval.txt, src/testdir/test_lambda.vim, src/userfunc.c,
            src/eval.c src/proto/userfunc.pro

Patch 7.4.2121
Problem:    No easy way to check if lambda and closure are supported.
Solution:   Add the +lambda feature.
Files:      src/evalfunc.c, src/version.c, src/testdir/test_lambda.vim

Patch 7.4.2122 (after 7.4.2118)
Problem:    Mac: don't get +clipboard in huge build.
Solution:   Move #define down below including feature.h
Files:      src/vim.h

Patch 7.4.2123
Problem:    No new style test for diff mode.
Solution:   Add a test.  Check that folds are in sync.
Files:      src/Makefile, src/testdir/test_diffmode.vim,
            src/testdir/Make_all.mak, src/testdir/test47.in,
            src/testdir/test47.ok

Patch 7.4.2124
Problem:    diffmode test leaves files behind, breaking another test.
Solution:   Delete the files.
Files:      src/testdir/test_diffmode.vim

Patch 7.4.2125
Problem:    Compiler warning for loss of data.
Solution:   Add a type cast. (Christian Brabandt)
Files:      src/message.c

Patch 7.4.2126
Problem:    No tests for :diffget and :diffput
Solution:   Add tests.
Files:      src/testdir/test_diffmode.vim

Patch 7.4.2127
Problem:    The short form of ":noswapfile" is ":noswap" instead of ":nos".
            (Kent Sibilev)
Solution:   Only require three characters.  Add a test for the short forms.
Files:      src/ex_docmd.c, src/testdir/test_usercommands.vim

Patch 7.4.2128
Problem:    Memory leak when saving for undo fails.
Solution:   Free allocated memory. (Hirohito Higashi)
Files:      src/ex_cmds.c
```

```
Patch 7.4.2129
Problem:    Memory leak when using timer_start(). (Dominique Pelle)
Solution:   Don't copy the callback when using a partial.
Files:      src/evalfunc.c

Patch 7.4.2130
Problem:    Pending timers cause false memory leak reports.
Solution:   Free all timers on exit.
Files:      src/ex_cmds2.c, src/proto/ex_cmds2.pro, src/misc2.c

Patch 7.4.2131
Problem:    More memory leaks when using partial, e.g. for "exit-cb".
Solution:   Don't copy the callback when using a partial.
Files:      src/channel.c

Patch 7.4.2132
Problem:    test_partial has memory leaks reported.
Solution:   Add a note about why this happens.
Files:      src/testdir/test_partial.vim

Patch 7.4.2133 (after 7.4.2128)
Problem:    Can't build with tiny features.
Solution:   Add #ifdef.
Files:      src/ex_cmds.c

Patch 7.4.2134
Problem:    No error for using function() badly.
Solution:   Check for passing wrong function name. (Ken Takata)
Files:      src/eval.c, src/evalfunc.c, src/proto/userfunc.pro,
            src/testdir/test_expr.vim, src/userfunc.c, src/vim.h

Patch 7.4.2135
Problem:    Various tiny issues.
Solution:   Update comments, white space, etc.
Files:      src/diff.c, src/digraph.c, src/testdir/test80.in,
            src/testdir/test_channel.vim, src/testdir/Makefile,
            runtime/menu.vim, src/INSTALLpc.txt, src/xpm/README.txt

Patch 7.4.2136
Problem:    Closure function fails.
Solution:   Don't reset uf_scoped when it points to another funccal.
Files:      src/userfunc.c, src/testdir/test_lambda.vim

Patch 7.4.2137
Problem:    Using function() with a name will find another function when it is
            redefined.
Solution:   Add funcref().  Refer to lambda using a partial.  Fix several
            reference counting issues.
Files:      src/vim.h, src/structs.h, src/userfunc.c, src/eval.c,
            src/evalfunc.c, src/channel.c, src/proto/eval.pro,
            src/proto/userfunc.pro, src/if_mzsch.c, src/regexp.c, src/misc2.c,
            src/if_py_both.h, src/testdir/test_expr.vim, runtime/doc/eval.txt

Patch 7.4.2138
```

```
Problem:    Test 86 and 87 fail.
Solution:   Call func_ref() also for regular functions.
Files:      src/if_py_both.h

Patch 7.4.2139
Problem:    :delfunction causes illegal memory access.
Solution:   Correct logic when deciding to free a function.
Files:      src/userfunc.c, src/testdir/test_lambda.vim

Patch 7.4.2140
Problem:    Tiny build fails.
Solution:   Add dummy typedefs.
Files:      src/structs.h

Patch 7.4.2141
Problem:    Coverity reports bogus NULL check.
Solution:   When checking for a variable in the funccal scope don't pass the
            varname.
Files:      src/userfunc.c, src/proto/userfunc.pro, src/eval.c

Patch 7.4.2142
Problem:    Leaking memory when redefining a function.
Solution:   Don't increment the function reference count when it's found by
            name. Don't remove the wrong function from the hashtab.  More
            reference counting fixes.
Files:      src/structs.h, src/userfunc.c

Patch 7.4.2143
Problem:    A funccal is garbage collected while it can still be used.
Solution:   Set copyID in all referenced functions.  Do not list lambda
            functions with ":function".
Files:      src/userfunc.c, src/proto/userfunc.pro, src/eval.c,
            src/testdir/test_lambda.vim

Patch 7.4.2144
Problem:    On MS-Windows quickfix does not handle a line with 1023 bytes
            ending in CR-LF properly.
Solution:   Don't consider CR a line break. (Ken Takata)
Files:      src/quickfix.c

Patch 7.4.2145
Problem:    Win32: Using CreateThread/ExitThread is not safe.
Solution:   Use _beginthreadex and return from the thread. (Ken Takata)
Files:      src/os_win32.c

Patch 7.4.2146
Problem:    Not enough testing for popup menu.  CTRL-E does not always work
            properly.
Solution:   Add more tests.  When using CTRL-E check if the popup menu is
            visible. (Christian Brabandt)
Files:      src/edit.c, src/testdir/test_popup.vim

Patch 7.4.2147 (after 7.4.2146)
Problem:    test_alot fails.
```

Solution: Close window.
Files: src/testdir/test_popup.vim

Patch 7.4.2148
Problem: Not much testing for cscope.
Solution: Add a test that uses the cscope program. (Christian Brabandt)
Files: src/testdir/test_cscope.vim

Patch 7.4.2149
Problem: If a test leaves a window open a following test may fail.
Solution: Always close extra windows after running a test.
Files: src/testdir/runtest.vim, src/testdir/test_popup.vim

Patch 7.4.2150
Problem: Warning with MinGW 64. (John Marriott)
Solution: Change return type. (Ken Takata)
Files: src/os_win32.c

Patch 7.4.2151
Problem: Quickfix test fails on MS-Windows.
Solution: Close the help window. (Christian Brabandt)
Files: src/testdir/test_quickfix.vim

Patch 7.4.2152
Problem: No proper translation of messages with a count.
Solution: Use ngettext(). (Sergey Alyoshin)
Files: src/evalfunc.c, src/fold.c, src/os_win32.c, src/screen.c, src/vim.h

Patch 7.4.2153
Problem: GUI test isn't testing much.
Solution: Turn into a new style test. Execute a shell command.
Files: src/testdir/test_gui.vim, src/testdir/test16.in,
            src/testdir/test16.ok, src/testdir/Make_all.mak, src/Makefile,
            src/testdir/Make_vms.mms

Patch 7.4.2154
Problem: Test_communicate() fails sometimes.
Solution: Add it to the flaky tests.
Files: src/testdir/runtest.vim

Patch 7.4.2155
Problem: Quotes make GUI test fail on MS-Windows.
Solution: Remove quotes, strip white space.
Files: src/testdir/test_gui.vim

Patch 7.4.2156
Problem: Compiler warning.
Solution: Add type cast. (Ken Takata, Mike Williams)
Files: src/os_win32.c

Patch 7.4.2157
Problem: Test_job_start_fails() is expected to report memory leaks, making
            it hard to see other leaks in test_partial.
Solution: Move Test_job_start_fails() to a separate test file.

```
Files:      src/testdir/test_partial.vim, src/testdir/test_job_fails.vim,
            src/Makefile, src/testdir/Make_all.mak

Patch 7.4.2158
Problem:    Result of getcompletion('', 'cscope') depends on previous
            completion. (Christian Brabandt)
Solution:   Call set_context_in_cscope_cmd().
Files:      src/evalfunc.c, src/testdir/test_cmdline.vim

Patch 7.4.2159
Problem:    Insufficient testing for cscope.
Solution:   Add more tests. (Dominique Pelle)
Files:      src/testdir/test_cscope.vim

Patch 7.4.2160
Problem:    setmatches() mixes up values. (Nikolai Pavlov)
Solution:   Save the string instead of reusing a shared buffer.
Files:      src/dict.c, src/evalfunc.c, src/testdir/test_expr.vim,

Patch 7.4.2161 (after 7.4.2160)
Problem:    Expression test fails without conceal feature.
Solution:   Only check "conceal" with the conceal feature.
Files:      src/testdir/test_expr.vim

Patch 7.4.2162
Problem:    Result of getcompletion('', 'sign') depends on previous
            completion.
Solution:   Call set_context_in_sign_cmd(). (Dominique Pelle)
Files:      src/evalfunc.c, src/testdir/test_cmdline.vim

Patch 7.4.2163
Problem:    match() and related functions tested with old style test.
Solution:   Convert to new style test. (Hirohito Higashi)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/test63.in,
            src/testdir/test63.ok, src/testdir/test_alot.vim,
            src/testdir/test_match.vim, src/testdir/test_matchstrpos.vim

Patch 7.4.2164
Problem:    It is not possible to use plugins in an "after" directory to tune
            the behavior of a package.
Solution:   First load plugins from non-after directories, then packages and
            finally plugins in after directories.
            Reset 'loadplugins' before executing --cmd arguments.
Files:      src/main.c, src/vim.h, src/ex_cmds2.c, src/testdir/Makefile,
            src/testdir/shared.vim, src/testdir/test_startup.vim,
            src/testdir/setup.vim, runtime/doc/starting.txt

Patch 7.4.2165 (after 7.4.2164)
Problem:    Startup test fails on MS-Windows.
Solution:   Don't check output if RunVim() returns zero.
Files:      src/testdir/test_startup.vim

Patch 7.4.2166 (after 7.4.2164)
Problem:    Small build can't run startup test.
```

```
Solution:   Skip the test.
Files:      src/testdir/test_startup.vim

Patch 7.4.2167 (after 7.4.2164)
Problem:    Small build can't run tests.
Solution:   Don't try setting 'packpath'.
Files:      src/testdir/setup.vim

Patch 7.4.2168
Problem:    Not running the startup test on MS-Windows.
Solution:   Write vimcmd.
Files:      src/testdir/Make_ming.mak, src/testdir/Make_dos.mak

Patch 7.4.2169 (after 7.4.2168)
Problem:    Startup test gets stuck on MS-Windows.
Solution:   Use double quotes.
Files:      src/testdir/shared.vim, src/testdir/test_startup.vim

Patch 7.4.2170
Problem:    Cannot get information about timers.
Solution:   Add timer_info().
Files:      src/evalfunc.c, src/ex_cmds2.c, src/proto/ex_cmds2.pro,
            runtime/doc/eval.txt

Patch 7.4.2171 (after 7.4.2170)
Problem:    MS-Windows build fails.
Solution:   Add QueryPerformanceCounter().
Files:      src/ex_cmds2.c

Patch 7.4.2172
Problem:    No test for "vim --help".
Solution:   Add a test.
Files:      src/testdir/test_startup.vim, src/testdir/shared.vim

Patch 7.4.2173 (after 7.4.2172)
Problem:    Can't test help on MS-Windows.
Solution:   Skip the test.
Files:      src/testdir/test_startup.vim

Patch 7.4.2174
Problem:    Adding duplicate flags to 'whichwrap' leaves commas behind.
Solution:   Also remove the commas. (Naruhiko Nishino)
Files:      src/Makefile, src/option.c, src/testdir/Make_all.mak,
            src/testdir/test_alot.vim, src/testdir/test_options.in,
            src/testdir/test_options.ok, src/testdir/test_options.vim

Patch 7.4.2175
Problem:    Insufficient testing of cscope.
Solution:   Add more tests. (Dominique Pelle)
Files:      src/testdir/test_cscope.vim

Patch 7.4.2176
Problem:    #ifdefs in main() are complicated.
Solution:   Always define vim_main2().  Move params to the file level.
```

            (suggested by Ken Takata)
Files: src/main.c, src/structs.h, src/vim.h, src/if_mzsch.c,
            src/proto/if_mzsch.pro

Patch 7.4.2177
Problem: No testing for -C and -N command line flags, file arguments,
            startuptime.
Solution: Add tests.
Files: src/testdir/test_startup.vim, src/testdir/shared.vim

Patch 7.4.2178
Problem: No test for reading from stdin.
Solution: Add a test.
Files: src/testdir/test_startup.vim, src/testdir/shared.vim

Patch 7.4.2179 (after 7.4.2178)
Problem: Reading from stdin test fails on MS-Windows.
Solution: Strip the extra space.
Files: src/testdir/test_startup.vim

Patch 7.4.2180
Problem: There is no easy way to stop all timers. There is no way to
            temporary pause a timer.
Solution: Add timer_stopall() and timer_pause().
Files: src/evalfunc.c, src/ex_cmds2.c, src/proto/ex_cmds2.pro,
            src/structs.h, src/testdir/test_timers.vim,
            src/testdir/shared.vim, runtime/doc/eval.txt

Patch 7.4.2181
Problem: Compiler warning for unused variable.
Solution: Remove it. (Dominique Pelle)
Files: src/ex_cmds2.c

Patch 7.4.2182
Problem: Color Grey40 used in startup but not in the short list.
Solution: Add Grey40 to the builtin colors.
Files: src/term.c

Patch 7.4.2183
Problem: Sign tests are old style.
Solution: Turn them into new style tests. (Dominique Pelle)
Files: src/Makefile, src/testdir/Make_all.mak, src/testdir/test_signs.in,
            src/testdir/test_signs.ok, src/testdir/test_signs.vim,

Patch 7.4.2184
Problem: Tests that use RunVim() do not actually perform the test.
Solution: Use "return" instead of "call". (Ken Takata)
Files: src/testdir/shared.vim

Patch 7.4.2185
Problem: Test glob2regpat does not test much.
Solution: Add a few more test cases. (Dominique Pelle)
Files: src/testdir/test_glob2regpat.vim

```
Patch 7.4.2186
Problem:    Timers test is flaky.
Solution:   Relax the sleep time check.
Files:      src/testdir/test_timers.vim

Patch 7.4.2187 (after 7.4.2185)
Problem:    glob2regpat test fails on Windows.
Solution:   Remove the checks that use backslashes.
Files:      src/testdir/test_glob2regpat.vim

Patch 7.4.2188 (after 7.4.2146)
Problem:    Completion does not work properly with some plugins.
Solution:   Revert the part related to typing CTRL-E. (closes #972)
Files:      src/edit.c, src/testdir/test_popup.vim

Patch 7.4.2189
Problem:    Cannot detect encoding in a fifo.
Solution:   Extend the stdin way of detecting encoding to fifo.  Add a test
            for detecting encoding on stdin and fifo. (Ken Takata)
Files:      src/buffer.c, src/fileio.c, src/Makefile,
            src/testdir/Make_all.mak, src/testdir/test_startup_utf8.vim,
            src/vim.h

Patch 7.4.2190
Problem:    When startup test fails it's not easy to find out why.
            GUI test fails with Gnome.
Solution:   Add the help entry matches to a list an assert that.
            Set $HOME for Gnome to create .gnome2 directory.
Files:      src/testdir/test_startup.vim, src/testdir/test_gui.vim

Patch 7.4.2191
Problem:    No automatic prototype for vim_main2().
Solution:   Move the #endif. (Ken Takata)
Files:      src/main.c, src/vim.h, src/proto/main.pro

Patch 7.4.2192
Problem:    Generating prototypes with Cygwin doesn't work well.
Solution:   Change #ifdefs. (Ken Takata)
Files:      src/gui.h, src/gui_w32.c, src/ops.c, src/proto/fileio.pro,
            src/proto/message.pro, src/proto/normal.pro, src/proto/ops.pro,
            src/vim.h

Patch 7.4.2193
Problem:    With Gnome when the GUI can't start test_startup hangs.
Solution:   Call gui_mch_early_init_check(). (Hirohito Higashi)
Files:      src/gui.c, src/gui_gtk_x11.c, src/proto/gui_gtk_x11.pro

Patch 7.4.2194
Problem:    Sign tests don't cover enough.
Solution:   Add more test cases. (Dominique Pelle)
Files:      src/testdir/test_signs.vim

Patch 7.4.2195
Problem:    MS-Windows: The vimrun program does not support Unicode.
```

```
Solution:   Use GetCommandLineW().  Cleanup old #ifdefs. (Ken Takata)
Files:      src/vimrun.c

Patch 7.4.2196
Problem:    glob2regpat test doesn't test everything on MS-Windows.
Solution:   Add patterns with backslash handling.
Files:      src/testdir/test_glob2regpat.vim

Patch 7.4.2197
Problem:    All functions are freed on exit, which may hide leaks.
Solution:   Only free named functions, not reference counted ones.
Files:      src/userfunc.c

Patch 7.4.2198
Problem:    Test alot sometimes fails under valgrind. (Dominique Pelle)
Solution:   Avoid passing a callback with the wrong number of arguments.
Files:      src/testdir/test_partial.vim

Patch 7.4.2199
Problem:    In the GUI the cursor is hidden when redrawing any window,
            causing flicker.
Solution:   Only undraw the cursor when updating the window it's in.
Files:      src/screen.c, src/gui.c, src/proto/gui.pro, src/gui_gtk_x11.c

Patch 7.4.2200
Problem:    Cannot get all information about a quickfix list.
Solution:   Add an optional argument to get/set loc/qf list(). (Yegappan
            Lakshmanan)
Files:      runtime/doc/eval.txt, src/evalfunc.c, src/proto/quickfix.pro,
            src/quickfix.c, src/tag.c, src/testdir/test_quickfix.vim

Patch 7.4.2201
Problem:    The sign column disappears when the last sign is deleted.
Solution:   Add the 'signcolumn' option. (Christian Brabandt)
Files:      runtime/doc/options.txt, runtime/optwin.vim, src/edit.c,
            src/move.c, src/option.c, src/option.h, src/proto/option.pro,
            src/screen.c, src/structs.h, src/testdir/test_options.vim

Patch 7.4.2202
Problem:    Build fails with small features.
Solution:   Correct option initialization.
Files:      src/option.c

Patch 7.4.2203
Problem:    Test fails with normal features.
Solution:   Check is signs are supported.
Files:      src/testdir/test_options.vim

Patch 7.4.2204
Problem:    It is not easy to get information about buffers, windows and
            tabpages.
Solution:   Add getbufinfo(), getwininfo() and gettabinfo(). (Yegappan
            Lakshmanan)
Files:      runtime/doc/eval.txt, runtime/doc/usr_41.txt, src/dict.c,
```

```
            src/evalfunc.c, src/option.c, src/proto/dict.pro,
            src/proto/option.pro, src/proto/window.pro,
            src/testdir/Make_all.mak, src/testdir/test_bufwintabinfo.vim,
            src/window.c, src/Makefile

Patch 7.4.2205
Problem:    'wildignore' always applies to getcompletion().
Solution:   Add an option to use 'wildignore' or not. (Yegappan Lakshmanan)
Files:      runtime/doc/eval.txt, src/evalfunc.c, src/testdir/test_cmdline.vim

Patch 7.4.2206
Problem:    Warning for unused function.
Solution:   Put the function inside #ifdef. (John Marriott)
Files:      src/evalfunc.c

Patch 7.4.2207
Problem:    The +xpm feature is not sorted properly in :version output.
Solution:   Move it up. (Tony Mechelynck)
Files:      src/version.c

Patch 7.4.2208
Problem:    Test for mappings is old style.
Solution:   Convert the test to new style.
Files:      src/testdir/test_mapping.vim, src/testdir/test_mapping.in,
            src/testdir/test_mapping.ok, src/Makefile,
            src/testdir/test_alot.vim, src/testdir/Make_all.mak

Patch 7.4.2209
Problem:    Cannot map <M-">. (Stephen Riehm)
Solution:   Solve the memory access problem in another way. (Dominique Pelle)
            Allow for using <M-\"> in a string.
Files:      src/eval.c, src/gui_mac.c, src/misc2.c, src/option.c,
            src/proto/misc2.pro, src/syntax.c, src/term.c,
            src/testdir/test_mapping.vim

Patch 7.4.2210
Problem:    On OSX configure mixes up a Python framework and the Unix layout.
Solution:   Make configure check properly. (Tim D. Smith, closes #980)
Files:      src/configure.in, src/auto/configure

Patch 7.4.2211
Problem:    Mouse support is not automatically enabled with simple term.
Solution:   Recognize "st" and other names. (Manuel Schiller, closes #963)
Files:      src/os_unix.c

Patch 7.4.2212
Problem:    Mark " is not set when closing a window in another tab. (Guraga)
Solution:   Check all tabs for the window to be valid. (based on patch by
            Hirohito Higashi, closes #974)
Files:      src/window.c, src/proto/window.pro, src/buffer.c,
            src/testdir/test_viminfo.vim

Patch 7.4.2213
Problem:    Cannot highlight the "~" lines at the end of a window differently.
```

Solution: Add the EndOfBuffer highlighting. (Marco Hinz, James McCoy)
Files: runtime/doc/options.txt, runtime/doc/syntax.txt, src/option.c,
            src/screen.c, src/syntax.c, src/vim.h

Patch 7.4.2214
Problem: A font that uses ligatures messes up the screen display.
Solution: Put spaces between characters when building the glyph table.
            (based on a patch from Manuel Schiller)
Files: src/gui_gtk_x11.c

Patch 7.4.2215
Problem: It's not easy to find out if a window is a quickfix or location
            list window.
Solution: Add "loclist" and "quickfix" entries to the dict returned by
            getwininfo(). (Yegappan Lakshmanan)
Files: runtime/doc/eval.txt, src/evalfunc.c,
            src/testdir/test_bufwintabinfo.vim

Patch 7.4.2216 (after 7.4.2215)
Problem: Test fails without the +sign feature.
Solution: Only check for signcolumn with the +sign feature.
Files: src/testdir/test_bufwintabinfo.vim

Patch 7.4.2217
Problem: When using matchaddpos() a character after the end of the line can
            be highlighted.
Solution: Only highlight existing characters. (Hirohito Higashi)
Files: src/screen.c, src/structs.h, src/testdir/test_match.vim

Patch 7.4.2218
Problem: Can't build with +timers when +digraph is not included.
Solution: Change #ifdef for e_number_exp. (Damien)
Files: src/globals.h

Patch 7.4.2219
Problem: Recursive call to substitute gets stuck in sandbox. (Nikolai
            Pavlov)
Solution: Handle the recursive call. (Christian Brabandt, closes #950)
            Add a test.
Files: src/ex_cmds.c, src/testdir/test_regexp_latin.vim

Patch 7.4.2220
Problem: printf() gives an error when the argument for %s is not a string.
            (Ozaki Kiichi)
Solution: Behave like invoking string() on the argument. (Ken Takata)
Files: runtime/doc/eval.txt, src/message.c, src/testdir/test_expr.vim

Patch 7.4.2221
Problem: printf() does not support binary format.
Solution: Add %b and %B. (Ozaki Kiichi)
Files: runtime/doc/eval.txt, src/message.c, src/testdir/test_expr.vim

Patch 7.4.2222
Problem: Sourcing a script where a character has 0x80 as a second byte does

```
            not work. (Filipe L B Correia)
Solution:   Turn 0x80 into K_SPECIAL KS_SPECIAL KE_FILLER. (Christian
            Brabandt, closes #728)  Add a test case.
Files:      src/getchar.c, src/proto/getchar.pro, src/misc1.c,
            src/testdir/test_regexp_utf8.vim

Patch 7.4.2223
Problem:    Buffer overflow when using latin1 character with feedkeys().
Solution:   Check for an illegal character.  Add a test.
Files:      src/testdir/test_regexp_utf8.vim, src/testdir/test_source_utf8.vim,
            src/testdir/test_alot_utf8.vim, src/Makefile, src/getchar.c,
            src/macros.h, src/evalfunc.c, src/os_unix.c, src/os_win32.c,
            src/spell.c,

Patch 7.4.2224
Problem:    Compiler warnings with older compiler and 64 bit numbers.
Solution:   Add "LL" to large values. (Mike Williams)
Files:      src/eval.c, src/evalfunc.c

Patch 7.4.2225
Problem:    Crash when placing a sign in a deleted buffer.
Solution:   Check for missing buffer name. (Dominique Pelle). Add a test.
Files:      src/ex_cmds.c, src/testdir/test_signs.vim

Patch 7.4.2226
Problem:    The field names used by getbufinfo(), gettabinfo() and
            getwininfo() are not consistent.
Solution:   Use bufnr, winnr and tabnr. (Yegappan Lakshmanan)
Files:      runtime/doc/eval.txt, src/evalfunc.c,
            src/testdir/test_bufwintabinfo.vim

Patch 7.4.2227
Problem:    Tab page tests are old style.
Solution:   Change into new style tests. (Hirohito Higashi)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/test62.in,
            src/testdir/test62.ok, src/testdir/test_alot.vim,
            src/testdir/test_tabpage.vim

Patch 7.4.2228
Problem:    Test files have inconsistent modelines.
Solution:   Don't set 'tabstop' to 2, use 'sts' and 'sw'.
Files:      src/testdir/README.txt, src/testdir/test_backspace_opt.vim,
            src/testdir/test_digraph.vim, src/testdir/test_gn.vim
            src/testdir/test_help_tagjump.vim,
            src/testdir/test_increment_dbcs.vim,
            src/testdir/test_increment.vim, src/testdir/test_match.vim,
            src/testdir/test_tagjump.vim, src/testdir/test_window_cmd.vim,
            src/testdir/test_regexp_latin.vim, src/testdir/test_timers.vim

Patch 7.4.2229
Problem:    Startup test fails on Solaris.
Solution:   Recognize a character device. (Danek Duvall)
Files:      src/buffer.c, src/fileio.c, src/proto/fileio.pro, src/vim.h
```

```
Patch 7.4.2230
Problem:    There is no equivalent of 'smartcase' for a tag search.
Solution:   Add value "followscs" and "smart" to 'tagcase'. (Christian
            Brabandt, closes #712) Turn tagcase test into new style.
Files:      runtime/doc/options.txt, runtime/doc/tagsrch.txt, src/option.h,
            src/tag.c, src/search.c, src/proto/search.pro,
            src/testdir/test_tagcase.in, src/testdir/test_tagcase.ok,
            src/testdir/test_tagcase.vim, src/Makefile,
            src/testdir/Make_all.mak, src/testdir/test_alot.vim

Patch 7.4.2231
Problem:    ":oldfiles" output is a very long list.
Solution:   Add a pattern argument. (Coot, closes #575)
Files:      runtime/doc/starting.txt, src/ex_cmds.h, src/eval.c,
            src/ex_cmds.c, src/proto/eval.pro, src/proto/ex_cmds.pro,
            src/testdir/test_viminfo.vim

Patch 7.4.2232
Problem:    The default ttimeoutlen is very long.
Solution:   Use "100". (Hirohito Higashi)
Files:      runtime/defaults.vim

Patch 7.4.2233
Problem:    Crash when using funcref() with invalid name. (Dominique Pelle)
Solution:   Check for NULL translated name.
Files:      src/evalfunc.c, src/testdir/test_expr.vim

Patch 7.4.2234
Problem:    Can't build with +eval but without +quickfix. (John Marriott)
Solution:   Move skip_vimgrep_pat() to separate #ifdef block.
Files:      src/quickfix.c

Patch 7.4.2235
Problem:    submatch() does not check for a valid argument.
Solution:   Give an error if the argument is out of range. (Dominique Pelle)
Files:      src/evalfunc.c, src/testdir/test_expr.vim

Patch 7.4.2236
Problem:    The 'langnoremap' option leads to double negatives.  And it does
            not work for the last character of a mapping.
Solution:   Add 'langremap' with the opposite value.  Keep 'langnoremap' for
            backwards compatibility.  Make it work for the last character of a
            mapping.  Make the test work.
Files:      runtime/doc/options.txt, runtime/defaults.vim, src/option.c,
            src/option.h, src/macros.h, src/testdir/test_mapping.vim

Patch 7.4.2237
Problem:    Can't use "." and "$" with ":tab".
Solution:   Support a range for ":tab". (Hirohito Higashi)
Files:      runtime/doc/tabpage.txt, src/ex_docmd.c,
            src/testdir/test_tabpage.vim

Patch 7.4.2238
Problem:    With SGR mouse reporting (suckless terminal) the mouse release and
```

```
            scroll up/down is confused.
Solution:   Don't see a release as a scroll up/down. (Ralph Eastwood)
Files:      src/term.c

Patch 7.4.2239
Problem:    Warning for missing declaration of skip_vimgrep_pat(). (John
            Marriott)
Solution:   Move it to another file.
Files:      src/quickfix.c, src/proto/quickfix.pro, src/ex_cmds.c,
            src/proto/ex_cmds.pro

Patch 7.4.2240
Problem:    Tests using the sleep time can be flaky.
Solution:   Use reltime() if available. (Partly by Shane Harper)
Files:      src/testdir/shared.vim, src/testdir/test_timers.vim

Patch 7.4.2241 (after 7.4.2240)
Problem:    Timer test sometimes fails.
Solution:   Increase the maximum time for repeating timer.
Files:      src/testdir/test_timers.vim

Patch 7.4.2242 (after 7.4.2240)
Problem:    Timer test sometimes fails.
Solution:   Increase the maximum time for callback timer test.
Files:      src/testdir/test_timers.vim

Patch 7.4.2243
Problem:    Warning for assigning negative value to unsigned. (Danek Duvall)
Solution:   Make cterm_normal_fg_gui_color and _bg_ guicolor_T, cast to long_u
            only when an unsigned is needed.
Files:      src/structs.h, src/globals.h, src/screen.c, src/term.c,
            src/syntax.c, src/gui_gtk_x11.c, src/gui.c, src/gui_mac.c,
            src/gui_photon.c, src/gui_w32.c, src/gui_x11.c,
            src/proto/term.pro, src/proto/gui_gtk_x11.pro,
            src/proto/gui_mac.pro, src/proto/gui_photon.pro,
            src/proto/gui_w32.pro, src/proto/gui_x11.pro

Patch 7.4.2244
Problem:    Adding pattern to ":oldfiles" is not a generic solution.
Solution:   Add the ":filter /pat/ cmd" command modifier.  Only works for some
            commands right now.
Files:      src/structs.h, src/ex_docmd.c, src/ex_cmds.h, src/message.c,
            src/proto/message.pro, runtime/doc/starting.txt,
            runtime/doc/various.txt, src/testdir/test_viminfo.vim,
            src/testdir/test_alot.vim, src/testdir/test_filter_cmd.vim,
            src/Makefile

Patch 7.4.2245 (after 7.4.2244)
Problem:    Filter test fails.
Solution:   Include missing changes.
Files:      src/buffer.c

Patch 7.4.2246 (after 7.4.2244)
Problem:    Oldfiles test fails.
```

```
Solution:   Include missing changes.
Files:      src/ex_cmds.c

Patch 7.4.2247 (after 7.4.2244)
Problem:    Tiny build fails. (Tony Mechelynck)
Solution:   Remove #ifdef.
Files:      src/ex_cmds.c

Patch 7.4.2248
Problem:    When cancelling the :ptjump prompt a preview window is opened for
            a following command.
Solution:   Reset g_do_tagpreview. (Hirohito Higashi)  Add a test.  Avoid that
            the test runner gets stuck in trying to close a window.
Files:      src/tag.c, src/testdir/test_tagjump.vim, src/testdir/runtest.vim

Patch 7.4.2249
Problem:    Missing colon in error message.
Solution:   Add the colon. (Dominique Pelle)
Files:      src/userfunc.c

Patch 7.4.2250
Problem:    Some error messages cannot be translated.
Solution:   Enclose them in _() and N_(). (Dominique Pelle)
Files:      src/channel.c, src/evalfunc.c, src/ex_cmds.c, src/spell.c,
            src/window.c

Patch 7.4.2251
Problem:    In rare cases diffing 4 buffers is not enough.
Solution:   Raise the limit to 8. (closes #1000)
Files:      src/structs.h, runtime/doc/diff.txt

Patch 7.4.2252
Problem:    Compiler warnings for signed/unsigned in expression.
Solution:   Remove type cast. (Dominique Pelle)
Files:      src/vim.h

Patch 7.4.2253
Problem:    Check for Windows 3.1 will always return false.  (Christian
            Brabandt)
Solution:   Remove the dead code.
Files:      src/gui_w32.c, src/evalfunc.c, src/ex_cmds.c, src/option.c,
            src/os_win32.c, src/version.c, src/proto/gui_w32.pro

Patch 7.4.2254
Problem:    Compiler warnings in MzScheme code.
Solution:   Add UNUSED.  Remove unreachable code.
Files:      src/if_mzsch.c

Patch 7.4.2255
Problem:    The script that checks translations can't handle plurals.
Solution:   Check for plural msgid and msgstr entries.  Leave the cursor on
            the first error.
Files:      src/po/check.vim
```

```
Patch 7.4.2256
Problem:    Coverity complains about null pointer check.
Solution:   Remove wrong and superfluous error check.
Files:      src/eval.c

Patch 7.4.2257
Problem:    Coverity complains about not checking for NULL.
Solution:   Check for out of memory.
Files:      src/if_py_both.h

Patch 7.4.2258
Problem:    Two JSON messages are sent without a separator.
Solution:   Separate messages with a NL. (closes #1001)
Files:      src/json.c, src/channel.c, src/vim.h, src/testdir/test_channel.py,
            src/testdir/test_channel.vim, runtime/doc/channel.txt

Patch 7.4.2259
Problem:    With 'incsearch' can only see the next match.
Solution:   Make CTRL-N/CTRL-P move to the previous/next match. (Christian
            Brabandt)
Files:      runtime/doc/cmdline.txt, src/ex_getln.c, src/testdir/Make_all.mak,
            src/testdir/test_search.vim, src/Makefile

Patch 7.4.2260 (after 7.4.2258)
Problem:    Channel test is flaky.
Solution:   Add a newline to separate JSON messages.
Files:      src/testdir/test_channel.vim

Patch 7.4.2261 (after 7.4.2259)
Problem:    Build fails with small features.
Solution:   Move "else" inside the #ifdef.
Files:      src/ex_getln.c

Patch 7.4.2262
Problem:    Fail to read register content from viminfo if it is 438 characters
            long. (John Chen)
Solution:   Adjust the check for line wrapping. (closes #1010)
Files:      src/testdir/test_viminfo.vim, src/ex_cmds.c

Patch 7.4.2263
Problem:    :filter does not work for many commands.  Can only get matching
            messages.
Solution:   Make :filter work for :command, :map, :list, :number and :print.
            Make ":filter!" show non-matching lines.
Files:      src/getchar.c, src/ex_cmds.c, src/ex_cmds.h, src/ex_docmd.c,
            src/message.c, src/structs.h, src/testdir/test_filter_cmd.vim

Patch 7.4.2264
Problem:    When adding entries to an empty quickfix list the title is reset.
Solution:   Improve handling of the title. (Yegappan Lakshmanan)
Files:      src/testdir/test_quickfix.vim, src/quickfix.c

Patch 7.4.2265
Problem:    printf() isn't tested much.
```

```
Solution:   Add more tests for printf(). (Dominique Pelle)
Files:      src/testdir/test_expr.vim

Patch 7.4.2266 (after 7.4.2265)
Problem:    printf() test fails on Windows. "-inf" is not used.
Solution:   Check for Windows-specific values for "nan".  Add sign to "inf"
            when appropriate.
Files:      src/message.c, src/testdir/test_expr.vim

Patch 7.4.2267 (after 7.4.2266)
Problem:    Build fails on MS-Windows.
Solution:   Add define to get isinf().
Files:      src/message.c

Patch 7.4.2268 (after 7.4.2259)
Problem:    Using CTRL-N and CTRL-P for incsearch shadows completion keys.
Solution:   Use CTRL-T and CTRL-G instead.
Files:      runtime/doc/cmdline.txt, src/ex_getln.c,
            src/testdir/test_search.vim

Patch 7.4.2269
Problem:    Using 'hlsearch' highlighting instead of matchpos if there is no
            search match.
Solution:   Pass NULL as last item to next_search_hl() when searching for
            'hlsearch' match. (Shane Harper, closes #1013)
Files:      src/screen.c, src/testdir/test_match.vim.

Patch 7.4.2270
Problem:    Insufficient testing for NUL bytes on a raw channel.
Solution:   Add a test for writing and reading.
Files:      src/testdir/test_channel.vim

Patch 7.4.2271
Problem:    Netbeans test doesn't read settings from file.
Solution:   Use "-Xnbauth".
Files:      src/testdir/test_netbeans.vim

Patch 7.4.2272
Problem:    getbufinfo(), getwininfo() and gettabinfo() are inefficient.
Solution:   Instead of making a copy of the variables dictionary, use a
            reference.
Files:      src/evalfunc.c

Patch 7.4.2273
Problem:    getwininfo() and getbufinfo() are inefficient.
Solution:   Do not make a copy of all window/buffer-local options.  Make it
            possible to get them with gettabwinvar() or getbufvar().
Files:      src/evalfunc.c, src/eval.c, src/testdir/test_bufwintabinfo.vim,
            runtime/doc/eval.txt

Patch 7.4.2274
Problem:    Command line completion on "find **/filename" drops sub-directory.
Solution:   Handle this case separately. (Harm te Hennepe, closes #932, closes
            #939)
```

```
Files:      src/misc1.c, src/testdir/test_cmdline.vim

Patch 7.4.2275
Problem:    ":diffoff!" does not remove filler lines.
Solution:   Force a redraw and invalidate the cursor. (closes #1014)
Files:      src/diff.c, src/testdir/test_diffmode.vim

Patch 7.4.2276
Problem:    Command line test fails on Windows when run twice.
Solution:   Wipe the buffer so that the directory can be deleted.
Files:      src/testdir/test_cmdline.vim

Patch 7.4.2277
Problem:    Memory leak in getbufinfo() when there is a sign. (Dominique
            Pelle)
Solution:   Remove extra vim_strsave().
Files:      src/evalfunc.c

Patch 7.4.2278
Problem:    New users have no idea of the 'scrolloff' option.
Solution:   Set 'scrolloff' in defaults.vim.
Files:      runtime/defaults.vim

Patch 7.4.2279
Problem:    Starting diff mode with the cursor in the last line might end up
            only showing one closed fold. (John Beckett)
Solution:   Scroll the window to show the same relative cursor position.
Files:      src/diff.c, src/window.c, src/proto/window.pro

Patch 7.4.2280
Problem:    printf() doesn't handle infinity float values correctly.
Solution:   Add a table with possible infinity values. (Dominique Pelle)
Files:      src/message.c, src/testdir/test_expr.vim

Patch 7.4.2281
Problem:    Timer test fails sometimes.
Solution:   Reduce minimum time by 1 msec.
Files:      src/testdir/test_timers.vim

Patch 7.4.2282
Problem:    When a child process is very fast waiting 10 msec for it is
            noticeable. (Ramel Eshed)
Solution:   Start waiting for 1 msec and gradually increase.
Files:      src/os_unix.c

Patch 7.4.2283
Problem:    Part of ":oldfiles" command isn't cleared. (Lifepillar)
Solution:   Clear the rest of the line. (closes 1018)
Files:      src/ex_cmds.c

Patch 7.4.2284
Problem:    Comment in scope header file is outdated. (KillTheMule)
Solution:   Point to the help instead. (closes #1017)
Files:      src/if_cscope.h
```

```
Patch 7.4.2285
Problem:    Generated files are outdated.
Solution:   Generate the files.  Avoid errors when generating prototypes.
Files:      src/if_mzsch.h, src/Makefile, src/option.h, src/os_mac_conv.c,
            src/os_amiga.c, src/vim.h, src/structs.h, src/os_win32.c,
            src/if_lua.c, src/proto/mbyte.pro

Patch 7.4.2286
Problem:    The tee program isn't included.  Makefile contains build
            instructions that don't work.
Solution:   Update the Filelist and build instructions. Remove build
            instructions for DOS and old Windows.  Add the tee program.
Files:      Filelist, Makefile, nsis/gvim.nsi

Patch 7.4.2287
Problem:    The callback passed to ch_sendraw() is not used.
Solution:   Pass the read part, not the send part. (haya14busa, closes #1019)
Files:      src/channel.c, src/testdir/test_channel.vim

Patch 7.4.2288
Problem:    MS-Windows build instructions are clumsy. "dosbin" doesn't build.
Solution:   Add rename.bat. Fix building "dosbin".
Files:      Makefile, Filelist, rename.bat

Patch 7.4.2289
Problem:    When installing and $DESTDIR is set the icons probably won't be
            installed.
Solution:   Create the icon directories if $DESTDIR is not empty. (Danek
            Duvall)
Files:      src/Makefile

Patch 7.4.2290
Problem:    Compiler warning in tiny build. (Tony Mechelynck)
Solution:   Add #ifdef around infinity_str().
Files:      src/message.c

Patch 7.4.2291
Problem:    printf() handles floats wrong when there is a sign.
Solution:   Fix placing the sign.  Add tests. (Dominique Pelle)
Files:      src/testdir/test_expr.vim, runtime/doc/eval.txt, src/message.c

Patch 7.4.2292 (after 7.4.2291)
Problem:    Not all systems understand %F in printf().
Solution:   Use %f.
Files:      src/message.c

Patch 7.4.2293
Problem:    Modelines in source code are inconsistent.
Solution:   Use the same line in most files.  Add 'noet'.  (Naruhiko Nishino)
Files:      src/alloc.h, src/arabic.c, src/arabic.h, src/ascii.h,
            src/blowfish.c, src/buffer.c, src/channel.c, src/charset.c,
            src/crypt.c, src/crypt_zip.c, src/dict.c, src/diff.c,
            src/digraph.c, src/dosinst.c, src/dosinst.h, src/edit.c,
```

Patch 7.4.2294
Problem: Sign test fails on MS-Windows when using the distributed zip
          archives.
Solution: Create dummy files instead of relying on files in the pixmaps
          directory.
Files: src/testdir/test_signs.vim

Patch 7.4.2295 (after 7.4.2293)
Problem: Cscope test fails.
Solution: Avoid checking for specific line and column numbers.
Files: src/testdir/test_cscope.vim

Patch 7.4.2296
Problem: No tests for :undolist and "U" command.
Solution: Add tests. (Dominique Pelle)
Files: src/testdir/test_undo.vim

Patch 7.4.2297

```
Problem:    When starting a job that reads from a buffer and reaching the end,
            the job hangs.
Solution:   Close the pipe or socket when all lines were read.
Files:      src/channel.c, src/testdir/test_channel.vim

Patch 7.4.2298
Problem:    It is not possible to close the "in" part of a channel.
Solution:   Add ch_close_in().
Files:      src/evalfunc.c, src/channel.c, src/proto/channel.pro,
            src/testdir/test_channel.vim, runtime/doc/eval.txt,
            runtime/doc/channel.txt

Patch 7.4.2299
Problem:    QuickFixCmdPre and QuickFixCmdPost autocommands are not always
            triggered.
Solution:   Also trigger on ":cexpr", ":cbuffer", etc. (Yegappan Lakshmanan)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 7.4.2300
Problem:    Get warning for deleting autocommand group when the autocommand
            using the group is scheduled for deletion. (Pavol Juhas)
Solution:   Check for deleted autocommand.
Files:      src/fileio.c, src/testdir/test_autocmd.vim

Patch 7.4.2301
Problem:    MS-Windows: some files remain after testing.
Solution:   Close the channel output file.  Wait for the file handle to be
            closed before deleting the file.
Files:      src/os_win32.c, src/testdir/test_channel.vim

Patch 7.4.2302
Problem:    Default interface versions for MS-Windows are outdated.
Solution:   Use Active Perl 5.24, Python 3.5.2.  Could only make it work with
            Ruby 1.9.2.
Files:      src/bigvim.bat, src/bigvim64.bat, src/Make_mvc.mak

Patch 7.4.2303
Problem:    When using "is" the mode isn't always updated.
Solution:   Redraw the command line. (Christian Brabandt)
Files:      src/search.c

Patch 7.4.2304
Problem:    In a timer callback the timer itself can't be found or stopped.
            (Thinca)
Solution:   Do not remove the timer from the list, remember whether it was
            freed.
Files:      src/ex_cmds2.c, src/testdir/test_timers.vim

Patch 7.4.2305
Problem:    Marks, writefile and nested function tests are old style.
Solution:   Turn them into new style tests. (Yegappan Lakshmanan)
Files:      src/testdir/Make_all.mak, src/testdir/test_marks.in,
            src/testdir/test_marks.ok, src/testdir/test_marks.vim,
            src/testdir/test_nested_function.in,
```

```
            src/testdir/test_nested_function.ok,
            src/testdir/test_nested_function.vim,
            src/testdir/test_writefile.in, src/testdir/test_writefile.ok,
            src/testdir/test_writefile.vim, src/Makefile

Patch 7.4.2306
Problem:    Default value for 'langremap' is wrong.
Solution:   Set the right value. (Jürgen Krämer)  Add a test.
Files:      src/option.c, src/testdir/test_mapping.vim

Patch 7.4.2307
Problem:    Several tests are old style.
Solution:   Turn them into new style tests. (Yegappan Lakshmanan)
Files:      src/testdir/Make_all.mak, src/testdir/test102.in,
            src/testdir/test102.ok, src/testdir/test46.in,
            src/testdir/test46.ok, src/testdir/test81.in,
            src/testdir/test81.ok, src/testdir/test_charsearch.in,
            src/testdir/test_charsearch.ok, src/testdir/test_charsearch.vim,
            src/testdir/test_fnameescape.vim, src/testdir/test_substitute.vim,
            src/Makefile

Patch 7.4.2308 (after 7.4.2307)
Problem:    Old charsearch test still listed in Makefile.
Solution:   Remove the line.
Files:      src/testdir/Make_all.mak

Patch 7.4.2309
Problem:    Crash when doing tabnext in a BufUnload autocmd. (Dominique Pelle)
Solution:   When detecting that the tab page changed, don't just abort but
            delete the window where w_buffer is NULL.
Files:      src/window.c, src/testdir/test_tabpage.vim

Patch 7.4.2310 (after 7.4.2304)
Problem:    Accessing freed memory when a timer does not repeat.
Solution:   Free after removing it. (Dominique Pelle)
Files:      src/ex_cmds2.c

Patch 7.4.2311
Problem:    Appveyor 64 bit build still using Python 3.4
Solution:   Switch to Python 3.5. (Ken Takata, closes #1032)
Files:      appveyor.yml, src/appveyor.bat

Patch 7.4.2312
Problem:    Crash when autocommand moves to another tab. (Dominique Pelle)
Solution:   When navigating to another window halfway the :edit command go
            back to the right window.
Files:      src/buffer.c, src/ex_cmds.c, src/ex_getln.c, src/ex_docmd.c,
            src/window.c, src/proto/ex_getln.pro, src/testdir/test_tabpage.vim

Patch 7.4.2313
Problem:    Crash when deleting an augroup and listing an autocommand.
            (Dominique Pelle)
Solution:   Make sure deleted_augroup is valid.
Files:      src/fileio.c, src/testdir/test_autocmd.vim
```

```
Patch 7.4.2314
Problem:    No error when deleting an augroup while it's the current one.
Solution:   Disallow deleting an augroup when it's the current one.
Files:      src/fileio.c, src/testdir/test_autocmd.vim

Patch 7.4.2315
Problem:    Insufficient testing for Normal mode commands.
Solution:   Add a big test. (Christian Brabandt, closes #1029)
Files:      src/Makefile, src/testdir/Make_all.mak,
            src/testdir/test_normal.vim

Patch 7.4.2316
Problem:    Channel sort test is flaky.
Solution:   Add a check the output has been read.
Files:      src/testdir/test_channel.vim

Patch 7.4.2317 (after 7.4.2315)
Problem:    Normal mode tests fail on MS-Windows.
Solution:   Do some tests only on Unix.  Set 'fileformat' to "unix".
Files:      src/testdir/test_normal.vim

Patch 7.4.2318
Problem:    When 'incsearch' is not set CTRL-T and CTRL-G are not inserted as
            before.
Solution:   Move #ifdef and don't use goto.
Files:      src/ex_getln.c

Patch 7.4.2319
Problem:    No way for a system wide vimrc to stop loading defaults.vim.
            (Christian Hesse)
Solution:   Bail out of defaults.vim if skip_defaults_vim was set.
Files:      runtime/defaults.vim

Patch 7.4.2320
Problem:    Redraw problem when using 'incsearch'.
Solution:   Save the current view when deleting characters. (Christian
            Brabandt) Fix that the '" mark is set in the wrong position. Don't
            change the search start when using BS.
Files:      src/ex_getln.c, src/normal.c, src/testdir/test_search.vim

Patch 7.4.2321
Problem:    When a test is commented out we forget about it.
Solution:   Let a test throw an exception with "Skipped" and list skipped test
            functions. (Christian Brabandt)
Files:      src/testdir/Makefile, src/testdir/runtest.vim,
            src/testdir/test_popup.vim, src/testdir/README.txt

Patch 7.4.2322
Problem:    Access memory beyond the end of the line. (Dominique Pelle)
Solution:   Adjust the cursor column.
Files:      src/move.c, src/testdir/test_normal.vim

Patch 7.4.2323
```

```
Problem:    Using freed memory when using 'formatexpr'. (Dominique Pelle)
Solution:   Make a copy of 'formatexpr' before evaluating it.
Files:      src/ops.c, src/testdir/test_normal.vim

Patch 7.4.2324
Problem:    Crash when editing a new buffer and BufUnload autocommand wipes
            out the new buffer. (Norio Takagi)
Solution:   Don't allow wiping out this buffer. (partly by Hirohito Higashi)
            Move old style test13 into test_autocmd. Avoid ml_get error when
            editing a file.
Files:      src/structs.h, src/buffer.c, src/ex_cmds.c, src/ex_docmd.c,
            src/window.c, src/testdir/test13.in, src/testdir/test13.ok,
            src/testdir/test_autocmd.vim, src/testdir/Make_all.mak,
            src/Makefile

Patch 7.4.2325 (after 7.4.2324)
Problem:    Tiny build fails.
Solution:   Add #ifdef.
Files:      src/buffer.c

Patch 7.4.2326
Problem:    Illegal memory access when Visual selection starts in invalid
            position. (Dominique Pelle)
Solution:   Correct position when needed.
Files:      src/normal.c, src/misc2.c, src/proto/misc2.pro

Patch 7.4.2327
Problem:    Freeing a variable that is on the stack.
Solution:   Don't free res_tv or err_tv. (Ozaki Kiichi)
Files:      src/channel.c

Patch 7.4.2328
Problem:    Crash when BufWinLeave autocmd goes to another tab page. (Hirohito
            Higashi)
Solution:   Make close_buffer() go back to the right window.
Files:      src/buffer.c, src/testdir/test_autocmd.vim

Patch 7.4.2329
Problem:    Error for min() and max() contains %s. (Nikolai Pavlov)
Solution:   Pass the function name. (closes #1040)
Files:      src/evalfunc.c, src/testdir/test_expr.vim

Patch 7.4.2330
Problem:    Coverity complains about not checking curwin to be NULL.
Solution:   Use firstwin to avoid the warning.
Files:      src/buffer.c

Patch 7.4.2331
Problem:    Using CTRL-X CTRL-V to complete a command line from Insert mode
            does not work after entering an expression on the command line.
Solution:   Don't use "ccline" when not actually using a command line. (test
            by Hirohito Higashi)
Files:      src/edit.c, src/ex_getln.c, src/proto/ex_getln.pro,
            src/testdir/test_popup.vim
```

```
Patch 7.4.2332
Problem:    Crash when stop_timer() is called in a callback of a callback.
            Vim hangs when the timer callback uses too much time.
Solution:   Set tr_id to -1 when a timer is to be deleted. Don't keep calling
            callbacks forever. (Ozaki Kiichi)
Files:      src/evalfunc.c, src/ex_cmds2.c, src/structs.h,
            src/proto/ex_cmds2.pro, src/testdir/test_timers.vim

Patch 7.4.2333
Problem:    Outdated comments in test.
Solution:   Cleanup normal mode test. (Christian Brabandt)
Files:      src/testdir/test_normal.vim

Patch 7.4.2334
Problem:    On MS-Windows test_getcwd leaves Xtopdir behind.
Solution:   Set 'noswapfile'. (Michael Soyka)
Files:      src/testdir/test_getcwd.in

Patch 7.4.2335
Problem:    taglist() is slow. (Luc Hermitte)
Solution:   Check for CTRL-C less often when doing a linear search. (closes
            #1044)
Files:      src/tag.c

Patch 7.4.2336
Problem:    Running normal mode tests leave a couple of files behind.
            (Yegappan Lakshmanan)
Solution:   Delete the files. (Christian Brabandt)
Files:      src/testdir/test_normal.vim

Patch 7.4.2337
Problem:    taglist() is still slow. (Luc Hermitte)
Solution:   Check for CTRL-C less often when finding duplicates.
Files:      src/tag.c

Patch 7.4.2338
Problem:    Can't build with small features. (John Marriott)
Solution:   Nearly always define FEAT_TAG_BINS.
Files:      src/feature.h, src/tag.c

Patch 7.4.2339
Problem:    Tab page test fails when run as fake root.
Solution:   Check 'buftype' instead of 'filetype'. (James McCoy, closes #1042)
Files:      src/testdir/test_tabpage.vim

Patch 7.4.2340
Problem:    MS-Windows: Building with Ruby uses old version.
Solution:   Update to 2.2.X. Use clearer name for the API version. (Ken
            Takata)
Files:      Makefile, src/INSTALLpc.txt, src/Make_cyg_ming.mak,
            src/Make_mvc.mak, src/bigvim.bat

Patch 7.4.2341
```

```
Problem:    Tiny things.  Test doesn't clean up properly.
Solution:   Adjust comment and white space. Restore option value.
Files:      src/ex_cmds.c, src/message.c, src/testdir/test_autocmd.vim

Patch 7.4.2342
Problem:    Typo in MS-Windows build script.
Solution:   change "w2" to "22".
Files:      src/bigvim.bat

Patch 7.4.2343
Problem:    Too many old style tests.
Solution:   Turn several into new style tests. (Yegappan Lakshmanan)
Files:      src/testdir/Make_all.mak, src/testdir/test101.in,
            src/testdir/test101.ok, src/testdir/test18.in,
            src/testdir/test18.ok, src/testdir/test2.in, src/testdir/test2.ok,
            src/testdir/test21.in, src/testdir/test21.ok,
            src/testdir/test6.in, src/testdir/test6.ok,
            src/testdir/test_arglist.vim, src/testdir/test_charsearch.vim,
            src/testdir/test_fnameescape.vim, src/testdir/test_gf.vim,
            src/testdir/test_hlsearch.vim, src/testdir/test_smartindent.vim,
            src/testdir/test_tagjump.vim, src/Makefile

Patch 7.4.2344
Problem:    The "Reading from channel output..." message can be unwanted.
            Appending to a buffer leaves an empty first line behind.
Solution:   Add the "out_msg" and "err_msg" options. Writing the first line
            overwrites the first, empty line.
Files:      src/structs.h, src/channel.c, src/testdir/test_channel.vim,
            runtime/doc/channel.txt

Patch 7.4.2345 (after 7.4.2340)
Problem:    For MinGW RUBY_API_VER_LONG isn't set correctly.  Many default
            version numbers are outdated.
Solution:   Set RUBY_API_VER_LONG to RUBY_VER_LONG. Use latest stable releases
            for defaults. (Ken Takata)
Files:      src/Make_cyg_ming.mak, src/Make_mvc.mak

Patch 7.4.2346
Problem:    Autocommand test fails when run directly, passes when run as part
            of test_alot.
Solution:   Add command to make the cursor move.  Close a tab page.
Files:      src/testdir/test_autocmd.vim

Patch 7.4.2347
Problem:    Crash when closing a buffer while Visual mode is active.
            (Dominique Pelle)
Solution:   Adjust the position before computing the number of lines.
            When closing the current buffer stop Visual mode.
Files:      src/buffer.c, src/normal.c, src/testdir/test_normal.vim

Patch 7.4.2348
Problem:    Crash on exit when EXITFREE is defined. (Dominique Pelle)
Solution:   Don't access curwin when exiting.
Files:      src/buffer.c
```

```
Patch 7.4.2349
Problem:    Valgrind reports using uninitialized memory. (Dominique Pelle)
Solution:   Check the length before checking for a NUL.
Files:      src/message.c

Patch 7.4.2350
Problem:    Test 86 and 87 fail with some version of Python.
Solution:   Unify "can't" and "cannot".  Unify quotes.
Files:      src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.4.2351
Problem:    Netbeans test fails when run from unpacked MS-Windows sources.
Solution:   Open README.txt instead of Makefile.
Files:      src/testdir/test_netbeans.py, src/testdir/test_netbeans.vim

Patch 7.4.2352
Problem:    Netbeans test fails in shadow directory.
Solution:   Also copy README.txt to the shadow directory.
Files:      src/Makefile

Patch 7.4.2353
Problem:    Not enough test coverage for Normal mode commands.
Solution:   Add more tests. (Christian Brabandt)
Files:      src/testdir/test_normal.vim

Patch 7.4.2354
Problem:    The example that explains nested backreferences does not work
            properly with the new regexp engine. (Harm te Hennepe)
Solution:   Also save the end position when adding a state. (closes #990)
Files:      src/regexp_nfa.c, src/testdir/test_regexp_latin.vim

Patch 7.4.2355
Problem:    Regexp fails to match when using "\>\)\?". (Ramel)
Solution:   When a state is already in the list, but addstate_here() is used
            and the existing state comes later, add the new state anyway.
Files:      src/regexp_nfa.c, src/testdir/test_regexp_latin.vim

Patch 7.4.2356
Problem:    Reading past end of line when using previous substitute pattern.
            (Dominique Pelle)
Solution:   Don't set "pat" only set "searchstr".
Files:      src/search.c, src/testdir/test_search.vim

Patch 7.4.2357
Problem:    Attempt to read history entry while not initialized.
Solution:   Skip when the index is negative.
Files:      src/ex_getln.c

Patch 7.4.2358
Problem:    Compiler warnings with Solaris Studio when using GTK3. (Danek
            Duvall)
Solution:   Define FUNC2GENERIC depending on the system. (Kazunobu Kuriyama)
```

```
Files:      src/gui.h, src/gui_beval.c, src/gui_gtk_f.c

Patch 7.4.2359
Problem:    Memory leak in timer_start().
Solution:   Check the right field to be NULL.
Files:      src/evalfunc.c, src/testdir/test_timers.vim

Patch 7.4.2360
Problem:    Invalid memory access when formatting. (Dominique Pelle)
Solution:   Make sure cursor line and column are associated.
Files:      src/misc1.c

Patch 7.4.2361
Problem:    Checking for last_timer_id to overflow is not reliable. (Ozaki
            Kiichi)
Solution:   Check for the number not going up.
Files:      src/ex_cmds2.c

Patch 7.4.2362
Problem:    Illegal memory access with ":1@". (Dominique Pelle)
Solution:   Correct cursor column after setting the line number.  Also avoid
            calling end_visual_mode() when not in Visual mode.
Files:      src/ex_docmd.c, src/buffer.c

Patch 7.4.2363
Problem:    Superfluous function prototypes.
Solution:   Remove them.
Files:      src/regexp.c

Patch 7.4.2364
Problem:    Sort test sometimes fails.
Solution:   Add it to the list of flaky tests.
Files:      src/testdir/runtest.vim

Patch 7.4.2365
Problem:    Needless line break. Confusing directory name.
Solution:   Remove line break.  Prepend "../" to "tools".
Files:      Makefile, src/normal.c

Patch 7.4.2366
Problem:    MS-Windows gvim.exe does not have DirectX support.
Solution:   Add the DIRECTX to the script.
Files:      src/bigvim.bat

Patch 7.4.2367 (after 7.4.2364)
Problem:    Test runner misses a comma.
Solution:   Add the comma.
Files:      src/testdir/runtest.vim

==============================================================================
VERSION 8.1                                  version-8.1   version8.1   vim-8.1

This section is about improvements made between version 8.0 and 8.1.
```

This release has hundreds of bug fixes, there is a new feature and there are
many minor improvements.

The terminal window new-terminal-window

You can now open a window which functions as a terminal. You can use it for:
- Running a command, such as "make", while editing in other windows
- Running a shell and execute several commands
- Use the terminal debugger plugin, see terminal-debugger

All of this is especially useful when running Vim on a remote (ssh)
connection, when you can't easily open more terminals.

For more information see terminal-window .

Changed changed-8.1

Internal: A few C99 features are now allowed such as // comments and a
comma after the last enum entry. See style-compiler .

Since patch 8.0.0029 removed support for older MS-Windows systems, only
MS-Windows XP and later are supported.

Added added-8.1

Various syntax, indent and other plugins were added.

Quickfix improvements (by Yegappan Lakshmanan):
	Added support for modifying any quickfix/location list in the quickfix
	stack.
	Added a unique identifier for every quickfix/location list.
	Added support for associating any Vim type as a context information to
	a quickfix/location list.
	Enhanced the getqflist(), getloclist(), setqflist() and setloclist()
	functions to get and set the various quickfix/location list attributes.
	Added the QuickFixLine highlight group to highlight the current line
	in the quickfix window.
	The quickfix buffer b:changedtick variable is incremented for every
	change to the contained quickfix list.
	Added a changedtick variable to a quickfix/location list which is
	incremented when the list is modified.
	Added support for parsing text using 'errorformat' without creating a
	new quickfix list.
	Added support for the "module" item to a quickfix entry which can be
	used for display purposes instead of a long file name.
	Added support for freeing all the lists in the quickfix/location stack.
	When opening a quickfix window using the :copen/:cwindow commands, the

```
        supplied split modifiers are used.

Functions:
        All the term_ functions.

         assert_beeps()
         assert_equalfile()
         assert_report()
         balloon_show()
         balloon_split()
         ch_canread()
         getchangelist()
         getjumplist()
         getwinpos()
         pyxeval()
         remote_startserver()
         setbufline()
         test_ignore_error()
         test_override()
         trim()
         win_screenpos()

Autocommands:
         CmdlineChanged
         CmdlineEnter
         CmdlineLeave
         ColorSchemePre
         DirChanged
         ExitPre
         TerminalOpen
         TextChangedP
         TextYankPost

Commands:
         :pyx
         :pythonx
         :pyxdo
         :pyxfile
         :terminal
         :tmapclear
         :tmap
         :tnoremap
         :tunmap

Options:
        'balloonevalterm'
        'imstyle'
        'mzschemedll'
        'mzschemegcdll'
        'makeencoding'
        'pumwidth'
        'pythonhome'
        'pythonthreehome'
        'pyxversion'
```

```
        'termwinkey'
        'termwinscroll'
        'termwinsize'
        'viminfofile'
        'winptydll'
```

Patches   patches-8.1

```
Patch 8.0.0001
Problem:    Intro screen still mentions version7. (Paul)
Solution:   Change it to version8.
Files:      src/version.c

Patch 8.0.0002
Problem:    The netrw plugin does not work.
Solution:   Make it accept version 8.0.
Files:      runtime/autoload/netrw.vim

Patch 8.0.0003
Problem:    getwinvar() returns wrong Value of boolean and number options,
            especially non big endian systems. (James McCoy)
Solution:   Cast the pointer to long or int. (closes #1060)
Files:      src/option.c, src/testdir/test_bufwintabinfo.vim

Patch 8.0.0004
Problem:    A string argument for function() that is not a function name
            results in an error message with NULL. (Christian Brabandt)
Solution:   Use the argument for the error message.
Files:      src/evalfunc.c, src/testdir/test_expr.vim

Patch 8.0.0005
Problem:    Netbeans test fails with Python 3. (Jonathonf)
Solution:   Encode the string before sending it. (closes #1070)
Files:      src/testdir/test_netbeans.py

Patch 8.0.0006
Problem:    ":lb" is interpreted as ":lbottom" while the documentation says it
            means ":lbuffer".
Solution:   Adjust the order of the commands. (haya14busa, closes #1093)
Files:      src/ex_cmds.h

Patch 8.0.0007
Problem:    Vim 7.4 is still mentioned in a few places.
Solution:   Update to Vim 8.  (Uncle Bill, closes #1094)
Files:      src/INSTALLpc.txt, src/vimtutor, uninstal.txt

Patch 8.0.0008
Problem:    Popup complete test is disabled.
Solution:   Enable the test and change the assert. (Hirohito Higashi)
Files:      src/testdir/test_popup.vim

Patch 8.0.0009
```

```
Problem:    Unnecessary workaround for AppVeyor.
Solution:   Revert patch 7.4.990. (Christian Brabandt)
Files:      appveyor.yml

Patch 8.0.0010
Problem:    Crash when editing file that starts with crypt header. (igor2x)
Solution:   Check for length of text. (Christian Brabandt) Add a test.
Files:      src/fileio.c, src/testdir/test_crypt.vim, src/Makefile,
            src/testdir/Make_all.mak

Patch 8.0.0011
Problem:    On OSX Test_pipe_through_sort_all() sometimes fails.
Solution:   Add the test to the list of flaky tests.
Files:      src/testdir/runtest.vim

Patch 8.0.0012
Problem:    Typos in comments.
Solution:   Change "its" to "it's". (Matthew Brener, closes #1088)
Files:      src/evalfunc.c, src/main.aap, src/nbdebug.c, src/netbeans.c,
            src/quickfix.c, src/workshop.c, src/wsdebug.c

Patch 8.0.0013 (after 8.0.0011)
Problem:    Missing comma in list.
Solution:   Add the comma.
Files:      src/testdir/runtest.vim

Patch 8.0.0014
Problem:    Crypt tests are old style.
Solution:   Convert to new style.
Files:      src/testdir/test71.in, src/testdir/test71.ok,
            src/testdir/test71a.in, src/testdir/test_crypt.vim, src/Makefile,
            src/testdir/Make_all.mak

Patch 8.0.0015
Problem:    Can't tell which part of a channel has "buffered" status.
Solution:   Add an optional argument to ch_status().  Let ch_info() also
            return "buffered" for out_status and err_status.
Files:      src/evalfunc.c, src/channel.c, src/proto/channel.pro,
            src/testdir/test_channel.vim, runtime/doc/eval.txt

Patch 8.0.0016 (after 8.0.0015)
Problem:    Build fails.
Solution:   Include missing change.
Files:      src/eval.c

Patch 8.0.0017
Problem:    Cannot get the number of the current quickfix or location list.
Solution:   Use the current list if "nr" in "what" is zero. (Yegappan
            Lakshmanan)  Remove debug command from test.
Files:      src/quickfix.c, src/testdir/test_quickfix.vim,
            runtime/doc/eval.txt

Patch 8.0.0018
Problem:    When using ":sleep" channel input is not handled.
```

```
Solution:   When there is a channel check for input also when not in raw mode.
            Check every 100 msec.
Files:      src/channel.c, src/proto/channel.pro, src/ui.c, src/proto/ui.pro,
            src/ex_docmd.c, src/os_amiga.c, src/proto/os_amiga.pro,
            src/os_unix.c, src/proto/os_unix.pro, src/os_win32.c,
            src/proto/os_win32.pro

Patch 8.0.0019
Problem:    Test_command_count is old style.
Solution:   Turn it into a new style test. (Naruhiko Nishino)
            Use more assert functions.
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/test_alot.vim,
            src/testdir/test_autocmd.vim, src/testdir/test_command_count.in,
            src/testdir/test_command_count.ok,
            src/testdir/test_command_count.vim

Patch 8.0.0020
Problem:    The regexp engines are not reentrant.
Solution:   Add regexec_T and save/restore the state when needed.
Files:      src/regexp.c, src/regexp_nfa.c, src/testdir/test_expr.vim,
            runtime/doc/eval.txt, runtime/doc/change.txt

Patch 8.0.0021
Problem:    In the GUI when redrawing the cursor it may be on the second half
            of a double byte character.
Solution:   Correct the cursor column. (Yasuhiro Matsumoto)
Files:      src/screen.c

Patch 8.0.0022
Problem:    If a channel in NL mode is missing the NL at the end the remaining
            characters are dropped.
Solution:   When the channel is closed use the remaining text. (Ozaki Kiichi)
Files:      src/channel.c, src/testdir/test_channel.vim

Patch 8.0.0023
Problem:    "gd" and "gD" may find a match in a comment or string.
Solution:   Ignore matches in comments and strings. (Anton Lindqvist)
Files:      src/normal.c, src/testdir/test_goto.vim

Patch 8.0.0024
Problem:    When the netbeans channel closes, "DETACH" is put in the output
            part. (Ozaki Kiichi)
Solution:   Write "DETACH" in the socket part.
Files:      src/channel.c, src/testdir/test_netbeans.vim

Patch 8.0.0025
Problem:    Inconsistent use of spaces vs tabs in gd test.
Solution:   Use tabs. (Anton Lindqvist)
Files:      src/testdir/test_goto.vim

Patch 8.0.0026
Problem:    Error format with %W, %C and %Z does not work. (Gerd Wachsmuth)
Solution:   Skip code when qf_multiignore is set. (Lcd)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim
```

```
Patch 8.0.0027
Problem:    A channel is closed when reading on stderr or stdout fails, but
            there may still be something to read on another part.
Solution:   Turn ch_to_be_closed into a bitfield. (Ozaki Kiichi)
Files:      src/channel.c, src/eval.c, src/structs.h, src/proto/channel.pro,
            src/testdir/test_channel.vim

Patch 8.0.0028
Problem:    Superfluous semicolons.
Solution:   Remove them. (Ozaki Kiichi)
Files:      src/ex_cmds2.c

Patch 8.0.0029
Problem:    Code for MS-Windows is complicated because of the exceptions for
            old systems.
Solution:   Drop support for MS-Windows older than Windows XP. (Ken Takata)
Files:      runtime/doc/gui_w32.txt, runtime/doc/os_win32.txt,
            runtime/doc/todo.txt, src/GvimExt/Makefile, src/Make_mvc.mak,
            src/evalfunc.c, src/ex_cmds.c, src/ex_docmd.c, src/gui_w32.c,
            src/if_cscope.c, src/misc1.c, src/misc2.c, src/option.c,
            src/os_mswin.c, src/os_win32.c, src/os_win32.h,
            src/proto/os_mswin.pro, src/proto/os_win32.pro, src/version.c

Patch 8.0.0030
Problem:    Mouse mode is not automatically detected for tmux.
Solution:   Check for 'term' to be "tmux". (Michael Henry)
Files:      src/os_unix.c

Patch 8.0.0031
Problem:    After ":bwipeout" 'fileformat' is not set to the right default.
Solution:   Get the default from 'fileformats'. (Mike Williams)
Files:      src/option.c, src/Makefile, src/testdir/test_fileformat.vim,
            src/testdir/test_alot.vim

Patch 8.0.0032
Problem:    Tests may change the input file when something goes wrong.
Solution:   Avoid writing the input file.
Files:      src/testdir/test51.in, src/testdir/test67.in,
            src/testdir/test97.in, src/testdir/test_tabpage.vim

Patch 8.0.0033
Problem:    Cannot use overlapping positions with matchaddpos().
Solution:   Check end of match. (Ozaki Kiichi) Add a test (Hirohito Higashi)
Files:      src/screen.c, src/testdir/test_match.vim

Patch 8.0.0034
Problem:    No completion for ":messages".
Solution:   Complete "clear" argument. (Hirohito Higashi)
Files:      src/ex_docmd.c, src/ex_getln.c, src/proto/ex_docmd.pro,
            src/testdir/test_cmdline.vim, src/vim.h,
            runtime/doc/eval.txt, runtime/doc/map.txt

Patch 8.0.0035 (after 7.4.2013)
```

```
Problem:    Order of matches for 'omnifunc' is messed up. (Danny Su)
Solution:   Do not set compl_curr_match when called from complete_check().
            (closes #1168)
Files:      src/edit.c, src/evalfunc.c, src/proto/edit.pro, src/search.c,
            src/spell.c, src/tag.c, src/testdir/test76.in,
            src/testdir/test76.ok, src/testdir/test_popup.vim, src/Makefile,
            src/testdir/Make_all.mak

Patch 8.0.0036
Problem:    Detecting that a job has finished may take a while.
Solution:   Check for a finished job more often (Ozaki Kiichi)
Files:      src/channel.c, src/os_unix.c, src/os_win32.c,
            src/proto/os_unix.pro, src/proto/os_win32.pro,
            src/testdir/test_channel.vim

Patch 8.0.0037
Problem:    Get E924 when switching tabs. ()
Solution:   Use win_valid_any_tab() instead of win_valid(). (Martin Vuille,
            closes #1167, closes #1171)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.0038
Problem:    OPEN_CHR_FILES not defined for FreeBSD using Debian userland
            files.
Solution:   Check for __FreeBSD_kernel__. (James McCoy, closes #1166)
Files:      src/vim.h

Patch 8.0.0039
Problem:    When Vim 8 reads an old viminfo and exits, the next time marks are
            not read from viminfo. (Ned Batchelder)
Solution:   Set a mark when it wasn't set before, even when the timestamp is
            zero. (closes #1170)
Files:      src/mark.c, src/testdir/test_viminfo.vim

Patch 8.0.0040 (after 8.0.0033)
Problem:    Whole line highlighting with matchaddpos() does not work.
Solution:   Check for zero length. (Hirohito Higashi)
Files:      src/screen.c, src/testdir/test_match.vim

Patch 8.0.0041
Problem:    When using Insert mode completion but not actually inserting
            anything an undo item is still created. (Tommy Allen)
Solution:   Do not call stop_arrow() when not inserting anything.
Files:      src/edit.c, src/testdir/test_popup.vim

Patch 8.0.0042 (after 8.0.0041)
Problem:    When using Insert mode completion with 'completeopt' containing
            "noinsert" change is not saved for undo.  (Tommy Allen)
Solution:   Call stop_arrow() before inserting for pressing Enter.
Files:      src/edit.c, src/testdir/test_popup.vim

Patch 8.0.0043 (after 8.0.0041)
Problem:    When using Insert mode completion with 'completeopt' containing
            "noinsert" with CTRL-N the change is not saved for undo.  (Tommy
```

            Allen)
Solution: Call stop_arrow() before inserting for any key.
Files: src/edit.c, src/testdir/test_popup.vim

Patch 8.0.0044
Problem: In diff mode the cursor may end up below the last line, resulting
            in an ml_get error.
Solution: Check the line to be valid.
Files: src/move.c, src/diff.c, src/proto/diff.pro,
            src/testdir/test_diffmode.vim

Patch 8.0.0045
Problem: Calling job_stop() right after job_start() does not work.
Solution: Block signals while fork is still busy. (Ozaki Kiichi, closes
            #1155)
Files: src/auto/configure, src/config.h.in, src/configure.in,
            src/os_unix.c, src/testdir/test_channel.vim

Patch 8.0.0046
Problem: Using NUL instead of NULL.
Solution: Change to NULL. (Dominique Pelle)
Files: src/ex_cmds.c, src/json.c

Patch 8.0.0047
Problem: Crash when using the preview window from an unnamed buffer.
            (lifepillar)
Solution: Do not clear the wrong buffer. (closes #1200)
Files: src/popupmnu.c

Patch 8.0.0048
Problem: On Windows job_stop() stops cmd.exe, not the processes it runs.
            (Linwei)
Solution: Iterate over all processes and terminate the one where the parent
            is the job process. (Yasuhiro Matsumoto, closes #1184)
Files: src/os_win32.c, src/structs.h

Patch 8.0.0049
Problem: When a match ends in part of concealed text highlighting, it might
            mess up concealing by resetting prev_syntax_id.
Solution: Do not reset prev_syntax_id and add a test to verify. (Christian
            Brabandt, closes #1092)
Files: src/screen.c, src/testdir/test_matchadd_conceal.vim

Patch 8.0.0050
Problem: An exiting job is detected with a large latency.
Solution: Check for pending job more often. (Ozaki Kiichi) Change the
            double loop in mch_inchar() into one.
Files: src/channel.c, src/os_unix.c, src/testdir/shared.vim,
            src/testdir/test_channel.vim

Patch 8.0.0051 (after 8.0.0048)
Problem: New code for job_stop() breaks channel test on AppVeyor.
Solution: Revert the change.
Files: src/os_win32.c, src/structs.h

```
Patch 8.0.0052 (after 8.0.0049)
Problem:    Conceal test passes even without the bug fix.
Solution:   Add a redraw command. (Christian Brabandt)
Files:      src/testdir/test_matchadd_conceal.vim

Patch 8.0.0053 (after 8.0.0047)
Problem:    No test for what 8.0.0047 fixes.
Solution:   Add a test. (Hirohito Higashi)
Files:      src/testdir/test_popup.vim

Patch 8.0.0054 (after 8.0.0051)
Problem:    On Windows job_stop() stops cmd.exe, not the processes it runs.
            (Linwei)
Solution:   Iterate over all processes and terminate the one where the parent
            is the job process. Now only when there is no job object.
            (Yasuhiro Matsumoto, closes #1203)
Files:      src/os_win32.c

Patch 8.0.0055
Problem:    Minor comment and style deficiencies.
Solution:   Update comments and fix style.
Files:      src/buffer.c, src/misc2.c, src/os_unix.c

Patch 8.0.0056
Problem:    When setting 'filetype' there is no check for a valid name.
Solution:   Only allow valid characters in 'filetype', 'syntax' and 'keymap'.
Files:      src/option.c, src/testdir/test_options.vim

Patch 8.0.0057 (after 8.0.0056)
Problem:    Tests fail without the 'keymap' features.
Solution:   Check for feature in test.
Files:      src/testdir/test_options.vim

Patch 8.0.0058
Problem:    Positioning of the popup menu is not good.
Solution:   Position it better. (Hirohito Higashi)
Files:      src/popupmnu.c

Patch 8.0.0059
Problem:    Vim does not build on VMS systems.
Solution:   Various changes for VMS. (Zoltan Arpadffy)
Files:      src/json.c, src/macros.h, src/Make_vms.mms, src/os_unix.c,
            src/os_unix.h, src/os_vms.c, src/os_vms_conf.h,
            src/proto/os_vms.pro, src/testdir/Make_vms.mms

Patch 8.0.0060
Problem:    When using an Ex command for 'keywordprg' it is escaped as with a
            shell command. (Romain Lafourcade)
Solution:   Escape for an Ex command. (closes #1175)
Files:      src/normal.c, src/testdir/test_normal.vim

Patch 8.0.0061 (after 8.0.0058)
Problem:    Compiler warning for unused variable.
```

```
Solution:   Add #ifdef. (John Marriott)
Files:      src/popupmnu.c

Patch 8.0.0062
Problem:    No digraph for HORIZONTAL ELLIPSIS.
Solution:   Use ",.". (Hans Ginzel, closes #1226)
Files:      src/digraph.c, runtime/doc/digraph.txt

Patch 8.0.0063
Problem:    Compiler warning for comparing with unsigned. (Zoltan Arpadffy)
Solution:   Change <= to ==.
Files:      src/undo.c

Patch 8.0.0064 (after 8.0.0060)
Problem:    Normal test fails on MS-Windows.
Solution:   Don't try using an illegal file name.
Files:      src/testdir/test_normal.vim

Patch 8.0.0065 (after 8.0.0056)
Problem:    Compiler warning for unused function in tiny build. (Tony
            Mechelynck)
Solution:   Add #ifdef.
Files:      src/option.c

Patch 8.0.0066
Problem:    when calling an operator function when 'linebreak' is set, it is
            internally reset before calling the operator function.
Solution:   Restore 'linebreak' before calling op_function(). (Christian
            Brabandt)
Files:      src/normal.c, src/testdir/test_normal.vim

Patch 8.0.0067
Problem:    VMS has a problem with infinity.
Solution:   Avoid an overflow. (Zoltan Arpadffy)
Files:      src/json.c, src/macros.h

Patch 8.0.0068
Problem:    Checking did_throw after executing autocommands is wrong. (Daniel
            Hahler)
Solution:   Call aborting() instead, and only when autocommands were executed.
Files:      src/quickfix.c, src/if_cscope.c, src/testdir/test_quickfix.vim

Patch 8.0.0069
Problem:    Compiler warning for self-comparison.
Solution:   Define ONE_WINDOW and add #ifdef.
Files:      src/globals.h, src/buffer.c, src/ex_docmd.c, src/move.c,
            src/screen.c, src/quickfix.c, src/window.c

Patch 8.0.0070
Problem:    Tests referred in Makefile that no longer exist.
Solution:   Remove test71 and test74 entries. (Michael Soyka)
Files:      src/testdir/Mak_ming.mak

Patch 8.0.0071
```

```
Problem:    Exit value from a shell command is wrong. (Hexchain Tong)
Solution:   Do not check for ended jobs while waiting for a shell command.
            (ichizok, closes #1196)
Files:      src/os_unix.c

Patch 8.0.0072
Problem:    MS-Windows: Crash with long font name. (Henry Hu)
Solution:   Fix comparing with LF_FACESIZE. (Ken Takata, closes #1243)
Files:      src/os_mswin.c

Patch 8.0.0073 (after 8.0.0069)
Problem:    More comparisons between firstwin and lastwin.
Solution:   Use ONE_WINDOW for consistency. (Hirohito Higashi)
Files:      src/buffer.c, src/ex_cmds.c, src/ex_docmd.c, src/option.c,
            src/window.c

Patch 8.0.0074
Problem:    Cannot make Vim fail on an internal error.
Solution:   Add IEMSG() and IEMSG2(). (Dominique Pelle)  Avoid reporting an
            internal error without mentioning where.
Files:      src/globals.h, src/blowfish.c, src/dict.c, src/edit.c, src/eval.c,
            src/evalfunc.c, src/ex_eval.c, src/getchar.c, src/gui_beval.c,
            src/gui_w32.c, src/hangulin.c, src/hashtab.c, src/if_cscope.c,
            src/json.c, src/memfile.c, src/memline.c, src/message.c,
            src/misc2.c, src/option.c, src/quickfix.c, src/regexp.c,
            src/spell.c, src/undo.c, src/userfunc.c, src/vim.h, src/window.c,
            src/proto/misc2.pro, src/proto/message.pro, src/Makefile

Patch 8.0.0075
Problem:    Using number for exception type lacks type checking.
Solution:   Use an enum.
Files:      src/structs.h, src/ex_docmd.c, src/ex_eval.c,
            src/proto/ex_eval.pro

Patch 8.0.0076
Problem:    Channel log has double parens ()().
Solution:   Remove () for write_buf_line. (Yasuhiro Matsumoto)
Files:      src/channel.c

Patch 8.0.0077
Problem:    The GUI code is not tested by Travis.
Solution:   Install the virtual framebuffer.
Files:      .travis.yml

Patch 8.0.0078
Problem:    Accessing freed memory in quickfix.
Solution:   Reset pointer when freeing 'errorformat'. (Dominique Pelle)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.0079
Problem:    Accessing freed memory in quickfix. (Dominique Pelle)
Solution:   Do not free the current list when adding to it.
Files:      src/quickfix.c, src/testdir/test_quickfix.vim
```

```
Patch 8.0.0080
Problem:    The OS X build fails on Travis.
Solution:   Skip the virtual framebuffer on OS X.
Files:      .travis.yml

Patch 8.0.0081
Problem:    Inconsistent function names.
Solution:   Rename do_cscope to ex_cscope.  Clean up comments.
Files:      src/ex_cmds.h, src/if_cscope.c, src/ex_docmd.c,
            src/proto/if_cscope.pro

Patch 8.0.0082
Problem:    Extension for configure should be ".ac".
Solution:   Rename configure.in to configure.ac. (James McCoy, closes #1173)
Files:      src/configure.in, src/configure.ac, Filelist, src/Makefile,
            src/blowfish.c, src/channel.c, src/config.h.in, src/main.aap,
            src/os_unix.c, src/INSTALL, src/mysign

Patch 8.0.0083
Problem:    Using freed memory with win_getid(). (Dominique Pelle)
Solution:   For the current tab use curwin.
Files:      src/window.c, src/testdir/test_window_id.vim

Patch 8.0.0084
Problem:    Using freed memory when adding to a quickfix list. (Dominique
            Pelle)
Solution:   Clear the directory name.
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.0085
Problem:    Using freed memory with recursive function call. (Dominique Pelle)
Solution:   Make a copy of the function name.
Files:      src/eval.c, src/testdir/test_nested_function.vim

Patch 8.0.0086
Problem:    Cannot add a comment after ":hide". (Norio Takagi)
Solution:   Make it work, add a test. (Hirohito Higashi)
Files:      src/Makefile, src/ex_cmds.h, src/ex_docmd.c,
            src/testdir/Make_all.mak, src/testdir/test_hide.vim

Patch 8.0.0087
Problem:    When the channel callback gets job info the job may already have
            been deleted. (lifepillar)
Solution:   Do not delete the job when the channel is still useful. (ichizok,
            closes #1242, closes #1245)
Files:      src/channel.c, src/eval.c, src/os_unix.c, src/os_win32.c,
            src/structs.h, src/testdir/test_channel.vim

Patch 8.0.0088
Problem:    When a test fails in Setup or Teardown the problem is not reported.
Solution:   Add a try/catch. (Hirohito Higashi)
Files:      src/testdir/runtest.vim

Patch 8.0.0089
```

```
Problem:    Various problems with GTK 3.22.2.
Solution:   Fix the problems, add #ifdefs. (Kazunobu Kuriyama)
Files:      src/gui_beval.c, src/gui_gtk.c, src/gui_gtk_x11.c

Patch 8.0.0090
Problem:    Cursor moved after last character when using 'breakindent'.
Solution:   Fix the cursor positioning.  Turn the breakindent test into new
            style.  (Christian Brabandt)
Files:      src/screen.c, src/testdir/Make_all.mak,
            src/testdir/test_breakindent.in, src/testdir/test_breakindent.ok,
            src/testdir/test_breakindent.vim, src/Makefile

Patch 8.0.0091
Problem:    Test_help_complete sometimes fails in MS-Windows console.
Solution:   Use getcompletion() instead of feedkeys() and command line
            completion. (Hirohito Higashi)
Files:      src/testdir/test_help_tagjump.vim

Patch 8.0.0092
Problem:    C indenting does not support nested namespaces that C++ 17 has.
Solution:   Add check that passes double colon inside a name. (Pauli, closes
            #1214)
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 8.0.0093
Problem:    Not using multiprocess build feature.
Solution:   Enable multiprocess build with MSVC 10. (Ken Takata)
Files:      src/Make_mvc.mak

Patch 8.0.0094
Problem:    When vimrun.exe is not found the error message is not properly
            encoded.
Solution:   Use utf-16 and MessageBoxW(). (Ken Takata)
Files:      src/os_win32.c

Patch 8.0.0095
Problem:    Problems with GTK 3.22.2 fixed in 3.22.4.
Solution:   Adjust the #ifdefs. (Kazunobu Kuriyama)
Files:      src/gui_gtk_x11.c

Patch 8.0.0096
Problem:    When the input or output is not a tty Vim appears to hang.
Solution:   Add the --ttyfail argument.  Also add the "ttyin" and "ttyout"
            features to be able to check in Vim script.
Files:      src/globals.h, src/structs.h, src/main.c, src/evalfunc.c,
            runtime/doc/starting.txt, runtime/doc/eval.txt

Patch 8.0.0097
Problem:    When a channel callback consumes a lot of time Vim becomes
            unresponsive. (skywind)
Solution:   Bail out of checking channel readahead after 100 msec.
Files:      src/os_unix.c, src/misc2.c, src/vim.h, src/os_win32.c,
            src/channel.c
```

```
Patch 8.0.0098 (after 8.0.0097)
Problem:    Can't build on MS-Windows.
Solution:   Add missing parenthesis.
Files:      src/vim.h

Patch 8.0.0099
Problem:    Popup menu always appears above the cursor when it is in the lower
            half of the screen. (Matt Gardner)
Solution:   Compute the available space better. (Hirohito Higashi,
            closes #1241)
Files:      src/popupmnu.c

Patch 8.0.0100
Problem:    Options that are a file name may contain non-filename characters.
Solution:   Check for more invalid characters.
Files:      src/option.c

Patch 8.0.0101
Problem:    Some options are not strictly checked.
Solution:   Add flags for stricter checks.
Files:      src/option.c

Patch 8.0.0102 (after 8.0.0101)
Problem:    Cannot set 'dictionary' to a path.
Solution:   Allow for slash and backslash.  Add a test (partly by Daisuke
            Suzuki, closes #1279, closes #1284)
Files:      src/option.c, src/testdir/test_options.vim

Patch 8.0.0103
Problem:    May not process channel readahead. (skywind)
Solution:   If there is readahead don't block on input.
Files:      src/channel.c, src/proto/channel.pro, src/os_unix.c,
            src/os_win32.c, src/misc2.c

Patch 8.0.0104
Problem:    Value of 'thesaurus' option not checked properly.
Solution:   Add P_NDNAME flag. (Daisuke Suzuki)
Files:      src/option.c, src/testdir/test_options.vim

Patch 8.0.0105
Problem:    When using ch_read() with zero timeout, can't tell the difference
            between reading an empty line and nothing available.
Solution:   Add ch_canread().
Files:      src/evalfunc.c, src/channel.c, src/proto/channel.pro,
            src/testdir/test_channel.vim, src/testdir/shared.vim,
            runtime/doc/eval.txt, runtime/doc/channel.txt

Patch 8.0.0106 (after 8.0.0100)
Problem:    Cannot use a semicolon in 'backupext'. (Jeff)
Solution:   Allow for a few more characters when "secure" isn't set.
Files:      src/option.c

Patch 8.0.0107
Problem:    When reading channel output in a timer, messages may go missing.
```

```
            (Skywind)
Solution:   Add the "drop" option.  Write error messages in the channel log.
            Don't have ch_canread() check for the channel being open.
Files:      src/structs.h, src/channel.c, src/message.c, src/evalfunc.c,
            src/proto/channel.pro, runtime/doc/channel.txt

Patch 8.0.0108 (after 8.0.0107)
Problem:    The channel "drop" option is not tested.
Solution:   Add a test.
Files:      src/testdir/test_channel.vim

Patch 8.0.0109
Problem:    Still checking if memcmp() exists while every system should have
            it now.
Solution:   Remove vim_memcmp().  (James McCoy, closes #1295)
Files:      src/config.h.in, src/configure.ac, src/misc2.c, src/os_vms_conf.h,
            src/osdef1.h.in, src/search.c, src/tag.c, src/vim.h

Patch 8.0.0110
Problem:    Drop command doesn't use existing window.
Solution:   Check the window width properly. (Hirohito Higashi)
Files:      src/buffer.c, src/testdir/test_tabpage.vim

Patch 8.0.0111
Problem:    The :history command is not tested.
Solution:   Add tests. (Dominique Pelle)
Files:      runtime/doc/cmdline.txt, src/testdir/test_history.vim

Patch 8.0.0112
Problem:    Tests 92 and 93 are old style.
Solution:   Make test92 and test93 new style. (Hirohito Higashi, closes #1289)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/Make_vms.mms,
            src/testdir/test92.in, src/testdir/test92.ok,
            src/testdir/test93.in, src/testdir/test93.ok,
            src/testdir/test_mksession.vim,
            src/testdir/test_mksession_utf8.vim

Patch 8.0.0113
Problem:    MS-Windows: message box to prompt for saving changes may appear on
            the wrong monitor.
Solution:   Adjust the CenterWindow function. (Ken Takata)
Files:      src/gui_w32.c

Patch 8.0.0114
Problem:    Coding style not optimal.
Solution:   Add spaces. (Ken Takata)
Files:      src/gui_w32.c, src/os_mswin.c

Patch 8.0.0115
Problem:    When building with Cygwin libwinpthread isn't found.
Solution:   Link winpthread statically. (jmmerz, closes #1255, closes #1256)
Files:      src/Make_cyg_ming.mak

Patch 8.0.0116
```

```
Problem:    When reading English help and using CTRl-] the language from
            'helplang' is used.
Solution:   Make help tag jumps keep the language. (Tatsuki, test by Hirohito
            Higashi, closes #1249)
Files:      src/tag.c, src/testdir/test_help_tagjump.vim

Patch 8.0.0117
Problem:    Parallel make fails. (J. Lewis Muir)
Solution:   Make sure the objects directory exists. (closes #1259)
Files:      src/Makefile

Patch 8.0.0118
Problem:    "make proto" adds extra function prototype.
Solution:   Add #ifdef.
Files:      src/misc2.c

Patch 8.0.0119
Problem:    No test for using CTRL-R on the command line.
Solution:   Add a test. (Dominique Pelle) And some more.
Files:      src/testdir/test_cmdline.vim

Patch 8.0.0120
Problem:    Channel test is still flaky on OS X.
Solution:   Set the drop argument to "never".
Files:      src/testdir/test_channel.vim

Patch 8.0.0121
Problem:    Setting 'cursorline' changes the curswant column. (Daniel Hahler)
Solution:   Add the P_RWINONLY flag. (closes #1297)
Files:      src/option.c, src/testdir/test_goto.vim

Patch 8.0.0122
Problem:    Channel test is still flaky on OS X.
Solution:   Add a short sleep.
Files:      src/testdir/test_channel.py

Patch 8.0.0123
Problem:    Modern Sun compilers define "__sun" instead of "sun".
Solution:   Use __sun. (closes #1296)
Files:      src/mbyte.c, src/pty.c, src/os_unixx.h, src/vim.h

Patch 8.0.0124
Problem:    Internal error for assert_inrange(1, 1).
Solution:   Adjust number of allowed arguments. (Dominique Pelle)
Files:      src/evalfunc.c, src/testdir/test_assert.vim

Patch 8.0.0125
Problem:    Not enough testing for entering Ex commands.
Solution:   Add test for CTRL-\ e {expr}. (Dominique Pelle)
Files:      src/testdir/test_cmdline.vim

Patch 8.0.0126
Problem:    Display problem with 'foldcolumn' and a wide character.
            (esiegerman)
```

```
Solution:   Don't use "extra" but an allocated buffer. (Christian Brabandt,
            closes #1310)
Files:      src/screen.c, src/testdir/Make_all.mak, src/Makefile,
            src/testdir/test_display.vim

Patch 8.0.0127
Problem:    Cancelling completion still inserts text when formatting is done
            for 'textwidth'. (lacygoill)
Solution:   Don't format when CTRL-E was typed. (Hirohito Higashi,
            closes #1312)
Files:      src/edit.c, src/testdir/test_popup.vim

Patch 8.0.0128 (after 8.0.0126)
Problem:    Display test fails on MS-Windows.
Solution:   Set 'isprint' to "@".
Files:      src/testdir/test_display.vim

Patch 8.0.0129
Problem:    Parallel make still doesn't work. (Lewis Muir)
Solution:   Define OBJ_MAIN.
Files:      src/Makefile

Patch 8.0.0130
Problem:    Configure uses "ushort" while the Vim code doesn't.
Solution:   Use "unsigned short" instead. (Fredrik Fornwall, closes #1314)
Files:      src/configure.ac, src/auto/configure

Patch 8.0.0131
Problem:    Not enough test coverage for syntax commands.
Solution:   Add more tests. (Dominique Pelle)
Files:      src/testdir/test_syntax.vim

Patch 8.0.0132 (after 8.0.0131)
Problem:    Test fails because of using :finish.
Solution:   Change to return.
Files:      src/testdir/test_syntax.vim

Patch 8.0.0133
Problem:    "2;'(" causes ml_get errors in an empty buffer.  (Dominique Pelle)
Solution:   Check the cursor line earlier.
Files:      src/ex_docmd.c, src/testdir/test_cmdline.vim

Patch 8.0.0134
Problem:    Null pointer access reported by UBsan.
Solution:   Check curwin->w_buffer is not NULL. (Yegappan Lakshmanan)
Files:      src/ex_cmds.c

Patch 8.0.0135
Problem:    An address relative to the current line, ":.,+3y", does not work
            properly on a closed fold. (Efraim Yawitz)
Solution:   Correct for including the closed fold. (Christian Brabandt)
Files:      src/ex_docmd.c, src/testdir/test_fold.vim,
            src/testdir/Make_all.mak, src/Makefile
```

Patch 8.0.0136
Problem: When using indent folding and changing indent the wrong fold is
            opened. (Jonathan Fudger)
Solution: Open the fold under the cursor a bit later. (Christian Brabandt)
Files: src/ops.c, src/testdir/test_fold.vim

Patch 8.0.0137
Problem: When 'maxfuncdepth' is set above 200 the nesting is limited to
            200. (Brett Stahlman)
Solution: Allow for Ex command recursion depending on 'maxfuncdepth'.
Files: src/ex_docmd.c, src/testdir/test_nested_function.vim

Patch 8.0.0138 (after 8.0.0137)
Problem: Small build fails.
Solution: Add #ifdef.
Files: src/ex_docmd.c

Patch 8.0.0139 (after 8.0.0135)
Problem: Warning for unused argument.
Solution: Add UNUSED.
Files: src/ex_docmd.c

Patch 8.0.0140
Problem: Pasting inserted text in Visual mode does not work properly.
            (Matthew Malcomson)
Solution: Stop Visual mode before stuffing the inserted text. (Christian
            Brabandt, from neovim #5709)
Files: src/ops.c, src/testdir/test_visual.vim

Patch 8.0.0141 (after 8.0.0137)
Problem: Nested function test fails on AppVeyor.
Solution: Disable the test on Windows for now.
Files: src/testdir/test_nested_function.vim

Patch 8.0.0142
Problem: Normal colors are wrong with 'termguicolors'.
Solution: Initialize to INVALCOLOR instead of zero. (Ben Jackson, closes
            #1344)
Files: src/syntax.c

Patch 8.0.0143
Problem: Line number of current buffer in getbufinfo() is wrong.
Solution: For the current buffer use the current line number. (Ken Takata)
Files: src/evalfunc.c

Patch 8.0.0144
Problem: When using MSVC the GvimExt directory is cleaned twice.
Solution: Remove the lines. (Ken Takata)
Files: src/Make_mvc.mak

Patch 8.0.0145
Problem: Running tests on MS-Windows is a little bit noisy.
Solution: Redirect some output to "nul". (Ken Takata)
Files: src/testdir/Make_dos.mak

```
Patch 8.0.0146
Problem:    When using 'termguicolors' on MS-Windows the RGB definition causes
            the colors to be wrong.
Solution:   Undefined RGB and use our own. (Gabriel Barta)
Files:      src/term.c

Patch 8.0.0147
Problem:    searchpair() does not work when 'magic' is off. (Chris Paul)
Solution:   Add \m in the pattern. (Christian Brabandt, closes #1341)
Files:      src/evalfunc.c, src/testdir/test_search.vim

Patch 8.0.0148
Problem:    When a C preprocessor statement has two line continuations the
            following line does not have the right indent. (Ken Takata)
Solution:   Add the indent of the previous continuation line. (Hirohito
            Higashi)
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 8.0.0149
Problem:    ":earlier" and ":later" do not work after startup or reading the
            undo file.
Solution:   Use absolute time stamps instead of relative to the Vim start
            time. (Christian Brabandt, Pavel Juhas, closes #1300, closes
            #1254)
Files:      src/testdir/test_undo.vim, src/undo.c

Patch 8.0.0150
Problem:    When the pattern of :filter does not have a separator then
            completion of the command fails.
Solution:   Skip over the pattern. (Ozaki Kiichi, closes #1299)
Files:      src/ex_docmd.c, src/testdir/test_filter_cmd.vim

Patch 8.0.0151
Problem:    To pass buffer content to system() and systemlist() one has to
            first create a string or list.
Solution:   Allow passing a buffer number. (LemonBoy, closes #1240)
Files:      runtime/doc/eval.txt, src/Makefile, src/evalfunc.c,
            src/testdir/Make_all.mak, src/testdir/test_system.vim

Patch 8.0.0152
Problem:    Running the channel test creates channellog.
Solution:   Delete the debug line.
Files:      src/testdir/test_channel.vim

Patch 8.0.0153 (after 8.0.0151)
Problem:    system() test fails on MS-Windows.
Solution:   Deal with extra space and CR.
Files:      src/testdir/test_system.vim

Patch 8.0.0154 (after 8.0.0151)
Problem:    system() test fails on OS/X.
Solution:   Deal with leading spaces.
Files:      src/testdir/test_system.vim
```

```
Patch 8.0.0155
Problem:    When sorting zero elements a NULL pointer is passed to qsort(),
            which ubsan warns for.
Solution:   Don't call qsort() if there are no elements. (Dominique Pelle)
Files:      src/syntax.c

Patch 8.0.0156
Problem:    Several float functions are not covered by tests.
Solution:   Add float tests. (Dominique Pelle)
Files:      src/Makefile, src/testdir/test_alot.vim,
            src/testdir/test_float_func.vim

Patch 8.0.0157
Problem:    No command line completion for ":syntax spell" and ":syntax sync".
Solution:   Implement the completion. (Dominique Pelle)
Files:      src/syntax.c, src/testdir/test_syntax.vim

Patch 8.0.0158 (after 8.0.0156)
Problem:    On MS-Windows some float functions return a different value when
            passed unusual values.  strtod() doesn't work for "inf" and "nan".
Solution:   Accept both results.  Fix str2float() for MS-Windows.  Also
            reorder assert function arguments.
Files:      src/testdir/test_float_func.vim, src/eval.c

Patch 8.0.0159
Problem:    Using a NULL pointer when using feedkeys() to trigger drawing a
            tabline.
Solution:   Skip drawing a tabline if TabPageIdxs is NULL. (Dominique Pelle)
            Also fix recursing into getcmdline() from the cmd window.
Files:      src/screen.c, src/ex_getln.c

Patch 8.0.0160
Problem:    EMSG() is sometimes used for internal errors.
Solution:   Change them to IEMSG(). (Dominique Pelle)  And a few more.
Files:      src/regexp_nfa.c, src/channel.c, src/eval.c

Patch 8.0.0161 (after 8.0.0159)
Problem:    Build fails when using small features.
Solution:   Update #ifdef for using save_ccline. (Hirohito Higashi)
Files:      src/ex_getln.c

Patch 8.0.0162
Problem:    Build error on Fedora 23 with small features and gnome2.
Solution:   Undefine ngettext(). (Hirohito Higashi)
Files:      src/gui_gtk.c, src/gui_gtk_x11.c

Patch 8.0.0163
Problem:    Ruby 2.4 no longer supports rb_cFixnum.
Solution:   move rb_cFixnum into an #ifdef. (Kazuki Sakamoto, closes #1365)
Files:      src/if_ruby.c

Patch 8.0.0164
Problem:    Outdated and misplaced comments.
```

```
Solution:   Fix the comments.
Files:      src/charset.c, src/getchar.c, src/list.c, src/misc2.c,
            src/testdir/README.txt

Patch 8.0.0165
Problem:    Ubsan warns for integer overflow.
Solution:   Swap two conditions. (Dominique Pelle)
Files:      src/regexp_nfa.c

Patch 8.0.0166
Problem:    JSON with a duplicate key gives an internal error. (Lcd)
Solution:   Give a normal error.  Avoid an error when parsing JSON from a
            remote client fails.
Files:      src/evalfunc.c, src/json.c, src/channel.c,
            src/testdir/test_json.vim

Patch 8.0.0167
Problem:    str2nr() and str2float() do not always work with negative values.
Solution:   Be more flexible about handling signs. (LemonBoy, closes #1332)
            Add more tests.
Files:      src/evalfunc.c, src/testdir/test_float_func.vim,
            src/testdir/test_functions.vim, src/testdir/test_alot.vim,
            src/Makefile

Patch 8.0.0168
Problem:    Still some float functionality is not covered by tests.
Solution:   Add more tests. (Dominique Pelle, closes #1364)
Files:      src/testdir/test_float_func.vim

Patch 8.0.0169
Problem:    For complicated string json_decode() may run out of stack space.
Solution:   Change the recursive solution into an iterative solution.
Files:      src/json.c

Patch 8.0.0170 (after 8.0.0169)
Problem:    Channel test fails for using freed memory.
Solution:   Fix memory use in json_decode().
Files:      src/json.c

Patch 8.0.0171
Problem:    JS style JSON does not support single quotes.
Solution:   Allow for single quotes. (Yasuhiro Matsumoto, closes #1371)
Files:      src/json.c, src/testdir/test_json.vim, src/json_test.c,
            runtime/doc/eval.txt

Patch 8.0.0172 (after 8.0.0159)
Problem:    The command selected in the command line window is not executed.
            (Andrey Starodubtsev)
Solution:   Save and restore the command line at a lower level. (closes #1370)
Files:      src/ex_getln.c, src/testdir/test_history.vim

Patch 8.0.0173
Problem:    When compiling with EBCDIC defined the build fails. (Yaroslav
            Kuzmin)
```

```
Solution:   Move sortFunctions() to the right file.  Avoid warning for
            redefining __SUSV3.
Files:      src/eval.c, src/evalfunc.c, src/os_unixx.h

Patch 8.0.0174
Problem:    For completion "locale -a" is executed on MS-Windows, even though
            it most likely won't work.
Solution:   Skip executing "locale -a" on MS-Windows. (Ken Takata)
Files:      src/ex_cmds2.c

Patch 8.0.0175
Problem:    Setting language in gvim on MS-Windows does not work when
            libintl.dll is dynamically linked with msvcrt.dll.
Solution:   Use putenv() from libintl as well. (Ken Takata, closes #1082)
Files:      src/mbyte.c, src/misc1.c, src/os_win32.c, src/proto/os_win32.pro,
            src/vim.h

Patch 8.0.0176
Problem:    Using :change in between :function and :endfunction fails.
Solution:   Recognize :change inside a function. (ichizok, closes #1374)
Files:      src/userfunc.c, src/testdir/test_viml.vim

Patch 8.0.0177
Problem:    When opening a buffer on a directory and inside a try/catch then
            the BufEnter event is not triggered.
Solution:   Return NOTDONE from readfile() for a directory and deal with the
            three possible return values. (Justin M. Keyes, closes #1375,
            closes #1353)
Files:      src/buffer.c, src/ex_cmds.c, src/ex_docmd.c, src/fileio.c,
            src/memline.c

Patch 8.0.0178
Problem:    test_command_count may fail when a previous test interferes, seen
            on MS-Windows.
Solution:   Run it separately.
Files:      src/testdir/test_alot.vim, src/testdir/Make_all.mak

Patch 8.0.0179
Problem:    'formatprg' is a global option but the value may depend on the
            type of buffer. (Sung Pae)
Solution:   Make 'formatprg' global-local. (closes #1380)
Files:      src/structs.h, src/option.h, src/option.c, src/normal.c,
            runtime/doc/options.txt, src/testdir/test_normal.vim

Patch 8.0.0180
Problem:    Error E937 is used both for duplicate key in JSON and for trying
            to delete a buffer that is in use.
Solution:   Rename the JSON error to E938. (Norio Takagi, closes #1376)
Files:      src/json.c, src/testdir/test_json.vim

Patch 8.0.0181
Problem:    When 'cursorbind' and 'cursorcolumn' are both on, the column
            highlight in non-current windows is wrong.
Solution:   Add validate_cursor(). (Masanori Misono, closes #1372)
```

```
Files:      src/move.c

Patch 8.0.0182
Problem:    When 'cursorbind' and 'cursorline' are set, but 'cursorcolumn' is
            not, then the cursor line highlighting is not updated. (Hirohito
            Higashi)
Solution:   Call redraw_later() with NOT_VALID.
Files:      src/move.c

Patch 8.0.0183
Problem:    Ubsan warns for using a pointer that is not aligned.
Solution:   First copy the address. (Yegappan Lakshmanan)
Files:      src/channel.c

Patch 8.0.0184
Problem:    When in Ex mode and an error is caught by try-catch, Vim still
            exits with a non-zero exit code.
Solution:   Don't set ex_exitval when inside a try-catch. (partly by Christian
            Brabandt)
Files:      src/message.c, src/testdir/test_system.vim

Patch 8.0.0185 (after 8.0.0184)
Problem:    The system() test fails on MS-Windows.
Solution:   Skip the test on MS-Windows.
Files:      src/testdir/test_system.vim

Patch 8.0.0186
Problem:    The error message from assert_notequal() is confusing.
Solution:   Only mention the expected value.
Files:      src/eval.c, src/testdir/test_assert.vim

Patch 8.0.0187
Problem:    Building with a new Ruby version fails.
Solution:   Use ruby_sysinit() instead of NtInitialize(). (Tomas Volf,
            closes #1382)
Files:      src/if_ruby.c

Patch 8.0.0188 (after 8.0.0182)
Problem:    Using NOT_VALID for redraw_later() to update the cursor
            line/column highlighting is not efficient.
Solution:   Call validate_cursor() when 'cul' or 'cuc' is set.
Files:      src/move.c

Patch 8.0.0189
Problem:    There are no tests for the :profile command.
Solution:   Add tests. (Dominique Pelle, closes #1383)
Files:      src/Makefile, src/testdir/Make_all.mak,
            src/testdir/test_profile.vim

Patch 8.0.0190
Problem:    Detecting duplicate tags uses a slow linear search.
Solution:   Use a much faster hash table solution. (James McCoy, closes #1046)
            But don't add hi_keylen, it makes hash tables 50% bigger.
Files:      src/tag.c
```

```
Patch 8.0.0191 (after 8.0.0187)
Problem:    Some systems do not have ruby_sysinit(), causing the build to
            fail.
Solution:   Clean up how ruby_sysinit() and NtInitialize() are used. (Taro
            Muraoka)
Files:      src/if_ruby.c

Patch 8.0.0192 (after 8.0.0190)
Problem:    Build fails with tiny features.
Solution:   Change #ifdef for hash_clear().  Avoid warning for unused
            argument.
Files:      src/hashtab.c, src/if_cscope.c

Patch 8.0.0193 (after 8.0.0188)
Problem:    Accidentally removed #ifdef.
Solution:   Put it back. (Masanori Misono)
Files:      src/move.c

Patch 8.0.0194 (after 8.0.0189)
Problem:    Profile tests fails if total and self time are equal.
Solution:   Make one time optional.
Files:      src/testdir/test_profile.vim

Patch 8.0.0195 (after 8.0.0190)
Problem:    Jumping to a tag that is a static item in the current file fails.
            (Kazunobu Kuriyama)
Solution:   Make sure the first byte of the tag key is not NUL. (Suggested by
            James McCoy, closes #1387)
Files:      src/tag.c, src/testdir/test_tagjump.vim

Patch 8.0.0196 (after 8.0.0194)
Problem:    The test for :profile is slow and does not work on MS-Windows.
Solution:   Use the "-es" argument. (Dominique Pelle)  Swap single and double
            quotes for system()
Files:      src/testdir/test_profile.vim

Patch 8.0.0197
Problem:    On MS-Windows the system() test skips a few parts.
Solution:   Swap single and double quotes for the command.
Files:      src/testdir/test_system.vim

Patch 8.0.0198
Problem:    Some syntax arguments take effect even after "if 0". (Taylor
            Venable)
Solution:   Properly skip the syntax statements.  Make "syn case" and "syn
            conceal" report the current state.  Fix that "syn clear" didn't
            reset the conceal flag.  Add tests for :syntax skipping properly.
Files:      src/syntax.c, src/testdir/test_syntax.vim

Patch 8.0.0199
Problem:    Warning for an unused parameter when the libcall feature is
            disabled.  Warning for a function type cast when compiling with
            -pedantic.
```

```
Solution:   Add UNUSED.  Use a different type cast. (Damien Molinier)
Files:      src/evalfunc.c, src/os_unix.c

Patch 8.0.0200
Problem:    Some syntax arguments are not tested.
Solution:   Add more syntax command tests.
Files:      src/testdir/test_syntax.vim

Patch 8.0.0201
Problem:    When completing a group name for a highlight or syntax command
            cleared groups are included.
Solution:   Skip groups that have been cleared.
Files:      src/syntax.c, src/testdir/test_syntax.vim

Patch 8.0.0202
Problem:    No test for invalid syntax group name.
Solution:   Add a test for group name error and warning.
Files:      src/testdir/test_syntax.vim

Patch 8.0.0203
Problem:    Order of complication flags is sometimes wrong.
Solution:   Put interface-specific flags before ALL_CFLAGS. (idea by Yousong
            Zhou, closes #1100)
Files:      src/Makefile

Patch 8.0.0204
Problem:    Compiler warns for uninitialized variable. (Tony Mechelynck)
Solution:   When skipping set "id" to -1.
Files:      src/syntax.c

Patch 8.0.0205
Problem:    After :undojoin some commands don't work properly, such as :redo.
            (Matthew Malcomson)
Solution:   Don't set curbuf->b_u_curhead. (closes #1390)
Files:      src/undo.c, src/testdir/test_undo.vim

Patch 8.0.0206
Problem:    Test coverage for :retab insufficient.
Solution:   Add test for :retab. (Dominique Pelle, closes #1391)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/test_retab.vim

Patch 8.0.0207
Problem:    Leaking file descriptor when system() cannot find the buffer.
            (Coverity)
Solution:   Close the file descriptor.  (Dominique Pelle, closes #1398)
Files:      src/evalfunc.c

Patch 8.0.0208
Problem:    Internally used commands for CTRL-Z and mouse click end up in
            history. (Matthew Malcomson)
Solution:   Use do_cmdline_cmd() instead of stuffing them in the readahead
            buffer. (James McCoy, closes #1395)
Files:      src/edit.c, src/normal.c
```

```
Patch 8.0.0209
Problem:    When using :substitute with the "c" flag and 'cursorbind' is set
            the cursor is not updated in other windows.
Solution:   Call do_check_cursorbind(). (Masanori Misono)
Files:      src/ex_cmds.c

Patch 8.0.0210
Problem:    Vim does not support bracketed paste, as implemented by xterm and
            other terminals.
Solution:   Add t_BE, t_BD, t_PS and t_PE.
Files:      src/term.c, src/term.h, src/option.c, src/misc2.c, src/keymap.h,
            src/edit.c, src/normal.c, src/evalfunc.c, src/getchar.c,
            src/vim.h, src/proto/edit.pro, runtime/doc/term.txt

Patch 8.0.0211 (after 8.0.0210)
Problem:    Build fails if the multi-byte feature is disabled.
Solution:   Change #ifdef around ins_char_bytes.
Files:      src/misc1.c

Patch 8.0.0212
Problem:    The buffer used to store a key name theoretically could be too
            small. (Coverity)
Solution:   Count all possible modifier characters.  Add a check for the
            length just in case.
Files:      src/keymap.h, src/misc2.c

Patch 8.0.0213
Problem:    The Netbeans "specialKeys" command does not check if the argument
            fits in the buffer. (Coverity)
Solution:   Add a length check.
Files:      src/netbeans.c

Patch 8.0.0214
Problem:    Leaking memory when syntax cluster id is unknown. (Coverity)
Solution:   Free the memory.
Files:      src/syntax.c

Patch 8.0.0215
Problem:    When a Cscope line contains CTRL-L a NULL pointer may be used.
            (Coverity)
Solution:   Don't check for an emacs tag in a cscope line.
Files:      src/tag.c

Patch 8.0.0216
Problem:    When decoding JSON with a JS style object the JSON test may use a
            NULL pointer. (Coverity)
Solution:   Check for a NULL pointer.
Files:      src/json.c, src/json_test.c

Patch 8.0.0217 (after 8.0.0215)
Problem:    Build fails without the cscope feature.
Solution:   Add #ifdef.
Files:      src/tag.c
```

```
Patch 8.0.0218
Problem:    No command line completion for :cexpr, :cgetexpr, :caddexpr, etc.
Solution:   Make completion work. (Yegappan Lakshmanan)  Add a test.
Files:      src/ex_docmd.c, src/testdir/test_cmdline.vim

Patch 8.0.0219
Problem:    Ubsan reports errors for integer overflow.
Solution:   Define macros for minimum and maximum values.  Select an
            expression based on the value. (Mike Williams)
Files:      src/charset.c, src/eval.c, src/evalfunc.c, src/structs.h,
            src/testdir/test_viml.vim

Patch 8.0.0220
Problem:    Completion for :match does not show "none" and other missing
            highlight names.
Solution:   Skip over cleared entries before checking the index to be at the
            end.
Files:      src/syntax.c, src/testdir/test_cmdline.vim

Patch 8.0.0221
Problem:    Checking if PROTO is defined inside a function has no effect.
Solution:   Remove the check for PROTO. (Hirohito Higashi)
Files:      src/misc1.c

Patch 8.0.0222
Problem:    When a multi-byte character ends in a zero byte, putting blockwise
            text puts it before the character instead of after it.
Solution:   Use int instead of char for the character under the cursor.
            (Luchr, closes #1403)  Add a test.
Files:      src/ops.c, src/testdir/test_put.vim, src/Makefile,
            src/testdir/test_alot.vim

Patch 8.0.0223
Problem:    Coverity gets confused by the flags passed to find_tags() and
            warns about uninitialized variable.
Solution:   Disallow using cscope and help tags at the same time.
Files:      src/tag.c

Patch 8.0.0224
Problem:    When 'fileformats' is changed in a BufReadPre auto command, it
            does not take effect in readfile(). (Gary Johnson)
Solution:   Check the value of 'fileformats' after executing auto commands.
            (Christian Brabandt)
Files:      src/fileio.c, src/testdir/test_fileformat.vim

Patch 8.0.0225
Problem:    When a block is visually selected and put is used on the end of
            the selection only one line is changed.
Solution:   Check for the end properly. (Christian Brabandt, neovim issue
            5781)
Files:      src/ops.c, src/testdir/test_put.vim

Patch 8.0.0226
Problem:    The test for patch 8.0.0224 misses the CR characters and passes
```

```
            even without the fix. (Christian Brabandt)
Solution:   Use double quotes and \<CR>.
Files:      src/testdir/test_fileformat.vim

Patch 8.0.0227
Problem:    Crash when 'fileformat' is forced to "dos" and the first line in
            the file is empty and does not have a CR character.
Solution:   Don't check for CR before the start of the buffer.
Files:      src/fileio.c, src/testdir/test_fileformat.vim

Patch 8.0.0228 (after 8.0.0210)
Problem:    When pasting test in an xterm on the command line it is surrounded
            by <PasteStart> and <PasteEnd>. (Johannes Kaltenbach)
Solution:   Add missing changes.
Files:      src/ex_getln.c, src/term.c

Patch 8.0.0229 (after 8.0.0179)
Problem:    When freeing a buffer the local value of the 'formatprg' option is
            not cleared.
Solution:   Add missing change.
Files:      src/buffer.c

Patch 8.0.0230 (after 8.0.0210)
Problem:    When using bracketed paste line breaks are not respected.
Solution:   Turn CR characters into a line break if the text is being
            inserted. (closes #1404)
Files:      src/edit.c

Patch 8.0.0231
Problem:    There are no tests for bracketed paste mode.
Solution:   Add a test.  Fix repeating with "normal .".
Files:      src/edit.c, src/testdir/test_paste.vim, src/Makefile,
            src/testdir/Make_all.mak

Patch 8.0.0232
Problem:    Pasting in Insert mode does not work when bracketed paste is used
            and 'esckeys' is off.
Solution:   When 'esckeys' is off disable bracketed paste in Insert mode.
Files:      src/edit.c

Patch 8.0.0233 (after 8.0.0231)
Problem:    The paste test fails if the GUI is being used.
Solution:   Skip the test in the GUI.
Files:      src/testdir/test_paste.vim

Patch 8.0.0234 (after 8.0.0225)
Problem:    When several lines are visually selected and one of them is short,
            using put may cause a crash. (Axel Bender)
Solution:   Check for a short line. (Christian Brabandt)
Files:      src/ops.c, src/testdir/test_put.vim

Patch 8.0.0235
Problem:    Memory leak detected when running tests for diff mode.
Solution:   Free p_extra_free.
```

```
Files:      src/screen.c

Patch 8.0.0236 (after 8.0.0234)
Problem:    Gcc complains that a variable may be used uninitialized. Confusion
            between variable and label name. (John Marriott)
Solution:   Initialize it.  Rename end to end_lnum.
Files:      src/ops.c

Patch 8.0.0237
Problem:    When setting wildoptions=tagfile the completion context is not set
            correctly. (desjardins)
Solution:   Check for EXPAND_TAGS_LISTFILES. (Christian Brabandt, closes #1399)
Files:      src/ex_getln.c, src/testdir/test_cmdline.vim

Patch 8.0.0238
Problem:    When using bracketed paste autoindent causes indent to be
            increased.
Solution:   Disable 'ai' and set 'paste' temporarily. (Ken Takata)
Files:      src/edit.c, src/testdir/test_paste.vim

Patch 8.0.0239
Problem:    The address sanitizer sometimes finds errors, but it needs to be
            run manually.
Solution:   Add an environment to Travis with clang and the address sanitizer.
            (Christian Brabandt)  Also include changes only on github.
Files:      .travis.yml

Patch 8.0.0240 (after 8.0.0239)
Problem:    The clang build on CI fails with one configuration.
Solution:   Redo a previous patch that was accidentally reverted.
Files:      .travis.yml

Patch 8.0.0241
Problem:    Vim defines a mch_memmove() function but it doesn't work, thus is
            always unused.
Solution:   Remove the mch_memmove implementation. (suggested by Dominique
            Pelle)
Files:      src/os_unix.h, src/misc2.c, src/vim.h

Patch 8.0.0242
Problem:    Completion of user defined functions is not covered by tests.
Solution:   Add tests.  Also test various errors of user-defined commands.
            (Dominique Pelle, closes #1413)
Files:      src/testdir/test_usercommands.vim

Patch 8.0.0243
Problem:    When making a character lower case with tolower() changes the byte
            count, it is not made lower case.
Solution:   Add strlow_save(). (Dominique Pelle, closes #1406)
Files:      src/evalfunc.c, src/misc2.c, src/proto/misc2.pro,
            src/testdir/test_functions.vim

Patch 8.0.0244
Problem:    When the user sets t_BE empty after startup to disable bracketed
```

```
            paste, this has no direct effect.
Solution:   When t_BE is made empty write t_BD.  When t_BE is made non-empty
            write the new value.
Files:      src/option.c

Patch 8.0.0245
Problem:    The generated zh_CN.cp936.po message file is not encoded properly.
Solution:   Instead of using zh_CN.po as input, use zh_CN.UTF-8.po.
Files:      src/po/Makefile

Patch 8.0.0246
Problem:    Compiler warnings for int to pointer conversion.
Solution:   Fix macro for mch_memmove(). (John Marriott)
Files:      src/vim.h

Patch 8.0.0247
Problem:    Under some circumstances, one needs to type Ctrl-N or Ctrl-P twice
            to have a menu entry selected. (Lifepillar)
Solution:   call ins_compl_free(). (Christian Brabandt, closes #1411)
Files:      src/edit.c, src/testdir/test_popup.vim

Patch 8.0.0248
Problem:    vim_strcat() cannot handle overlapping arguments.
Solution:   Use mch_memmove() instead of strcpy(). (Justin M. Keyes,
            closes #1415)
Files:      src/misc2.c

Patch 8.0.0249
Problem:    When two submits happen quick after each other, the tests for the
            first one may error out.
Solution:   Use a git depth of 10 instead of 1. (Christian Brabandt)
Files:      .travis.yml

Patch 8.0.0250
Problem:    When virtcol() gets a column that is not the first byte of a
            multi-byte character the result is unpredictable. (Christian
            Ludwig)
Solution:   Correct the column to the first byte of a multi-byte character.
            Change the utf-8 test to new style.
Files:      src/charset.c, src/testdir/test_utf8.in, src/testdir/test_utf8.ok,
            src/testdir/test_utf8.vim, src/Makefile, src/testdir/Make_all.mak,
            src/testdir/test_alot_utf8.vim

Patch 8.0.0251
Problem:    It is not so easy to write a script that works with both Python 2
            and Python 3, even when the Python code works with both.
Solution:   Add 'pyxversion', :pyx, etc. (Marc Weber, Ken Takata)
Files:      Filelist, runtime/doc/eval.txt, runtime/doc/if_pyth.txt,
            runtime/doc/index.txt, runtime/doc/options.txt,
            runtime/optwin.vim, runtime/doc/quickref.txt,
            runtime/doc/usr_41.txt, src/Makefile, src/evalfunc.c,
            src/ex_cmds.h, src/ex_cmds2.c, src/ex_docmd.c, src/if_python.c,
            src/if_python3.c, src/option.c, src/option.h,
            src/proto/ex_cmds2.pro, src/testdir/Make_all.mak,
```

```
            src/testdir/pyxfile/py2_magic.py,
            src/testdir/pyxfile/py2_shebang.py,
            src/testdir/pyxfile/py3_magic.py,
            src/testdir/pyxfile/py3_shebang.py, src/testdir/pyxfile/pyx.py,
            src/testdir/test_pyx2.vim, src/testdir/test_pyx3.vim
            src/userfunc.c

Patch 8.0.0252
Problem:    Characters below 256 that are not one byte are not always
            recognized as word characters.
Solution:   Make vim_iswordc() and vim_iswordp() work the same way. Add a test
            for this. (Ozaki Kiichi)
Files:      src/Makefile, src/charset.c, src/kword_test.c, src/mbyte.c,
            src/proto/mbyte.pro

Patch 8.0.0253
Problem:    When creating a session when 'winminheight' is 2 or larger and
            loading that session gives an error.
Solution:   Also set 'winminheight' before setting 'winheight' to 1. (Rafael
            Bodill, neovim #5717)
Files:      src/ex_docmd.c, src/testdir/test_mksession.vim

Patch 8.0.0254
Problem:    When using an assert function one can either specify a message or
            get a message about what failed, not both.
Solution:   Concatenate the error with the message.
Files:      src/eval.c, src/testdir/test_assert.vim

Patch 8.0.0255
Problem:    When calling setpos() with a buffer argument it often is ignored.
            (Matthew Malcomson)
Solution:   Make the buffer argument work for all marks local to a buffer.
            (neovim #5713)  Add more tests.
Files:      src/mark.c, src/testdir/test_marks.vim, runtime/doc/eval.txt

Patch 8.0.0256 (after 8.0.0255)
Problem:    Tests fail because some changes were not included.
Solution:   Add changes to evalfunc.c
Files:      src/evalfunc.c

Patch 8.0.0257 (after 8.0.0252)
Problem:    The keyword test file is not included in the archive.
Solution:   Update the list of files.
Files:      Filelist

Patch 8.0.0258 (after 8.0.0253)
Problem:    mksession test leaves file behind.
Solution:   Delete the file.  Rename files to start with "X".
Files:      src/testdir/test_mksession.vim

Patch 8.0.0259
Problem:    Tab commands do not handle count correctly. (Ken Hamada)
Solution:   Add ADDR_TABS_RELATIVE. (Hirohito Higashi)
Files:      runtime/doc/tabpage.txt, src/ex_cmds.h, src/ex_docmd.c,
```

```
            src/testdir/test_tabpage.vim

Patch 8.0.0260
Problem:    Build fails with tiny features.
Solution:   Move get_tabpage_arg() inside #ifdef.
Files:      src/ex_docmd.c

Patch 8.0.0261
Problem:    Not enough test coverage for eval functions.
Solution:   Add more tests. (Dominique Pelle, closes #1420)
Files:      src/testdir/test_functions.vim

Patch 8.0.0262
Problem:    Farsi support is barely tested.
Solution:   Add more tests for Farsi.  Clean up the code.
Files:      src/edit.c, src/farsi.c, src/testdir/test_farsi.vim

Patch 8.0.0263
Problem:    Farsi support is not tested enough.
Solution:   Add more tests for Farsi.  Clean up the code.
Files:      src/farsi.c, src/testdir/test_farsi.vim

Patch 8.0.0264
Problem:    Memory error reported by ubsan, probably for using the string
            returned by execute().
Solution:   NUL terminate the result of execute().
Files:      src/evalfunc.c

Patch 8.0.0265
Problem:    May get ml_get error when :pydo deletes lines or switches to
            another buffer. (Nikolai Pavlov, issue #1421)
Solution:   Check the buffer and line every time.
Files:      src/if_py_both.h, src/testdir/test_python2.vim,
            src/testdir/test_python3.vim, src/Makefile,
            src/testdir/Make_all.mak

Patch 8.0.0266
Problem:    Compiler warning for using uninitialized variable.
Solution:   Set tab_number also when there is an error.
Files:      src/ex_docmd.c

Patch 8.0.0267
Problem:    A channel test sometimes fails on Mac.
Solution:   Add the test to the list of flaky tests.
Files:      src/testdir/runtest.vim

Patch 8.0.0268
Problem:    May get ml_get error when :luado deletes lines or switches to
            another buffer. (Nikolai Pavlov, issue #1421)
Solution:   Check the buffer and line every time.
Files:      src/if_lua.c, src/testdir/test_lua.vim, src/Makefile,
            src/testdir/Make_all.mak

Patch 8.0.0269
```

```
Problem:    May get ml_get error when :perldo deletes lines or switches to
            another buffer. (Nikolai Pavlov, issue #1421)
Solution:   Check the buffer and line every time.
Files:      src/if_perl.xs, src/testdir/test_perl.vim

Patch 8.0.0270
Problem:    May get ml_get error when :rubydo deletes lines or switches to
            another buffer. (Nikolai Pavlov, issue #1421)
Solution:   Check the buffer and line every time.
Files:      src/if_ruby.c, src/testdir/test_ruby.vim

Patch 8.0.0271
Problem:    May get ml_get error when :tcldo deletes lines or switches to
            another buffer. (Nikolai Pavlov, closes #1421)
Solution:   Check the buffer and line every time.
Files:      src/if_tcl.c, src/testdir/test_tcl.vim, src/Makefile,
            src/testdir/Make_all.mak

Patch 8.0.0272
Problem:    Crash on exit is not detected when running tests.
Solution:   Remove the dash before the command. (Dominique Pelle, closes
            #1425)
Files:      src/testdir/Makefile

Patch 8.0.0273
Problem:    Dead code detected by Coverity when not using gnome.
Solution:   Rearrange the #ifdefs to avoid dead code.
Files:      src/gui_gtk_x11.c

Patch 8.0.0274
Problem:    When update_single_line() is called recursively, or another screen
            update happens while it is busy, errors may occur.
Solution:   Check and update updating_screen. (Christian Brabandt)
Files:      src/screen.c

Patch 8.0.0275
Problem:    When checking for CTRL-C typed the GUI may detect a screen resize
            and redraw the screen, causing trouble.
Solution:   Set updating_screen in ui_breakcheck().
Files:      src/ui.c

Patch 8.0.0276
Problem:    Checking for FEAT_GUI_GNOME inside GTK 3 code is unnecessary.
Solution:   Remove the #ifdef. (Kazunobu Kuriyama)
Files:      src/gui_gtk_x11.c

Patch 8.0.0277
Problem:    The GUI test may trigger fontconfig and take a long time.
Solution:   Set $XDG_CACHE_HOME. (Kazunobu Kuriyama)
Files:      src/testdir/unix.vim, src/testdir/test_gui.vim

Patch 8.0.0278 (after 8.0.0277)
Problem:    GUI test fails on MS-Windows.
Solution:   Check that tester_HOME exists.
```

```
Files:      src/testdir/test_gui.vim

Patch 8.0.0279
Problem:    With MSVC 2015 the dll name is vcruntime140.dll.
Solution:   Check the MSVC version and use the right dll name. (Ken Takata)
Files:      src/Make_mvc.mak

Patch 8.0.0280
Problem:    On MS-Windows setting an environment variable with multi-byte
            strings does not work well.
Solution:   Use wputenv when possible. (Taro Muraoka, Ken Takata)
Files:      src/misc1.c, src/os_win32.c, src/os_win32.h,
            src/proto/os_win32.pro, src/vim.h

Patch 8.0.0281
Problem:    MS-Windows files are still using ARGSUSED while most other files
            have UNUSED.
Solution:   Change ARGSUSED to UNUSED or delete it.
Files:      src/os_win32.c, src/gui_w32.c, src/os_mswin.c, src/os_w32exe.c,
            src/winclip.c

Patch 8.0.0282
Problem:    When doing a Visual selection and using "I" to go to insert mode,
            CTRL-O needs to be used twice to go to Normal mode. (Coacher)
Solution:   Check for the return value of edit(). (Christian Brabandt,
            closes #1290)
Files:      src/normal.c, src/ops.c

Patch 8.0.0283
Problem:    The return value of mode() does not indicate that completion is
            active in Replace and Insert mode. (Zhen-Huan (Kenny) Hu)
Solution:   Add "c" or "x" for two kinds of completion. (Yegappan Lakshmanan,
            closes #1397)  Test some more modes.
Files:      runtime/doc/eval.txt, src/evalfunc.c,
            src/testdir/test_functions.vim, src/testdir/test_mapping.vim

Patch 8.0.0284
Problem:    The Test_collapse_buffers() test failed once, looks like it is
            flaky.
Solution:   Add it to the list of flaky tests.
Files:      src/testdir/runtest.vim

Patch 8.0.0285 (after 8.0.0277)
Problem:    Tests fail with tiny build on Unix.
Solution:   Only set g:tester_HOME when build with the +eval feature.
Files:      src/testdir/unix.vim

Patch 8.0.0286
Problem:    When concealing is active and the screen is resized in the GUI it
            is not immediately redrawn.
Solution:   Use update_prepare() and update_finish() from
            update_single_line().
Files:      src/screen.c
```

```
Patch 8.0.0287
Problem:    Cannot access the arguments of the current function in debug mode.
            (Luc Hermitte)
Solution:   use get_funccal(). (LemonBoy, closes #1432, closes #1352)
Files:      src/userfunc.c

Patch 8.0.0288 (after 8.0.0284)
Problem:    Errors reported while running tests.
Solution:   Put comma in the right place.
Files:      src/testdir/runtest.vim

Patch 8.0.0289
Problem:    No test for "ga" and :ascii.
Solution:   Add a test. (Dominique Pelle, closes #1429)
Files:      src/Makefile, src/testdir/test_alot.vim, src/testdir/test_ga.vim

Patch 8.0.0290
Problem:    If a wide character doesn't fit at the end of the screen line, and
            the line doesn't fit on the screen, then the cursor position may
            be wrong. (anliting)
Solution:   Don't skip over wide character. (Christian Brabandt, closes #1408)
Files:      src/screen.c

Patch 8.0.0291 (after 8.0.0282)
Problem:    Visual block insertion does not insert in all lines.
Solution:   Don't bail out of insert too early. Add a test. (Christian
            Brabandt, closes #1290)
Files:      src/ops.c, src/testdir/test_visual.vim

Patch 8.0.0292
Problem:    The stat test is a bit slow.
Solution:   Remove a couple of sleep comments and reduce another.
Files:      src/testdir/test_stat.vim

Patch 8.0.0293
Problem:    Some tests have a one or three second wait.
Solution:   Reset the 'showmode' option.  Use a test time of one to disable
            sleep after an error or warning message.
Files:      src/misc1.c, src/testdir/runtest.vim, src/testdir/test_normal.vim

Patch 8.0.0294
Problem:    Argument list is not stored correctly in a session file.
            (lgpasquale)
Solution:   Use "$argadd" instead of "argadd". (closes #1434)
Files:      src/ex_docmd.c, src/testdir/test_mksession.vim

Patch 8.0.0295 (after 8.0.0293)
Problem:    test_viml hangs.
Solution:   Put resetting 'more' before sourcing the script.
Files:      src/testdir/runtest.vim

Patch 8.0.0296
Problem:    Bracketed paste can only append, not insert.
Solution:   When the cursor is in the first column insert the text.
```

```
Files:      src/normal.c, src/testdir/test_paste.vim, runtime/doc/term.txt

Patch 8.0.0297
Problem:    Double free on exit when using a closure. (James McCoy)
Solution:   Split free_al_functions in two parts. (closes #1428)
Files:      src/userfunc.c, src/structs.h

Patch 8.0.0298
Problem:    Ex command range with repeated search does not work. (Bruce
            DeVisser)
Solution:   Skip over \/, \? and \&.
Files:      src/ex_docmd.c, src/testdir/test_cmdline.vim

Patch 8.0.0299
Problem:    When the GUI window is resized Vim does not always take over the
            new size. (Luchr)
Solution:   Reset new_p_guifont in gui_resize_shell().  Call
            gui_may_resize_shell() in the main loop.
Files:      src/main.c, src/gui.c

Patch 8.0.0300
Problem:    Cannot stop diffing hidden buffers. (Daniel Hahler)
Solution:   When using :diffoff! make the whole list if diffed buffers empty.
            (closes #736)
Files:      src/diff.c, src/testdir/test_diffmode.vim

Patch 8.0.0301
Problem:    No tests for ":set completion" and various errors of the :set
            command.
Solution:   Add more :set tests. (Dominique Pelle, closes #1440)
Files:      src/testdir/test_options.vim

Patch 8.0.0302
Problem:    Cannot set terminal key codes with :let.
Solution:   Make it work.
Files:      src/option.c, src/testdir/test_assign.vim

Patch 8.0.0303
Problem:    Bracketed paste does not work in Visual mode.
Solution:   Delete the text before pasting
Files:      src/normal.c, src/ops.c, src/proto/ops.pro,
            src/testdir/test_paste.vim

Patch 8.0.0304 (after 8.0.0302)
Problem:    Assign test fails in the GUI.
Solution:   Skip the test for setting t_k1.
Files:      src/testdir/test_assign.vim

Patch 8.0.0305
Problem:    Invalid memory access when option has duplicate flag.
Solution:   Correct pointer computation. (Dominique Pelle, closes #1442)
Files:      src/option.c, src/testdir/test_options.vim

Patch 8.0.0306
```

```
Problem:    mode() not sufficiently tested.
Solution:   Add more tests. (Yegappan Lakshmanan)
Files:      src/testdir/test_functions.vim

Patch 8.0.0307
Problem:    Asan detects a memory error when EXITFREE is defined. (Dominique
            Pelle)
Solution:   In getvcol() check for ml_get_buf() returning an empty string.
            Also skip adjusting the scroll position.  Set "exiting" in
            mch_exit() for all systems.
Files:      src/charset.c, src/window.c, src/os_mswin.c, src/os_win32.c,
            src/os_amiga.c

Patch 8.0.0308
Problem:    When using a symbolic link, the package path will not be inserted
            at the right position in 'runtimepath'. (Dugan Chen, Norio Takagi)
Solution:   Resolve symbolic links when finding the right position in
            'runtimepath'. (Hirohito Higashi)
Files:      src/ex_cmds2.c, src/testdir/test_packadd.vim

Patch 8.0.0309
Problem:    Cannot use an empty key in json.
Solution:   Allow for using an empty key.
Files:      src/json.c, src/testdir/test_json.vim

Patch 8.0.0310
Problem:    Not enough testing for GUI functionality.
Solution:   Add tests for v:windowid and getwinpos[xy](). (Kazunobu Kuriyama)
Files:      src/testdir/test_gui.vim

Patch 8.0.0311
Problem:    Linebreak tests are old style.
Solution:   Turn the tests into new style. Share utility functions. (Ozaki
            Kiichi, closes #1444)
Files:      src/Makefile, src/testdir/Make_all.mak,
            src/testdir/test_breakindent.vim, src/testdir/test_listlbr.in,
            src/testdir/test_listlbr.ok, src/testdir/test_listlbr.vim,
            src/testdir/test_listlbr_utf8.in,
            src/testdir/test_listlbr_utf8.ok,
            src/testdir/test_listlbr_utf8.vim, src/testdir/view_util.vim

Patch 8.0.0312
Problem:    When a json message arrives in pieces, the start is dropped and
            the decoding fails.
Solution:   Do not drop the start when it is still needed. (Kay Zheng)  Add a
            test.  Reset the timeout when something is received.
Files:      src/channel.c, src/testdir/test_channel.vim, src/structs.h,
            src/testdir/test_channel_pipe.py

Patch 8.0.0313 (after 8.0.0310)
Problem:    Not enough testing for GUI functionality.
Solution:   Add tests for the GUI font. (Kazunobu Kuriyama)
Files:      src/testdir/test_gui.vim
```

```
Patch 8.0.0314
Problem:    getcmdtype(), getcmdpos() and getcmdline() are not tested.
Solution:   Add tests. (Yegappan Lakshmanan)
Files:      src/testdir/test_cmdline.vim

Patch 8.0.0315
Problem:    ":help :[range]" does not work. (Tony Mechelynck)
Solution:   Translate to insert a backslash.
Files:      src/ex_cmds.c

Patch 8.0.0316
Problem:    ":help z?" does not work. (Pavol Juhas)
Solution:   Remove exception for z?.
Files:      src/ex_cmds.c

Patch 8.0.0317
Problem:    No test for setting 'guifont'.
Solution:   Add a test for X11 GUIs. (Kazunobu Kuriyama)
Files:      src/testdir/test_gui.vim

Patch 8.0.0318
Problem:    Small mistake in 7x13 font name.
Solution:   Use ISO 8859-1 name instead of 10646-1. (Kazunobu Kuriyama)
Files:      src/testdir/test_gui.vim

Patch 8.0.0319
Problem:    Insert mode completion does not respect "start" in 'backspace'.
Solution:   Check whether backspace can go before where insert started.
            (Hirohito Higashi)
Files:      src/edit.c, src/testdir/test_popup.vim

Patch 8.0.0320
Problem:    Warning for unused variable with small build.
Solution:   Change #ifdef to exclude FEAT_CMDWIN. (Kazunobu Kuriyama)
Files:      src/ex_getln.c

Patch 8.0.0321
Problem:    When using the tiny version trying to load the matchit plugin
            gives an error. On MS-Windows some default mappings fail.
Solution:   Add a check if the command used is available. (Christian Brabandt)
Files:      runtime/mswin.vim, runtime/macros/matchit.vim

Patch 8.0.0322
Problem:    Possible overflow with spell file where the tree length is
            corrupted.
Solution:   Check for an invalid length (suggested by shqking)
Files:      src/spellfile.c

Patch 8.0.0323
Problem:    When running the command line tests there is a one second wait.
Solution:   Change an Esc to Ctrl-C. (Yegappan Lakshmanan)
Files:      src/testdir/test_cmdline.vim

Patch 8.0.0324
```

```
Problem:    Illegal memory access with "1;y".
Solution:   Call check_cursor() instead of check_cursor_lnum(). (Dominique
            Pelle, closes #1455)
Files:      src/ex_docmd.c, src/testdir/test_cmdline.vim

Patch 8.0.0325
Problem:    Packadd test does not clean up symlink.
Solution:   Delete the link. (Hirohito Higashi)
Files:      src/testdir/test_packadd.vim

Patch 8.0.0326 (after 8.0.0325)
Problem:    Packadd test uses wrong directory name.
Solution:   Use the variable name value. (Hirohito Higashi)
Files:      src/testdir/test_packadd.vim

Patch 8.0.0327
Problem:    The E11 error message in the command line window is not
            translated.
Solution:   use _(). (Hirohito Higashi)
Files:      src/ex_docmd.c

Patch 8.0.0328
Problem:    The "zero count" error doesn't have a number. (Hirohito Higashi)
Solution:   Give it a number and be more specific about the error.
Files:      src/globals.h

Patch 8.0.0329
Problem:    Xfontset and guifontwide are not tested.
Solution:   Add tests. (Kazunobu Kuriyama)
Files:      src/testdir/test_gui.vim

Patch 8.0.0330
Problem:    Illegal memory access after "vapo". (Dominique Pelle)
Solution:   Fix the cursor column.
Files:      src/search.c, src/testdir/test_visual.vim

Patch 8.0.0331
Problem:    Restoring help snapshot accesses freed memory. (Dominique Pelle)
Solution:   Don't restore a snapshot when the window closes.
Files:      src/window.c, src/Makefile, src/testdir/Make_all.mak,
            src/testdir/test_help.vim

Patch 8.0.0332
Problem:    GUI test fails on some systems.
Solution:   Try different language settings. (Kazunobu Kuriyama)
Files:      src/testdir/test_gui.vim

Patch 8.0.0333
Problem:    Illegal memory access when 'complete' ends in a backslash.
Solution:   Check for trailing backslash. (Dominique Pelle, closes #1478)
Files:      src/option.c, src/testdir/test_options.vim

Patch 8.0.0334
Problem:    Can't access b:changedtick from a dict reference.
```

```
Solution:   Make changedtick a member of the b: dict. (inspired by neovim
            #6112)
Files:      src/structs.h, src/buffer.c, src/edit.c, src/eval.c,
            src/evalfunc.c, src/ex_docmd.c, src/main.c, src/globals.h,
            src/fileio.c, src/memline.c, src/misc1.c, src/syntax.c,
            src/proto/eval.pro, src/testdir/test_changedtick.vim,
            src/Makefile, src/testdir/test_alot.vim, src/testdir/test91.in,
            src/testdir/test91.ok, src/testdir/test_functions.vim

Patch 8.0.0335 (after 8.0.0335)
Problem:    Functions test fails.
Solution:   Use the right buffer number.
Files:      src/testdir/test_functions.vim

Patch 8.0.0336
Problem:    Flags of :substitute not sufficiently tested.
Solution:   Test up to two letter flag combinations. (James McCoy, closes
            #1479)
Files:      src/testdir/test_substitute.vim

Patch 8.0.0337
Problem:    Invalid memory access in :recover command.
Solution:   Avoid access before directory name. (Dominique Pelle,
            closes #1488)
Files:      src/Makefile, src/memline.c, src/testdir/test_alot.vim,
            src/testdir/test_recover.vim

Patch 8.0.0338 (after 8.0.0337)
Problem:    :recover test fails on MS-Windows.
Solution:   Use non-existing directory on MS-Windows.
Files:      src/testdir/test_recover.vim

Patch 8.0.0339
Problem:    Illegal memory access with vi'
Solution:   For quoted text objects bail out if the Visual area spans more
            than one line.
Files:      src/search.c, src/testdir/test_visual.vim

Patch 8.0.0340
Problem:    Not checking return value of dict_add(). (Coverity)
Solution:   Handle a failure.
Files:      src/buffer.c

Patch 8.0.0341
Problem:    When using complete() and typing a character undo is saved after
            the character was inserted. (Shougo)
Solution:   Save for undo before inserting the character.
Files:      src/edit.c, src/testdir/test_popup.vim

Patch 8.0.0342
Problem:    Double free when compiled with EXITFREE and setting 'ttytype'.
Solution:   Avoid setting P_ALLOCED on 'ttytype'. (Dominique Pelle,
            closes #1461)
Files:      src/option.c, src/testdir/test_options.vim
```

```
Patch 8.0.0343
Problem:    b:changedtick can be unlocked, even though it has no effect.
            (Nikolai Pavlov)
Solution:   Add a check and error E940. (closes #1496)
Files:      src/eval.c, src/testdir/test_changedtick.vim, runtime/doc/eval.txt

Patch 8.0.0344
Problem:    Unlet command leaks memory. (Nikolai Pavlov)
Solution:   Free the memory on error. (closes #1497)
Files:      src/eval.c, src/testdir/test_unlet.vim

Patch 8.0.0345
Problem:    islocked('d.changedtick') does not work.
Solution:   Make it work.
Files:      src/buffer.c, src/eval.c, src/evalfunc.c, src/vim.h,
            src/testdir/test_changedtick.vim,

Patch 8.0.0346
Problem:    Vim relies on limits.h to be included indirectly, but on Solaris 9
            it may not be. (Ben Fritz)
Solution:   Always include limits.h.
Files:      src/os_unixx.h, src/vim.h

Patch 8.0.0347
Problem:    When using CTRL-X CTRL-U inside a comment, the use of the comment
            leader may not work. (Klement)
Solution:   Save and restore did_ai. (Christian Brabandt, closes #1494)
Files:      src/edit.c, src/testdir/test_popup.vim

Patch 8.0.0348
Problem:    When building with a shadow directory on macOS lacks the
            +clipboard feature.
Solution:   Link *.m files, specifically os_macosx.m. (Kazunobu Kuriyama)
Files:      src/Makefile

Patch 8.0.0349
Problem:    Redrawing errors with GTK 3.
Solution:   When updating, first clear all rectangles and then draw them.
            (Kazunobu Kuriyama, Christian Ludwig, closes #848)
Files:      src/gui_gtk_x11.c

Patch 8.0.0350
Problem:    Not enough test coverage for Perl.
Solution:   Add more Perl tests. (Dominique Pelle, closes #1500)
Files:      src/testdir/test_perl.vim

Patch 8.0.0351
Problem:    No test for concatenating an empty string that results from out of
            bounds indexing.
Solution:   Add a simple test.
Files:      src/testdir/test_expr.vim

Patch 8.0.0352
```

```
Problem:    The condition for when a typval needs to be cleared is too
            complicated.
Solution:   Init the type to VAR_UNKNOWN and always clear it.
Files:      src/eval.c

Patch 8.0.0353
Problem:    If [RO] in the status line is translated to a longer string, it is
            truncated to 4 bytes.
Solution:   Skip over the resulting string. (Jente Hidskes, closes #1499)
Files:      src/screen.c

Patch 8.0.0354
Problem:    Test to check that setting termcap key fails sometimes.
Solution:   Check for "t_k1" to exist. (Christian Brabandt, closes #1459)
Files:      src/testdir/test_assign.vim

Patch 8.0.0355
Problem:    Using uninitialized memory when 'isfname' is empty.
Solution:   Don't call getpwnam() without an argument. (Dominique Pelle,
            closes #1464)
Files:      src/misc1.c, src/testdir/test_options.vim

Patch 8.0.0356 (after 8.0.0342)
Problem:    Leaking memory when setting 'ttytype'.
Solution:   Get free_oldval from the right option entry.
Files:      src/option.c

Patch 8.0.0357
Problem:    Crash when setting 'guicursor' to weird value.
Solution:   Avoid negative size. (Dominique Pelle, closes #1465)
Files:      src/misc2.c, src/testdir/test_options.vim

Patch 8.0.0358
Problem:    Invalid memory access in C-indent code.
Solution:   Don't go over end of empty line. (Dominique Pelle, closes #1492)
Files:      src/edit.c, src/testdir/test_options.vim

Patch 8.0.0359
Problem:    'number' and 'relativenumber' are not properly tested.
Solution:   Add tests, change old style to new style tests. (Ozaki Kiichi,
            closes #1447)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/Make_vms.mms,
            src/testdir/test89.in, src/testdir/test89.ok,
            src/testdir/test_alot.vim, src/testdir/test_findfile.vim,
            src/testdir/test_number.vim

Patch 8.0.0360
Problem:    Sometimes VimL is used, which is confusing.
Solution:   Consistently use "Vim script". (Hirohito Higashi)
Files:      runtime/doc/if_mzsch.txt, runtime/doc/if_pyth.txt,
            runtime/doc/syntax.txt, runtime/doc/usr_02.txt,
            runtime/doc/version7.txt, src/Makefile, src/eval.c,
            src/ex_getln.c, src/if_py_both.h, src/if_xcmdsrv.c,
            src/testdir/Make_all.mak, src/testdir/runtest.vim,
```

```
            src/testdir/test49.vim, src/testdir/test_vimscript.vim,
            src/testdir/test_viml.vim

Patch 8.0.0361
Problem:    GUI initialisation is not sufficiently tested.
Solution:   Add the gui_init test. (Kazunobu Kuriyama)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Makefile,
            src/testdir/gui_init.vim, src/testdir/setup_gui.vim,
            src/testdir/test_gui.vim, src/testdir/test_gui_init.vim, Filelist

Patch 8.0.0362 (after 8.0.0361)
Problem:    Tests fail on MS-Windows.
Solution:   Use $*.vim instead of $<.
Files:      src/testdir/Make_dos.mak

Patch 8.0.0363
Problem:    Travis is too slow to keep up with patches.
Solution:   Increase git depth to 20
Files:      .travis.yml

Patch 8.0.0364
Problem:    ]s does not move cursor with two spell errors in one line. (Manuel
            Ortega)
Solution:   Don't stop search immediately when wrapped, search the line first.
            (Ken Takata)  Add a test.
Files:      src/spell.c, src/Makefile, src/testdir/test_spell.vim,
            src/testdir/Make_all.mak

Patch 8.0.0365
Problem:    Might free a dict item that wasn't allocated.
Solution:   Call dictitem_free(). (Nikolai Pavlov)  Use this for
            b:changedtick.
Files:      src/dict.c, src/structs.h, src/buffer.c, src/edit.c,
            src/evalfunc.c, src/ex_docmd.c, src/fileio.c, src/main.c,
            src/memline.c, src/misc1.c, src/syntax.c

Patch 8.0.0366 (after 8.0.0365)
Problem:    Build fails with tiny features.
Solution:   Add #ifdef.
Files:      src/buffer.c

Patch 8.0.0367
Problem:    If configure defines _LARGE_FILES some include files are included
            before it is defined.
Solution:   Include vim.h first. (Sam Thursfield, closes #1508)
Files:      src/gui_at_sb.c, src/gui_athena.c, src/gui_motif.c, src/gui_x11.c,
            src/gui_xmdlg.c

Patch 8.0.0368
Problem:    Not all options are tested with a range of values.
Solution:   Generate a test script from the source code.
Files:      Filelist, src/gen_opt_test.vim, src/testdir/test_options.vim,
            src/Makefile
```

```
Patch 8.0.0369 (after 8.0.0368)
Problem:    The 'balloondelay', 'ballooneval' and 'balloonexpr' options are
            not defined without the +balloon_eval feature. Testing that an
            option value fails does not work for unsupported options.
Solution:   Make the options defined but not supported.  Don't test if
            setting unsupported options fails.
Files:      src/option.c, src/gen_opt_test.vim

Patch 8.0.0370
Problem:    Invalid memory access when setting wildchar empty.
Solution:   Avoid going over the end of the option value. (Dominique Pelle,
            closes #1509)  Make option test check all number options with
            empty value.
Files:      src/gen_opt_test.vim, src/option.c, src/testdir/test_options.vim

Patch 8.0.0371 (after 8.0.0365)
Problem:    Leaking memory when setting v:completed_item.
Solution:   Or the flags instead of setting them.
Files:      src/eval.c

Patch 8.0.0372
Problem:    More options are not always defined.
Solution:   Consistently define all possible options.
Files:      src/option.c, src/testdir/test_expand_dllpath.vim

Patch 8.0.0373
Problem:    Build fails without +folding.
Solution:   Move misplaced #ifdef.
Files:      src/option.c

Patch 8.0.0374
Problem:    Invalid memory access when using :sc in Ex mode. (Dominique Pelle)
Solution:   Avoid the column being negative.  Also fix a hang in Ex mode.
Files:      src/ex_getln.c, src/ex_cmds.c, src/testdir/test_substitute.vim

Patch 8.0.0375
Problem:    The "+ register is not tested.
Solution:   Add a test using another Vim instance to change the "+ register.
            (Kazunobu Kuriyama)
Files:      src/testdir/test_gui.vim

Patch 8.0.0376
Problem:    Size computations in spell file reading are not exactly right.
Solution:   Make "len" a "long" and check with LONG_MAX.
Files:      src/spellfile.c

Patch 8.0.0377
Problem:    Possible overflow when reading corrupted undo file.
Solution:   Check if allocated size is not too big. (King)
Files:      src/undo.c

Patch 8.0.0378
Problem:    Another possible overflow when reading corrupted undo file.
```

```
Solution:   Check if allocated size is not too big. (King)
Files:      src/undo.c

Patch 8.0.0379
Problem:    CTRL-Z and mouse click use CTRL-O unnecessary.
Solution:   Remove stuffing CTRL-O. (James McCoy, closes #1453)
Files:      src/edit.c, src/normal.c

Patch 8.0.0380
Problem:    With 'linebreak' set and 'breakat' includes ">" a double-wide
            character results in "<<" displayed.
Solution:   Check for the character not to be replaced. (Ozaki Kiichi,
            closes #1456)
Files:      src/screen.c, src/testdir/test_listlbr_utf8.vim

Patch 8.0.0381
Problem:    Diff mode is not sufficiently tested.
Solution:   Add more diff mode tests. (Dominique Pelle, closes #1515)
Files:      src/testdir/test_diffmode.vim

Patch 8.0.0382 (after 8.0.0380)
Problem:    Warning in tiny build for unused variable. (Tony Mechelynck)
Solution:   Add #ifdefs.
Files:      src/screen.c

Patch 8.0.0383 (after 8.0.0382)
Problem:    Misplaced #ifdef. (Christ van Willigen)
Solution:   Split assignment.
Files:      src/screen.c

Patch 8.0.0384
Problem:    Timer test failed for no apparent reason.
Solution:   Mark the test as flaky.
Files:      src/testdir/runtest.vim

Patch 8.0.0385
Problem:    No tests for arabic.
Solution:   Add a first test for arabic. (Dominique Pelle, closes #1518)
Files:      src/Makefile, src/testdir/Make_all.mak,
            src/testdir/test_arabic.vim

Patch 8.0.0386
Problem:    Tiny build has a problem with generating the options test.
Solution:   Change the "if" to skip over statements.
Files:      src/gen_opt_test.vim

Patch 8.0.0387
Problem:    compiler warnings
Solution:   Add type casts. (Christian Brabandt)
Files:      src/channel.c, src/memline.c,

Patch 8.0.0388
Problem:    filtering lines through "cat", without changing the line count,
            changes manual folds.
```

```
Solution:   Change how marks and folds are adjusted. (Matthew Malcomson, from
            neovim #6194).
Files:      src/fold.c, src/testdir/test_fold.vim

Patch 8.0.0389
Problem:    Test for arabic does not check what is displayed.
Solution:   Improve what is asserted. (Dominique Pelle, closes #1523)
            Add a first shaping test.
Files:      src/testdir/test_arabic.vim

Patch 8.0.0390
Problem:    When the window scrolls horizontally when the popup menu is
            displayed part of it may not be cleared. (Neovim issue #6184)
Solution:   Remove the menu when the windows scrolled. (closes #1524)
Files:      src/edit.c

Patch 8.0.0391
Problem:    Arabic support is verbose and not well tested.
Solution:   Simplify the code.  Add more tests.
Files:      src/arabic.c, src/testdir/test_arabic.vim

Patch 8.0.0392
Problem:    GUI test fails with Athena and Motif.
Solution:   Add test_ignore_error().  Use it to ignore the "failed to create
            input context" error.
Files:      src/message.c, src/proto/message.pro, src/evalfunc.c,
            src/testdir/test_gui.vim, runtime/doc/eval.txt

Patch 8.0.0393 (after 8.0.0190)
Problem:    When the same tag appears more than once, the order is
            unpredictable. (Charles Campbell)
Solution:   Besides using a dict for finding duplicates, use a grow array for
            keeping the tags in sequence.
Files:      src/tag.c, src/testdir/test_tagjump.vim

Patch 8.0.0394
Problem:    Tabs are not aligned when scrolling horizontally and a Tab doesn't
            fit. (Axel Bender)
Solution:   Handle a Tab as a not fitting character. (Christian Brabandt)
            Also fix that ":redraw" does not scroll horizontally to show the
            cursor.  And fix the test that depended on the old behavior.
Files:      src/screen.c, src/ex_docmd.c, src/testdir/test_listlbr.vim,
            src/testdir/test_listlbr_utf8.vim,
            src/testdir/test_breakindent.vim

Patch 8.0.0395 (after 8.0.0392)
Problem:    Testing the + register fails with Motif.
Solution:   Also ignore the "failed to create input context" error in the
            second gvim.  Don't use msg() when it would result in a dialog.
Files:      src/message.c, src/testdir/test_gui.vim, src/testdir/setup_gui.vim

Patch 8.0.0396
Problem:    'balloonexpr' only works synchronously.
Solution:   Add balloon_show(). (Jusufadis Bakamovic, closes #1449)
```

```
Files:      runtime/doc/eval.txt, src/evalfunc.c, src/os_unix.c,
            src/os_win32.c

Patch 8.0.0397 (after 8.0.0392)
Problem:    Cannot build with the viminfo feature but without the eval
            feature.
Solution:   Adjust #ifdef. (John Marriott)
Files:      src/message.c, src/misc2.c

Patch 8.0.0398
Problem:    Illegal memory access with "t".
Solution:   Use strncmp() instead of memcmp(). (Dominique Pelle, closes #1528)
Files:      src/search.c, src/testdir/test_search.vim

Patch 8.0.0399
Problem:    Crash when using balloon_show() when not supported. (Hirohito
            Higashi)
Solution:   Check for balloonEval not to be NULL. (Ken Takata)
Files:      src/evalfunc.c, src/testdir/test_functions.vim

Patch 8.0.0400
Problem:    Some tests have a one second delay.
Solution:   Add --not-a-term in RunVim().
Files:      src/testdir/shared.vim

Patch 8.0.0401
Problem:    Test fails with missing balloon feature.
Solution:   Add check for balloon feature.
Files:      src/testdir/test_functions.vim

Patch 8.0.0402
Problem:    :map completion does not have <special>. (Dominique Pelle)
Solution:   Recognize <special> in completion.  Add a test.
Files:      src/getchar.c, src/testdir/test_cmdline.vim

Patch 8.0.0403
Problem:    GUI tests may fail.
Solution:   Ignore the E285 error better. (Kazunobu Kuriyama)
Files:      src/testdir/test_gui.vim, src/testdir/test_gui_init.vim

Patch 8.0.0404
Problem:    Not enough testing for quickfix.
Solution:   Add some more tests. (Yegappan Lakshmanan)
Files:      src/testdir/test_quickfix.vim

Patch 8.0.0405
Problem:    v:progpath may become invalid after ":cd".
Solution:   Turn v:progpath into a full path if needed.
Files:      src/main.c, src/testdir/test_startup.vim, runtime/doc/eval.txt

Patch 8.0.0406
Problem:    The arabic shaping code is verbose.
Solution:   Shorten the code without changing the functionality.
Files:      src/arabic.c
```

Patch 8.0.0407 (after 8.0.0388)
Problem: Filtering folds with marker method not tested.
Solution: Also set 'foldmethod' to "marker".
Files: src/testdir/test_fold.vim

Patch 8.0.0408
Problem: Updating folds does not work properly when inserting a file and a
            few other situations.
Solution: Adjust the way folds are updated. (Matthew Malcomson)
Files: src/fold.c, src/testdir/test_fold.vim

Patch 8.0.0409
Problem: set_progpath is defined but not always used
Solution: Adjust #ifdef.
Files: src/main.c

Patch 8.0.0410
Problem: Newer gettext/iconv library has extra dll file.
Solution: Add the file to the Makefile and nsis script. (Christian Brabandt)
Files: Makefile, nsis/gvim.nsi

Patch 8.0.0411
Problem: We can't change the case in menu entries, it breaks translations.
Solution: Ignore case when looking up a menu translation.
Files: src/menu.c, src/testdir/test_menu.vim

Patch 8.0.0412 (after 8.0.0411)
Problem: Menu test fails on MS-Windows.
Solution: Use a menu entry with only ASCII characters.
Files: src/testdir/test_menu.vim

Patch 8.0.0413 (after 8.0.0412)
Problem: Menu test fails on MS-Windows using gvim.
Solution: First delete the English menus.
Files: src/testdir/test_menu.vim

Patch 8.0.0414
Problem: Balloon eval is not tested.
Solution: Add a few balloon tests. (Kazunobu Kuriyama)
Files: src/testdir/test_gui.vim

Patch 8.0.0415 (after 8.0.0414)
Problem: Balloon test fails on MS-Windows.
Solution: Test with 0x7fffffff instead of 0xffffffff.
Files: src/testdir/test_gui.vim

Patch 8.0.0416
Problem: Setting v:progpath is not quite right.
Solution: On MS-Windows add the extension. On Unix use the full path for a
            relative directory. (partly by James McCoy, closes #1531)
Files: src/main.c, src/os_win32.c, src/os_unix.c

Patch 8.0.0417

```
Problem:    Test for the clipboard fails sometimes.
Solution:   Add it to the flaky tests.
Files:      src/testdir/runtest.vim

Patch 8.0.0418
Problem:    ASAN logs are disabled and don't cause a failure.
Solution:   Enable ASAN logs and fail if not empty. (James McCoy,
            closes #1425)
Files:      .travis.yml

Patch 8.0.0419
Problem:    Test for v:progpath fails on MS-Windows.
Solution:   Expand to full path.  Also add ".exe" when the path is an absolute
            path.
Files:      src/os_win32.c, src/main.c

Patch 8.0.0420
Problem:    When running :make the output may be in the system encoding,
            different from 'encoding'.
Solution:   Add the 'makeencoding' option. (Ken Takata)
Files:      runtime/doc/options.txt, runtime/doc/quickfix.txt,
            runtime/doc/quickref.txt, src/Makefile, src/buffer.c,
            src/if_cscope.c, src/main.c, src/option.c, src/option.h,
            src/proto/quickfix.pro, src/quickfix.c, src/structs.h,
            src/testdir/Make_all.mak, src/testdir/test_makeencoding.py,
            src/testdir/test_makeencoding.vim

Patch 8.0.0421
Problem:    Diff mode is displayed wrong when adding a line at the end of a
            buffer.
Solution:   Adjust marks in diff mode. (James McCoy, closes #1329)
Files:      src/misc1.c, src/ops.c, src/testdir/test_diffmode.vim

Patch 8.0.0422
Problem:    Python test fails with Python 3.6.
Solution:   Convert new exception messages to old ones. (closes #1359)
Files:      src/testdir/test87.in

Patch 8.0.0423
Problem:    The effect of adding "#" to 'cinoptions' is not always removed.
            (David Briscoe)
Solution:   Reset b_ind_hash_comment. (Christian Brabandt, closes #1475)
Files:      src/misc1.c, src/Makefile, src/testdir/Make_all.mak,
            src/testdir/test_cindent.vim, src/testdir/test3.in

Patch 8.0.0424
Problem:    Compiler warnings on MS-Windows. (Ajit Thakkar)
Solution:   Add type casts.
Files:      src/os_win32.c

Patch 8.0.0425
Problem:    Build errors when building without folding.
Solution:   Add #ifdefs. (John Marriott)
Files:      src/diff.c, src/edit.c, src/option.c, src/syntax.c
```

```
Patch 8.0.0426
Problem:    Insufficient testing for statusline.
Solution:   Add several tests. (Dominique Pelle, closes #1534)
Files:      src/testdir/test_statusline.vim

Patch 8.0.0427
Problem:    'makeencoding' missing from the options window.
Solution:   Add the entry.
Files:      runtime/optwin.vim

Patch 8.0.0428
Problem:    Git and hg see new files after running tests. (Manuel Ortega)
Solution:   Add the generated file to .hgignore (or .gitignore). Delete the
            resulting verbose file. (Christian Brabandt)  Improve dependency
            on opt_test.vim.  Reset the 'more' option.
Files:      .hgignore, src/gen_opt_test.vim, src/testdir/gen_opt_test.vim,
            src/Makefile, src/testdir/Make_all.mak, src/testdir/Makefile,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            Filelist

Patch 8.0.0429
Problem:    Options test does not always test everything.
Solution:   Fix dependency for opt_test.vim.  Give a message when opt_test.vim
            was not found.
Files:      src/testdir/test_options.vim, src/testdir/gen_opt_test.vim,
            src/testdir/Makefile, src/testdir/Make_all.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak

Patch 8.0.0430
Problem:    Options test fails or hangs on MS-Windows.
Solution:   Run it separately instead of part of test_alot.  Use "-S" instead
            of "-u" to run the script.  Fix failures.
Files:      src/testdir/Make_all.mak, src/testdir/test_alot.vim,
            src/testdir/Makefile, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/gen_opt_test.vim

Patch 8.0.0431
Problem:    'cinoptions' cannot set indent for extern block.
Solution:   Add the "E" flag in 'cinoptions'. (Hirohito Higashi)
Files:      runtime/doc/indent.txt, src/misc1.c, src/structs.h,
            src/testdir/test_cindent.vim

Patch 8.0.0432
Problem:    "make shadow" creates an invalid link.
Solution:   Don't link "*.vim". (Kazunobu Kuriyama)
Files:      src/Makefile

Patch 8.0.0433
Problem:    Quite a few beeps when running tests.
Solution:   Set 'belloff' for these tests. (Christian Brabandt)
Files:      src/testdir/test103.in, src/testdir/test14.in,
            src/testdir/test29.in, src/testdir/test30.in,
            src/testdir/test32.in, src/testdir/test45.in,
```

```
            src/testdir/test72.in, src/testdir/test73.in,
            src/testdir/test77.in, src/testdir/test78.in,
            src/testdir/test85.in, src/testdir/test94.in,
            src/testdir/test_alot.vim, src/testdir/test_alot_utf8.vim,
            src/testdir/test_close_count.in, src/testdir/test_cmdline.vim,
            src/testdir/test_diffmode.vim, src/testdir/test_digraph.vim,
            src/testdir/test_erasebackword.in, src/testdir/test_normal.vim,
            src/testdir/test_packadd.vim, src/testdir/test_search.vim,
            src/testdir/test_textobjects.vim, src/testdir/test_undo.vim,
            src/testdir/test_usercommands.vim, src/testdir/test_visual.vim

Patch 8.0.0434
Problem:    Clang version not correctly detected.
Solution:   Adjust the configure script. (Kazunobu Kuriyama)
Files:      src/configure.ac, src/auto/configure

Patch 8.0.0435
Problem:    Some functions are not tested.
Solution:   Add more tests for functions. (Dominique Pelle, closes #1541)
Files:      src/testdir/test_functions.vim

Patch 8.0.0436
Problem:    Running the options test sometimes resizes the terminal.
Solution:   Clear out t_WS.
Files:      src/testdir/gen_opt_test.vim

Patch 8.0.0437
Problem:    The packadd test does not create the symlink correctly and does
            not test the right thing.
Solution:   Create the directory and symlink correctly.
Files:      src/testdir/test_packadd.vim

Patch 8.0.0438
Problem:    The fnamemodify test changes 'shell' in a way later tests may not
            be able to use system().
Solution:   Save and restore 'shell'.
Files:      src/testdir/test_fnamemodify.vim

Patch 8.0.0439
Problem:    Using ":%argdel" while the argument list is already empty gives an
            error. (Pavol Juhas)
Solution:   Don't give an error. (closes #1546)
Files:      src/ex_cmds2.c, src/testdir/test_arglist.vim

Patch 8.0.0440
Problem:    Not enough test coverage in Insert mode.
Solution:   Add lots of tests.  Add test_override(). (Christian Brabandt,
            closes #1521)
Files:      runtime/doc/eval.txt, runtime/doc/usr_41.txt, src/edit.c,
            src/evalfunc.c, src/globals.h,  src/screen.c,
            src/testdir/Make_all.mak, src/testdir/test_cursor_func.vim,
            src/testdir/test_edit.vim, src/testdir/test_search.vim,
            src/testdir/test_assert.vim, src/Makefile, src/testdir/runtest.vim
```

```
Patch 8.0.0441
Problem:    Dead code in #ifdef.
Solution:   Remove the #ifdef and #else part.
Files:      src/option.c

Patch 8.0.0442
Problem:    Patch shell command uses double quotes around the argument, which
            allows for $HOME to be expanded. (Etienne)
Solution:   Use single quotes on Unix. (closes #1543)
Files:      src/diff.c, src/testdir/test_diffmode.vim

Patch 8.0.0443
Problem:    Terminal width is set to 80 in test3.
Solution:   Instead of setting 'columns' set 'wrapmargin' depending on
            'columns.
Files:      src/testdir/test3.in

Patch 8.0.0444 (after 8.0.0442)
Problem:    Diffpatch fails when the file name has a quote.
Solution:   Escape the name properly. (zetzei)
Files:      src/diff.c, src/testdir/test_diffmode.vim

Patch 8.0.0445
Problem:    Getpgid is not supported on all systems.
Solution:   Add a configure check.
Files:      src/configure.ac, src/auto/configure, src/config.h.in,
            src/os_unix.c

Patch 8.0.0446
Problem:    The ";" command does not work after characters with a lower byte
            that is NUL.
Solution:   Properly check for not having a previous character. (Hirohito
            Higashi)
Files:      src/Makefile, src/search.c, src/testdir/test_alot_utf8.vim,
            src/testdir/test_charsearch_utf8.vim

Patch 8.0.0447
Problem:    Getting font name does not work on X11.
Solution:   Implement gui_mch_get_fontname() for X11.  Add more GUI tests.
            (Kazunobu Kuriyama)
Files:      src/gui_x11.c, src/syntax.c, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Makefile,
            src/testdir/gui_init.vim, src/testdir/gui_preinit.vim,
            src/testdir/test_gui.vim, src/testdir/test_gui_init.vim,
            Filelist

Patch 8.0.0448
Problem:    Some macros are in lower case, which can be confusing.
Solution:   Make a few lower case macros upper case.
Files:      src/macros.h, src/buffer.c, src/charset.c, src/ops.c, src/diff.c,
            src/edit.c, src/evalfunc.c, src/ex_cmds.c, src/ex_getln.c,
            src/fileio.c, src/fold.c, src/gui.c, src/gui_beval.c, src/main.c,
            src/mark.c, src/misc1.c, src/move.c, src/normal.c,
            src/option.c, src/popupmnu.c, src/regexp.c, src/screen.c,
```

```
            src/search.c, src/spell.c, src/tag.c, src/ui.c, src/undo.c,
            src/version.c, src/workshop.c, src/if_perl.xs

Patch 8.0.0449 (after 8.0.0448)
Problem:    Part of fold patch accidentally included.
Solution:   Revert that part of the patch.
Files:      src/ex_cmds.c

Patch 8.0.0450
Problem:    v:progpath is not reliably set.
Solution:   Read /proc/self/exe if possible. (idea by Michal Grochmal)
            Also fixes missing #if.
Files:      src/main.c, src/config.h.in

Patch 8.0.0451
Problem:    Some macros are in lower case.
Solution:   Make a few more macros upper case. Avoid lower case macros use an
            argument twice.
Files:      src/macros.h, src/charset.c, src/misc2.c, src/proto/misc2.pro,
            src/edit.c, src/eval.c, src/ex_cmds.c, src/ex_cmds2.c,
            src/ex_docmd.c, src/ex_getln.c, src/fileio.c, src/fold.c,
            src/gui.c, src/gui_gtk.c, src/mark.c, src/memline.c, src/mbyte.c,
            src/menu.c, src/message.c, src/misc1.c, src/ops.c, src/option.c,
            src/os_amiga.c, src/os_mswin.c, src/os_unix.c, src/os_win32.c,
            src/popupmnu.c, src/regexp.c, src/regexp_nfa.c, src/screen.c,
            src/search.c, src/spell.c, src/spellfile.c, src/syntax.c,
            src/tag.c, src/ui.c, src/undo.c, src/window.c

Patch 8.0.0452
Problem:    Some macros are in lower case.
Solution:   Make a few more macros upper case.
Files:      src/vim.h, src/macros.h, src/evalfunc.c, src/fold.c,
            src/gui_gtk.c, src/gui_gtk_x11.c, src/charset.c, src/diff.c,
            src/edit.c, src/eval.c, src/ex_cmds.c, src/ex_cmds2.c,
            src/ex_docmd.c, src/ex_getln.c, src/fileio.c, src/getchar.c,
            src/gui.c, src/gui_w32.c, src/if_cscope.c, src/mbyte.c,
            src/menu.c, src/message.c, src/misc1.c, src/misc2.c, src/normal.c,
            src/ops.c, src/option.c, src/os_unix.c, src/os_win32.c,
            src/quickfix.c, src/regexp.c, src/regexp_nfa.c, src/screen.c,
            src/search.c, src/spell.c, src/syntax.c, src/tag.c, src/userfunc.c

Patch 8.0.0453
Problem:    Adding fold marker creates new comment.
Solution:   Use an existing comment if possible. (LemonBoy, closes #1549)
Files:      src/ops.c, src/proto/ops.pro, src/fold.c,
            src/testdir/test_fold.vim

Patch 8.0.0454
Problem:    Compiler warnings for comparing unsigned char with 256 always
            being true. (Manuel Ortega)
Solution:   Add type cast.
Files:      src/screen.c, src/charset.c

Patch 8.0.0455
```

```
Problem:    The mode test may hang in Test_mode(). (Michael Soyka)
Solution:   Set 'complete' to only search the current buffer (as suggested by
            Michael)
Files:      src/testdir/test_functions.vim

Patch 8.0.0456
Problem:    Typo in MinGW test makefile.
Solution:   Change an underscore to a dot. (Michael Soyka)
Files:      src/testdir/Make_ming.mak

Patch 8.0.0457
Problem:    Using :move messes up manual folds.
Solution:   Split adjusting marks and folds.  Add foldMoveRange(). (neovim
            patch #6221)
Files:      src/ex_cmds.c, src/fold.c, src/mark.c, src/proto/fold.pro,
            src/proto/mark.pro src/testdir/test_fold.vim

Patch 8.0.0458
Problem:    Potential crash if adding list or dict to dict fails.
Solution:   Make sure the reference count is correct. (Nikolai Pavlov, closes
            #1555)
Files:      src/dict.c

Patch 8.0.0459 (after 8.0.0457)
Problem:    Old fix for :move messing up folding no longer needed, now that we
            have a proper solution.
Solution:   Revert patch 7.4.700. (Christian Brabandt)
Files:      src/ex_cmds.c

Patch 8.0.0460 (after 8.0.0452)
Problem:    Can't build on HPUX.
Solution:   Fix argument names in vim_stat(). (John Marriott)
Files:      src/misc2.c

Patch 8.0.0461 (after 8.0.0457)
Problem:    Test 45 hangs on MS-Windows.
Solution:   Reset 'shiftwidth'.  Also remove redundant function.
Files:      src/fold.c, src/testdir/test45.in

Patch 8.0.0462
Problem:    If an MS-Windows tests succeeds at first and then fails in a way
            it does not produce a test.out file it looks like the test
            succeeded.
Solution:   Delete the previous output file.
Files:      src/testdir/Make_dos.mak

Patch 8.0.0463
Problem:    Resetting 'compatible' in defaults.vim has unexpected side
            effects. (David Fishburn)
Solution:   Only reset 'compatible' if it was set.
Files:      runtime/defaults.vim

Patch 8.0.0464
Problem:    Can't find executable name on Solaris and FreeBSD.
```

```
Solution:   Check for "/proc/self/path/a.out". (Danek Duvall) And for
            "/proc/curproc/file".
Files:      src/config.h.in, src/configure.ac, src/main.c,
            src/auto/configure

Patch 8.0.0465
Problem:    Off-by-one error in using :move with folding.
Solution:   Correct off-by-one mistakes and add more tests. (Matthew
            Malcomson)
Files:      src/fold.c, src/testdir/test_fold.vim

Patch 8.0.0466
Problem:    There are still a few macros that should be all-caps.
Solution:   Make a few more macros all-caps.
Files:      src/buffer.c, src/edit.c, src/ex_cmds.c, src/ex_cmds2.c,
            src/ex_docmd.c, src/ex_getln.c, src/farsi.c, src/fileio.c,
            src/getchar.c, src/gui_beval.c, src/hardcopy.c, src/if_cscope.c,
            src/if_xcmdsrv.c, src/mark.c, src/memline.c, src/menu.c,
            src/message.c, src/misc1.c, src/normal.c, src/ops.c, src/option.c,
            src/quickfix.c, src/screen.c, src/search.c, src/syntax.c,
            src/tag.c, src/term.c, src/term.h, src/ui.c, src/undo.c,
            src/userfunc.c, src/version.c, src/vim.h

Patch 8.0.0467
Problem:    Using g< after :for does not show the right output. (Marcin
            Szamotulski)
Solution:   Call msg_sb_eol() in :echomsg.
Files:      src/eval.c

Patch 8.0.0468
Problem:    After aborting an Ex command g< does not work. (Marcin
            Szamotulski)
Solution:   Postpone clearing scrollback messages to until the command line
            has been entered.  Also fix that the screen isn't redrawn if after
            g< the command line is cancelled.
Files:      src/message.c, src/proto/message.pro, src/ex_getln.c, src/misc2.c,
            src/gui.c

Patch 8.0.0469
Problem:    Compiler warnings on MS-Windows.
Solution:   Add type casts. (Christian Brabandt)
Files:      src/fold.c

Patch 8.0.0470
Problem:    Not enough testing for help commands.
Solution:   Add a few more help tests. (Dominique Pelle, closes #1565)
Files:      src/testdir/test_help.vim, src/testdir/test_help_tagjump.vim

Patch 8.0.0471
Problem:    Exit callback test sometimes fails.
Solution:   Add it to the list of flaky tests.
Files:      src/testdir/runtest.vim

Patch 8.0.0472
```

```
Problem:    When a test fails and test.log is created, Test_edit_CTRL_I
            matches it instead of test1.in.
Solution:   Match with runtest.vim instead.
Files:      src/testdir/test_edit.vim

Patch 8.0.0473
Problem:    No test covering arg_all().
Solution:   Add a test expanding ##.
Files:      src/testdir/test_arglist.vim

Patch 8.0.0474
Problem:    The client-server feature is not tested.
Solution:   Add a test.
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/shared.vim,
            src/testdir/test_clientserver.vim, src/os_mswin.c

Patch 8.0.0475
Problem:    Not enough testing for the client-server feature.
Solution:   Add more tests.  Add the remote_startserver() function.  Fix that
            a locally evaluated expression uses function-local variables.
Files:      src/if_xcmdsrv.c, src/evalfunc.c, src/os_mswin.c,
            src/proto/main.pro, src/testdir/test_clientserver.vim,
            runtime/doc/eval.txt

Patch 8.0.0476 (after 8.0.0475)
Problem:    Missing change to main.c.
Solution:   Add new function.
Files:      src/main.c

Patch 8.0.0477
Problem:    The client-server test may hang when failing.
Solution:   Set a timer.  Add assert_report()
Files:      src/testdir/test_clientserver.vim, src/testdir/runtest.vim,
            src/eval.c, src/evalfunc.c, src/proto/eval.pro, src/if_xcmdsrv.c,
            src/os_mswin.c, runtime/doc/eval.txt

Patch 8.0.0478
Problem:    Tests use assert_true(0) and assert_false(1) to report errors.
Solution:   Use assert_report().
Files:      src/testdir/test_cscope.vim, src/testdir/test_expr.vim,
            src/testdir/test_perl.vim, src/testdir/test_channel.vim,
            src/testdir/test_cursor_func.vim, src/testdir/test_gui.vim,
            src/testdir/test_menu.vim, src/testdir/test_popup.vim,
            src/testdir/test_viminfo.vim, src/testdir/test_vimscript.vim,
            src/testdir/test_assert.vim

Patch 8.0.0479
Problem:    remote_peek() is not tested.
Solution:   Add a test.
Files:      src/testdir/test_clientserver.vim, src/testdir/runtest.vim

Patch 8.0.0480
Problem:    The remote_peek() test fails on MS-Windows.
Solution:   Check for pending messages. Also report errors in the first run if
```

            a flaky test fails twice.
Files: src/os_mswin.c, src/testdir/runtest.vim

Patch 8.0.0481
Problem: Unnecessary if statement.
Solution: Remove the statement. Fix "it's" vs "its" mistakes. (Dominique
            Pelle, closes #1568)
Files: src/syntax.c

Patch 8.0.0482
Problem: The setbufvar() function may mess up the window layout. (Kay Z.)
Solution: Do not check the window to be valid if it is NULL.
Files: src/window.c, src/testdir/test_functions.vim

Patch 8.0.0483
Problem: Illegal memory access when using :all. (Dominique Pelle)
Solution: Adjust the cursor position right after setting "curwin".
Files: src/window.c, src/testdir/test_window_cmd.vim

Patch 8.0.0484
Problem: Using :lhelpgrep with an argument that should fail does not
            produce an error if the previous :helpgrep worked.
Solution: Use another way to detect that autocommands made the quickfix info
            invalid. (Yegappan Lakshmanan)
Files: src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.0485
Problem: Not all windows commands are tested.
Solution: Add more tests for windows commands. (Dominique Pelle,
            closes #1575) Run test_autocmd separately, it interferes with
            other tests. Fix tests that depended on side effects.
Files: src/testdir/test_window_cmd.vim, src/testdir/test_alot.vim,
            src/testdir/test_autocmd.vim, src/testdir/test_fnamemodify.vim,
            src/testdir/test_functions.vim, src/testdir/test_delete.vim,
            src/testdir/Make_all.mak

Patch 8.0.0486
Problem: Crash and endless loop when closing windows in a SessionLoadPost
            autocommand.
Solution: Check for valid tabpage. (partly neovim #6308)
Files: src/testdir/test_autocmd.vim, src/fileio.c, src/proto/window.pro,
            src/window.c

Patch 8.0.0487
Problem: The autocmd test hangs on MS-Windows.
Solution: Skip the hanging tests for now.
Files: src/testdir/test_autocmd.vim

Patch 8.0.0488
Problem: Running tests leaves an "xxx" file behind.
Solution: Delete the 'verbosefile' after resetting the option.
Files: src/testdir/gen_opt_test.vim

Patch 8.0.0489

```
Problem:    Clipboard and "* register is not tested.
Solution:   Add a test for Mac and X11. (Kazunobu Kuriyama)
Files:      src/Makefile, src/testdir/Make_all.mak,
            src/testdir/test_quotestar.vim, src/testdir/runtest.vim

Patch 8.0.0490
Problem:    Splitting a 'winfixwidth' window vertically makes it one column
            smaller. (Dominique Pelle)
Solution:   Add one to the width for the separator.
Files:      src/window.c, src/testdir/test_window_cmd.vim

Patch 8.0.0491
Problem:    The quotestar test fails when a required feature is missing.
Solution:   Prepend "Skipped" to the thrown exception.
Files:      src/testdir/test_quotestar.vim

Patch 8.0.0492
Problem:    A failing client-server request can make Vim hang.
Solution:   Add a timeout argument to functions that wait.
Files:      src/evalfunc.c, src/if_xcmdsrv.c, src/proto/if_xcmdsrv.pro,
            src/main.c, src/os_mswin.c, src/proto/os_mswin.pro,
            src/vim.h, runtime/doc/eval.txt, src/testdir/test_clientserver.vim

Patch 8.0.0493
Problem:    Crash with cd command with very long argument.
Solution:   Check for running out of space. (Dominique Pelle, closes #1576)
Files:      src/testdir/test_alot.vim, src/testdir/test_cd.vim, src/Makefile,
            src/misc2.c

Patch 8.0.0494
Problem:    Build failure with older compiler on MS-Windows.
Solution:   Move declaration to start of block.
Files:      src/evalfunc.c, src/main.c, src/os_mswin.c

Patch 8.0.0495
Problem:    The quotestar test uses a timer instead of a timeout, thus it
            cannot be rerun like a flaky test.
Solution:   Remove the timer and add a timeout. (Kazunobu Kuriyama)
Files:      src/testdir/test_quotestar.vim

Patch 8.0.0496
Problem:    Insufficient testing for folding.
Solution:   Add a couple more fold tests. (Dominique Pelle, closes #1579)
Files:      src/testdir/test_fold.vim

Patch 8.0.0497
Problem:    Arabic support is not fully tested.
Solution:   Add more tests for the untested functions.  Comment out
            unreachable code.
Files:      src/arabic.c, src/testdir/test_arabic.vim

Patch 8.0.0498
Problem:    Two autocmd tests are skipped on MS-Windows.
Solution:   Make the test pass on MS-Windows. Write the messages in a file
```

```
            instead of getting the output of system().
Files:      src/testdir/test_autocmd.vim

Patch 8.0.0499
Problem:    taglist() does not prioritize tags for a buffer.
Solution:   Add an optional buffer argument. (Duncan McDougall, closes #1194)
Files:      runtime/doc/eval.txt, src/evalfunc.c, src/proto/tag.pro,
            src/Makefile, src/tag.c, src/testdir/test_alot.vim,
            src/testdir/test_taglist.vim

Patch 8.0.0500
Problem:    Quotestar test is still a bit flaky.
Solution:   Add a slower check for v:version.
Files:      src/testdir/test_quotestar.vim

Patch 8.0.0501
Problem:    On MS-Windows ":!start" does not work as expected.
Solution:   When creating a process fails try passing the argument to
            ShellExecute().  (Katsuya Hino, closes #1570)
Files:      runtime/doc/os_win32.txt, src/os_win32.c

Patch 8.0.0502
Problem:    Coverity complains about possible NULL pointer.
Solution:   Add an assert(), let's see if this works on all systems.
Files:      src/window.c

Patch 8.0.0503
Problem:    Endless loop in updating folds with 32 bit ints.
Solution:   Subtract from LHS instead of add to the RHS. (Matthew Malcomson)
Files:      src/fold.c

Patch 8.0.0504
Problem:    Looking up an Ex command is a bit slow.
Solution:   Instead of just using the first letter, also use the second letter
            to skip ahead in the list of commands. Generate the table with a
            Perl script. (Dominique Pelle, closes #1589)
Files:      src/Makefile, src/create_cmdidxs.pl, src/ex_docmd.c, Filelist

Patch 8.0.0505
Problem:    Failed window split for :stag not handled. (Coverity CID 99204)
Solution:   If the split fails skip to the end. (bstaletic, closes #1577)
Files:      src/tag.c

Patch 8.0.0506 (after 8.0.0504)
Problem:    Can't build with ANSI C.
Solution:   Move declarations to start of block.
Files:      src/ex_docmd.c

Patch 8.0.0507
Problem:    Client-server tests fail when $DISPLAY is not set.
Solution:   Check for E240 before running the test.
Files:      src/testdir/test_quotestar.vim, src/testdir/test_clientserver.vim

Patch 8.0.0508
```

```
Problem:    Coveralls no longer shows per-file coverage.
Solution:   Add coverage from codecov.io. (Christian Brabandt)
Files:      .travis.yml

Patch 8.0.0509
Problem:    No link to codecov.io results.
Solution:   Add a badge to the readme file.
Files:      README.md

Patch 8.0.0510 (after 8.0.0509)
Problem:    Typo in link to codecov.io results.
Solution:   Remove duplicate https:.
Files:      README.md

Patch 8.0.0511
Problem:    Message for skipping client-server tests is unclear.
Solution:   Be more specific about what's missing (Hirohito Higashi, Kazunobu
            Kuriyama)
Files:      src/testdir/test_quotestar.vim, src/testdir/test_clientserver.vim

Patch 8.0.0512
Problem:    Check for available characters takes too long.
Solution:   Only check did_start_blocking if wtime is negative. (Daisuke
            Suzuki, closes #1591)
Files:      src/os_unix.c

Patch 8.0.0513 (after 8.0.0201)
Problem:    Getting name of cleared highlight group is wrong. (Matt Wozniski)
Solution:   Only skip over cleared names for completion. (closes #1592)
            Also fix that a cleared group causes duplicate completions.
Files:      src/syntax.c, src/proto/syntax.pro, src/evalfunc.c,
            src/ex_cmds.c, src/testdir/test_syntax.vim,
            src/testdir/test_cmdline.vim

Patch 8.0.0514
Problem:    Script for creating cmdidxs can be improved.
Solution:   Count skipped lines instead of collecting the lines.  Add "const".
            (Dominique Pelle, closes #1594)
Files:      src/create_cmdidxs.pl, src/ex_docmd.c

Patch 8.0.0515
Problem:    ml_get errors in silent Ex mode. (Dominique Pelle)
Solution:   Clear valid flags when setting the cursor.  Set the topline when
            not in full screen mode.
Files:      src/ex_docmd.c, src/move.c, src/testdir/test_startup.vim

Patch 8.0.0516
Problem:    A large count on a normal command causes trouble. (Dominique
            Pelle)
Solution:   Make "opcount" long.
Files:      src/globals.h, src/testdir/test_normal.vim

Patch 8.0.0517
Problem:    There is no way to remove quickfix lists (for testing).
```

```
Solution:   Add the 'f' action to setqflist(). Add tests. (Yegappan
            Lakshmanan)
Files:      runtime/doc/eval.txt, src/evalfunc.c, src/quickfix.c,
            src/testdir/test_quickfix.vim

Patch 8.0.0518
Problem:    Storing a zero byte from a multi-byte character causes fold text
            to show up wrong.
Solution:   Avoid putting zero in ScreenLines. (Christian Brabandt,
            closes #1567)
Files:      src/screen.c, src/testdir/test_display.vim

Patch 8.0.0519
Problem:    Character classes are not well tested. They can differ between
            platforms.
Solution:   Add tests.  In the documentation make clear which classes depend
            on what library function.  Only use :cntrl: and :graph: for ASCII.
            (Kazunobu Kuriyama, Dominique Pelle, closes #1560)
            Update the documentation.
Files:      src/regexp.c, src/regexp_nfa.c, runtime/doc/pattern.txt,
            src/testdir/test_regexp_utf8.vim

Patch 8.0.0520
Problem:    Using a function pointer instead of the actual function, which we
            know.
Solution:   Change mb_ functions to utf_ functions when already checked for
            Unicode. (Dominique Pelle, closes #1582)
Files:      src/message.c, src/misc2.c, src/regexp.c, src/regexp_nfa.c,
            src/screen.c, src/spell.c

Patch 8.0.0521
Problem:    GtkForm handling is outdated.
Solution:   Get rid of event filter functions.  Get rid of GtkForm.width and
            .height.  Eliminate gtk_widget_size_request() calls. (Kazunobu
            Kuriyama)
Files:      src/gui_gtk_f.c, src/gui_gtk_f.h

Patch 8.0.0522
Problem:    MS-Windows: when 'clipboard' is "unnamed" yyp does not work in a
            :global command.
Solution:   When setting the clipboard was postponed, do not clear the
            register.
Files:      src/ops.c, src/proto/ui.pro, src/ui.c, src/globals.h,
            src/testdir/test_global.vim, src/Makefile,
            src/testdir/test_alot.vim

Patch 8.0.0523
Problem:    dv} deletes part of a multi-byte character. (Urtica Dioica)
Solution:   Include the whole character.
Files:      src/search.c, src/testdir/test_normal.vim

Patch 8.0.0524 (after 8.0.0518)
Problem:    Folds are messed up when 'encoding' is "utf-8".
Solution:   Also set the fold character when it's not multi-byte.
```

```
Files:      src/screen.c, src/testdir/test_display.vim

Patch 8.0.0525
Solution:   Completion for user command argument not tested.
Problem:    Add a test.
Files:      src/testdir/test_cmdline.vim

Patch 8.0.0526
Problem:    Coverity complains about possible negative value.
Solution:   Check return value of ftell() not to be negative.
Files:      src/os_unix.c

Patch 8.0.0527
Problem:    RISC OS support was removed long ago, but one file is still
            included.
Solution:   Delete the file. (Thomas Dziedzic, closes #1603)
Files:      Filelist, src/swis.s

Patch 8.0.0528
Problem:    When 'wildmenu' is set and 'wildmode' has "longest" then the first
            file name is highlighted, even though the text shows the longest
            match.
Solution:   Do not highlight the first match. (LemonBoy, closes #1602)
Files:      src/ex_getln.c

Patch 8.0.0529
Problem:    Line in test commented out.
Solution:   Uncomment the lines for character classes that were failing before
            8.0.0519. (Dominique Pelle, closes #1599)
Files:      src/testdir/test_regexp_utf8.vim

Patch 8.0.0530
Problem:    Buffer overflow when 'columns' is very big. (Nikolai Pavlov)
Solution:   Correctly compute where to truncate.  Fix translation.
            (closes #1600)
Files:      src/edit.c, src/testdir/test_edit.vim

Patch 8.0.0531 (after 8.0.0530)
Problem:    Test with long directory name fails on non-unix systems.
Solution:   Skip the test on non-unix systems.
Files:      src/testdir/test_edit.vim

Patch 8.0.0532 (after 8.0.0531)
Problem:    Test with long directory name fails on Mac.
Solution:   Skip the test on Mac systems.
Files:      src/testdir/test_edit.vim

Patch 8.0.0533
Problem:    Abbreviation doesn't work after backspacing newline. (Hkonrk)
Solution:   Set the insert start column. (closes #1609)
Files:      src/testdir/test_mapping.vim, src/edit.c

Patch 8.0.0534
Problem:    Defaults.vim does not work well with tiny features. (crd477)
```

```
Solution:   When the +eval feature is not available always reset 'compatible'.
Files:      runtime/defaults.vim

Patch 8.0.0535
Problem:    Memory leak when exiting from within a user function.
Solution:   Clear the function call stack on exit.
Files:      src/userfunc.c

Patch 8.0.0536
Problem:    Quickfix window not updated when freeing quickfix stack.
Solution:   Update the quickfix window. (Yegappan Lakshmanan)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.0537
Problem:    Illegal memory access with :z and large count.
Solution:   Check for number overflow, using long instead of int. (Dominique
            Pelle, closes #1612)
Files:      src/Makefile, src/ex_cmds.c, src/testdir/test_alot.vim,
            src/testdir/test_ex_z.vim

Patch 8.0.0538
Problem:    No test for falling back to default term value.
Solution:   Add a test.
Files:      src/testdir/test_startup.vim

Patch 8.0.0539 (after 8.0.0538)
Problem:    Startup test fails on Mac.
Solution:   Use another term name, "unknown" is known. Avoid a 2 second delay.
Files:      src/testdir/test_startup.vim, src/main.c, src/proto/main.pro,
            src/term.c

Patch 8.0.0540 (after 8.0.0540)
Problem:    Building unit tests fails.
Solution:   Move params outside of #ifdef.
Files:      src/main.c, src/message_test.c

Patch 8.0.0541
Problem:    Compiler warning on MS-Windows.
Solution:   Add a type cast. (Mike Williams)
Files:      src/edit.c

Patch 8.0.0542
Problem:    getpos() can return a negative line number. (haya14busa)
Solution:   Handle a zero topline and botline. (closes #1613)
Files:      src/eval.c, runtime/doc/eval.txt

Patch 8.0.0543
Problem:    Test_edit causes older xfce4-terminal to close. (Dominique Pelle)
Solution:   Reduce number of columns to 2000.  Try to restore the window
            position.
Files:      src/testdir/test_edit.vim, src/evalfunc.c, src/term.c,
            src/proto/term.pro, src/term.h

Patch 8.0.0544
```

```
Problem:    Cppcheck warnings.
Solution:   Use temp variable. Change NUL to NULL. Swap conditions. (Dominique
            Pelle)
Files:      src/channel.c, src/edit.c, src/farsi.c

Patch 8.0.0545
Problem:    Edit test may fail on some systems.
Solution:   If creating a directory with a very long path fails, bail out.
Files:      src/testdir/test_edit.vim

Patch 8.0.0546
Problem:    Swap file exists briefly when opening the command window.
Solution:   Set the noswapfile command modifier before splitting the window.
            (James McCoy, closes #1620)
Files:      src/ex_getln.c, src/option.c

Patch 8.0.0547
Problem:    Extra line break in verbosefile when using ":echomsg". (Ingo
            Karkat)
Solution:   Don't call msg_start(). (closes #1618)
Files:      src/eval.c, src/testdir/test_cmdline.vim

Patch 8.0.0548
Problem:    Saving the redo buffer only works one time, resulting in the "."
            command not working well for a function call inside another
            function call. (Ingo Karkat)
Solution:   Save the redo buffer at every user function call. (closes #1619)
Files:      src/getchar.c, src/proto/getchar.pro, src/structs.h,
            src/fileio.c, src/userfunc.c, src/testdir/test_functions.vim

Patch 8.0.0549
Problem:    No test for the 8g8 command.
Solution:   Add a test. (Dominique Pelle, closes #1615)
Files:      src/testdir/test_normal.vim

Patch 8.0.0550
Problem:    Some etags format tags file use 0x01, breaking the parsing.
Solution:   Use 0x02 for TAG_SEP. (James McCoy, closes #1614)
Files:      src/tag.c, src/testdir/test_taglist.vim

Patch 8.0.0551
Problem:    The typeahead buffer is reallocated too often.
Solution:   Re-use the existing buffer if possible.
Files:      src/getchar.c

Patch 8.0.0552
Problem:    Toupper and tolower don't work properly for Turkish when 'casemap'
            is empty. (Bjorn Linse)
Solution:   Check the 'casemap' options when deciding how to upper/lower case.
Files:      src/charset.c, src/testdir/test_normal.vim

Patch 8.0.0553 (after 8.0.0552)
Problem:    Toupper/tolower test with Turkish locale fails on Mac.
Solution:   Skip the test on Mac.
```

```
Files:      src/testdir/test_normal.vim

Patch 8.0.0554 (after 8.0.0552)
Problem:    Toupper and tolower don't work properly for Turkish when 'casemap'
            contains "keepascii". (Bjorn Linse)
Solution:   When 'casemap' contains "keepascii" use ASCII toupper/tolower.
Files:      src/charset.c, src/testdir/test_normal.vim

Patch 8.0.0555 (after 8.0.0552)
Problem:    Toupper/tolower test fails on OSX without Darwin.
Solution:   Skip that part of the test also for OSX. (Kazunobu Kuriyama)
Files:      src/testdir/test_normal.vim

Patch 8.0.0556
Problem:    Getting the window position fails if both the GUI and term
            code is built in.
Solution:   Return after getting the GUI window position. (Kazunobu Kuriyama)
Files:      src/evalfunc.c

Patch 8.0.0557
Problem:    GTK: using static gravities is not useful.
Solution:   Remove setting static gravities. (Kazunobu Kuriyama)
Files:      src/gui_gtk_f.c

Patch 8.0.0558
Problem:    The :ownsyntax command is not tested.
Solution:   Add a test. (Dominique Pelle, closes #1622)
Files:      src/testdir/test_syntax.vim

Patch 8.0.0559
Problem:    Setting 'ttytype' to xxx does not always fail as expected. (Marvin
            Schmidt)
Solution:   Catch both possible errors. (closes #1601)
Files:      src/testdir/test_options.vim

Patch 8.0.0560
Problem:    :windo allows for ! but it's not supported.
Solution:   Disallow passing !. (Hirohito Higashi)
Files:      src/ex_cmds.h

Patch 8.0.0561
Problem:    Undefined behavior when using backslash after empty line.
Solution:   Check for an empty line. (Dominique Pelle, closes #1631)
Files:      src/misc2.c, src/testdir/test_vimscript.vim

Patch 8.0.0562
Problem:    Not enough test coverage for syntax commands.
Solution:   Add a few more tests. (Dominique Pelle, closes #1624)
Files:      src/testdir/test_cmdline.vim, src/testdir/test_syntax.vim

Patch 8.0.0563
Problem:    Crash when getting the window position in tmux. (Marvin Schmidt)
Solution:   Add t_GP to the list of terminal options. (closes #1627)
Files:      src/option.c
```

```
Patch 8.0.0564
Problem:    Cannot detect Bazel BUILD files on some systems.
Solution:   Check for BUILD after script checks. (Issue #1340)
Files:      runtime/filetype.vim

Patch 8.0.0565
Problem:    Using freed memory in :caddbuf after clearing quickfix list.
            (Dominique Pelle)
Solution:   Set qf_last to NULL.
Files:      src/quickfix.c

Patch 8.0.0566
Problem:    Setting 'nocompatible' for the tiny version moves the cursor.
Solution:   Use another trick to skip commands when the +eval feature is
            present. (Christian Brabandt, closes #1630)
Files:      runtime/defaults.vim

Patch 8.0.0567
Problem:    Call for requesting color and ambiwidth is too early. (Hirohito
            Higashi)
Solution:   Move the call down to below resetting "starting".
Files:      src/main.c

Patch 8.0.0568
Problem:    "1gd" may hang.
Solution:   Don't get stuck in one position. (Christian Brabandt, closes #1643)
Files:      src/testdir/test_goto.vim, src/normal.c

Patch 8.0.0569
Problem:    Bracketed paste is still enabled when executing a shell command.
            (Michael Smith)
Solution:   Disable bracketed paste when going into cooked mode. (closes #1638)
Files:      src/term.c

Patch 8.0.0570
Problem:    Can't run make with several jobs, creating directories has a race
            condition.
Solution:   Use the MKDIR_P autoconf mechanism. (Eric N. Vander Weele,
            closes #1639)
Files:      src/configure.ac, src/auto/configure, src/Makefile,
            src/config.mk.in, src/install-sh, src/mkinstalldirs, Filelist

Patch 8.0.0571
Problem:    The cursor line number becomes negative when using :z^ in an empty
            buffer. (neovim #6557)
Solution:   Correct the line number.  Also reset the column.
Files:      src/testdir/test_ex_z.vim, src/ex_cmds.c

Patch 8.0.0572
Problem:    Building the command table requires Perl.
Solution:   Use a Vim script solution. (Dominique Pelle, closes #1641)
Files:      src/Makefile, src/create_cmdidxs.pl, src/create_cmdidxs.vim,
            src/ex_cmdidxs.h, src/ex_docmd.c, Filelist
```

```
Patch 8.0.0573
Problem:    Running parallel make after distclean fails. (Manuel Ortega)
Solution:   Instead of using targets "scratch config myself" use "reconfig".
Files:      src/Makefile, src/config.mk.dist

Patch 8.0.0574
Problem:    Get only one quickfix list after :caddbuf.
Solution:   Reset qf_multiline. (Yegappan Lakshmanan)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.0575
Problem:    Using freed memory when resetting 'indentexpr' while evaluating
            it. (Dominique Pelle)
Solution:   Make a copy of 'indentexpr'.
Files:      src/misc1.c, src/testdir/test_options.vim

Patch 8.0.0576 (after 8.0.0570 and 8.0.0573)
Problem:    Can't build when configure chooses "install-sh". (Daniel Hahler)
Solution:   Always use install-sh.  Fix remaining use of mkinstalldirs.
            (closes #1647)
Files:      src/installman.sh, src/installml.sh, src/config.mk.in,
            src/configure.ac, src/auto/configure, src/Makefile

Patch 8.0.0577 (after 8.0.0575)
Problem:    Warning for uninitialized variable. (John Marriott)
Solution:   Initialize "indent".
Files:      src/misc1.c

Patch 8.0.0578
Problem:    :simalt on MS-Windows does not work properly.
Solution:   Put something in the typeahead buffer. (Christian Brabandt)
Files:      src/gui_w32.c

Patch 8.0.0579
Problem:    Duplicate test case for quickfix.
Solution:   Remove the function. (Yegappan Lakshmanan)
Files:      src/testdir/test_quickfix.vim

Patch 8.0.0580
Problem:    Cannot set the valid flag with setqflist().
Solution:   Add the "valid" argument. (Yegappan Lakshmanan, closes #1642)
Files:      runtime/doc/eval.txt, src/quickfix.c,
            src/testdir/test_quickfix.vim

Patch 8.0.0581
Problem:    Moving folded text is sometimes not correct.
Solution:   Bail out when "move_end" is zero. (Matthew Malcomson)
Files:      src/fold.c, src/testdir/test_fold.vim

Patch 8.0.0582
Problem:    Illegal memory access with z= command. (Dominique Pelle)
Solution:   Avoid case folded text to be longer than the original text.  Use
            MB_PTR2LEN() instead of MB_BYTE2LEN().
```

```
Files:      src/spell.c, src/testdir/test_spell.vim

Patch 8.0.0583
Problem:    Fold test hangs on MS-Windows.
Solution:   Avoid overflow in compare.
Files:      src/fold.c

Patch 8.0.0584
Problem:    Memory leak when executing quickfix tests.
Solution:   Free the list reference. (Yegappan Lakshmanan)
Files:      src/quickfix.c

Patch 8.0.0585
Problem:    Test_options fails when run in the GUI.
Solution:   Also check the 'imactivatekey' value when the GUI is not running.
            Specify test values that work and that fail.
Files:      src/option.c, src/testdir/gen_opt_test.vim

Patch 8.0.0586
Problem:    No test for mapping timing out.
Solution:   Add a test.
Files:      src/testdir/test_mapping.vim

Patch 8.0.0587
Problem:    Configure check for return value of tgetent is skipped.
Solution:   Always perform the check. (Marvin Schmidt, closes #1664)
Files:      src/configure.ac, src/auto/configure

Patch 8.0.0588
Problem:    job_stop() often assumes the channel will be closed, while the job
            may not actually be stopped. (Martin Gammelsæter)
Solution:   Only assume the job stops on "kill".  Don't send a signal if the
            job has already ended. (closes #1632)
Files:      src/channel.c

Patch 8.0.0589 (after 8.0.0578)
Problem:    :simalt still does not work.
Solution:   Use K_NOP instead of K_IGNORE. (Christian Brabandt)
Files:      src/gui_w32.c

Patch 8.0.0590
Problem:    Cannot add a context to locations.
Solution:   Add the "context" entry in location entries. (Yegappan Lakshmanan,
            closes #1012)
Files:      src/eval.c, src/proto/quickfix.pro, src/quickfix.c,
            src/testdir/test_quickfix.vim

Patch 8.0.0591
Problem:    Changes to eval functionality not documented.
Solution:   Include all the changes.
Files:      runtime/doc/eval.txt

Patch 8.0.0592
Problem:    If a job writes to a buffer and the user is typing a command, the
```

```
            screen isn't updated. When a message is displayed the changed
            buffer may cause it to be cleared. (Ramel Eshed)
Solution:   Update the screen and then the command line if the screen didn't
            scroll. Avoid inserting screen lines, as it clears any message.
            Update the status line when the buffer changed.
Files:      src/channel.c, src/screen.c, src/ex_getln.c, src/globals.h,
            src/vim.h, src/proto/ex_getln.pro, src/proto/screen.pro

Patch 8.0.0593
Problem:    Duplication of code for adding a list or dict return value.
Solution:   Add rettv_dict_set() and rettv_list_set(). (Yegappan Lakshmanan)
Files:      src/dict.c, src/eval.c, src/evalfunc.c, src/if_perl.xs, src/list.c,
            src/proto/dict.pro, src/proto/list.pro

Patch 8.0.0594 (after 8.0.0592)
Problem:    Build failure when windows feature is missing.
Solution:   Add #ifdef.
Files:      src/screen.c

Patch 8.0.0595 (after 8.0.0590)
Problem:    Coverity warning for not checking return value of dict_add().
Solution:   Check the return value for FAIL.
Files:      src/quickfix.c

Patch 8.0.0596
Problem:    Crash when complete() is called after complete_add() in
            'completefunc'. (Lifepillar)
Solution:   Bail out if compl_pattern is NULL. (closes #1668)
            Also avoid using freed memory.
Files:      src/edit.c, src/testdir/test_popup.vim

Patch 8.0.0597
Problem:    Off-by-one error in buffer size computation.
Solution:   Use ">=" instead of ">". (LemonBoy, closes #1694)
Files:      src/quickfix.c

Patch 8.0.0598
Problem:    Building with gcc 7.1 yields new warnings.
Solution:   Initialize result. (John Marriott)
Files:      src/ex_docmd.c

Patch 8.0.0599
Problem:    diff mode is insufficiently tested
Solution:   Add more test cases. (Dominique Pelle, closes #1685)
Files:      src/diff.c, src/testdir/test_diffmode.vim

Patch 8.0.0600
Problem:    test_recover fails on some systems.
Solution:   Explicitly check if "/" is writable. (Ken Takata)
Files:      src/testdir/test_recover.vim

Patch 8.0.0601
Problem:    No test coverage for :spellrepall.
Solution:   Add a test. (Dominique Pelle, closes #1717)
```

```
Files:      src/testdir/test_spell.vim

Patch 8.0.0602
Problem:    When gF fails to edit the file the cursor still moves to the found
            line number.
Solution:   Check the return value of do_ecmd(). (Michael Hwang)
Files:      src/normal.c, src/testdir/test_gf.vim

Patch 8.0.0603 (after 8.0.0602)
Problem:    gF test fails on MS-Windows.
Solution:   Use @ instead of : before the line number
Files:      src/testdir/test_gf.vim

Patch 8.0.0604 (after 8.0.0603)
Problem:    gF test still fails on MS-Windows.
Solution:   Use : before the line number and remove it from 'isfname'.
Files:      src/testdir/test_gf.vim

Patch 8.0.0605
Problem:    The buffer that quickfix caches for performance may become
            invalid. (Daniel Hahler)
Solution:   Reset qf_last_bufref in qf_init_ext(). (Daniel Hahler,
            closes #1728, closes #1676)
Files:      src/quickfix.c

Patch 8.0.0606
Problem:    Cannot set the context for a specified quickfix list.
Solution:   Use the list index instead of the current list. (Yegappan
            Lakshmanan)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.0607
Problem:    When creating a bufref, then using :bwipe and :new it might get
            the same memory and bufref_valid() returns true.
Solution:   Add br_fnum to check the buffer number didn't change.
Files:      src/structs.h, src/buffer.c, src/globals.h, src/if_py_both.h,
            src/quickfix.c

Patch 8.0.0608
Problem:    Cannot manipulate other than the current quickfix list.
Solution:   Pass the list index to quickfix functions. (Yegappan Lakshmanan)
Files:      src/quickfix.c

Patch 8.0.0609
Problem:    For some people the hint about quitting is not sufficient.
Solution:   Put <Enter> separately.  Also use ":qa!" to get out even when
            there are changes.
Files:      src/normal.c

Patch 8.0.0610
Problem:    The screen is redrawn when t_BG is set and used to detect the
            value for 'background'.
Solution:   Don't redraw when the value of 'background' didn't change.
Files:      src/term.c.
```

```
Patch 8.0.0611
Problem:    When t_u7 is sent a few characters in the second screen line are
            overwritten and not redrawn later. (Rastislav Barlik)
Solution:   Move redrawing the screen to after overwriting the characters.
Files:      src/main.c, src/term.c.

Patch 8.0.0612
Problem:    Package directories are added to 'runtimepath' only after loading
            non-package plugins.
Solution:   Split off the code to add package directories to 'runtimepath'.
            (Ingo Karkat, closes #1680)
Files:      src/ex_cmds2.c, src/globals.h, src/main.c, src/proto/ex_cmds2.pro,
            src/testdir/test_startup.vim

Patch 8.0.0613
Problem:    The conf filetype detection is done before ftdetect scripts from
            packages that are added later.
Solution:   Add the FALLBACK argument to :setfiletype. (closes #1679,
            closes #1693)
Files:      src/ex_docmd.c, runtime/filetype.vim, src/Makefile,
            src/testdir/test_filetype.vim, src/testdir/test_alot.vim

Patch 8.0.0614
Problem:    float2nr() is not exactly right.
Solution:   Make float2nr() more accurate.  Turn test65 into a new style test.
            (Hirohito Higashi, closes #1688)
Files:      src/Makefile, src/evalfunc.c, src/testdir/Make_all.mak,
            src/testdir/Make_vms.mms, src/testdir/test65.in,
            src/testdir/test65.ok, src/testdir/test_float_func.vim,
            src/testdir/test_vimscript.vim, src/macros.h

Patch 8.0.0615
Problem:    Using % with :hardcopy wrongly escapes spaces. (Alexey Muranov)
Solution:   Expand % differently. (Christian Brabandt, closes #1682)
Files:      src/ex_docmd.c, src/testdir/test_hardcopy.vim

Patch 8.0.0616
Problem:    When setting the cterm background with ":hi Normal" the value of
            'background' may be set wrongly.
Solution:   Check that the color is less than 16.  Don't set 'background' when
            it was set explicitly. (LemonBoy, closes #1710)
Files:      src/syntax.c, src/testdir/test_syntax.vim

Patch 8.0.0617 (after 8.0.0615)
Problem:    Hardcopy test hangs on MS-Windows.
Solution:   Check the postscript feature is supported.
Files:      src/testdir/test_hardcopy.vim

Patch 8.0.0618
Problem:    NFA regex engine handles [0-z] incorrectly.
Solution:   Return at the right point. (James McCoy, closes #1703)
Files:      src/regexp_nfa.c, src/testdir/test36.in, src/testdir/test36.ok
```

Patch 8.0.0619
Problem: In the GUI, when a timer uses feedkeys(), it still waits for an
            event. (Raymond Ko)
Solution: Check tb_change_cnt in one more place.
Files: src/gui.c

Patch 8.0.0620
Problem: Since we only support GTK versions that have it, the check for
            HAVE_GTK_MULTIHEAD is no longer needed.
Solution: Remove HAVE_GTK_MULTIHEAD. (Kazunobu Kuriyama)
Files: src/config.h.in, src/configure.ac, src/auto/configure,
            src/gui_beval.c, src/gui_gtk_x11.c, src/mbyte.c

Patch 8.0.0621
Problem: The ":stag" command does not respect 'switchbuf'.
Solution: Check 'switchbuf' for tag commands that may open a new window.
            (Ingo Karkat, closes #1681) Define macros for the return values
            of getfile().
Files: src/tag.c, src/testdir/test_tagjump.vim, src/vim.h, src/buffer.c,
            src/ex_cmds.c, src/search.c,

Patch 8.0.0622
Problem: Using a text object to select quoted text fails when 'selection'
            is set to "exclusive". (Guraga)
Solution: Swap cursor and visual start position. (Christian Brabandt,
            closes #1687)
Files: src/search.c, src/testdir/test_textobjects.vim

Patch 8.0.0623
Problem: The message "Invalid range" is used for multiple errors.
Solution: Add two more specific error messages. (Itchyny, Ken Hamada)
Files: src/regexp.c, src/regexp_nfa.c, src/testdir/test_regexp_utf8.vim

Patch 8.0.0624 (after 8.0.0623)
Problem: Warning for unused variable in tiny build. (Tony Mechelynck)
Solution: Add an #ifdef.
Files: src/regexp.c

Patch 8.0.0625
Problem: shellescape() always escapes a newline, which does not work with
            some shells. (Harm te Hennepe)
Solution: Only escape a newline when the "special" argument is non-zero.
            (Christian Brabandt, closes #1590)
Files: src/evalfunc.c, src/testdir/test_functions.vim

Patch 8.0.0626
Problem: In the GUI the cursor may flicker.
Solution: Check the cmd_silent flag before updating the cursor shape.
            (Hirohito Higashi, closes #1637)
Files: src/getchar.c

Patch 8.0.0627
Problem: When 'wrapscan' is off "gn" does not select the whole pattern when

            it's the last one in the text. (KeyboardFire)
Solution: Check if the search fails. (Christian Brabandt, closes #1683)
Files: src/search.c, src/testdir/test_gn.vim

Patch 8.0.0628 (after 8.0.0626
Problem: Cursor disappears after silent mapping. (Ramel Eshed)
Solution: Do restore the cursor when it was changed, but don't change it in
            the first place for a silent mapping.
Files: src/getchar.c

Patch 8.0.0629 (after 8.0.0611)
Problem: Checking for ambiguous width is not working. (Hirohito Higashi)
Solution: Reset "starting" earlier.
Files: src/main.c

Patch 8.0.0630
Problem: The :global command does not work recursively, which makes it
            difficult to execute a command on a line where one pattern matches
            and another does not match. (Miles Cranmer)
Solution: Allow for recursion if it is for only one line. (closes #1760)
Files: src/ex_cmds.c, src/testdir/test_global.vim, runtime/doc/repeat.txt

Patch 8.0.0631
Problem: Perl 5.26 also needs S_TOPMARK and S_POPMARK defined.
Solution: Define the functions when needed. (Jesin, closes #1748)
Files: src/if_perl.xs

Patch 8.0.0632
Problem: The quotestar test is still a bit flaky.
Solution: Kill any existing server to make the retry work. Wait for the
            register to be filled.
Files: src/testdir/test_quotestar.vim

Patch 8.0.0633
Problem: The client-server test is still a bit flaky.
Solution: Wait a bit for the GUI to start. Check that the version number
            can be obtained.
Files: src/testdir/test_clientserver.vim

Patch 8.0.0634
Problem: Cannot easily get to the last quickfix list.
Solution: Add "$" as a value for the "nr" argument of getqflist() and
            setqflist(). (Yegappan Lakshmanan)
Files: runtime/doc/eval.txt, src/quickfix.c,
            src/testdir/test_quickfix.vim

Patch 8.0.0635
Problem: When 'ignorecase' is set script detection is inaccurate.
Solution: Enforce matching case for text. (closes #1753)
Files: runtime/scripts.vim

Patch 8.0.0636
Problem: When reading the undo file fails may use uninitialized data.

```
Solution:   Always clear the buffer on failure.
Files:      src/undo.c

Patch 8.0.0637
Problem:    Crash when using some version of GTK 3.
Solution:   Add #ifdefs around incrementing the menu index. (Kazunobu
            Kuriyama)
Files:      src/gui_gtk.c

Patch 8.0.0638
Problem:    Cannot build with new MSVC version VS2017.
Solution:   Change the compiler arguments. (Leonardo Valeri Manera,
            closes #1731, closes #1747)
Files:      src/GvimExt/Makefile, src/Make_mvc.mak

Patch 8.0.0639
Problem:    The cursor position is set to the last position in a new commit
            message.
Solution:   Don't set the position if the filetype matches "commit".
            (Christian Brabandt)
Files:      runtime/defaults.vim

Patch 8.0.0640
Problem:    Mismatch between help and actual message for ":syn conceal".
Solution:   Change the message to match the help. (Ken Takata)
Files:      src/syntax.c

Patch 8.0.0641
Problem:    Cannot set a separate highlighting for the current line in the
            quickfix window.
Solution:   Add QuickFixLine. (anishsane, closes #1755)
Files:      src/option.c, src/quickfix.c, src/screen.c, src/syntax.c,
            src/vim.h, runtime/doc/options.txt, runtime/doc/quickfix.txt

Patch 8.0.0642
Problem:    writefile() continues after detecting an error.
Solution:   Bail out as soon as an error is detected. (suggestions by Nikolai
            Pavlov, closes #1476)
Files:      src/evalfunc.c, src/testdir/test_writefile.vim

Patch 8.0.0643
Problem:    When 'hlsearch' is set and matching with the last search pattern
            is very slow, Vim becomes unusable.  Cannot quit search by
            pressing CTRL-C.
Solution:   When the search times out set a flag and don't try again.  Check
            for timeout and CTRL-C in NFA loop that adds states.
Files:      src/screen.c, src/ex_cmds.c, src/quickfix.c, src/regexp.c,
            src/proto/regexp.pro, src/regexp.h, src/search.c,
            src/proto/search.pro, src/syntax.c, src/regexp_nfa.c, src/spell.c,
            src/tag.c, src/gui.c, src/edit.c, src/evalfunc.c, src/ex_docmd.c,
            src/ex_getln.c, src/normal.c

Patch 8.0.0644
Problem:    There is no test for 'hlsearch' timing out.
```

```
Solution:   Add a test.
Files:      src/testdir/test_hlsearch.vim

Patch 8.0.0645
Problem:    The new regexp engine does not give an error for using a back
            reference where it is not allowed. (Dominique Pelle)
Solution:   Check the back reference like the old engine. (closes #1774)
Files:      src/regexp.c, src/regexp_nfa.c, src/testdir/test_hlsearch.vim,
            src/testdir/test_statusline.vim,
            src/testdir/test_regexp_latin1.vim

Patch 8.0.0646
Problem:    The hlsearch test fails on fast systems.
Solution:   Make the search pattern slower.  Fix that the old regexp engine
            doesn't timeout properly.
Files:      src/regexp.c, src/testdir/test_hlsearch.vim

Patch 8.0.0647
Problem:    Syntax highlighting can cause a freeze.
Solution:   Apply 'redrawtime' to syntax highlighting, per window.
Files:      src/structs.h, src/screen.c, src/syntax.c, src/normal.c,
            src/regexp.c, src/proto/syntax.pro, src/testdir/test_syntax.vim,
            runtime/doc/options.txt

Patch 8.0.0648
Problem:    Possible use of NULL pointer if buflist_new() returns NULL.
            (Coverity)
Solution:   Check for NULL pointer in set_bufref().
Files:      src/buffer.c

Patch 8.0.0649
Problem:    When opening a help file the filetype is set several times.
Solution:   When setting the filetype to the same value from a modeline, don't
            trigger FileType autocommands.  Don't set the filetype to "help"
            when it's already set correctly.
Files:      src/ex_cmds.c, src/option.c, runtime/filetype.vim

Patch 8.0.0650
Problem:    For extra help files the filetype is set more than once.
Solution:   In *.txt files check that there is no help file modline.
Files:      runtime/filetype.vim

Patch 8.0.0651 (after 8.0.0649)
Problem:    Build failure without the auto command feature.
Solution:   Add #ifdef. (closes #1782)
Files:      src/ex_cmds.c

Patch 8.0.0652
Problem:    Unicode information is outdated.
Solution:   Update to Unicode 10. (Christian Brabandt)
Files:      runtime/tools/unicode.vim, src/mbyte.c

Patch 8.0.0653
Problem:    The default highlight for QuickFixLine does not work for several
```

```
            color schemes. (Manas Thakur)
Solution:   Make the default use the old color. (closes #1780)
Files:      src/syntax.c

Patch 8.0.0654
Problem:    Text found after :endfunction is silently ignored.
Solution:   Give a warning if 'verbose' is set.  When | or \n are used,
            execute the text as a command.
Files:      src/testdir/test_vimscript.vim, src/userfunc.c,
            runtime/doc/eval.txt

Patch 8.0.0655
Problem:    Not easy to make sure a function does not exist.
Solution:   Add ! as an optional argument to :delfunc.
Files:      src/userfunc.c, src/ex_cmds.h, src/testdir/test_vimscript.vim

Patch 8.0.0656
Problem:    Cannot use ! after some user commands.
Solution:   Properly check for existing command. (Hirohito Higashi)
Files:      src/ex_docmd.c, src/testdir/test_vimscript.vim

Patch 8.0.0657
Problem:    Cannot get and set quickfix list items.
Solution:   Add the "items" argument to getqflist() and setqflist(). (Yegappan
            Lakshmanan)
Files:      runtime/doc/eval.txt, src/quickfix.c,
            src/testdir/test_quickfix.vim

Patch 8.0.0658
Problem:    Spell test is old style.
Solution:   Turn the spell test into a new style test (pschuh, closes #1778)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/Make_vms.mms,
            src/testdir/test58.in, src/testdir/test58.ok,
            src/testdir/test_spell.vim

Patch 8.0.0659
Problem:    No test for conceal mode.
Solution:   Add a conceal mode test. (Dominique Pelle, closes #1783)
Files:      runtime/doc/eval.txt, src/evalfunc.c, src/testdir/test_syntax.vim

Patch 8.0.0660
Problem:    Silent install on MS-Windows does show a dialog.
Solution:   Add /SD to the default choice. (allburov, closes #1772)
Files:      nsis/gvim.nsi

Patch 8.0.0661
Problem:    Recognizing urxvt mouse codes does not work well.
Solution:   Recognize "Esc[*M" and "Esc[*m". (Maurice Bos, closes #1486)
Files:      src/keymap.h, src/misc2.c, src/os_unix.c, src/term.c

Patch 8.0.0662 (after 8.0.0659)
Problem:    Stray FIXME for fixed problem.
Solution:   Remove the comment. (Dominique Pelle)
Files:      src/testdir/test_syntax.vim
```

Patch 8.0.0663
Problem: Giving an error message only when 'verbose' set is unexpected.
Solution: Give a warning message instead.
Files: src/message.c, src/proto/message.pro, src/userfunc.c,
            src/testdir/test_vimscript.vim, runtime/doc/eval.txt

Patch 8.0.0664 (after 8.0.0661)
Problem: Mouse does not work in tmux. (lilydjwg)
Solution: Add flag for SGR release being present.
Files: src/term.c

Patch 8.0.0665 (after 8.0.0661)
Problem: Warning for uninitialized variable. (Tony Mechelynck)
Solution: Initialize it.
Files: src/term.c

Patch 8.0.0666
Problem: Dead for loop. (Coverity)
Solution: Remove the for loop.
Files: src/term.c

Patch 8.0.0667
Problem: Memory access error when command follows :endfunction. (Nikolai
            Pavlov)
Solution: Make memory handling in :function straightforward. (closes #1793)
Files: src/userfunc.c, src/testdir/test_vimscript.vim

Patch 8.0.0668 (after 8.0.0660)
Problem: Nsis installer script does not work. (Christian Brabandt)
Solution: Fix the syntax of /SD.
Files: nsis/gvim.nsi

Patch 8.0.0669
Problem: In Insert mode, CTRL-N at start of the buffer does not work
            correctly. (zuloloxi)
Solution: Wrap around the start of the buffer. (Christian Brabandt)
Files: src/edit.c, src/testdir/test_popup.vim

Patch 8.0.0670
Problem: Can't use input() in a timer callback. (Cosmin Popescu)
Solution: Reset vgetc_busy and set timer_busy. (Ozaki Kiichi, closes #1790,
            closes #1129)
Files: src/evalfunc.c, src/ex_cmds2.c, src/globals.h,
            src/testdir/test_timers.vim

Patch 8.0.0671
Problem: When a function invoked from a timer calls confirm() and the user
            types CTRL-C then Vim hangs.
Solution: Reset typebuf_was_filled. (Ozaki Kiichi, closes #1791)
Files: src/getchar.c

Patch 8.0.0672
Problem: Third item of synconcealed() changes too often. (Dominique Pelle)

```
Solution:   Reset the sequence number at the start of each line.
Files:      src/syntax.c, src/testdir/test_syntax.vim, runtime/doc/eval.txt

Patch 8.0.0673 (after 8.0.0673)
Problem:    Build failure without conceal feature.
Solution:   Add #ifdef.
Files:      src/syntax.c

Patch 8.0.0674 (after 8.0.0670)
Problem:    Cannot build with eval but without timers.
Solution:   Add #ifdef (John Marriott)
Files:      src/evalfunc.c

Patch 8.0.0675
Problem:    'colorcolumn' has a higher priority than 'hlsearch', it should be
            the other way around. (Nazri Ramliy)
Solution:   Change the priorities. (LemonBoy, closes #1794)
Files:      src/screen.c, src/testdir/test_listlbr_utf8.vim

Patch 8.0.0676
Problem:    Crash when closing the quickfix window in a FileType autocommand
            that triggers when the quickfix window is opened.
Solution:   Save the new value before triggering the OptionSet autocommand.
            Add the "starting" flag to test_override() to make the text work.
Files:      src/evalfunc.c, src/option.c, runtime/doc/eval.txt

Patch 8.0.0677
Problem:    Setting 'filetype' internally may cause the current buffer and
            window to change unexpectedly.
Solution:   Set curbuf_lock. (closes #1734)
Files:      src/quickfix.c, src/ex_cmds.c, src/ex_getln.c,
            src/testdir/test_quickfix.vim

Patch 8.0.0678
Problem:    When 'equalalways' is set and closing a window in a separate
            frame, not all window sizes are adjusted. (Glacambre)
Solution:   Resize all windows if the new current window is not in the same
            frame as the closed window. (closes #1707)
Files:      src/window.c, src/testdir/test_window_cmd.vim

Patch 8.0.0679 (after 8.0.0678)
Problem:    Using freed memory.
Solution:   Get the parent frame pointer earlier.
Files:      src/window.c

Patch 8.0.0680 (after 8.0.0612)
Problem:    Plugins in start packages are sourced twice. (mseplowitz)
Solution:   Use the unmodified runtime path when loading plugins (test by Ingo
            Karkat, closes #1801)
Files:      src/testdir/test_startup.vim, src/main.c, src/ex_cmds2.c,
            src/proto/ex_cmds2.pro

Patch 8.0.0681
Problem:    Unnamed register only contains the last deleted text when
```

            appending deleted text to a register. (Wolfgang Jeltsch)
Solution: Only set y_previous when not using y_append. (Christian Brabandt)
Files: src/ops.c, src/testdir/test_put.vim

Patch 8.0.0682
Problem: No test for synIDtrans().
Solution: Add a test. (Dominique Pelle, closes #1796)
Files: src/testdir/test_syntax.vim

Patch 8.0.0683
Problem: When using a visual bell there is no delay, causing the flash to
            be very short, possibly unnoticeable. Also, the flash and the
            beep can lockup the UI when repeated often.
Solution: Do the delay in Vim or flush the output before the delay. Limit the
            bell to once per half a second. (Ozaki Kiichi, closes #1789)
Files: src/misc1.c, src/proto/term.pro, src/term.c

Patch 8.0.0684
Problem: Old style tests are not nice.
Solution: Turn two tests into new style. (pschuh, closes #1797)
Files: src/Makefile, src/testdir/Make_all.mak, src/testdir/Make_vms.mms,
            src/testdir/test82.in, src/testdir/test82.ok,
            src/testdir/test90.in, src/testdir/test90.ok,
            src/testdir/test_sha256.vim, src/testdir/test_utf8_comparisons.vim

Patch 8.0.0685
Problem: When making backups is disabled and conversion with iconv fails
            the written file is truncated. (Luo Chen)
Solution: First try converting the file and write the file only when it did
            not fail. (partly by Christian Brabandt)
Files: src/fileio.c, src/testdir/test_writefile.vim

Patch 8.0.0686
Problem: When typing CTRL-L in a window that's not the first one, another
            redraw will happen later. (Christian Brabandt)
Solution: Reset must_redraw after calling screenclear().
Files: src/screen.c

Patch 8.0.0687
Problem: Minor issues related to quickfix.
Solution: Set the proper return status for all cases in setqflist() and at
            test cases for this. Move the "adding" flag outside of
            FEAT_WINDOWS. Minor update to the setqflist() help text. (Yegappan
            Lakshmanan)
Files: runtime/doc/eval.txt, src/quickfix.c,
            src/testdir/test_quickfix.vim

Patch 8.0.0688
Problem: Cannot resize the window in a FileType autocommand. (Ingo Karkat)
Solution: Add the CMDWIN flag to :resize. (test by Ingo Karkat,
            closes #1804)
Files: src/ex_cmds.h, src/testdir/test_quickfix.vim

Patch 8.0.0689

```
Problem:    The ~ character is not escaped when adding to the search pattern
            with CTRL-L. (Ramel Eshed)
Solution:   Escape the character. (Christian Brabandt)
Files:      src/ex_getln.c, src/testdir/test_search.vim

Patch 8.0.0690
Problem:    Compiler warning on non-Unix system.
Solution:   Add #ifdef. (John Marriott)
Files:      src/term.c

Patch 8.0.0691
Problem:    Compiler warning without the linebreak feature.
Solution:   Add #ifdef. (John Marriott)
Files:      src/edit.c

Patch 8.0.0692
Problem:    Using CTRL-G with 'incsearch' and ? goes in the wrong direction.
            (Ramel Eshed)
Solution:   Adjust search_start. (Christian Brabandt)
Files:      src/ex_getln.c, src/testdir/test_search.vim

Patch 8.0.0693
Problem:    No terminal emulator support.  Cannot properly run commands in the
            GUI.  Cannot run a job interactively with an ssh connection.
Solution:   Very early implementation of the :terminal command.  Includes
            libvterm converted to ANSI C.  Many parts still missing.
Files:      src/feature.h, src/Makefile, src/configure.ac, src/auto/configure,

Patch 8.0.0694
Problem:    Building in shadow directory does not work.  Running Vim fails.
Solution:   Add the new libvterm directory.  Add missing change in command
            list.
Files:      src/Makefile, src/ex_cmds.h

Patch 8.0.0695
Problem:    Missing dependencies breaks parallel make.
Solution:   Add dependencies for terminal.o.
Files:      src/Makefile

Patch 8.0.0696
Problem:    The .inc files are missing in git. (Nazri Ramliy)
Solution:   Remove the .inc line from .gitignore.
Files:      src/libvterm/.gitignore

Patch 8.0.0697
Problem:    Recorded key sequences may become invalid.
Solution:   Add back KE_SNIFF removed in 7.4.1433. Use fixed numbers for the
            key_extra enum.
Files:      src/keymap.h
```

```
Patch 8.0.0698
Problem:    When a timer uses ":pyeval" or another Python command and it
            happens to be triggered while exiting a Crash may happen.
            (Ricky Zhou)
Solution:   Avoid running a Python command after python_end() was called.
            Do not trigger timers while exiting.  (closes #1824)
Files:      src/if_python.c, src/if_python3.c, src/ex_cmds2.c

Patch 8.0.0699
Problem:    Checksum tests are not actually run.
Solution:   Add the tests to the list. (Dominique Pelle, closes #1819)
Files:      src/testdir/test_alot.vim, src/testdir/test_alot_utf8.vim

Patch 8.0.0700
Problem:    Segfault with QuitPre autocommand closes the window. (Marek)
Solution:   Check that the window pointer is still valid. (Christian Brabandt,
            closes #1817)
Files:      src/testdir/test_tabpage.vim, src/ex_docmd.c

Patch 8.0.0701
Problem:    System test failing when using X11 forwarding.
Solution:   Set $XAUTHORITY before changing $HOME. (closes #1812)
            Also use a better check for the exit value.
Files:      src/testdir/setup.vim, src/testdir/test_system.vim

Patch 8.0.0702
Problem:    An error in a timer can make Vim unusable.
Solution:   Don't set the error flag or exception from a timer.  Stop a timer
            if it causes an error 3 out of 3 times.  Discard an exception
            caused inside a timer.
Files:      src/ex_cmds2.c, src/structs.h, src/testdir/test_timers.vim,
            runtime/doc/eval.txt

Patch 8.0.0703
Problem:    Illegal memory access with empty :doau command.
Solution:   Check the event for being out of range. (James McCoy)
Files:      src/testdir/test_autocmd.vim, src/fileio.c

Patch 8.0.0704
Problem:    Problems with autocommands when opening help.
Solution:   Avoid using invalid "varp" value.  Allow using :wincmd if buffer
            is locked. (closes #1806, closes #1804)
Files:      src/option.c, src/ex_cmds.h

Patch 8.0.0705 (after 8.0.0702)
Problem:    Crash when there is an error in a timer callback. (Aron Griffis,
            Ozaki Kiichi)
Solution:   Check did_throw before discarding an exception.  NULLify
            current_exception when no longer valid.
Files:      src/ex_eval.c, src/ex_cmds2.c

Patch 8.0.0706
Problem:    Crash when cancelling the cmdline window in Ex mode. (James McCoy)
Solution:   Do not set cmdbuff to NULL, make it empty.
```

```
Files:      src/ex_getln.c

Patch 8.0.0707
Problem:    Freeing wrong memory when manipulating buffers in autocommands.
            (James McCoy)
Solution:   Also set the w_s pointer if w_buffer was NULL.
Files:      src/ex_cmds.c

Patch 8.0.0708
Problem:    Some tests are old style.
Solution:   Change a few tests from old style to new style. (pschuh,
            closes #1813)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_vms.mms, src/testdir/main.aap,
            src/testdir/test23.in, src/testdir/test23.ok,
            src/testdir/test24.in, src/testdir/test24.ok,
            src/testdir/test26.in, src/testdir/test26.ok,

            src/testdir/test_escaped_glob.vim,
            src/testdir/test_exec_while_if.vim,
            src/testdir/test_exists_autocmd.vim, src/testdir/test_getcwd.in,
            src/testdir/test_getcwd.ok, src/testdir/test_getcwd.vim,
            src/testdir/test_maparg.vim, src/testdir/test_plus_arg_edit.vim,
            src/testdir/test_regex_char_classes.vim

Patch 8.0.0709
Problem:    Libvterm cannot use vsnprintf(), it does not exist in C90.
Solution:   Use vim_vsnprintf() instead.
Files:      src/message.c, src/Makefile, src/proto.h, src/evalfunc.c,
            src/netbeans.c, src/libvterm/src/vterm.c

Patch 8.0.0710
Problem:    A job that writes to a buffer clears command line completion.
            (Ramel Eshed)
Solution:   Do not redraw while showing the completion menu.
Files:      src/screen.c

Patch 8.0.0711 (after 8.0.0710)
Problem:    Cannot build without the wildmenu feature.
Solution:   Add #ifdef
Files:      src/screen.c

Patch 8.0.0712
Problem:    The terminal implementation is incomplete.
Solution:   Add the 'termkey' option.
Files:      src/option.c, src/option.h, src/structs.h

Patch 8.0.0713 (after 8.0.0712)
Problem:    'termkey' option not fully implemented.
Solution:   Add initialisation.
```

```
Files:      src/option.c

Patch 8.0.0714
Problem:    When a timer causes a command line redraw the " that is displayed
            for CTRL-R goes missing.
Solution:   Remember an extra character to display.
Files:      src/ex_getln.c

Patch 8.0.0715
Problem:    Writing to the wrong buffer if the buffer that a channel writes to
            was closed.
Solution:   Do not write to a buffer that was unloaded.
Files:      src/channel.c, src/testdir/test_channel.vim,
            src/testdir/test_channel_write.py

Patch 8.0.0716
Problem:    Not easy to start Vim cleanly without changing the viminfo file.
            Not possible to know whether the -i command line flag was used.
Solution:   Add the --clean command line argument.  Add the 'viminfofile'
            option.  Add "-u DEFAULTS".
Files:      src/main.c, runtime/doc/starting.txt, src/option.c, src/option.h,
            src/ex_cmds.c, src/globals.h, runtime/doc/options.txt

Patch 8.0.0717
Problem:    Terminal feature not included in :version output.
Solution:   Add +terminal or -terminal.
Files:      src/version.c, src/terminal.c

Patch 8.0.0718
Problem:    Output of job in terminal is not displayed.
Solution:   Connect the job output to the terminal.
Files:      src/channel.c, src/proto/channel.pro, src/terminal.c,
            src/proto/terminal.pro, src/channel.c, src/proto/channel.pro,
            src/evalfunc.c, src/screen.c, src/proto/screen.pro

Patch 8.0.0719
Problem:    Build failure without +terminal feature.
Solution:   Add #ifdefs.
Files:      src/screen.c, src/channel.c

Patch 8.0.0720
Problem:    Unfinished mapping not displayed when running timer.
Solution:   Also use the extra_char while waiting for a mapping and digraph.
            (closes #1844)
Files:      src/ex_getln.c

Patch 8.0.0721
Problem:    :argedit can only have one argument.
Solution:   Allow for multiple arguments. (Christian Brabandt)
Files:      runtime/doc/editing.txt, src/ex_cmds.h, src/ex_cmds2.c,
            src/testdir/test_arglist.vim

Patch 8.0.0722
Problem:    Screen is messed by timer up at inputlist() prompt.
```

```
Solution:   Set state to ASKMORE. (closes #1843)
Files:      src/misc1.c

Patch 8.0.0723 (after 8.0.0721)
Problem:    Arglist test fails if file name case is ignored.
Solution:   Wipe existing buffers, check for fname_case property.
Files:      src/testdir/test_arglist.vim

Patch 8.0.0724
Problem:    The message for yanking doesn't indicate the register.
Solution:   Show the register name in the "N lines yanked" message. (LemonBoy,
            closes #1803, closes #1809)
Files:      src/ops.c, src/Makefile, src/testdir/test_registers.vim,
            src/testdir/Make_all.mak

Patch 8.0.0725
Problem:    A terminal window does not handle keyboard input.
Solution:   Add terminal_loop().  ":term bash -i" sort of works now.
Files:      src/main.c, src/terminal.c, src/proto/terminal.pro, src/normal.c

Patch 8.0.0726
Problem:    Translations cleanup script is too conservative.
Solution:   Also delete untranslated messages.
Files:      src/po/cleanup.vim

Patch 8.0.0727
Problem:    Message about what register to yank into is not translated.
            (LemonBoy)
Solution:   Add _().
Files:      src/ops.c

Patch 8.0.0728
Problem:    The terminal structure is never freed.
Solution:   Free the structure and unreference what it contains.
Files:      src/terminal.c, src/buffer.c, src/proto/terminal.pro,
            src/channel.c, src/proto/channel.pro, src/evalfunc.c

Patch 8.0.0729
Problem:    The help for the terminal configure option is wrong.
Solution:   Change "Disable" to "Enable". (E Kawashima, closes #1849)
            Improve alignment.
Files:      src/configure.ac, src/auto/configure

Patch 8.0.0730
Problem:    Terminal feature only supports Unix-like systems.
Solution:   Prepare for adding an MS-Windows implementation.
Files:      src/terminal.c

Patch 8.0.0731
Problem:    Cannot build the terminal feature on MS-Windows.
Solution:   Add the Makefile changes. (Yasuhiro Matsumoto, closes #1851)
Files:      src/Make_cyg_ming.mak, src/Make_mvc.mak

Patch 8.0.0732
```

```
Problem:    When updating a buffer for a callback the modeless selection is
            lost.
Solution:   Do not insert or delete screen lines when redrawing for a callback
            and there is a modeless selection.
Files:      src/screen.c

Patch 8.0.0733
Problem:    Can only add entries to one list in the quickfix stack.
Solution:   Move state variables from qf_list_T to qf_list_T. (Yegappan
            Lakshmanan)
Files:      src/quickfix.c

Patch 8.0.0734
Problem:    The script to check translations can be improved.
Solution:   Restore the view when no errors are found.  Check for matching
            line break at the end of the message. (Christian Brabandt)
Files:      src/po/check.vim

Patch 8.0.0735
Problem:    There is no way to notice that the quickfix window contents has
            changed.
Solution:   Increment b:changedtick when updating the quickfix window.
            (Yegappan Lakshmanan)
Files:      runtime/doc/quickfix.txt, src/quickfix.c,
            src/testdir/test_quickfix.vim

Patch 8.0.0736
Problem:    The OptionSet autocommand event is not triggered when entering
            diff mode.
Solution:   use set_option_value() instead of setting the option directly.
            Change the tests from old to new style. (Christian Brabandt)
Files:      src/diff.c, src/testdir/Make_all.mak, src/Makefile,
            src/testdir/test_autocmd.vim, src/testdir/test_autocmd_option.in,
            src/testdir/test_autocmd_option.ok

Patch 8.0.0737
Problem:    Crash when X11 selection is very big.
Solution:   Use static items instead of allocating them.  Add callbacks.
            (Ozaki Kiichi)
Files:      src/testdir/shared.vim, src/testdir/test_quotestar.vim,
            src/ui.c

Patch 8.0.0738
Problem:    Cannot use the mouse to resize window while the focus is in a
            terminal window.
Solution:   Recognize nice mouse events in the terminal window.  A few more
            fixes for the terminal window.
Files:      src/terminal.c

Patch 8.0.0739
Problem:    Terminal resizing doesn't work well.
Solution:   Resize the terminal to the Vim window and the other way around.
            Avoid mapping typed keys.  Set the environment properly.
Files:      src/terminal.c, src/os_unix.c, src/structs.h
```

Patch 8.0.0740
Problem: Cannot resize a terminal window by the command running in it.
Solution: Add support for the window size escape sequence. Make BS work.
Files: src/terminal.c, src/libvterm/src/state.c

Patch 8.0.0741
Problem: Cannot build with HPUX.
Solution: Rename envbuf_TERM to envbuf_Term. (John Marriott)
Files: src/os_unix.c

Patch 8.0.0742
Problem: Terminal feature does not work on MS-Windows.
Solution: Use libvterm and libwinpty on MS-Windows. (Yasuhiro Matsumoto)
Files: src/INSTALLpc.txt, src/Make_cyg_ming.mak, src/channel.c,
            src/proto/channel.pro, src/terminal.c

Patch 8.0.0743
Problem: The 'termsize' option can be set to an invalid value.
Solution: Check the 'termsize' option to be valid.
Files: src/option.c, src/testdir/gen_opt_test.vim

Patch 8.0.0744
Problem: A terminal window uses pipes instead of a pty.
Solution: Add pty support.
Files: src/structs.h, src/os_unix.c, src/terminal.c, src/channel.c,
            src/proto/os_unix.pro, src/os_win32.c, src/proto/os_win32.pro

Patch 8.0.0745
Problem: multi-byte characters in a terminal window are not displayed
            properly.
Solution: Set the unused screen characters. (Yasuhiro Matsumoto, closes
            #1857)
Files: src/terminal.c

Patch 8.0.0746
Problem: When :term fails the job is not properly cleaned up.
Solution: Free the terminal. Handle a job that failed to start. (closes
            #1858)
Files: src/os_unix.c, src/channel.c, src/terminal.c

Patch 8.0.0747
Problem: :terminal without an argument doesn't work.
Solution: Use the 'shell' option. (Yasuhiro Matsumoto, closes #1860)
Files: src/terminal.c

Patch 8.0.0748
Problem: When running Vim in a terminal window it does not detect the right
            number of colors available.
Solution: Detect the version string that libvterm returns. Pass the number
            of colors in $COLORS.
Files: src/term.c, src/os_unix.c

Patch 8.0.0749

```
Problem:    Some unicode digraphs are hard to remember.
Solution:   Add alternatives with a backtick. (Chris Harding, closes #1861)
Files:      src/digraph.c

Patch 8.0.0750
Problem:    OpenPTY missing in non-GUI build.
Solution:   Always include pty.c, add an #ifdef to skip over the contents.
Files:      src/pty.c, src/Makefile

Patch 8.0.0751 (after 8.0.0750)
Problem:    OpenPTY missing with some combination of features. (Kazunobu
            Kuriyama)
Solution:   Adjust #ifdef.  Also include pty.pro when needed.
Files:      src/pty.c, src/misc2.c, src/proto.h

Patch 8.0.0752
Problem:    Build fails on MS-Windows.
Solution:   Change #ifdef for set_color_count().
Files:      src/term.c

Patch 8.0.0753
Problem:    A job running in a terminal does not get notified of changes in
            the terminal size.
Solution:   Use ioctl() and SIGWINCH to report the terminal size.
Files:      src/terminal.c, src/os_unix.c, src/proto/os_unix.pro

Patch 8.0.0754
Problem:    Terminal window does not support colors.
Solution:   Lookup the color attribute.
Files:      src/terminal.c, src/syntax.c, src/proto/syntax.pro

Patch 8.0.0755
Problem:    Terminal window does not have colors in the GUI.
Solution:   Lookup the GUI color.
Files:      src/terminal.c, src/syntax.c, src/proto/syntax.pro, src/term.c,
            src/proto/term.pro, src/gui_gtk_x11.c, src/proto/gui_gtk_x11.pro,
            src/gui_x11.c, src/proto/gui_x11.pro, src/gui_mac.c,
            src/proto/gui_mac.pro, src/gui_photon.c, src/proto/gui_photon.pro,
            src/gui_w32.c, src/proto/gui_w32.pro,

Patch 8.0.0756
Problem:    Cannot build libvterm with MSVC.
Solution:   Add an MSVC Makefile to libvterm. (Yasuhiro Matsumoto, closes
            #1865)
Files:      src/INSTALLpc.txt, src/Make_mvc.mak, src/libvterm/Makefile.msc

Patch 8.0.0757
Problem:    Libvterm MSVC Makefile not included in the distribution.
Solution:   Add the file to the list.
Files:      Filelist

Patch 8.0.0758
Problem:    Possible crash when using a terminal window.
Solution:   Check for NULL pointers. (Yasuhiro Matsumoto, closes #1864)
```

```
Files:      src/terminal.c

Patch 8.0.0759
Problem:    MS-Windows: terminal does not adjust size to the Vim window size.
Solution:   Add a call to winpty_set_size(). (Yasuhiro Matsumoto, closes #1863)
Files:      src/terminal.c

Patch 8.0.0760
Problem:    Terminal window colors wrong with 'termguicolors'.
Solution:   Add 'termguicolors' support.
Files:      src/terminal.c, src/syntax.c, src/proto/syntax.pro

Patch 8.0.0761
Problem:    Options of a buffer for a terminal window are not set properly.
Solution:   Add "terminal" value for 'buftype'.  Make 'buftype' and
            'bufhidden' not depend on the quickfix feature.
            Also set the buffer name and show "running" or "finished" in the
            window title.
Files:      src/option.c, src/terminal.c, src/proto/terminal.pro,
            runtime/doc/options.txt, src/quickfix.c, src/proto/quickfix.pro,
            src/structs.h, src/buffer.c, src/ex_docmd.c, src/fileio.c,
            src/channel.c

Patch 8.0.0762
Problem:    ml_get error with :psearch in buffer without a name. (Dominique
            Pelle)
Solution:   Use the buffer number instead of the file name.  Check the cursor
            position.
Files:      src/search.c, src/testdir/test_preview.vim, src/Makefile,
            src/testdir/Make_all.mak

Patch 8.0.0763
Problem:    Libvterm can be improved.
Solution:   Various small improvements, more comments.
Files:      src/libvterm/README, src/libvterm/include/vterm.h,
            src/libvterm/include/vterm_keycodes.h,
            src/libvterm/src/keyboard.c, src/libvterm/src/parser.c,
            src/libvterm/src/screen.c, src/libvterm/src/state.c

Patch 8.0.0764
Problem:    'termkey' does not work yet.
Solution:   Implement 'termkey'.
Files:      src/terminal.c, src/option.c, src/proto/option.pro

Patch 8.0.0765
Problem:    Build fails with tiny features.
Solution:   Adjust #ifdef. (John Marriott)
Files:      src/option.c, src/option.h

Patch 8.0.0766
Problem:    Option test fails with +terminal feature.
Solution:   Fix using the right option when checking the value.
Files:      src/option.c
```

```
Patch 8.0.0767
Problem:    Build failure with Athena and Motif.
Solution:   Move local variable declarations. (Kazunobu Kuriyama)
Files:      src/gui_x11.c

Patch 8.0.0768
Problem:    Terminal window status shows "[Scratch]".
Solution:   Show "[Terminal]" when no title was set. (Yasuhiro Matsumoto)
            Store the terminal title that vterm sends and use it.  Update the
            special buffer name.  (closes #1869)
Files:      src/terminal.c, src/proto/terminal.pro, src/buffer.c

Patch 8.0.0769
Problem:    Build problems with terminal on MS-Windows using MSVC.
Solution:   Remove stdbool.h dependency. Only use ScreenLinesUC when it was
            allocated. Fix typos. (Ken Takata)
Files:      src/libvterm/bin/vterm-ctrl.c, runtime/doc/terminal.txt,
            src/INSTALLpc.txt, src/Make_cyg_ming.mak, src/Make_mvc.mak,
            src/libvterm/Makefile.msc, src/terminal.c

Patch 8.0.0770
Problem:    Compiler warning for missing field initializer.
Solution:   Add two more values. (Yegappan Lakshmanan)
Files:      src/libvterm/src/encoding.c

Patch 8.0.0771
Problem:    Cursor in a terminal window not always updated in the GUI.
Solution:   Call gui_update_cursor(). (Yasuhiro Matsumoto, closes #1868)
Files:      src/terminal.c

Patch 8.0.0772
Problem:    Other stdbool.h dependencies in libvterm.
Solution:   Remove the dependency and use TRUE/FALSE/int. (Ken Takata)
Files:      src/libvterm/include/vterm.h, src/libvterm/src/mouse.c,
            src/libvterm/src/pen.c, src/libvterm/t/harness.c,
            src/libvterm/bin/unterm.c

Patch 8.0.0773
Problem:    Mixing 32 and 64 bit libvterm builds fails.
Solution:   Use OUTDIR. (Ken Takata)
Files:      src/Make_cyg_ming.mak, src/Make_mvc.mak, src/libvterm/Makefile.msc

Patch 8.0.0774
Problem:    Build failure without the multi-byte feature on HPUX.
Solution:   Move #ifdefs. (John Marriott)
Files:      src/term.c

Patch 8.0.0775
Problem:    In a terminal the cursor is updated too often.
Solution:   Only flush when needed. (Yasuhiro Matsumoto).  Remember whether the
            cursor is visible. (closes #1873)
Files:      src/terminal.c

Patch 8.0.0776
```

```
Problem:    Function prototypes missing without the quickfix feature. (Tony
            Mechelynck)
Solution:   Move non-quickfix functions to buffer.c.
Files:      src/buffer.c, src/proto/buffer.pro, src/quickfix.c,
            src/proto/quickfix.pro

Patch 8.0.0777
Problem:    Compiler warnings with 64 bit compiler.
Solution:   Add type casts. (Mike Williams)
Files:      src/libvterm/src/pen.c, src/libvterm/src/state.c, src/terminal.c

Patch 8.0.0778
Problem:    In a terminal the cursor may be hidden and screen updating lags
            behind. (Nazri Ramliy)
Solution:   Switch the cursor on and flush output when needed. (Ozaki Kiichi)
Files:      src/terminal.c

Patch 8.0.0779
Problem:    :term without an argument uses empty buffer name but runs the
            shell.
Solution:   Change the command to the shell earlier.
Files:      src/terminal.c

Patch 8.0.0780
Problem:    Build failure on Travis.
Solution:   Set distribution explicitly. Use Lua and Ruby dev. (Ken Takata,
            closes #1884)
Files:      .travis.yml

Patch 8.0.0781
Problem:    MS-Windows: Memory leak when using :terminal.
Solution:   Handle failures properly. (Ken Takata)
Files:      src/terminal.c

Patch 8.0.0782
Problem:    Using freed memory in quickfix code. (Dominique Pelle)
Solution:   Handle a help window differently. (Yegappan Lakshmanan)
Files:      src/buffer.c, src/proto/buffer.pro, src/quickfix.c,
            src/testdir/test_quickfix.vim, src/ex_cmds.c, src/window.c

Patch 8.0.0783
Problem:    Job of terminal may be freed too early.
Solution:   Increment job refcount. (Yasuhiro Matsumoto)
Files:      src/terminal.c

Patch 8.0.0784
Problem:    Job of terminal may be garbage collected.
Solution:   Set copyID on job in terminal. (Ozaki Kiichi)
Files:      src/terminal.c, src/eval.c, src/proto/terminal.pro

Patch 8.0.0785
Problem:    Wildcards are not expanded for :terminal.
Solution:   Add FILES to the command flags. (Yasuhiro Matsumoto, closes #1883)
            Also complete commands.
```

```
Files:      src/ex_cmds.h, src/ex_docmd.c

Patch 8.0.0786
Problem:    Build failures on Travis.
Solution:   Go back to precise temporarily.  Disable coverage with clang.
Files:      .travis.yml

Patch 8.0.0787
Problem:    Cannot send CTRL-W command to terminal job.
Solution:   Make CTRL-W . a prefix for sending a key to the job.
Files:      src/terminal.c, runtime/doc/terminal.txt, src/option.c

Patch 8.0.0788
Problem:    MS-Windows: cannot build with terminal feature.
Solution:   Move set_ref_in_term(). (Ozaki Kiichi)
Files:      src/terminal.c

Patch 8.0.0789
Problem:    When splitting a terminal window where the terminal follows the
            size of the window doesn't work.
Solution:   Use the size of the smallest window. (Yasuhiro Matsumoto, closes
            #1885)
Files:      src/terminal.c

Patch 8.0.0790
Problem:    MSVC compiler warning for strncpy in libvterm.
Solution:   Add a define to stop the warnings. (Mike Williams)
Files:      src/Make_mvc.mak

Patch 8.0.0791
Problem:    Terminal colors depend on the system.
Solution:   Use the highlight color lookup tables.
Files:      src/syntax.c, src/proto/syntax.pro, src/terminal.c

Patch 8.0.0792
Problem:    Spell test leaves files behind.
Solution:   Delete the files.
Files:      src/testdir/test_spell.vim

Patch 8.0.0793
Problem:    Using wrong terminal name for terminal window.
Solution:   When 'term' starts with "xterm" use it for $TERM in a terminal
            window.
Files:      src/os_unix.c

Patch 8.0.0794
Problem:    The script to check translations fails if there is more than one
            NL in one line.
Solution:   Count the number of NL characters.  Make count() accept a string.
Files:      src/po/check.vim, src/evalfunc.c, runtime/doc/eval.txt,
            src/testdir/test_functions.vim

Patch 8.0.0795
Problem:    Terminal feature does not build with older MSVC.
```

```
Solution:   Do not use stdint.h.
Files:      src/libvterm/include/vterm.h

Patch 8.0.0796
Problem:    No coverage on Travis with clang.
Solution:   Use a specific coveralls version. (Ozaki Kiichi, closes #1888)
Files:      .travis.yml

Patch 8.0.0797
Problem:    Finished job in terminal window is not handled.
Solution:   Add the scrollback buffer.  Use it to fill the buffer when the job
            has ended.
Files:      src/terminal.c, src/screen.c, src/proto/terminal.pro,
            src/channel.c, src/os_unix.c, src/buffer.c

Patch 8.0.0798
Problem:    No highlighting in a terminal window with a finished job.
Solution:   Highlight the text.
Files:      src/terminal.c, src/proto/terminal.pro, src/screen.c, src/undo.c

Patch 8.0.0799
Problem:    Missing semicolon.
Solution:   Add it.
Files:      src/terminal.c

Patch 8.0.0800
Problem:    Terminal window scrollback contents is wrong.
Solution:   Fix handling of multi-byte characters (Yasuhiro Matsumoto) Handle
            empty lines correctly. (closes #1891)
Files:      src/terminal.c

Patch 8.0.0801
Problem:    The terminal window title sometimes still says "running" even
            though the job has finished.
Solution:   Also consider the job finished when the channel has been closed.
Files:      src/terminal.c

Patch 8.0.0802
Problem:    After a job exits the last line in the terminal window does not
            get color attributes.
Solution:   Fix off-by-one error.
Files:      src/terminal.c

Patch 8.0.0803
Problem:    Terminal window functions not yet implemented.
Solution:   Implement several functions. Add a first test. (Yasuhiro
            Matsumoto, closes #1871)
Files:      runtime/doc/eval.txt, src/Makefile, src/evalfunc.c,
            src/proto/evalfunc.pro, src/proto/terminal.pro, src/terminal.c,
            src/testdir/Make_all.mak, src/testdir/test_terminal.vim

Patch 8.0.0804
Problem:    Running tests fails when stdin is /dev/null. (James McCoy)
Solution:   Do not bail out from getting input if the --not-a-term argument
```

```
            was given. (closes #1460)
Files:      src/eval.c, src/evalfunc.c

Patch 8.0.0805
Problem:    GUI test fails with gnome2.
Solution:   Set $HOME to an existing directory.
Files:      src/testdir/setup.vim, src/testdir/runtest.vim

Patch 8.0.0806
Problem:    Tests may try to create XfakeHOME twice.
Solution:   Avoid loading setup.vim twice.
Files:      src/testdir/setup.vim

Patch 8.0.0807
Problem:    Terminal window can't handle mouse buttons. (Hirohito Higashi)
Solution:   Implement mouse buttons and many other keys.  Ignore the ones that
            are not implemented.
Files:      src/terminal.c

Patch 8.0.0808
Problem:    Cannot build with terminal feature and DEBUG defined. (Christian
            Brabandt)
Solution:   Use DEBUG_LOG3().
Files:      src/libvterm/src/pen.c

Patch 8.0.0809
Problem:    MS-Windows: tests hang.
Solution:   Delete the XfakeHOME directory.
Files:      src/testdir/Make_dos.mak, src/testdir/Make_ming.mak

Patch 8.0.0810
Problem:    MS-Windows: tests still hang.
Solution:   Only create the XfakeHOME directory if it does not exist yet.
Files:      src/testdir/setup.vim

Patch 8.0.0811
Problem:    MS-Windows: test_expand_dllpath fails.
Solution:   Change backslashes to forward slashes
Files:      src/testdir/test_expand_dllpath.vim

Patch 8.0.0812
Problem:    Terminal window colors shift when 'number' is set. (Nazri Ramliy)
Solution:   Use vcol instead of col.
Files:      src/screen.c

Patch 8.0.0813
Problem:    Cannot use Vim commands in a terminal window while the job is
            running.
Solution:   Implement Terminal Normal mode.
Files:      src/terminal.c, src/proto/terminal.pro, src/main.c, src/screen.c,
            src/normal.c, src/option.c, runtime/doc/terminal.txt

Patch 8.0.0814 (after 8.0.0757)
Problem:    File in Filelist does not exist.
```

```
Solution:   Remove the line.
Files:      Filelist

Patch 8.0.0815
Problem:    Terminal window not correctly updated when 'statusline' invokes
            ":sleep". (NIkolay Pavlov)
Solution:   Clear got_int.  Repeat redrawing when needed.
Files:      src/terminal.c

Patch 8.0.0816
Problem:    Crash when using invalid buffer number.
Solution:   Check for NULL buffer. (Yasuhiro Matsumoto, closes #1899)
Files:      src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.0817
Problem:    Cannot get the line of a terminal window at the cursor.
Solution:   Make the row argument optional. (Yasuhiro Matsumoto, closes #1898)
Files:      runtime/doc/eval.txt, src/evalfunc.c, src/terminal.c

Patch 8.0.0818
Problem:    Cannot get the cursor position of a terminal.
Solution:   Add term_getcursor().
Files:      runtime/doc/eval.txt, src/evalfunc.c, src/terminal.c,
            src/proto/terminal.pro

Patch 8.0.0819
Problem:    After changing current window the cursor position in the terminal
            window is not updated.
Solution:   Set w_wrow, w_wcol and w_valid.
Files:      src/terminal.c

Patch 8.0.0820
Problem:    GUI: cursor in terminal window lags behind.
Solution:   call gui_update_cursor() under different conditions. (Ozaki
            Kiichi, closes #1893)
Files:      src/terminal.c

Patch 8.0.0821
Problem:    Cannot get the title and status of a terminal window.
Solution:   Implement term_gettitle() and term_getstatus().
Files:      src/evalfunc.c, src/terminal.c, src/proto/terminal.pro,
            runtime/doc/eval.txt

Patch 8.0.0822
Problem:    Test_with_partial_callback is a tiny bit flaky.
Solution:   Add it to the list of flaky tests.
Files:      src/testdir/runtest.vim

Patch 8.0.0823
Problem:    Cannot paste text into a terminal window.
Solution:   Make CTRL-W " work.
Files:      src/terminal.c

Patch 8.0.0824
```

```
Problem:    In Terminal mode the cursor and screen gets redrawn when the job
            produces output.
Solution:   Check for tl_terminal_mode. (partly by Yasuhiro Matsumoto, closes
            #1904)
Files:      src/terminal.c

Patch 8.0.0825
Problem:    Not easy to see that a window is a terminal window.
Solution:   Add StatusLineTerm highlighting.
Files:      src/option.c, src/vim.h, src/screen.c, src/syntax.c

Patch 8.0.0826
Problem:    Cannot use text objects in Terminal mode.
Solution:   Check for pending operator and Visual mode first. (Yasuhiro
            Matsumoto, closes #1906)
Files:      src/normal.c

Patch 8.0.0827
Problem:    Coverity: could leak pty file descriptor, theoretically.
Solution:   If channel is NULL, free the file descriptors.
Files:      src/os_unix.c

Patch 8.0.0828
Problem:    Coverity: may dereference NULL pointer.
Solution:   Bail out if calloc_state() returns NULL.
Files:      src/regexp_nfa.c

Patch 8.0.0829
Problem:    A job running in a terminal window cannot easily communicate with
            the Vim it is running in.
Solution:   Pass v:servername in an environment variable. (closes #1908)
Files:      src/os_unix.c

Patch 8.0.0830
Problem:    Translating messages is not ideal.
Solution:   Add a remark about obsolete messages.  Use msgfmt in the check
            script. (Christian Brabandt)
Files:      src/po/README.txt, src/po/check.vim

Patch 8.0.0831 (after 8.0.0791)
Problem:    With 8 colors the bold attribute is not set properly.
Solution:   Move setting HL_TABLE() out of lookup_color. (closes #1901)
Files:      src/syntax.c, src/proto/syntax.pro, src/terminal.c

Patch 8.0.0832
Problem:    Terminal function arguments are not consistent.
Solution:   Use one-based instead of zero-based rows and cols.  Use "." for
            the current row.
Files:      src/terminal.c, runtime/doc/eval.txt

Patch 8.0.0833
Problem:    Terminal test fails.
Solution:   Update the row argument to one based.
Files:      src/testdir/test_terminal.vim
```

```
Patch 8.0.0834
Problem:    Can't build without the client-server feature.
Solution:   Add #ifdef.
Files:      src/os_unix.c

Patch 8.0.0835
Problem:    Translations check with msgfmt does not work.
Solution:   Add a space before the file name.
Files:      src/po/check.vim

Patch 8.0.0836
Problem:    When a terminal buffer is changed it can still be accidentally
            abandoned.
Solution:   When making a change reset the 'buftype' option.
Files:      src/terminal.c, src/testdir/test_terminal.vim, src/option.c

Patch 8.0.0837
Problem:    Signs can be drawn on top of console messages.
Solution:   don't redraw at a prompt or when scrolled up. (Christian Brabandt,
            closes #1907)
Files:      src/screen.c

Patch 8.0.0838
Problem:    Buffer hangs around when terminal window is closed.
Solution:   When the job has ended wipe out a terminal buffer when the window
            is closed.
Files:      src/buffer.c, src/terminal.c, src/proto/terminal.pro,
            src/testdir/test_terminal.vim

Patch 8.0.0839
Problem:    Cannot kill a job in a terminal with CTRL-C.
Solution:   Set the controlling tty and send SIGINT. (closes #1910)
Files:      src/os_unix.c, src/terminal.c, src/proto/os_unix.pro

Patch 8.0.0840
Problem:    MS-Windows: fopen() and open() prototypes do not match the ones in
            the system header file.  Can't build without FEAT_MBYTE.
Solution:   Add "const".  Move macro to after including protoo.h.
Files:      src/os_win32.c, src/proto/os_win32.pro, src/macros.h, src/vim.h

Patch 8.0.0841
Problem:    term_getline() may cause a crash.
Solution:   Check that the row is valid. (Hirohito Higashi)
Files:      src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.0842
Problem:    Using slave pty after closing it.
Solution:   Do the ioctl() before dup'ing it.
Files:      src/os_unix.c

Patch 8.0.0843
Problem:    MS-Windows: compiler warning for signed/unsigned.
Solution:   Add type cast. (Yasuhiro Matsumoto, closes #1912)
```

```
Files:      src/terminal.c

Patch 8.0.0844
Problem:    Wrong function prototype because of missing static.
Solution:   Add "static".
Files:      src/os_win32.c, src/proto/os_win32.pro

Patch 8.0.0845
Problem:    MS-Windows: missing semicolon in terminal code.
Solution:   Add it. (Naruhiko Nishino, closes #1923)
Files:      src/terminal.c

Patch 8.0.0846
Problem:    Cannot get the name of the pty of a job.
Solution:   Add the "tty" entry to the job info. (Ozaki Kiichi, closes #1920)
            Add the term_gettty() function.
Files:      runtime/doc/eval.txt, src/channel.c, src/os_unix.c, src/structs.h,
            src/terminal.c, src/proto/terminal.pro, src/evalfunc.c,
            src/testdir/test_terminal.vim

Patch 8.0.0847
Problem:    :argadd without argument can't handle space in file name. (Harm te
            Hennepe)
Solution:   Escape the space. (Yasuhiro Matsumoto, closes #1917)
Files:      src/ex_cmds2.c, src/proto/ex_cmds2.pro,
            src/testdir/test_arglist.vim

Patch 8.0.0848
Problem:    Using multiple ch_log functions is clumsy.
Solution:   Use variable arguments. (Ozaki Kiichi, closes #1919)
Files:      src/channel.c, src/message.c, src/proto/channel.pro,
            src/terminal.c

Patch 8.0.0849
Problem:    Crash when job exit callback wipes the terminal.
Solution:   Check for b_term to be NULL.  (Yasuhiro Matsumoto, closes #1922)
            Implement options for term_start() to be able to test.
            Make term_wait() more reliable.
Files:      src/terminal.c, src/testdir/test_terminal.vim, src/channel.c

Patch 8.0.0850
Problem:    MS-Windows: Depending on the console encoding, an error message
            that is given during startup may be broken.
Solution:   Convert the message to the console codepage. (Yasuhiro Matsumoto,
            closes #1927)
Files:      src/message.c

Patch 8.0.0851
Problem:    'smartindent' is used even when 'indentexpr' is set.
Solution:   Ignore 'smartindent' when 'indentexpr' is set. (Hirohito Higashi)
Files:      src/misc1.c, src/testdir/test_smartindent.vim

Patch 8.0.0852 (after 8.0.0850)
Problem:    MS-Windows: possible crash when giving a message on startup.
```

```
Solution:   Initialize length. (Yasuhiro Matsumoto, closes #1931)
Files:      src/message.c

Patch 8.0.0853
Problem:    Crash when running terminal with unknown command.
Solution:   Check "term" not to be NULL. (Yasuhiro Matsumoto, closes #1932)
Files:      src/terminal.c

Patch 8.0.0854
Problem:    No redraw after terminal was closed.
Solution:   Set typebuf_was_filled. (Yasuhiro Matsumoto, closes #1925, closes
            #1924)  Add function to check for messages even when input is
            available.
Files:      src/terminal.c, src/os_unix.c, src/proto/os_unix.pro,
            src/os_win32.c, src/proto/os_win32.pro, src/os_mswin.c

Patch 8.0.0855
Problem:    MS-Windows: can't get tty name of terminal.
Solution:   Use the winpty process number. (Yasuhiro Matsumoto, closes #1929)
Files:      src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.0856
Problem:    MS-Windows: terminal job doesn't take options.
Solution:   Call job_set_options(). (Yasuhiro Matsumoto)
Files:      src/terminal.c

Patch 8.0.0857
Problem:    Terminal test fails on MS-Windows.
Solution:   Sleep a fraction of a second.
Files:      src/testdir/test_terminal.vim

Patch 8.0.0858
Problem:    Can exit while a terminal is still running a job.
Solution:   Consider a buffer with a running job like a changed file.
Files:      src/undo.c, src/terminal.c, src/option.h, src/buffer.c,
            src/ex_cmds.c, src/ex_cmds2.c, src/ex_docmd.c, src/normal.c,
            src/window.c, src/testdir/test_terminal.vim

Patch 8.0.0859
Problem:    NULL pointer access when term_free_vterm called twice.
Solution:   Return when tl_vterm is NULL. (Yasuhiro Matsumoto, closes #1934)
Files:      src/terminal.c

Patch 8.0.0860
Problem:    There may be side effects when a channel appends to a buffer that
            is not the current buffer.
Solution:   Properly switch to another buffer before appending. (Yasuhiro
            Matsumoto, closes #1926, closes #1937)
Files:      src/channel.c, src/buffer.c, src/proto/buffer.pro,
            src/if_py_both.h

Patch 8.0.0861
Problem:    Still many old style tests.
Solution:   Convert several tests to new style. (Yegappan Lakshmanan)
```

```
Files:      src/testdir/Make_all.mak, src/testdir/Make_vms.mms,
            src/testdir/main.aap, src/testdir/test104.in,
            src/testdir/test104.ok, src/testdir/test22.in,
            src/testdir/test22.ok, src/testdir/test77.in,
            src/testdir/test77.ok, src/testdir/test84.in,
            src/testdir/test84.ok, src/testdir/test9.in, src/testdir/test9.ok,
            src/testdir/test98.in, src/testdir/test98.ok,
            src/testdir/test_autocmd.vim, src/testdir/test_curswant.vim,
            src/testdir/test_file_size.vim, src/testdir/test_let.vim,
            src/testdir/test_lineending.vim, src/testdir/test_scrollbind.vim,
            src/Makefile

Patch 8.0.0862 (after 8.0.0862)
Problem:    File size test fails on MS-Windows.
Solution:   Set fileformat after opening new buffer.  Strip CR.
Files:      src/testdir/test_file_size.vim

Patch 8.0.0863
Problem:    A remote command starting with CTRL-\ CTRL-N does not work in the
            terminal window. (Christian J. Robinson)
Solution:   Use CTRL-\ CTRL-N as a prefix or a Normal mode command.
Files:      src/terminal.c, runtime/doc/terminal.txt

Patch 8.0.0864
Problem:    Cannot specify the name of a terminal.
Solution:   Add the "term_name" option. (Yasuhiro Matsumoto, closes #1936)
Files:      src/channel.c, src/structs.h, src/terminal.c, runtime/doc/eval.txt

Patch 8.0.0865
Problem:    Cannot build with channel but without terminal feature.
Solution:   Add #ifdef
Files:      src/channel.c

Patch 8.0.0866
Problem:    Solaris also doesn't have MIN and MAX.
Solution:   Define MIN and MAX whenever they are not defined. (Ozaki Kiichi,
            closes #1939)
Files:      src/terminal.c

Patch 8.0.0867
Problem:    When using a job or channel value as a dict value, when turning it
            into a string the quotes are missing.
Solution:   Add quotes to the job and channel values. (Yasuhiro Matsumoto,
            closes #1930)
Files:      src/list.c, src/eval.c, src/testdir/test_terminal.vim

Patch 8.0.0868
Problem:    Cannot specify the terminal size on the command line.
Solution:   Use the address range for the terminal size. (Yasuhiro Matsumoto,
            closes #1941)
Files:      src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.0869
Problem:    Job output is sometimes not displayed in a terminal.
```

```
Solution:   Flush output before closing the channel.
Files:      src/channel.c, src/terminal.c

Patch 8.0.0870
Problem:    Mouse escape codes sent to terminal unintentionally.
Solution:   Fix libvterm to send mouse codes only when enabled.
Files:      src/terminal.c, src/libvterm/src/mouse.c

Patch 8.0.0871
Problem:    The status line for a terminal window always has "[+]".
Solution:   Do make the status line include "[+]" for a terminal window.
Files:      src/screen.c

Patch 8.0.0872
Problem:    Using mouse scroll while a terminal window has focus and the mouse
            pointer is on another window does not work.  Same for focus in a
            non-terminal window and the mouse pointer is over a terminal
            window.
Solution:   Send the scroll action to the right window.
Files:      src/terminal.c, src/normal.c, src/proto/terminal.pro

Patch 8.0.0873
Problem:    In a terminal window cannot use CTRL-\ CTRL-N to start Visual
            mode.
Solution:   After CTRL-\ CTRL-N enter Terminal-Normal mode for one command.
Files:      src/main.c, src/terminal.c, src/proto/terminal.pro

Patch 8.0.0874 (after 8.0.0873)
Problem:    Can't build with terminal feature.
Solution:   Include change to term_use_loop(). (Dominique Pelle)
Files:      src/normal.c

Patch 8.0.0875
Problem:    Crash with weird command sequence. (Dominique Pelle)
Solution:   Use vim_snprintf() instead of STRCPY().
Files:      src/misc1.c

Patch 8.0.0876
Problem:    MS-Windows: Backslashes and wildcards in backticks don't work.
Solution:   Do not handle backslashes inside backticks in the wrong place.
            (Yasuhiro Matsumoto, closes #1942)
Files:      src/os_mswin.c, src/os_win32.c

Patch 8.0.0877
Problem:    Using CTRL-\ CTRL-N in terminal is inconsistent.
Solution:   Stay in Normal mode.
Files:      src/terminal.c, src/proto/terminal.pro, src/main.c, src/normal.c,
            src/option.c

Patch 8.0.0878
Problem:    No completion for :mapclear.
Solution:   Add completion (Nobuhiro Takasaki et al. closes #1943)
Files:      runtime/doc/eval.txt, runtime/doc/map.txt, src/ex_docmd.c,
            src/ex_getln.c, src/proto/ex_docmd.pro,
```

```
            src/testdir/test_cmdline.vim, src/vim.h

Patch 8.0.0879
Problem:    Crash when shifting with huge number.
Solution:   Check for overflow. (Dominique Pelle, closes #1945)
Files:      src/ops.c, src/testdir/test_visual.vim

Patch 8.0.0880
Problem:    Travis uses an old Ubuntu version.
Solution:   Switch from precise to trusty. (Ken Takata, closes #1897)
Files:      .travis.yml, Filelist, src/testdir/if_ver-1.vim,
            src/testdir/if_ver-2.vim, src/testdir/lsan-suppress.txt

Patch 8.0.0881
Problem:    win32.mak no longer included in Windows SDK.
Solution:   Do not include win32.mak. (Ken Takata)
Files:      src/GvimExt/Makefile, src/Make_mvc.mak

Patch 8.0.0882
Problem:    term_scrape() and term_getline() require two arguments but it is
            not enforced.
Solution:   Correct minimal number of arguments. (Hirohito Higashi)  Update
            documentation. (Ken Takata)
Files:      src/evalfunc.c, runtime/doc/eval.txt

Patch 8.0.0883
Problem:    Invalid memory access with nonsensical script.
Solution:   Check "dstlen" being positive. (Dominique Pelle)
Files:      src/misc1.c

Patch 8.0.0884
Problem:    Can't specify the wait time for term_wait().
Solution:   Add an optional second argument.
Files:      src/evalfunc.c, src/terminal.c, runtime/doc/eval.txt

Patch 8.0.0885
Problem:    Terminal window scrollback is stored inefficiently.
Solution:   Store the text in the Vim buffer.
Files:      src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.0886
Problem:    Crash when using ":term ls".
Solution:   Fix line number computation.  Add a test for this.
Files:      src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.0887
Problem:    Can create a logfile in the sandbox.
Solution:   Disable ch_logfile() in the sandbox. (Yasuhiro Matsumoto)
Files:      src/evalfunc.c

Patch 8.0.0888
Problem:    Compiler warnings with 64 bit build.
Solution:   Add type cast of change the type. (Mike Williams)
Files:      src/message.c, src/os_mswin.c, src/os_win32.c
```

Patch 8.0.0889
Problem: Gcc gives warnings for uninitialized variables. (Tony Mechelynck)
Solution: Initialize variables even though they are not used.
Files: src/terminal.c

Patch 8.0.0890
Problem: Still many old style tests.
Solution: Convert several tests to new style. (Yegappan Lakshmanan)
Files: src/testdir/Make_all.mak, src/testdir/Make_vms.mms,
            src/testdir/test103.in, src/testdir/test103.ok,
            src/testdir/test107.in, src/testdir/test107.ok,
            src/testdir/test51.in, src/testdir/test51.ok,
            src/testdir/test91.in, src/testdir/test91.ok,
            src/testdir/test_getvar.vim, src/testdir/test_highlight.vim,
            src/testdir/test_visual.vim, src/testdir/test_window_cmd.vim,
            src/Makefile

Patch 8.0.0891
Problem: Uninitialized memory use with empty line in terminal.
Solution: Initialize growarray earlier. (Yasuhiro Matsumoto, closes #1949)
Files: src/terminal.c

Patch 8.0.0892
Problem: When opening a terminal the pty size doesn't always match.
Solution: Update the pty size after opening the terminal. (Ken Takata)
Files: src/terminal.c

Patch 8.0.0893
Problem: Cannot get the scroll count of a terminal window.
Solution: Add term_getscrolled().
Files: src/terminal.c, src/proto/terminal.pro, src/evalfunc.c,
            runtime/doc/eval.txt, src/testdir/test_terminal.vim

Patch 8.0.0894
Problem: There is no test for runtime filetype detection.
Solution: Test a list of filetypes from patterns.
Files: src/testdir/test_filetype.vim, runtime/filetype.vim

Patch 8.0.0895 (after 8.0.0894)
Problem: Filetype test fails on MS-Windows.
Solution: Fix file names.
Files: src/testdir/test_filetype.vim

Patch 8.0.0896
Problem: Cannot automatically close a terminal window when the job ends.
Solution: Add the ++close argument to :term. Add the term_finish option to
            term_start(). (Yasuhiro Matsumoto, closes #1950) Also add
            ++open.
Files: runtime/doc/eval.txt, runtime/doc/terminal.txt, src/channel.c,
            src/structs.h, src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.0897 (after 8.0.0896)
Problem: Wrong error message for invalid term_finish value

```
Solution:   Pass the right argument to emsg().
Files:      src/channel.c

Patch 8.0.0898
Problem:    Can't use the alternate screen in a terminal window.
Solution:   Initialize the alternate screen. (Yasuhiro Matsumoto, closes
            #1957)  Add term_getaltscreen().
Files:      src/libvterm/include/vterm.h, src/terminal.c,
            src/proto/terminal.pro, src/evalfunc.c, runtime/doc/eval.txt

Patch 8.0.0899
Problem:    Function name mch_stop_job() is confusing.
Solution:   Rename to mch_signal_job().
Files:      src/channel.c, src/os_unix.c, src/proto/os_unix.pro,
            src/os_win32.c, src/proto/os_win32.pro, src/terminal.c

Patch 8.0.0900
Problem:    :tab options doesn't open a new tab page. (Aviany)
Solution:   Support the :tab modifier. (closes #1960)
Files:      src/ex_cmds2.c, runtime/optwin.vim

Patch 8.0.0901
Problem:    Asan suppress file missing from distribution.
Solution:   Add the file.
Files:      Filelist

Patch 8.0.0902
Problem:    Cannot specify directory or environment for a job.
Solution:   Add the "cwd" and "env" arguments to job options. (Yasuhiro
            Matsumoto, closes #1160)
Files:      runtime/doc/channel.txt, src/channel.c, src/terminal.c,
            src/os_unix.c, src/os_win32.c, src/structs.h,
            src/testdir/test_channel.vim, src/testdir/test_terminal.vim

Patch 8.0.0903 (after 8.0.0902)
Problem:    Early return from test function.
Solution:   Remove the return.
Files:      src/testdir/test_terminal.vim

Patch 8.0.0904
Problem:    Cannot set a location list from text.
Solution:   Add the "text" argument to setqflist(). (Yegappan Lakshmanan)
Files:      runtime/doc/eval.txt, src/quickfix.c,
            src/testdir/test_quickfix.vim

Patch 8.0.0905
Problem:    MS-Windows: broken multi-byte characters in the console.
Solution:   Restore all regions of the console buffer. (Ken Takata)
Files:      src/os_win32.c

Patch 8.0.0906
Problem:    Don't recognize Couchbase files.
Solution:   Add filetype detection. (Eugene Ciurana, closes #1951)
Files:      runtime/filetype.vim, src/testdir/test_filetype.vim
```

```
Patch 8.0.0907
Problem:    With cp932 font names might be misinterpreted.
Solution:   Do not see "_" as a space when it is the second byte of a double
            byte character. (Ken Takata)
Files:      src/os_win32.c

Patch 8.0.0908
Problem:    Cannot set terminal size with options.
Solution:   Add "term_rows", "term_cols" and "vertical".
Files:      src/terminal.c, runtime/doc/eval.txt, src/channel.c,
            src/proto/channel.pro, src/structs.h, src/evalfunc.c,
            src/testdir/test_terminal.vim

Patch 8.0.0909
Problem:    Channel test fails.
Solution:   Allow for "cwd" and "env" arguments.
Files:      src/channel.c

Patch 8.0.0910
Problem:    Cannot create a terminal in the current window.
Solution:   Add option "curwin" and ++curwin.
Files:      src/terminal.c, runtime/doc/eval.txt, src/channel.c,
            src/structs.h, src/ex_cmds.h, src/testdir/test_terminal.vim

Patch 8.0.0911
Problem:    Terminal test takes too long.
Solution:   Instead of "sleep 1" use a Python program to briefly sleep.
Files:      src/testdir/test_terminal.vim, src/testdir/test_short_sleep.py

Patch 8.0.0912
Problem:    Cannot run a job in a hidden terminal.
Solution:   Add option "hidden" and ++hidden.
Files:      src/terminal.c, src/structs.h, src/channel.c, src/fileio.c,
            runtime/doc/terminal.txt, src/testdir/test_terminal.vim

Patch 8.0.0913
Problem:    MS-Windows: CTRL-C kills shell in terminal window instead of the
            command running in the shell.
Solution:   Make CTRL-C only send a CTRL_C_EVENT and have CTRL-BREAK kill the
            job. (partly by Yasuhiro Matsumoto, closes #1962)
Files:      src/os_win32.c, src/gui_w32.c, src/terminal.c, src/globals.h

Patch 8.0.0914
Problem:    Highlight attributes are always combined.
Solution:   Add the 'nocombine' value to replace attributes instead of
            combining them. (scauligi, closes #1963)
Files:      runtime/doc/syntax.txt, src/syntax.c, src/vim.h

Patch 8.0.0915
Problem:    Wrong initialisation of global.
Solution:   Use INIT().
Files:      src/globals.h
```

```
Patch 8.0.0916
Problem:    Cannot specify properties of window for when opening a window for
            a finished terminal job.
Solution:   Add "term_opencmd".
Files:      src/channel.c, src/structs.h, src/terminal.c,
            runtime/doc/eval.txt, src/testdir/test_terminal.vim

Patch 8.0.0917
Problem:    MS-Windows:CTRL-C handling in terminal window is wrong
Solution:   Pass CTRL-C as a key. Turn CTRL-BREAK into a key stroke. (Yasuhiro
            Matsumoto, closes #1965)
Files:      src/os_win32.c, src/terminal.c

Patch 8.0.0918
Problem:    Cannot get terminal window cursor shape or attributes.
Solution:   Support cursor shape, attributes and color.
Files:      src/terminal.c, runtime/doc/eval.txt,
            src/libvterm/include/vterm.h, src/libvterm/src/state.c,
            src/libvterm/src/vterm.c, src/feature.h, src/ui.c,
            src/proto/ui.pro, src/term.c, src/proto/term.pro,
            src/option.c, src/term.h

Patch 8.0.0919
Problem:    Cursor color isn't set on startup.
Solution:   Initialize showing_mode to invalid value.
Files:      src/term.c

Patch 8.0.0920
Problem:    The cursor shape is wrong after switch back from an alternate
            screen in a terminal window. (Marius Gedminas)
Solution:   Change bitfield to unsigned.  Set flag that cursor shape was set.
Files:      src/terminal.c, src/libvterm/src/vterm_internal.h

Patch 8.0.0921
Problem:    Terminal window cursor shape not supported in the GUI.
Solution:   Use the terminal window cursor shape in the GUI.
Files:      src/terminal.c, src/proto/terminal.pro, src/gui.c, src/syntax.c,
            src/proto/syntax.pro

Patch 8.0.0922
Problem:    Quickfix list always added after current one.
Solution:   Make it possible to add a quickfix list after the last one.
            (Yegappan Lakshmanan)
Files:      runtime/doc/eval.txt, src/quickfix.c,
            src/testdir/test_quickfix.vim

Patch 8.0.0923
Problem:    Crash in GUI when terminal job exits. (Kazunobu Kuriyama)
Solution:   reset in_terminal_loop when a terminal is freed.
Files:      src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.0924
Problem:    Terminal window not updated after using term_sendkeys().
Solution:   Call redraw_after_callback().
```

```
Files:      src/terminal.c

Patch 8.0.0925
Problem:    MS-Windows GUI: channel I/O not handled right away.
Solution:   Don't call process_message() unless a message is available.
            (Yasuhiro Matsumoto, closes #1969)
Files:      src/gui_w32.c

Patch 8.0.0926
Problem:    When job in terminal window ends topline may be wrong.
Solution:   When the job ends adjust topline so that the active part of the
            terminal is displayed.
Files:      src/terminal.c

Patch 8.0.0927
Problem:    If a terminal job sends a blank title "running" is not shown.
Solution:   When the title is blank make it empty.
Files:      src/terminal.c

Patch 8.0.0928
Problem:    MS-Windows: passing arglist to job has escaping problems.
Solution:   Improve escaping. (Yasuhiro Matsumoto, closes #1954)
Files:      src/testdir/test_channel.vim, src/testdir/test_terminal.vim,
            src/channel.c, src/proto/channel.pro, src/terminal.c

Patch 8.0.0929
Problem:    :term without argument does not work.
Solution:   Use shell for empty command. (Yasuhiro Matsumoto, closes #1970)
Files:      src/terminal.c

Patch 8.0.0930
Problem:    Terminal buffers are stored in the viminfo file while they can't
            be useful.
Solution:   Skip terminal buffers for file marks and buffer list
Files:      src/buffer.c, src/mark.c

Patch 8.0.0931
Problem:    getwininfo() does not indicate a terminal window.
Solution:   Add "terminal" to the dictionary.
Files:      runtime/doc/eval.txt, src/evalfunc.c

Patch 8.0.0932
Problem:    Terminal may not use right characters for BS and Enter.
Solution:   Get the characters from the tty.
Files:      src/os_unix.c, src/proto/os_unix.pro, src/terminal.c

Patch 8.0.0933
Problem:    Terminal test tries to start GUI when it's not possible.
Solution:   Check if the GUI can run. (James McCoy, closes #1971)
Files:      src/testdir/shared.vim, src/testdir/test_terminal.vim,
            src/testdir/test_gui.vim, src/testdir/test_gui_init.vim

Patch 8.0.0934 (after 8.0.0932)
Problem:    Change to struts.h missing in patch.
```

```
Solution:   Include adding ttyinfo_T.
Files:      src/structs.h

Patch 8.0.0935
Problem:    Cannot recognize a terminal buffer in :ls output.
Solution:   Use R for a running job and F for a finished job.
Files:      src/buffer.c

Patch 8.0.0936
Problem:    Mode() returns wrong value for a terminal window.
Solution:   Return 't' when typed keys go to a job.
Files:      src/evalfunc.c, src/testdir/test_terminal.vim

Patch 8.0.0937
Problem:    User highlight groups are not adjusted for StatusLineTerm.
Solution:   Combine attributes like for StatusLineNC.
Files:      src/syntax.c, src/globals.h, src/screen.c

Patch 8.0.0938
Problem:    Scrolling in terminal window is inefficient.
Solution:   Use win_del_lines().
Files:      src/terminal.c

Patch 8.0.0939
Problem:    Test_terminal_env is flaky. (James McCoy)
Solution:   Use WaitFor() instead of term_wait().
Files:      src/testdir/test_terminal.vim

Patch 8.0.0940
Problem:    Test_terminal_scrape_multibyte is flaky. (James McCoy)
Solution:   Use WaitFor() instead of term_wait().
Files:      src/testdir/test_terminal.vim

Patch 8.0.0941
Problem:    Existing color schemes don't work well with StatusLineTerm.
Solution:   Don't use "reverse", use fg and bg colors.  Also add
            StatusLineTermNC.
Files:      src/syntax.c, src/vim.h, src/screen.c, src/globals.h, src/option.c

Patch 8.0.0942
Problem:    Using freed memory with ":terminal" if an autocommand changes
            'shell' when splitting the window. (Marius Gedminas)
Solution:   Make a copy of 'shell'. (closes #1974)
Files:      src/terminal.c

Patch 8.0.0943
Problem:    Test_terminal_scrape_multibyte fails if the codepage is not utf-8.
Solution:   Start "cmd" with the utf-8 codepage. (micbou, closes #1975)
Files:      src/testdir/test_terminal.vim

Patch 8.0.0944
Problem:    Test_profile is a little bit flaky.
Solution:   Accept a match when self and total time are the same. (James
            McCoy, closes #1972)
```

```
Files:      src/testdir/test_profile.vim

Patch 8.0.0945
Problem:    64-bit compiler warnings.
Solution:   Use "size_t" instead of "int". (Mike Williams)
Files:      src/os_win32.c

Patch 8.0.0946
Problem:    Using PATH_MAX does not work well on some systems.
Solution:   use MAXPATHL instead. (James McCoy, closes #1973)
Files:      src/main.c

Patch 8.0.0947
Problem:    When in Insert mode and using CTRL-O CTRL-W CTRL-W to move to a
            terminal window, get in a weird Insert mode.
Solution:   Don't go to Insert mode in a terminal window. (closes #1977)
Files:      src/normal.c

Patch 8.0.0948
Problem:    Crash if timer closes window while dragging status line.
Solution:   Check if the window still exists. (Yasuhiro Matsumoto, closes
            #1979)
Files:      src/edit.c, src/evalfunc.c, src/gui.c, src/normal.c, src/ui.c

Patch 8.0.0949
Problem:    winpty.dll name is fixed.
Solution:   Add the 'winptydll' option. Make the default name depend on
            whether it is a 32-bit or 64-bit build. (idea by Yasuhiro
            Matsumoto, closes #1978)
Files:      src/option.c, src/option.h, src/terminal.c,
            runtime/doc/options.txt

Patch 8.0.0950
Problem:    MS-Windows: wrong #ifdef, compiler warnings for signed/unsigned.
Solution:   Change variable type. Change TERMINAL to FEAT_TERMINAL.
Files:      src/os_win32.c, src/option.h

Patch 8.0.0951
Problem:    Another wrong #ifdef.
Solution:   Change TERMINAL to FEAT_TERMINAL. (closes #1981)
Files:      src/option.c

Patch 8.0.0952
Problem:    MS-Windows: has('terminal') does not check existence of dll file.
Solution:   Check if the winpty dll file can be loaded. (Ken Takata)
Files:      src/evalfunc.c, src/proto/terminal.pro, src/terminal.c

Patch 8.0.0953
Problem:    Get "no write since last change" error in terminal window.
Solution:   Use another message when closing a terminal window. Make ":quit!"
            also end the job.
Files:      src/globals.h, src/buffer.c, src/proto/buffer.pro, src/ex_cmds.c,
            src/ex_cmds2.c, src/ex_docmd.c, src/quickfix.c, src/terminal.c
```

```
Patch 8.0.0954
Problem:    /proc/self/exe might be a relative path.
Solution:   Make the path a full path. (James McCoy, closes #1983)
Files:      src/main.c

Patch 8.0.0955
Problem:    Test_existent_file() fails on some file systems.
Solution:   Run the test again with a sleep when the test fails without a
            sleep. (James McCoy, closes #1984)
Files:      src/testdir/test_stat.vim

Patch 8.0.0956
Problem:    Scrolling in a terminal hwindow as flicker when the Normal
            background differs from the terminal window background.
Solution:   Set the attribute to clear with.
Files:      src/terminal.c, src/screen.c, src/proto/screen.pro, src/message.c,
            src/move.c

Patch 8.0.0957
Problem:    When term_sendkeys() sends many keys it may get stuck in writing
            to the job.
Solution:   Make the write non-blocking, buffer keys to be sent.
Files:      src/terminal.c, src/channel.c, src/proto/channel.pro,
            src/structs.h src/testdir/test_terminal.vim

Patch 8.0.0958
Problem:    The terminal test fails on MS-Windows when compiled with the
            terminal feature but the winpty DLL is missing.
Solution:   Check if the terminal feature works. (Ken Takata)
Files:      src/testdir/test_terminal.vim

Patch 8.0.0959
Problem:    Build failure on MS-Windows.
Solution:   Use ioctlsocket() instead of fcntl().
Files:      src/channel.c

Patch 8.0.0960
Problem:    Job in terminal does not get CTRL-C, we send a SIGINT instead.
Solution:   Don't call may_send_sigint() on CTRL-C.  Make CTRL-W CTRL-C end
            the job.
Files:      src/terminal.c, runtime/doc/terminal.txt

Patch 8.0.0961
Problem:    The script to build the installer does not include winpty.
Solution:   Add winpty32.dll and winpty-agent.exe like diff.exe
Files:      nsis/gvim.nsi

Patch 8.0.0962
Problem:    Crash with virtualedit and joining lines. (Joshua T Corbin, Neovim
            #6726)
Solution:   When using a mark check that coladd is valid.
Files:      src/normal.c, src/misc2.c, src/Makefile,
            src/testdir/test_virtualedit.vim, src/testdir/test_alot.vim
```

```
Patch 8.0.0963
Problem:    Terminal test fails on MacOS. (chdiza)
Solution:   Wait for the shell to echo the characters. (closes #1991)
Files:      src/testdir/test_terminal.vim

Patch 8.0.0964
Problem:    Channel write buffer does not work with poll().
Solution:   Use the same mechanism as with select().
Files:      src/channel.c

Patch 8.0.0965
Problem:    The cursor shape is not reset after it was changed in a terminal.
Solution:   Request the original cursor shape and restore it.  Add t_RS.
            Do not add t_SH for now, it does not work properly.
Files:      src/term.c, src/term.h, src/option.c, src/terminal.c

Patch 8.0.0966 (after 8.0.0965)
Problem:    Build failure without terminal feature.
Solution:   Move #endif.
Files:      src/term.c

Patch 8.0.0967
Problem:    Using a terminal may cause the cursor to blink.
Solution:   Do not set t_vs, since we cannot restore the old blink state.
Files:      src/term.c

Patch 8.0.0968
Problem:    Crash when switching terminal modes. (Nikolai Pavlov)
Solution:   Check that there are scrollback lines.
Files:      src/terminal.c

Patch 8.0.0969
Problem:    Coverity warning for unused return value.
Solution:   Add (void) to avoid the warning.
Files:      src/channel.c

Patch 8.0.0970
Problem:    if there is no StatusLine highlighting and there is StatusLineNC
            or StatusLineTermNC highlighting then an invalid highlight id is
            passed to combine_stl_hlt(). (Coverity)
Solution:   Check id_S to be -1 instead of zero.
Files:      src/syntax.c

Patch 8.0.0971
Problem:    'winptydll' missing from :options.
Solution:   Add the entry.
Files:      runtime/optwin.vim

Patch 8.0.0972
Problem:    Compiler warnings for unused variables. (Tony Mechelynck)
Solution:   Add #ifdefs.
Files:      src/term.c

Patch 8.0.0973
```

```
Problem:    initial info about blinking cursor is wrong
Solution:   Invert the blink flag.  Add t_VS to stop a blinking cursor.
Files:      src/term.c, src/proto/term.pro, src/term.h, src/option.c,
            src/terminal.c

Patch 8.0.0974
Problem:    Resetting a string option does not trigger OptionSet. (Rick Howe)
Solution:   Set the origval.
Files:      src/option.c, src/testdir/test_autocmd.vim

Patch 8.0.0975
Problem:    Using freed memory when setting 'backspace'.
Solution:   When changing oldval also change origval.
Files:      src/option.c

Patch 8.0.0976
Problem:    Cannot send lines to a terminal job.
Solution:   Make [range]terminal send selected lines to the job.
            Use ++rows and ++cols for the terminal size.
Files:      src/ex_cmds.h, src/terminal.c, src/os_unix.c,
            src/testdir/test_terminal.vim

Patch 8.0.0977
Problem:    Cannot send lines to a terminal job on MS-Windows.
Solution:   Set jv_in_buf.  Command doesn't get EOF yet though.
Files:      src/terminal.c

Patch 8.0.0978
Problem:    Writing to terminal job is not tested.
Solution:   Add a test.
Files:      src/testdir/test_terminal.vim

Patch 8.0.0979
Problem:    Terminal noblock test fails on MS-Windows. (Christian Brabandt)
Solution:   Ignore empty line below "done".
Files:      src/testdir/test_terminal.vim

Patch 8.0.0980
Problem:    Coverity warning for failing to open /dev/null.
Solution:   When /dev/null can't be opened exit the child.
Files:      src/os_unix.c

Patch 8.0.0981
Problem:    Cursor in terminal window blinks by default, while in a real xterm
            it does not blink, unless the -bc argument is used.
Solution:   Do not use a blinking cursor by default.
Files:      src/terminal.c

Patch 8.0.0982
Problem:    When 'encoding' is set to a multi-byte encoding other than utf-8
            the characters from their terminal are messed up.
Solution:   Convert displayed text from utf-8 to 'encoding' for MS-Windows.
            (Yasuhiro Matsumoto, close #2000)
Files:      src/terminal.c
```

```
Patch 8.0.0983
Problem:    Unnecessary check for NULL pointer.
Solution:   Remove the NULL check in dialog_changed(), it already happens in
            dialog_msg(). (Ken Takata)
Files:      src/ex_cmds2.c

Patch 8.0.0984
Problem:    Terminal blinking cursor not correct in the GUI.
Solution:   Set blinkoff correctly.  Also make the cursor blink on MS-Windows
            by default. (Ken Takata)
Files:      src/terminal.c

Patch 8.0.0985
Problem:    Libvterm has its own idea of character width.
Solution:   Use the Vim functions for character width and composing to avoid a
            mismatch. (idea by Yasuhiro Matsumoto)
Files:      src/Makefile, src/libvterm/src/unicode.c, src/mbyte.c,
            src/proto/mbyte.pro, src/Make_cyg_ming.mak, src/Make_mvc.mak

Patch 8.0.0986
Problem:    Terminal feature always requires multi-byte feature.
Solution:   Remove #ifdef FEAT_MBYTE, disable terminal without multi-byte.
Files:      src/terminal.c, src/feature.h

Patch 8.0.0987
Problem:    terminal: second byte of double-byte char wrong
Solution:   Set the second byte to NUL only for utf-8 and non-multibyte.
Files:      src/terminal.c

Patch 8.0.0988
Problem:    Warning from Covscan about using NULL pointer.
Solution:   Add extra check for NULL. (zdohnal)
Files:      src/fileio.c, src/undo.c

Patch 8.0.0989
Problem:    ActiveTcl dll name has changed in 8.6.6.
Solution:   Adjust the makefile. (Ken Takata)
Files:      src/INSTALLpc.txt, src/Make_cyg_ming.mak, src/Make_mvc.mak

Patch 8.0.0990
Problem:    When 'encoding' is a double-byte encoding, pasting a register into
            a terminal ends up with the wrong characters.
Solution:   Convert from 'encoding' to utf-8. (Yasuhiro Matsumoto, closes
            #2007)
Files:      src/terminal.c

Patch 8.0.0991
Problem:    Using wrong character conversion for DBCS.
Solution:   Use utf_char2bytes instead of mb_char2bytes. (Yasuhiro Matsumoto,
            closes #2012)
Files:      src/terminal.c

Patch 8.0.0992
```

```
Problem:    Terminal title is wrong when 'encoding' is DBCS.
Solution:   Convert the title from DBCS to utf-8. (Yasuhiro Matsumoto, closes
            #2009)
Files:      src/terminal.c

Patch 8.0.0993
Problem:    Sometimes an xterm sends an extra CTRL-X after the response for
            the background color.  Related to t_RS.
Solution:   Check for the CTRL-X after the terminating 0x7.
Files:      src/term.c

Patch 8.0.0994
Problem:    MS-Windows: cursor in terminal blinks even though the blinking
            cursor was disabled on the system.
Solution:   Use GetCaretBlinkTime(). (Ken Takata)
Files:      src/terminal.c

Patch 8.0.0995
Problem:    Terminal tests fail on Mac.
Solution:   Add workaround: sleep a moment in between sending keys.
Files:      src/testdir/test_terminal.vim

Patch 8.0.0996
Problem:    Mac: t_RS is echoed on the screen in Terminal.app.  Even though
            $TERM is set to "xterm-256colors" it cannot handle this xterm
            escape sequence.
Solution:   Recognize Terminal.app from the termresponse and skip sending t_RS
            if it looks like Terminal.app.
Files:      src/term.c

Patch 8.0.0997 (after 8.0.0996)
Problem:    Libvterm and Terminal.app not recognized from termresponse.
Solution:   Adjust string compare.
Files:      src/term.c

Patch 8.0.0998
Problem:    Strange error when using K while only spaces are selected.
            (Christian J. Robinson)
Solution:   Check for blank argument.
Files:      src/normal.c, src/testdir/test_help.vim

Patch 8.0.0999
Problem:    Indenting raw C++ strings is wrong.
Solution:   Add special handling of raw strings. (Christian Brabandt)
Files:      src/misc1.c, src/testdir/test_cindent.vim

Patch 8.0.1000
Problem:    Cannot open a terminal without running a job in it.
Solution:   Make ":terminal NONE" open a terminal with a pty.
Files:      src/terminal.c, src/os_unix.c, src/proto/os_unix.pro,
            src/channel.c, src/proto/channel.pro, src/structs.h,
            src/testdir/test_terminal.c, src/misc2.c, src/gui_gtk_x11.c

Patch 8.0.1001
```

```
Problem:    Setting 'encoding' makes 'printheader' invalid.
Solution:   Do not translate the default value of 'printheader'. (Yasuhiro
            Matsumoto, closes #2026)
Files:      src/option.c

Patch 8.0.1002
Problem:    Unnecessarily updating screen after timer callback.
Solution:   Check if calling the timer sets must_redraw.
Files:      src/ex_cmds2.c, src/channel.c, src/screen.c, src/proto/screen.pro,
            src/terminal.c

Patch 8.0.1003
Problem:    64 bit compiler warning
Solution:   Add type cast. (Mike Williams)
Files:      src/channel.c

Patch 8.0.1004
Problem:    Matchstrpos() without a match returns too many items.
Solution:   Also remove the second item when the position is beyond the end of
            the string. (Hirohito Higashi)  Use an enum for the type.
Files:      src/evalfunc.c, src/testdir/test_match.vim

Patch 8.0.1005
Problem:    Terminal without job updates slowly in GUI.
Solution:   Poll for input when a channel has the keep_open flag.
Files:      src/channel.c, src/proto/channel.pro, src/gui_gtk_x11.c

Patch 8.0.1006
Problem:    Cannot parse text with 'errorformat' without changing a quickfix
            list.
Solution:   Add the "text" argument to getqflist(). (Yegappan Lakshmanan)
Files:      runtime/doc/eval.txt, src/evalfunc.c, src/proto/quickfix.pro,
            src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.1007
Problem:    No test for filetype detection for scripts.
Solution:   Add a first test file script filetype detection.
Files:      src/testdir/test_filetype.vim, runtime/scripts.vim

Patch 8.0.1008
Problem:    Slow updating of terminal window in Motif.
Solution:   Add a timeout to the wait-for-character loop.
Files:      src/gui_x11.c

Patch 8.0.1009
Problem:    Xterm cursor blinking status may be inverted.
Solution:   Use another request to get the blink status and compare with the
            cursor style report
Files:      src/term.c, src/proto/term.pro, src/term.h, src/option.c,
            src/terminal.c

Patch 8.0.1010 (after 8.0.1009)
Problem:    Build failure without termresponse feature.
Solution:   Add #ifdef.
```

```
Files:      src/term.c

Patch 8.0.1011
Problem:    Terminal test fails with Athena and Motif.
Solution:   Ignore the error for the input context. (Kazunobu Kuriyama)
Files:      src/testdir/test_terminal.vim

Patch 8.0.1012
Problem:    MS-Windows: Problem with $HOME when it was set internally.
Solution:   Only use the $HOME default internally. (Yasuhiro Matsumoto, closes
            #2013)
Files:      src/misc1.c, src/testdir/Make_all.mak, src/Makefile,
            src/testdir/test_windows_home.vim

Patch 8.0.1013
Problem:    A terminal window with a running job behaves different from a
            window containing a changed buffer.
Solution:   Do not set 'bufhidden' to "hide".  Fix that a buffer where a
            terminal used to run is listed as "[Scratch]".
Files:      src/terminal.c, runtime/doc/terminal.txt, src/buffer.c

Patch 8.0.1014
Problem:    Old compiler doesn't know uint32_t. Warning for using NULL instead
            of NUL.
Solution:   Use UINT32_T.  Use NUL instead of NULL.
Files:      src/mbyte.c, src/proto/mbyte.pro, src/misc1.c

Patch 8.0.1015 (after 8.0.1013)
Problem:    Missing update to terminal test.
Solution:   Add the changes to the test.
Files:      src/testdir/test_terminal.vim

Patch 8.0.1016
Problem:    Gnome terminal echoes t_RC.
Solution:   Detect Gnome terminal by the version string.  Add v: variables for
            all the term responses.
Files:      src/term.c, src/eval.c, src/vim.h, runtime/doc/eval.txt

Patch 8.0.1017
Problem:    Test for MS-Windows $HOME always passes.
Solution:   Rename the test function.  Make the test pass.
Files:      src/testdir/test_windows_home.vim

Patch 8.0.1018
Problem:    Warnings from 64-bit compiler. (Christian Brabandt)
Solution:   Add type casts.
Files:      src/terminal.c

Patch 8.0.1019
Problem:    Pasting in virtual edit happens in the wrong place.
Solution:   Do not adjust coladd when after the end of the line (closes #2015)
Files:      src/testdir/test_virtualedit.vim, src/misc2.c

Patch 8.0.1020
```

```
Problem:    When a timer calls getchar(1) input is overwritten.
Solution:   Increment tb_change_cnt in inchar(). (closes #1940)
Files:      src/getchar.c

Patch 8.0.1021
Problem:    Older Gnome terminal still echoes t_RC. (François Ingelrest)
Solution:   Check for version > 3000 instead of 4000.
Files:      src/term.c

Patch 8.0.1022
Problem:    Test 80 is old style.
Solution:   Turn it into a new style test. (Yegappan Lakshmanan)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/Make_vms.mms,
            src/testdir/test80.in, src/testdir/test80.ok,
            src/testdir/test_substitute.vim

Patch 8.0.1023
Problem:    It is not easy to identify a quickfix list.
Solution:   Add the "id" field. (Yegappan Lakshmanan)
Files:      runtime/doc/eval.txt, runtime/doc/quickfix.txt, src/quickfix.c,
            src/testdir/test_quickfix.vim

Patch 8.0.1024
Problem:    Manual folds are lost when a session file has the same buffer in
            two windows. (Jeansen)
Solution:   Use ":edit" only once. (Christian Brabandt, closes #1958)
Files:      src/ex_docmd.c, src/testdir/test_mksession.vim

Patch 8.0.1025
Problem:    Stray copy command in test.
Solution:   Remove the copy command.
Files:      src/testdir/test_mksession.vim

Patch 8.0.1026
Problem:    GTK on-the-spot input has problems. (Gerd Wachsmuth)
Solution:   Support over-the-spot. (Yukihiro Nakadaira, Ken Takata, closes
            #1215)
Files:      runtime/doc/mbyte.txt, runtime/doc/options.txt, src/edit.c,
            src/ex_getln.c, src/mbyte.c, src/misc1.c, src/option.c,
            src/option.h, src/screen.c, src/undo.c,
            src/testdir/gen_opt_test.vim

Patch 8.0.1027
Problem:    More terminals can't handle requesting cursor mode.
Solution:   Recognize Putty. (Hirohito Higashi)  Also include Xfce in the
            version check. (Dominique Pelle)  Recognize Konsole.
Files:      src/term.c

Patch 8.0.1028
Problem:    MS-Windows: viminfo uses $VIM/_viminfo if $HOME not set. (Yongwei
            Wu)
Solution:   Use vim_getenv() but check it's returning the default "C:/".
Files:      src/ex_cmds.c
```

```
Patch 8.0.1029
Problem:    Return value of getqflist() is inconsistent.  (Lcd47)
Solution:   Always return an "items" entry.
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.1030
Problem:    MS-Windows: wrong size computation in is_cygpty().
Solution:   Compute the size properly. (Ken Takata)
Files:      src/iscygpty.c, src/iscygpty.h

Patch 8.0.1031
Problem:    "text" argument for getqflist() is confusing. (Lcd47)
Solution:   Use "lines" instead. (Yegappan Lakshmanan)
Files:      runtime/doc/eval.txt, src/quickfix.c,
            src/testdir/test_quickfix.vim

Patch 8.0.1032
Problem:    "make tags" doesn't work well on MS-Windows.
Solution:   Add or fix tags target. (Ken Takata)
Files:      src/Make_cyg_ming.mak, src/Make_mvc.mak

Patch 8.0.1033
Problem:    Detecting background color does not work in screen, even when it
            is working like an xterm.
Solution:   Make "screen.xterm" use termcap entries like an xterm. (Lubomir
            Rintel, closes #2048)  When termresponse version is huge also
            recognize as not being an xterm.
Files:      src/os_unix.c, src/term.c

Patch 8.0.1034
Problem:    Sending buffer lines to terminal doesn't work on MS-Windows.
Solution:   Send CTRL-D to mark the end of the text. (Yasuhiro Matsumoto,
            closes #2043) Add the "eof_chars" option.
Files:      src/channel.c, src/proto/terminal.pro, src/terminal.c,
            src/testdir/test_terminal.vim, src/structs.h

Patch 8.0.1035
Problem:    Sending buffer lines to terminal doesn't work on MS-Windows.
Solution:   Use CR instead of NL after every line.  Make the EOF text work
            properly.  Add the ++eof argument to :terminal.
Files:      src/structs.h, src/channel.c, src/terminal.c,
            runtime/doc/terminal.txt, runtime/doc/eval.txt

Patch 8.0.1036
Problem:    ++eof argument for terminal only available on MS-Windows.
Solution:   Also support ++eof on Unix.  Add a test.
Files:      src/channel.c, src/terminal.c, src/structs.h,
            src/testdir/test_terminal.vim

Patch 8.0.1037
Problem:    "icase" of 'diffopt' is not used for highlighting differences.
Solution:   Also use "icase". (Rick Howe)
Files:      src/diff.c, src/testdir/test_diffmode.vim
```

```
Patch 8.0.1038
Problem:    Strike-through text not supported.
Solution:   Add support for the "strikethrough" attribute. (Christian
            Brabandt, Ken Takata)
Files:      runtime/doc/eval.txt, runtime/doc/options.txt,
            runtime/doc/syntax.txt, runtime/doc/term.txt, src/evalfunc.c,
            src/gui.c, src/gui.h, src/gui_gtk_x11.c, src/gui_mac.c,
            src/gui_w32.c, src/gui_x11.c, src/option.c, src/screen.c,
            src/syntax.c, src/term.c, src/term.h, src/terminal.c, src/vim.h

Patch 8.0.1039
Problem:    Cannot change a line in a buffer other than the current one.
Solution:   Add setbufline(). (Yasuhiro Matsumoto, Ozaki Kiichi, closes #1953)
Files:      src/evalfunc.c, runtime/doc/eval.txt, src/Makefile,
            src/testdir/test_bufline.vim, src/testdir/test_alot.vim

Patch 8.0.1040
Problem:    Cannot use another error format in getqflist().
Solution:   Add the "efm" argument to getqflist(). (Yegappan Lakshmanan)
Files:      runtime/doc/eval.txt, src/quickfix.c,
            src/testdir/test_quickfix.vim

Patch 8.0.1041
Problem:    Bogus characters appear when indenting kicks in while doing a
            visual-block append.
Solution:   Recompute when indenting is done. (Christian Brabandt)
Files:      runtime/doc/visual.txt, src/charset.c, src/edit.c, src/misc1.c,
            src/ops.c, src/proto/charset.pro, src/proto/misc1.pro,
            src/screen.c, src/spell.c, src/testdir/test_cindent.vim

Patch 8.0.1042 (after 8.0.1038)
Problem:    Without the syntax feature highlighting doesn't work.
Solution:   Always use unsigned short to store attributes.
Files:      src/vim.h

Patch 8.0.1043
Problem:    Warning for uninitialized variable. (John Marriott)
Solution:   Move code to check indent inside "if".
Files:      src/ops.c

Patch 8.0.1044
Problem:    Warning for uninitialized variable. (John Marriott)
Solution:   Initialize ind_pre.
Files:      src/ops.c

Patch 8.0.1045
Problem:    Running tests may pollute shell history. (Manuel Ortega)
Solution:   Make $HISTFILE empty.
Files:      src/testdir/setup.vim

Patch 8.0.1046
Problem:    Code duplication in diff mode.
Solution:   Use diff_equal_char() also in diff_cmp(). (Rick Howe)
```

```
Files:      src/diff.c

Patch 8.0.1047
Problem:    Buffer overflow in Ruby.
Solution:   Allocate one more byte. (Dominique Pelle)
Files:      src/if_ruby.c

Patch 8.0.1048
Problem:    No test for what 8.0.1020 fixes.
Solution:   Add test_feedinput().  Add a test. (Ozaki Kiichi, closes #2046)
Files:      runtime/doc/eval.txt, src/evalfunc.c, src/testdir/test_timers.vim,
            src/ui.c

Patch 8.0.1049
Problem:    Shell on Mac can't handle long text, making terminal test fail.
Solution:   Only write 1000 characters instead of 5000.
Files:      src/testdir/test_terminal.vim

Patch 8.0.1050
Problem:    Terminal window feature not included by default.
Solution:   Include the terminal feature for the "huge" build.
Files:      src/configure.ac, src/auto/configure

Patch 8.0.1051
Problem:    Cannot run terminal with spaces in argument.
Solution:   Accept backslash to escape space and other characters. (closes
            #1999)
Files:      src/os_unix.c, src/testdir/test_terminal.vim

Patch 8.0.1052
Problem:    term_start() does not allow in_io, out_io and err_io options.
Solution:   Add JO_OUT_IO to get_job_options().
Files:      src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.1053
Problem:    setline() does not work on startup. (Manuel Ortega)
Solution:   Do not check for ml_mfp to be set for the current buffer.
            (Christian Brabandt)
Files:      src/testdir/shared.vim, src/testdir/test_alot.vim,
            src/testdir/test_bufline.vim, src/testdir/test_timers.vim,
            src/evalfunc.c

Patch 8.0.1054
Problem:    Terminal test fails on MS-Windows.
Solution:   Disable the redirection test for now.  Improve scrape test to make
            it less flaky.
Files:      src/testdir/test_terminal.vim

Patch 8.0.1055
Problem:    Bufline test hangs on MS-Windows.
Solution:   Avoid message for writing file.  Source shared.vim when running
            test individually.
Files:      src/testdir/test_bufline.vim, src/testdir/test_timers.vim
```

```
Patch 8.0.1056
Problem:    Cannot build with the diff feature but without the multi-byte
            feature.
Solution:   Remove #ifdefs. (John Marriott)
Files:      src/diff.c

Patch 8.0.1057
Problem:    Terminal scrape test waits too long, it checks for one instead of
            three.
Solution:   Check there are three characters. (micbou)
Files:      src/testdir/test_terminal.vim

Patch 8.0.1058
Problem:    Terminal redirection test is flaky.
Solution:   Wait for job to finish.
Files:      src/testdir/test_terminal.vim

Patch 8.0.1059
Problem:    older Gnome terminal returns smaller version number. (antarestrue)
Solution:   Lower version limit from 2800 to 2500. (#2032)
Files:      src/term.c

Patch 8.0.1060
Problem:    When imstyle is zero, mapping <Left> breaks preediting.
Solution:   Pass though preediting key-events. (Yasuhiro Matsumoto, closes
            #2064, closes #2063)
Files:      src/getchar.c, src/mbyte.c

Patch 8.0.1061
Problem:    Coverity: no check for NULL command.
Solution:   Check for NULL list item.
Files:      src/terminal.c

Patch 8.0.1062
Problem:    Coverity warnings in libvterm.
Solution:   Add (void) to avoid warning for not checking return value.
            Add "break" before "case".
Files:      src/libvterm/src/screen.c, src/libvterm/src/state.c

Patch 8.0.1063
Problem:    Coverity warns for NULL check and using variable pointer as an
            array.
Solution:   Remove the NULL check.  Make "argvar" an array.
Files:      src/terminal.c

Patch 8.0.1064
Problem:    Coverity warns for leaking resource.
Solution:   Free pty_master_fd on failure.
Files:      src/os_unix.c

Patch 8.0.1065
Problem:    Not all macro examples are included in the self-installing
            executable. (lkintact)
Solution:   Add the directories to the NSIS script. (closes #2065)
```

```
Files:      nsis/gvim.nsi

Patch 8.0.1066
Problem:    Some terminals can't handle requesting cursor mode. (Steven
            Hartland)
Solution:   Recognize vandyke SecureCRT. (closes #2008)
Files:      src/term.c

Patch 8.0.1067
Problem:    Using try/catch in timer does not prevent it from being stopped.
Solution:   Reset the exception context and use did_emsg instead of
            called_emsg.
Files:      src/ex_cmds2.c, src/testdir/test_timers.vim, src/globals.h,
            src/message.c

Patch 8.0.1068 (after 8.0.1066)
Problem:    Vandyke SecureCRT terminal can't handle cursor mode request.
            (Steven Hartland)
Solution:   Fix pointer computation. (closes #2008)
Files:      src/term.c

Patch 8.0.1069
Problem:    Still get CTRL-X sometimes for t_RS request.
Solution:   Also skip 0x18 after a key code response.
Files:      src/term.c

Patch 8.0.1070
Problem:    Terminal test is flaky on Mac.
Solution:   Add Test_terminal_noblock() to list of flaky tests.
Files:      src/testdir/runtest.vim

Patch 8.0.1071
Problem:    $TERM names starting with "putty" and "cygwin" are likely to have
            a dark background, but are not recognized.
Solution:   Only check the first few characters of $TERM to match "putty" or
            "cygwin". (Christian Brabandt)
Files:      src/option.c

Patch 8.0.1072
Problem:    The :highlight command causes a redraw even when nothing changed.
Solution:   Only set "need_highlight_changed" when an attribute changed.
Files:      src/syntax.c

Patch 8.0.1073
Problem:    May get an endless loop if 'statusline' changes a highlight.
Solution:   Do not let evaluating 'statusline' trigger a redraw.
Files:      src/buffer.c

Patch 8.0.1074
Problem:    ":term NONE" does not work on MS-Windows.
Solution:   Make it work.  Split "pty" into "pty_in" and "pty_out". (Yasuhiro
            Matsumoto, closes #2058, closes #2045)
Files:      runtime/doc/eval.txt,
            runtime/pack/dist/opt/termdebug/plugin/termdebug.vim,
```

```
            src/channel.c, src/evalfunc.c, src/os_unix.c, src/structs.h,
            src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.1075
Problem:    MS-Windows: mouse does not work in terminal.
Solution:   Force the winpty mouse on. (Yasuhiro Matsumoto, closes #2072)
Files:      src/terminal.c

Patch 8.0.1076
Problem:    term_start() does not take callbacks. When using two terminals
            without a job only one is read from.  A terminal without a window
            returns the wrong pty.
Solution:   Support "callback", "out_cb" and "err_cb".  Fix terminal without a
            window. Fix reading from multiple channels.
Files:      src/terminal.c, src/proto/terminal.pro, src/channel.c,

Patch 8.0.1077
Problem:    No debugger making use of the terminal window.
Solution:   Add the term debugger plugin.  So far only displays the current
            line when stopped.
Files:      Filelist, runtime/pack/dist/opt/termdebug/plugin/termdebug.vim

Patch 8.0.1078
Problem:    Using freed memory with ":hi Normal".
Solution:   Get "item" again after updating the table.
Files:      src/syntax.c

Patch 8.0.1079
Problem:    Memory leak when remote_foreground() fails.
Solution:   Free the error message.
Files:      src/evalfunc.c, src/if_xcmdsrv.c

Patch 8.0.1080
Problem:    Memory leak for eof_chars terminal option and buffer name.
Solution:   Free job options. Free the buffer name
Files:      src/terminal.c

Patch 8.0.1081
Problem:    Memory leak for the channel write queue.
Solution:   Free the write queue when clearing a channel.
Files:      src/channel.c

Patch 8.0.1082
Problem:    Tests fail when run under valgrind.
Solution:   Increase waiting times.
Files:      src/testdir/test_clientserver.vim, src/testdir/test_terminal.vim

Patch 8.0.1083
Problem:    Leaking memory in input part of channel.
Solution:   Clear the input part of channel.  Free the entry. Move failing
            command test to a separate file to avoid bogus leak reports
            clouding tests that should not leak.
Files:      src/channel.c, src/testdir/test_terminal.vim, src/Makefile,
            src/testdir/test_terminal_fail.vim, src/testdir/Make_all.mak
```

```
Patch 8.0.1084
Problem:    GTK build has compiler warnings. (Christian Brabandt)
Solution:   Get screen size with a different function. (Ken Takata, Yasuhiro
            Matsumoto)
Files:      src/mbyte.c, src/gui_gtk_x11.c, src/proto/gui_gtk_x11.pro,
            src/gui_beval.c

Patch 8.0.1085
Problem:    The terminal debugger can't set breakpoints.
Solution:   Add :Break and :Delete commands.  Also commands for stepping
            through code.
Files:      runtime/pack/dist/opt/termdebug/plugin/termdebug.vim,
            runtime/doc/terminal.txt

Patch 8.0.1086 (after 8.0.1084)
Problem:    Can't build with GTK 3.
Solution:   Rename function argument. (Kazunobu Kuriyama)
Files:      src/gui_gtk_x11.c

Patch 8.0.1087
Problem:    Test_terminal_cwd is flaky. MS-Windows: term_start() "cwd"
            argument does not work.
Solution:   Wait for the condition to be true instead of using a sleep.
            Pass the directory to winpty.
Files:      src/testdir/test_terminal.vim, src/terminal.c

Patch 8.0.1088
Problem:    Occasional memory use after free.
Solution:   Use the highlight table directly, don't keep a pointer.
Files:      src/syntax.c

Patch 8.0.1089
Problem:    Cannot get range count in user command.
Solution:   Add <range> argument.
Files:      src/ex_docmd.c, runtime/doc/map.txt

Patch 8.0.1090
Problem:    cannot get the text under the cursor like v:beval_text
Solution:   Add <cexpr>.
Files:      src/ex_docmd.c, src/testdir/test_normal.vim,
            runtime/doc/cmdline.txt

Patch 8.0.1091 (after 8.0.1090)
Problem:    Test for <cexpr> fails without +balloon_eval feature.
Solution:   Remove #ifdefs.
Files:      src/normal.c

Patch 8.0.1092
Problem:    Terminal debugger can't evaluate expressions.
Solution:   Add :Evaluate and K.  Various other improvements.
Files:      runtime/pack/dist/opt/termdebug/plugin/termdebug.vim,
            runtime/doc/terminal.txt
```

```
Patch 8.0.1093
Problem:    Various small quickfix issues.
Solution:   Remove ":" prefix from title set by a user. Add the qf_id2nr().
            function. Add a couple more tests.  Update documentation.
            (Yegappan Lakshmanan)
Files:      runtime/doc/eval.txt, runtime/doc/quickfix.txt, src/evalfunc.c,
            src/proto/quickfix.pro, src/quickfix.c,
            src/testdir/test_quickfix.vim

Patch 8.0.1094
Problem:    Using ssh from Terminal.app runs into xterm incompatibility.
Solution:   Also detect Terminal.app on non-Mac systems.
Files:      src/term.c

Patch 8.0.1095
Problem:    Terminal multibyte scrape test is flaky.
Solution:   Add another condition to wait for.
Files:      src/testdir/test_terminal.vim

Patch 8.0.1096
Problem:    Terminal window in Normal mode has wrong background.
Solution:   Store the default background and use it for clearing until the
            end of the line.  Not for below the last line, since there is no
            text there.
Files:      src/screen.c, src/terminal.c

Patch 8.0.1097 (after 8.0.1096)
Problem:    Background color wrong if job changes background color.
Solution:   Get the background color from vterm.
Files:      src/terminal.c, src/screen.c

Patch 8.0.1098
Problem:    Build failure if libvterm installed on the system. (Oleh
            Hushchenkov)
Solution:   Change the CCCTERM argument order. (Ken Takata, closes #2080)
Files:      src/Makefile

Patch 8.0.1099
Problem:    Warnings for GDK calls.
Solution:   Use other calls for GTK 3 and fix a few problems. (Kazunobu
            Kuriyama)
Files:      src/mbyte.c

Patch 8.0.1100
Problem:    Stuck in redraw loop when 'lazyredraw' is set.
Solution:   Don't loop on update_screen() when not redrawing. (Yasuhiro
            Matsumoto, closes #2082)
Files:      src/terminal.c, src/screen.c, src/proto/screen.pro

Patch 8.0.1101
Problem:    Channel write fails if writing to log fails.
Solution:   Ignore return value of fwrite(). (Ozaki Kiichi, closes #2081)
Files:      src/channel.c
```

```
Patch 8.0.1102
Problem:    Terminal window does not use Normal colors.
Solution:   For the GUI and when 'termguicolors' is enabled, use the actual
            foreground and background colors for the terminal.  (Yasuhiro
            Matsumoto, closes #2067)
            Use the "Terminal" highlight group if defined.
Files:      src/terminal.c, src/syntax.c, src/proto/syntax.pro

Patch 8.0.1103 (after 8.0.1102)
Problem:    Converting cterm color fails for grey ramp.
Solution:   Use index instead of number.
Files:      src/terminal.c

Patch 8.0.1104
Problem:    The qf_jump() function is too long.
Solution:   Split of parts to separate functions. (Yegappan Lakshmanan)
Files:      src/quickfix.c

Patch 8.0.1105
Problem:    match() and matchend() are not tested.
Solution:   Add tests. (Ozaki Kiichi, closes #2088)
Files:      src/testdir/test_functions.vim, src/testdir/test_match.vim

Patch 8.0.1106
Problem:    Terminal colors on an MS-Windows console are not matching the
            normal colors.
Solution:   Use the normal colors for the terminal. (Yasuhiro Matsumoto,
            closes #2087)
Files:      src/terminal.c

Patch 8.0.1107
Problem:    Terminal debugger jumps to non-existing file.
Solution:   Check that the file exists.  Add an option to make the Vim width
            wide. Fix removing highlight groups.
Files:      runtime/pack/dist/opt/termdebug/plugin/termdebug.vim,
            runtime/doc/terminal.txt

Patch 8.0.1108
Problem:    Cannot specify mappings for the terminal window.
Solution:   Add the :tmap command and associated code.  (Jacob Askeland,
            closes #2073)
Files:      runtime/doc/map.txt, runtime/doc/terminal.txt, src/ex_cmdidxs.h,
            src/ex_cmds.h, src/ex_docmd.c, src/getchar.c, src/gui.c,
            src/terminal.c, src/testdir/test_terminal.vim, src/vim.h,
            src/proto/terminal.pro, src/main.c, src/evalfunc.c

Patch 8.0.1109
Problem:    Timer causes error on exit from Ex mode. (xtal8)
Solution:   save and restore the ex_pressedreturn flag. (Christian Brabandt,
            closes #2079)
Files:      src/ex_docmd.c, src/proto/ex_docmd.pro, src/ex_cmds2.c,
            src/testdir/test_timers.vim

Patch 8.0.1110
```

```
Problem:    FORTIFY_SOURCE from Perl causes problems. (Scott Baker)
Solution:   Filter out the flag. (Christian Brabandt, closes #2068)
Files:      src/configure.ac, src/auto/configure

Patch 8.0.1111
Problem:    Syntax error in configure when using Perl.
Solution:   Add missing quote
Files:      src/configure.ac, src/auto/configure

Patch 8.0.1112
Problem:    Can't get size or current index from quickfix list.
Solution:   Add "idx" and "size" options. (Yegappan Lakshmanan)
Files:      runtime/doc/eval.txt, src/quickfix.c,
            src/testdir/test_quickfix.vim

Patch 8.0.1113
Problem:    Can go to Insert mode from Terminal-Normal mode.
Solution:   Prevent :startinsert and "VA" to enter Insert mode. (Yasuhiro
            Matsumoto, closes #2092)
Files:      src/normal.c

Patch 8.0.1114
Problem:    Default for 'iminsert' is annoying.
Solution:   Make the default always zero. (Yasuhiro Matsumoto, closes #2071)
Files:      src/option.c, runtime/doc/options.txt

Patch 8.0.1115
Problem:    Crash when using foldtextresult() recursively.
Solution:   Avoid recursive calls. (Yasuhiro Matsumoto, closes #2098)
Files:      src/evalfunc.c, src/testdir/test_fold.vim

Patch 8.0.1116
Problem:    Terminal test fails on MS-Windows.
Solution:   Wait for the text to appear. (micbou, closes #2097)
Files:      src/testdir/test_terminal.vim

Patch 8.0.1117
Problem:    Test_terminal_no_cmd hangs on MS-Windows with GUI. (Christian
            Brabandt)
Solution:   Run the command with "start" and wait for the text to appear.
            (micbou, closes #2096)
Files:      src/testdir/test_terminal.vim

Patch 8.0.1118
Problem:    FEAT_WINDOWS adds a lot of #ifdefs while it is nearly always
            enabled and only adds 7% to the binary size of the tiny build.
Solution:   Graduate FEAT_WINDOWS.
Files:      src/feature.h, src/window.c, src/vim.h, src/structs.h,
            src/globals.h, src/gui.h, src/if_py_both.h, src/option.h,
            src/term.h, src/buffer.c, src/charset.c, src/digraph.c,
            src/edit.c, src/eval.c, src/evalfunc.c, src/ex_cmds.c,
            src/ex_cmds2.c, src/ex_docmd.c, src/ex_getln.c, src/fileio.c,
            src/fold.c, src/getchar.c, src/gui.c, src/gui_athena.c,
            src/gui_beval.c, src/gui_gtk.c, src/gui_motif.c, src/gui_w32.c,
```

```
            src/if_cscope.c, src/if_lua.c, src/if_mzsch.c, src/if_python.c,
            src/if_python3.c, src/if_ruby.c, src/if_tcl.c, src/main.c,
            src/mark.c, src/memline.c, src/misc1.c, src/misc2.c, src/move.c,
            src/netbeans.c, src/normal.c, src/option.c, src/popupmnu.c,
            src/quickfix.c, src/screen.c, src/search.c, src/spell.c,
            src/syntax.c, src/tag.c, src/term.c, src/ui.c, src/version.c,
            src/workshop.c, src/if_perl.xs, src/testdir/test_normal.vim

Patch 8.0.1119
Problem:    Quitting a split terminal window kills the job. (Yasuhiro
            Matsumoto)
Solution:   Only stop terminal job if it is the last window.
Files:      src/buffer.c, src/testdir/test_terminal.vim

Patch 8.0.1120 (after 8.0.1108)
Problem:    :tm means :tmap instead of :tmenu. (Taro Muraoka)
Solution:   Move the new entry below the old entry. (closes #2102)
Files:      src/ex_cmds.h, runtime/doc/map.txt

Patch 8.0.1121
Problem:    Can uncheck executables in MS-Windows installer.
Solution:   Make the choice read-only. (Ken Takata, closes #2106)
Files:      nsis/gvim.nsi

Patch 8.0.1122
Problem:    vimtutor.bat doesn't work well with vim.bat.
Solution:   Use "call vim". (Ken Takata, closes #2105)
Files:      vimtutor.bat

Patch 8.0.1123
Problem:    Cannot define a toolbar for a window.
Solution:   Add a window-local toolbar.
Files:      src/syntax.c, src/proto/syntax.pro, src/structs.h, src/menu.c,
            src/proto/menu.pro, src/testdir/test_winbar.vim, src/Makefile,
            src/normal.c, src/testdir/Make_all.mak, src/if_perl.xs,
            src/eval.c, src/evalfunc.c, src/window.c, src/ui.c,
            src/terminal.c, src/screen.c,
            runtime/pack/dist/opt/termdebug/plugin/termdebug.vim,
            runtime/doc/gui.txt, runtime/doc/terminal.txt

Patch 8.0.1124
Problem:    Use of MZSCHEME_VER is unclear.
Solution:   Add a comment. (Ken Takata)
Files:      src/Make_cyg_ming.mak, src/Make_mvc.mak

Patch 8.0.1125
Problem:    Wrong window height when splitting window with window toolbar.
Solution:   Add or subtract the window toolbar height.
Files:      src/window.c

Patch 8.0.1126
Problem:    Endless resize when terminal showing in two buffers. (Hirohito
            Higashi)
Solution:   Set a flag to prevent resizing the window.
```

```
Files:      src/terminal.c

Patch 8.0.1127
Problem:    Test_peek_and_get_char fails on 32 bit system. (Elimar
            Riesebieter)
Solution:   Avoid an integer overflow. (James McCoy, closes #2116)
Files:      src/ex_cmds2.c

Patch 8.0.1128
Problem:    Old xterm sends CTRL-X in response to t_RS.
Solution:   Only send t_RS for xterm 279 and later.  Remove the workaround to
            ignore CTRL-X.
Files:      src/term.c

Patch 8.0.1129
Problem:    Window toolbar missing a part of the patch.
Solution:   Add change in vim.h.
Files:      src/vim.h

Patch 8.0.1130
Problem:    The qf_jump() function is still too long.
Solution:   Split of parts to separate functions. (Yegappan Lakshmanan)
Files:      src/quickfix.c

Patch 8.0.1131
Problem:    It is not easy to trigger an autocommand for new terminal window.
            (Marco Restelli)
Solution:   Trigger BufWinEnter after setting 'buftype'.
Files:      src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.1132
Problem:    #if condition is not portable.
Solution:   Add defined(). (Zuloloxi, closes #2136)
Files:      src/libvterm/src/vterm.c

Patch 8.0.1133
Problem:    Syntax timeout not used correctly.
Solution:   Do not pass the timeout to syntax_start() but set it explicitly.
            (Yasuhiro Matsumoto, closes #2139)
Files:      src/proto/syntax.pro, src/screen.c, src/syntax.c

Patch 8.0.1134
Problem:    Superfluous call to syn_get_final_id().
Solution:   Remove it. (Ken Takata)
Files:      src/syntax.c

Patch 8.0.1135
Problem:    W_WINCOL() is always the same.
Solution:   Expand the macro.
Files:      src/edit.c, src/ex_docmd.c, src/gui_gtk.c, src/gui_w32.c,
            src/netbeans.c, src/popupmnu.c, src/screen.c, src/term.c,
            src/terminal.c, src/ui.c, src/window.c, src/if_py_both.h,
            src/structs.h, src/vim.h
```

Patch 8.0.1136
Problem: W_WIDTH() is always the same.
Solution: Expand the macro.
Files: src/charset.c, src/edit.c, src/evalfunc.c, src/ex_cmds.c,
            src/ex_docmd.c, src/getchar.c, src/gui.c, src/gui_beval.c,
            src/gui_mac.c, src/if_lua.c, src/if_mzsch.c, src/if_py_both.h,
            src/if_ruby.c, src/misc1.c, src/misc2.c, src/move.c, src/normal.c,
            src/popupmnu.c, src/quickfix.c, src/screen.c, src/search.c,
            src/structs.h, src/ui.c, src/vim.h, src/window.c

Patch 8.0.1137 (after 8.0.1136)
Problem: Cannot build with Ruby.
Solution: Fix misplaced brace.
Files: src/if_ruby.c

Patch 8.0.1138
Problem: Click in window toolbar starts Visual mode.
Solution: Add the MOUSE_WINBAR flag.
Files: src/ui.c, src/vim.h, src/normal.c

Patch 8.0.1139
Problem: Using window toolbar changes state.
Solution: Always execute window toolbar actions in Normal mode.
Files: runtime/doc/gui.txt, src/structs.h, src/ex_docmd.c,
            src/proto/ex_docmd.pro, src/menu.c

Patch 8.0.1140
Problem: Still old style tests.
Solution: Convert two tests to new style. (Yegappan Lakshmanan)
Files: src/Makefile, src/testdir/Make_all.mak, src/testdir/Make_vms.mms,
            src/testdir/test56.in, src/testdir/test56.ok,
            src/testdir/test57.in, src/testdir/test57.ok,
            src/testdir/test_sort.vim, src/testdir/test_vimscript.vim

Patch 8.0.1141
Problem: MS-Windows build dependencies are incomplete.
Solution: Fix the dependencies. (Ken Takata)
Files: src/Make_cyg.mak, src/Make_cyg_ming.mak, src/Make_ming.mak,
            src/Make_mvc.mak

Patch 8.0.1142
Problem: Window toolbar menu gets a tear-off item.
Solution: Recognize the window toolbar.
Files: src/menu.c

Patch 8.0.1143
Problem: Macros always expand to the same thing.
Solution: Remove W_VSEP_WIDTH() and W_STATUS_HEIGHT().
Files: src/vim.h, src/structs.h, src/gui.c, src/ex_getln.c, src/screen.c

Patch 8.0.1144
Problem: Using wrong #ifdef for computing length.
Solution: use BACKSLASH_IN_FILENAME instead of COLON_IN_FILENAME. (Yasuhiro
            Matsumoto, closes #2153)

```
Files:      src/quickfix.c

Patch 8.0.1145
Problem:    Warning when compiling with Perl.
Solution:   Remove unused variable. (Ken Takata)
Files:      src/if_perl.xs

Patch 8.0.1146
Problem:    Redraw when highlight is set with same names. (Ozaki Kiichi)
Solution:   Only free and save a name when it changed. (closes #2120)
Files:      src/syntax.c

Patch 8.0.1147
Problem:    Fail to build with tiny features. (Tony Mechelynck)
Solution:   Move #ifdefs.
Files:      src/syntax.c

Patch 8.0.1148
Problem:    "gN" doesn't work on last match with 'wrapscan' off. (fcpg)
Solution:   Adjust for searching backward. (Christian Brabandt)
Files:      src/search.c, src/testdir/test_gn.vim

Patch 8.0.1149
Problem:    libvterm colors differ from xterm.
Solution:   Use the xterm colors for libvterm.
Files:      src/terminal.c, src/libvterm/src/pen.c,
            src/testdir/xterm_ramp.vim, Filelist

Patch 8.0.1150
Problem:    MS-Windows GUI: dialog font size is incorrect.
Solution:   Pass flag to indicate 'encoding' or active codepage. (Yasuhiro
            Matsumoto, closes #2160)
Files:      src/gui_w32.c

Patch 8.0.1151
Problem:    "vim -c startinsert!" doesn't append.
Solution:   Correct line number on startup. (Christian Brabandt, closes #2117)
Files:      src/ex_docmd.c, src/testdir/test_startup.vim

Patch 8.0.1152
Problem:    Encoding of error message wrong in Cygwin terminal.
Solution:   Get locale from environment variables. (Ken Takata)
Files:      src/main.c, src/mbyte.c, src/proto/mbyte.pro

Patch 8.0.1153
Problem:    No tests for diff_hlID() and diff_filler().
Solution:   Add tests. (Dominique Pelle, closes #2156)
Files:      src/testdir/test_diffmode.vim

Patch 8.0.1154
Problem:    'indentkeys' does not work properly. (Gary Johnson)
Solution:   Get the cursor line again. (Christian Brabandt, closes #2151)
Files:      src/edit.c, src/testdir/test_edit.vim
```

```
Patch 8.0.1155
Problem:    Ruby command triggers a warning when RUBYOPT is set to "-w".
Solution:   use "-e_=0" instead of "-e0". (Masataka Pocke Kuwabara, closes
            #2143)
Files:      src/if_ruby.c

Patch 8.0.1156
Problem:    Removing one -W argument from Perl CFLAGS may cause trouble.
Solution:   Remove all -W flags. (Christian Brabandt)
Files:      src/configure.ac, src/auto/configure

Patch 8.0.1157
Problem:    Compiler warning on MS-Windows.
Solution:   Add type cast. (Yasuhiro Matsumoto)
Files:      src/main.c

Patch 8.0.1158
Problem:    Still old style tests.
Solution:   Convert several tests to new style. (Yegappan Lakshmanan)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/Make_vms.mms,
            src/testdir/main.aap, src/testdir/test33.in,
            src/testdir/test33.ok, src/testdir/test41.in,
            src/testdir/test41.ok, src/testdir/test43.in,
            src/testdir/test43.ok, src/testdir/test53.in,
            src/testdir/test53.ok, src/testdir/test_file_size.vim,
            src/testdir/test_lispwords.vim, src/testdir/test_search.vim,
            src/testdir/test_textobjects.vim

Patch 8.0.1159
Problem:    Typo in #ifdef.
Solution:   Change "PROT" to "PROTO". (Nobuhiro Takasaki, closes #2165)
Files:      src/syntax.c

Patch 8.0.1160
Problem:    Getting tab-local variable fails after closing window.
Solution:   set tp_firstwin and tp_lastwin. (Jason Franklin, closes #2170)
Files:      src/window.c, src/evalfunc.c, src/testdir/test_getvar.vim

Patch 8.0.1161
Problem:    Popup menu drawing problem when resizing terminal.
Solution:   Redraw after resizing also when a popup menu is visible. (Ozaki
            Kiichi, closes #2110)
Files:      src/popupmnu.c, src/term.c, src/testdir/shared.vim,
            src/testdir/test_popup.vim

Patch 8.0.1162
Problem:    Shared script for tests cannot be included twice.
Solution:   Include it where needed, it will "finish" if loaded again.
Files:      src/testdir/test_alot.vim, src/testdir/test_bufline.vim,
            src/testdir/test_timers.vim

Patch 8.0.1163
Problem:    Popup test is flaky.
Solution:   Add a WaitFor() and fix another.
```

```
Files:      src/testdir/test_popup.vim

Patch 8.0.1164
Problem:    Changing StatusLine highlight while evaluating 'statusline' may
            not change the status line color.
Solution:   When changing highlighting while redrawing don't cause another
            redraw. (suggested by Ozaki Kiichi, closes #2171, closes #2120)
Files:      src/buffer.c, src/syntax.c

Patch 8.0.1165
Problem:    Popup test is still flaky.
Solution:   Add a term_wait() call. (Ozaki Kiichi)
Files:      src/testdir/test_popup.vim

Patch 8.0.1166
Problem:    :terminal doesn't work on Mac High Sierra.
Solution:   Change #ifdef for OpenPTY(). (Ozaki Kiichi, Kazunobu Kuriyama,
            closes #2162)
Files:      src/pty.c

Patch 8.0.1167
Problem:    Motif: typing in terminal window is slow.
Solution:   Do not redraw the whole terminal window but only what was changed.
Files:      src/terminal.c

Patch 8.0.1168
Problem:    wrong highlighting with combination of match and 'cursorline'.
Solution:   Use "line_attr" when appropriate. (Ozaki Kiichi, closes #2111)
            But don't highlight more than one character.
Files:      src/screen.c, src/testdir/test_highlight.vim,
            src/testdir/view_util.vim

Patch 8.0.1169
Problem:    Highlighting one char too many with 'list' and 'cul'.
Solution:   Check for 'list' being active. (Ozaki Kiichi, closes #2177)
Files:      src/screen.c, src/testdir/test_highlight.vim

Patch 8.0.1170
Problem:    Using termdebug results in 100% CPU time. (tomleb)
Solution:   Use polling instead of select().
Files:      src/os_unix.c, src/channel.c, src/proto/channel.pro

Patch 8.0.1171
Problem:    Popup test is still a bit flaky.
Solution:   Change term_wait() calls. (Ozaki Kiichi)
Files:      src/testdir/test_popup.vim

Patch 8.0.1172
Problem:    When E734 is given option is still set.
Solution:   Assign NULL to "s". (Christian Brabandt)
Files:      src/eval.c, src/testdir/test_assign.vim

Patch 8.0.1173
Problem:    Terminal window is not redrawn after CTRL-L. (Marcin Szamotulski)
```

```
Solution:   Redraw the whole terminal when w_redr_type is NOT_VALID.
Files:      src/terminal.c

Patch 8.0.1174
Problem:    Mac Terminal.app has wrong color for white.
Solution:   Use white from the color cube.
Files:      src/globals.h, src/term.c, src/syntax.c

Patch 8.0.1175 (after  8.0.1174)
Problem:    Build failure without +termresponse.
Solution:   Add #ifdef.
Files:      src/syntax.c

Patch 8.0.1176
Problem:    Job_start() does not handle quote and backslash correctly.
Solution:   Remove quotes, recognize and remove backslashes.
Files:      src/testdir/test_channel.vim, src/os_unix.c

Patch 8.0.1177
Problem:    In a terminal window the popup menu is not cleared. (Gerry
            Agbobada)
Solution:   Redraw when SOME_VALID is used instead of NOT_VALID. (closes
            #2194)
Files:      src/terminal.c

Patch 8.0.1178
Problem:    Using old compiler on MS-Windows.
Solution:   Switch default build on MS-Windows to use MSVC 2015. (Ken Takata)
Files:      src/msvc2015.bat, src/INSTALLpc.txt, src/GvimExt/Makefile,
            src/Make_mvc.mak, src/tee/Make_mvc.mak, src/xxd/Make_mvc.mak

Patch 8.0.1179
Problem:    Test_popup_and_window_resize() does not always pass.
Solution:   Do not use $VIMPROG, pass the Vim executable in the vimcmd file.
            (Ozaki Kiichi, closes #2186)
Files:      src/testdir/Makefile, src/testdir/shared.vim,
            src/testdir/test_popup.vim

Patch 8.0.1180
Problem:    MS-Windows testclean target deletes the color script.
Solution:   Rename the script file.
Files:      src/testdir/xterm_ramp.vim, src/testdir/color_ramp.vim

Patch 8.0.1181
Problem:    Tests using Vim command fail on MS-Windows.
Solution:   Do not add quotes around the Vim command.
Files:      src/testdir/Make_dos.mak, src/testdir/Make_ming.mak

Patch 8.0.1182
Problem:    Cannot see or change mzscheme dll name.
Solution:   Add 'mzschemedll' and 'mzschemegcdll'.
Files:      src/if_mzsch.c, src/option.h, src/option.c,
            runtime/doc/if_mzsch.txt
```

```
Patch 8.0.1183
Problem:    MS-Windows build instructions are outdated.
Solution:   Update instructions for MSVC 2015.  Update the build script.
Files:      Filelist, Makefile, src/INSTALLpc.txt, src/bigvim.bat

Patch 8.0.1184
Problem:    The :marks command is not tested.
Solution:   Add a test. (Dominique Pelle, closes #2197)
Files:      src/testdir/test_marks.vim

Patch 8.0.1185
Problem:    Ruby library includes minor version number.
Solution:   Only use the API version number. (Ben Boeckel, closes #2199)
Files:      src/configure.ac, src/auto/configure

Patch 8.0.1186
Problem:    Still quite a few old style tests.
Solution:   Convert old to new style tests. (Yegappan Lakshmanan)
            Avoid ringing the bell while running tests.
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_vms.mms, src/testdir/main.aap,
            src/testdir/test31.in, src/testdir/test31.ok,
            src/testdir/test4.in, src/testdir/test4.ok, src/testdir/test5.in,
            src/testdir/test5.ok, src/testdir/test60.in,
            src/testdir/test60.ok, src/testdir/test60.vim,
            src/testdir/test7.in, src/testdir/test7.ok, src/testdir/test78.in,
            src/testdir/test78.ok, src/testdir/test_autocmd.vim,
            src/testdir/test_exists.vim, src/testdir/test_recover.vim,
            src/testdir/test_winbuf_close.vim, src/testdir/runtest.vim

Patch 8.0.1187
Problem:    Building with lua fails for OSX on Travis.
Solution:   Separate brew-update and brew-install. (Ozaki Kiichi, closes #2203)
Files:      .travis.yml

Patch 8.0.1188
Problem:    Autocmd test fails on MS-Windows.
Solution:   Give the buffer a name and find the buffer to be wiped out by
            name.
Files:      src/testdir/test_autocmd.vim

Patch 8.0.1189
Problem:    E172 is not actually useful, it's only on Unix anyway.
Solution:   Remove the check and the error.
Files:      src/ex_docmd.c, runtime/doc/message.txt

Patch 8.0.1190
Problem:    Vim becomes unusable after opening new window in BufWritePre
            event.
Solution:   Call not_exiting(). (Martin Tournoij, closes #2205)
            Also for "2q" when a help window is open.  Add a test.
Files:      src/ex_docmd.c, src/testdir/test_writefile.vim

Patch 8.0.1191
```

```
Problem:    MS-Windows: missing 32 and 64 bit files in installer.
Solution:   Include both 32 and 64 bit GvimExt and related dll files. Remove
            old Windows code from the installer. (Ken Takata, closes #2144)
Files:      nsis/README.txt, nsis/gvim.nsi, src/GvimExt/gvimext.cpp,
            src/dosinst.c, src/dosinst.h, src/uninstal.c, Makefile

Patch 8.0.1192
Problem:    MS-Windows: terminal feature not enabled by default.
Solution:   Enable it. (Ken Takata)
Files:      src/Make_cyg_ming.mak, src/Make_mvc.mak

Patch 8.0.1193
Problem:    Crash when wiping out a buffer after using getbufinfo().
            (Yegappan Lakshmanan)
Solution:   Remove b:changedtick from the buffer variables.
Files:      src/buffer.c, src/testdir/test_autocmd.vim

Patch 8.0.1194
Problem:    Actual fg and bg colors of terminal are unknown.
Solution:   Add t_RF.  Store response to t_RB and t_RF, use for terminal.
Files:      src/term.c, src/term.h, src/proto/term.pro, src/terminal.c,
            src/vim.h, src/eval.c, runtime/doc/eval.txt

Patch 8.0.1195 (after 8.0.1194)
Problem:    Can't build on MS-Windows.
Solution:   Adjust #ifdef and add #ifdefs.
Files:      src/term.c, src/terminal.c

Patch 8.0.1196 (after 8.0.1194)
Problem:    Crash when t_RF is not set. (Brian Pina)
Solution:   Add t_RF to the list of terminal options. (Hirohito Higashi)
Files:      src/option.c

Patch 8.0.1197
Problem:    MS-Windows build instructions are not up to date.
Solution:   Adjust the instructions.  Fix the nsis script.
Files:      Makefile, nsis/gvim.nsi

Patch 8.0.1198
Problem:    Older compilers don't know uint8_t.
Solution:   Use char_u instead.
Files:      src/term.c, src/proto/term.pro

Patch 8.0.1199
Problem:    When 'clipboard' is "autoselectplus" the star register is also
            set. (Gilles Moris)
Solution:   Don't set the star register in this situation.
Files:      src/ops.c

Patch 8.0.1200
Problem:    Tests switch the bell off twice.
Solution:   Don't set 'belloff' in individual tests. (Christian Brabandt)
Files:      src/testdir/test_alot.vim, src/testdir/test_alot_utf8.vim,
            src/testdir/test_autocmd.vim, src/testdir/test_cmdline.vim,
```

```
            src/testdir/test_diffmode.vim, src/testdir/test_digraph.vim,
            src/testdir/test_edit.vim, src/testdir/test_file_size.vim,
            src/testdir/test_gn.vim, src/testdir/test_normal.vim,
            src/testdir/test_packadd.vim, src/testdir/test_popup.vim,
            src/testdir/test_recover.vim, src/testdir/test_search.vim,
            src/testdir/test_textobjects.vim, src/testdir/test_undo.vim,
            src/testdir/test_usercommands.vim, src/testdir/test_visual.vim

Patch 8.0.1201
Problem:    "yL" is affected by 'scrolloff'. (Eli the Bearded)
Solution:   Don't use 'scrolloff' when an operator is pending.
Files:      src/normal.c, runtime/doc/motion.txt

Patch 8.0.1202
Problem:    :wall gives an error for a terminal window. (Marius Gedminas)
Solution:   Don't try writing a buffer that can't be written. (Yasuhiro
            Matsumoto, closes #2190)
Files:      src/ex_cmds.c, src/testdir/test_terminal.vim

Patch 8.0.1203
Problem:    Terminal window mistreats composing characters.
Solution:   Count composing characters with the base character. (Ozaki Kiichi,
            closes #2195)
Files:      src/mbyte.c, src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.1204
Problem:    A QuitPre autocommand may get the wrong file name.
Solution:   Pass the buffer being closed to apply_autocmds(). (Rich Howe)
Files:      src/ex_docmd.c, src/testdir/test_autocmd.vim

Patch 8.0.1205
Problem:    Using "1q" it is possible to unload a changed buffer. (Rick Howe)
Solution:   Check the right window for changes.
Files:      src/testdir/test_edit.vim, src/ex_docmd.c

Patch 8.0.1206
Problem:    No autocmd for entering or leaving the command line.
Solution:   Add CmdlineEnter and CmdlineLeave.
Files:      runtime/doc/autocmd.txt, src/ex_getln.c, src/fileio.c, src/vim.h,
            src/testdir/test_autocmd.vim

Patch 8.0.1207
Problem:    Profiling skips the first and last script line.
Solution:   Check for BOM after setting script ID. (LemonBoy, closes #2103,
            closes #2112) Add a test. List the trailing script lines.
Files:      src/testdir/test_profile.vim, src/ex_cmds2.c

Patch 8.0.1208
Problem:    'statusline' drops empty group with highlight change.
Solution:   Do not drop an empty group if it changes highlighting. (Marius
            Gedminas, closes #2228)
Files:      src/buffer.c, src/testdir/test_statusline.vim

Patch 8.0.1209
```

```
Problem:    Still too many old style tests.
Solution:   Convert a few more tests to new style. (Yegappan Lakshmanan,
            closes #2230)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Makefile, src/testdir/Make_vms.mms,
            src/testdir/main.aap, src/testdir/test34.in,
            src/testdir/test34.ok, src/testdir/test54.in,
            src/testdir/test54.ok, src/testdir/test8.in, src/testdir/test8.ok,
            src/testdir/test_autocmd.vim, src/testdir/test_autoformat_join.in,
            src/testdir/test_autoformat_join.ok, src/testdir/test_join.vim,
            src/testdir/test_user_func.vim

Patch 8.0.1210
Problem:    When typing a search pattern CTRL-G and CTRL-T are ignored when
            there is typeahead.
Solution:   Don't pass SEARCH_PEEK and don't call char_avail(). (haya14busa,
            closes #2233)
Files:      src/ex_getln.c, src/testdir/test_search.vim

Patch 8.0.1211
Problem:    Cannot reorder tab pages with drag & drop.
Solution:   Support drag & drop for GTK and MS-Windows. (Ken Takata, Masamichi
            Abe)
Files:      src/gui_gtk_x11.c, src/gui_w32.c

Patch 8.0.1212
Problem:    MS-Windows: tear-off menu does not work on 64 bit. (shaggyaxe)
Solution:   Change how the menu handle is looked up. (Ken Takata, closes
            #1205)
Files:      src/gui_w32.c

Patch 8.0.1213
Problem:    Setting 'mzschemedll' has no effect.
Solution:   Move loading .vimrc to before call to mzscheme_main().
Files:      src/main.c

Patch 8.0.1214
Problem:    Accessing freed memory when EXITFREE is set and there is more than
            one tab and window. (Dominique Pelle)
Solution:   Free options later.  Skip redraw when exiting.
Files:      src/screen.c, src/misc2.c

Patch 8.0.1215
Problem:    Newer gcc warns for implicit fallthrough.
Solution:   Consistently use a FALLTHROUGH comment. (Christian Brabandt)
Files:      src/buffer.c, src/edit.c, src/eval.c, src/ex_docmd.c,
            src/ex_getln.c, src/main.c, src/message.c, src/normal.c,
            src/regexp.c, src/regexp_nfa.c, src/spell.c, src/window.c,
            src/if_perl.xs

Patch 8.0.1216
Problem:    Tabline is not always updated for :file command. (Norio Takagi)
Solution:   Set redraw_tabline. (Hirohito Higashi)
```

```
Files:      src/ex_cmds.c

Patch 8.0.1217
Problem:    Can't use remote eval to inspect vars in debug mode.
Solution:   Don't discard the call stack in debug mode. (closes #2237, #2247)
Files:      src/globals.h, src/ex_cmds2.c, src/main.c

Patch 8.0.1218
Problem:    Writing to freed memory in autocmd.
Solution:   Make a copy of the tag line. (Dominique Pelle, closes #2245)
Files:      src/tag.c, src/testdir/test_autocmd.vim

Patch 8.0.1219
Problem:    Terminal test is flaky.
Solution:   Add test function to list of flaky tests.
Files:      src/testdir/runtest.vim

Patch 8.0.1220
Problem:    Skipping empty statusline groups is not correct.
Solution:   Also set group_end_userhl. (itchyny)
Files:      src/buffer.c, src/testdir/test_statusline.vim

Patch 8.0.1221
Problem:    Still too many old style tests.
Solution:   Convert a few more tests to new style. (Yegappan Lakshmanan,
            closes #2256)
Files:      src/Makefile, src/testdir/Make_all.mak,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_vms.mms,
            src/testdir/main.aap, src/testdir/test19.in,
            src/testdir/test19.ok, src/testdir/test20.in,
            src/testdir/test20.ok, src/testdir/test25.in,
            src/testdir/test25.ok, src/testdir/test28.in,
            src/testdir/test28.ok, src/testdir/test32.in,
            src/testdir/test32.ok, src/testdir/test38.in,
            src/testdir/test38.ok, src/testdir/test66.in,
            src/testdir/test66.ok, src/testdir/test79.in,
            src/testdir/test79.ok, src/testdir/test_ins_complete.vim,
            src/testdir/test_source_utf8.vim, src/testdir/test_substitute.vim,
            src/testdir/test_tab.vim, src/testdir/test_tagjump.vim,
            src/testdir/test_undo.vim, src/testdir/test_visual.vim,
            src/testdir/test79.ok, src/testdir/test79.in,
            src/testdir/test28.in

Patch 8.0.1222
Problem:    Test functions interfere with each other.
Solution:   Cleanup tab pages, windows and buffers.  Reset option.
Files:      src/testdir/runtest.vim, src/testdir/test_filetype.vim,
            src/testdir/test_tabpage.vim, src/testdir/test_lispwords.vim

Patch 8.0.1223
Problem:    Crash when using autocomplete and tab pages.
Solution:   Check if the current tab changed. (Christian Brabandt, closes
            #2239)
```

```
Files:      src/popupmnu.c, src/testdir/test_popup.vim, src/misc1.c,

Patch 8.0.1224
Problem:    Still interference between test functions.
Solution:   Clear autocommands. Wipe all buffers.  Fix tests that depend on a
            specific start context.
Files:      src/testdir/runtest.vim, src/testdir/test_autocmd.vim,
            src/testdir/test_arglist.vim, src/testdir/test_bufwintabinfo.vim,
            src/testdir/test_command_count.vim, src/testdir/test_quickfix.vim,
            src/testdir/test_hardcopy.vim, src/testdir/test_ins_complete.vim,
            src/testdir/test_packadd.vim, src/testdir/test_signs.vim,
            src/testdir/test_autochdir.vim

Patch 8.0.1225
Problem:    No check for spell region being zero. (geeknik)
Solution:   Check for zero. (closes #2252)
Files:      src/spellfile.c, src/testdir/test_spell.vim

Patch 8.0.1226
Problem:    Edit and popup tests failing.
Solution:   Make the tests pass.
Files:      src/testdir/test_edit.vim, src/testdir/test_popup.vim

Patch 8.0.1227
Problem:    Undefined left shift in readfile(). (Brian 'geeknik' Carpenter)
Solution:   Add cast to unsigned. (Dominique Pelle, closes #2253)
Files:      src/fileio.c

Patch 8.0.1228
Problem:    Invalid memory access in GUI test.
Solution:   Check that the row is not outside of the screen.
Files:      src/screen.c

Patch 8.0.1229
Problem:    Condition in vim_str2nr() is always true. (Nikolai Pavlov)
Solution:   Remove the condition. (Closes #2259)
Files:      src/charset.c

Patch 8.0.1230
Problem:    CTRL-A in Visual mode uses character after selection. (Nikolai
            Pavlov)
Solution:   Check the length before using a character.
Files:      src/charset.c

Patch 8.0.1231
Problem:    Expanding file name drops dash. (stucki)
Solution:   Use the right position. (Christian Brabandt, closes #2184)
Files:      src/ex_docmd.c, src/testdir/test_cmdline.vim

Patch 8.0.1232
Problem:    MS-Windows users are confused about default mappings.
Solution:   Don't map keys in the console where they don't work.  Add a choice
            in the installer to use MS-Windows key bindings or not. (Christian
            Brabandt, Ken Takata, closes #2093)
```

```
Files:      Filelist, nsis/gvim.nsi, nsis/vimrc.ini, src/dosinst.c,
            runtime/mswin.vim

Patch 8.0.1233
Problem:    Typo in dos installer.
Solution:   Remove comma.
Files:      src/dosinst.c

Patch 8.0.1234
Problem:    MS-Windows: composing characters are not shown properly.
Solution:   Pass base character and composing characters to the renderer at
            once. (Ken Takata, closes #2206)
Files:      src/gui.c, src/gui_w32.c

Patch 8.0.1235
Problem:    Cannot disable the terminal feature in a huge build. (lindhobe)
Solution:   Adjust the autoconf check. (Kazunobu Kuriyama, closes #2242)
Files:      src/configure.ac, src/auto/configure, src/Makefile

Patch 8.0.1236
Problem:    Mac features are confusing.
Solution:   Make feature names more consistent, add "osxdarwin". Rename
            feature flags, cleanup Mac code. (Kazunobu Kuriyama, closes #2178)
            Also includes a fix for when Ruby throws an exception inside
            :rubyfile. (ujihisa)
Files:      runtime/doc/eval.txt, runtime/doc/os_mac.txt, src/auto/configure,
            src/config.h.in, src/configure.ac, src/digraph.c, src/edit.c,
            src/evalfunc.c, src/feature.h, src/fileio.c, src/getchar.c,
            src/globals.h, src/gui.c, src/gui_mac.c, src/if_python.c,
            src/if_python3.c, src/if_ruby.c, src/keymap.h, src/macros.h,
            src/main.c, src/mbyte.c, src/message.c, src/misc1.c, src/misc2.c,
            src/option.c, src/os_mac.h, src/os_macosx.m, src/os_unix.c,
            src/proto.h, src/pty.c, src/structs.h, src/term.c, src/termlib.c,
            src/ui.c, src/undo.c, src/version.c, src/vim.h, src/window.c

Patch 8.0.1237
Problem:    ":set scroll&" often gives an error.
Solution:   Don't use a fixed default value, use half the window height. Add a
            test. (Ozaki Kiichi, closes #2104)
Files:      src/Makefile, src/option.c, src/testdir/test_alot.vim,
            src/testdir/test_scroll_opt.vim

Patch 8.0.1238
Problem:    Incremental search only shows one match.
Solution:   When 'incsearch' and 'hlsearch' are both set highlight all
            matches. (haya14busa, itchyny, closes #2198)
Files:      runtime/doc/options.txt, src/ex_getln.c, src/proto/search.pro,
            src/search.c, src/testdir/test_search.vim

Patch 8.0.1239
Problem:    Cannot use a lambda for the skip argument to searchpair().
Solution:   Evaluate a partial, funcref and lambda. (LemonBoy, closes #1454,
            closes #2265)
Files:      runtime/doc/eval.txt, src/evalfunc.c, src/proto/evalfunc.pro,
```

```
            src/eval.c, src/proto/eval.pro, src/search.c,
            src/testdir/test_search.vim

Patch 8.0.1240
Problem:    MS-Windows: term_start() does not support environment.
Solution:   Implement the environment argument. (Yasuhiro Matsumoto, closes
            #2264)
Files:      src/os_win32.c, src/proto/os_win32.pro, src/terminal.c,
            src/testdir/test_terminal.vim

Patch 8.0.1241
Problem:    Popup test is flaky. (James McCoy)
Solution:   Increase the wait time. (Dominique Pelle)
Files:      src/testdir/test_popup.vim

Patch 8.0.1242
Problem:    Function argument with only dash is seen as number zero. (Wang
            Shidong)
Solution:   See a dash as a string. (Christian Brabandt)
Files:      src/testdir/test_ins_complete.vim, src/Makefile, src/eval.c

Patch 8.0.1243
Problem:    No test for what 8.0.1227 fixes.
Solution:   Add a test that triggers the problem. (Christian Brabandt)
Files:      src/testdir/test_normal.vim, src/testdir/test_search.vim

Patch 8.0.1244
Problem:    Search test does not work correctly on MS-Windows.
Solution:   Put text in a file instead of sending it to the terminal.
            (Christian Brabandt)
Files:      src/testdir/test_search.vim

Patch 8.0.1245
Problem:    When WaitFor() has a wrong expression it just waits a second,
            which goes unnoticed. (James McCoy)
Solution:   When WaitFor() times out throw an exception.  Fix places where the
            expression was wrong.
Files:      src/testdir/shared.vim, src/testdir/test_channel.vim,
            src/testdir/test_netbeans.vim, src/testdir/test_terminal.vim

Patch 8.0.1246
Problem:    Popup test has an arbitrary delay.
Solution:   Wait for the ruler to show. (James McCoy)
Files:      src/testdir/test_popup.vim

Patch 8.0.1247
Problem:    Not easy to find Debian build info.
Solution:   Add a badge in the README file. (Dominique Pelle)
Files:      README.md

Patch 8.0.1248 (after 8.0.1247)
Problem:    Stray + in README file.
Solution:   Remove the +.  Add a line break.
Files:      README.md
```

```
Patch 8.0.1249
Problem:    No error when WaitFor() gets an invalid wrong expression.
Solution:   Do not ignore errors in evaluation of the expression.  Fix places
            where the expression was wrong.
Files:      src/testdir/shared.vim, src/testdir/test_netbeans.vim

Patch 8.0.1250
Problem:    'hlsearch' highlighting not removed after incsearch (lacygoill)
Solution:   Redraw all windows. Start search at the end of the match.  Improve
            how CTRL-G works with incremental search. Add tests. (Christian
            Brabandt, Hirohito Higashi, haya14busa, closes #2267)
Files:      runtime/doc/options.txt, src/ex_getln.c,
            src/testdir/test_search.vim

Patch 8.0.1251 (after 8.0.1249)
Problem:    Invalid expression passed to WaitFor().
Solution:   Check if the variable exists.
Files:      src/testdir/test_clientserver.vim

Patch 8.0.1252
Problem:    Incomplete translations makefile for MinGW/Cygwin.
Solution:   Add missing source files.  Make it work with msys2's bash. (Ken
            Takata)
Files:      src/po/Make_cyg.mak, src/po/Make_ming.mak, src/po/Make_mvc.mak

Patch 8.0.1253
Problem:    Still too many old style tests.
Solution:   Convert a few more tests to new style. (Yegappan Lakshmanan,
            closes #2272)
Files:      src/Makefile, src/testdir/Make_all.mak,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_vms.mms,
            src/testdir/main.aap, src/testdir/test12.in,
            src/testdir/test12.ok, src/testdir/test40.in,
            src/testdir/test40.ok, src/testdir/test45.in,
            src/testdir/test45.ok, src/testdir/test83.in,
            src/testdir/test83.ok, src/testdir/test_autocmd.vim,
            src/testdir/test_fold.vim, src/testdir/test_swap.vim,
            src/testdir/test_tagjump.vim

Patch 8.0.1254
Problem:    Undefined left shift in gethexchrs(). (geeknik)
Solution:   Use unsigned long. (idea by Christian Brabandt, closes #2255)
Files:      src/regexp.c, src/regexp_nfa.c

Patch 8.0.1255 (after 8.0.1248)
Problem:    duplicate badge README file.
Solution:   Remove one. (Dominique Pelle)
Files:      README.md

Patch 8.0.1256
Problem:    Typo in configure variable vim_cv_tgent. (Matthieu Guillard)
```

```
Solution:   Rename the variable. (closes #2281)
Files:      src/configure.ac, src/auto/configure

Patch 8.0.1257 (after 8.0.1254)
Problem:    No test for fix of undefined behavior.
Solution:   Add a test. (closes #2255)
Files:      src/testdir/test_search.vim

Patch 8.0.1258
Problem:    'ttymouse' is set to "sgr" even though it's not supported. (Gary
            Johnson)
Solution:   Adjust #ifdef
Files:      src/term.c

Patch 8.0.1259
Problem:    Search test can be flaky.
Solution:   Use WaitFor() instead of a delay.  Make it possible to pass a
            funcref to WaitFor() to avoid the need for global variables.
            (James McCoy, closes #2282)
Files:      src/testdir/shared.vim, src/testdir/test_search.vim

Patch 8.0.1260 (after 8.0.1259)
Problem:    Using global variables for WaitFor().
Solution:   Use a lambda function instead.  Don't check a condition if
            WaitFor() already checked it.
Files:      src/testdir/test_popup.vim, src/testdir/test_terminal.vim,
            src/testdir/test_channel.vim, src/testdir/test_clientserver.vim,
            src/testdir/test_job_fails.vim, src/testdir/test_quotestar.vim

Patch 8.0.1261
Problem:    Program in terminal window gets NL instead of CR. (Lifepillar)
Solution:   Check the tty setup more often. (closes #1998)
Files:      src/terminal.c

Patch 8.0.1262
Problem:    Terminal redir test is flaky.
Solution:   Add it to the list of flaky tests.
Files:      src/testdir/runtest.vim

Patch 8.0.1263
Problem:    Others can read the swap file if a user is careless with his
            primary group.
Solution:   If the group permission allows for reading but the world
            permissions doesn't, make sure the group is right.
Files:      src/fileio.c, src/testdir/test_swap.vim, src/Makefile

Patch 8.0.1264
Problem:    Terminal debugger gets stuck in small window.
Solution:   Add "-quiet" to the gdb command. (Christian Brabandt, closes #2154)
Files:      runtime/pack/dist/opt/termdebug/plugin/termdebug.vim

Patch 8.0.1265 (after 8.0.1263)
Problem:    Swap test not skipped when there is one group.
Solution:   Convert list to string for the message.
```

```
Files:      src/testdir/test_swap.vim

Patch 8.0.1266 (after 8.0.1263)
Problem:    Test_swap_directory was accidentally commented out.
Solution:   Uncomment the test.
Files:      src/testdir/test_swap.vim

Patch 8.0.1267 (after 8.0.1263)
Problem:    Test_swap_group may leave file behind.
Solution:   Add a try/finally.
Files:      src/testdir/test_swap.vim, src/testdir/test_undo.vim

Patch 8.0.1268
Problem:    PC install instructions are incomplete.
Solution:   Update the instructions. (Ken Takata)
Files:      src/INSTALLpc.txt

Patch 8.0.1269
Problem:    Effect of autocommands on marks is not tested.
Solution:   Add a couple of tests. (James McCoy, closes #2271)
Files:      src/testdir/test_autocmd.vim

Patch 8.0.1270
Problem:    Mismatching file name with Filelist.
Solution:   Rename color_ramp.vim to xterm_ramp.vim
Files:      src/testdir/color_ramp.vim, src/testdir/xterm_ramp.vim

Patch 8.0.1271
Problem:    Still too many old style tests.
Solution:   Convert a few more tests to new style. (Yegappan Lakshmanan,
            closes #2290)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/Make_vms.mms,
            src/testdir/sautest/autoload/footest.vim, src/testdir/test55.in,
            src/testdir/test55.ok, src/testdir/test_changelist.in,
            src/testdir/test_changelist.ok, src/testdir/test_fold.vim,
            src/testdir/test_ins_complete.vim,
            src/testdir/test_insertcount.in, src/testdir/test_insertcount.ok,
            src/testdir/test_listdict.vim, src/testdir/test_normal.vim,
            src/testdir/test_search.vim, src/testdir/test_search_mbyte.in

Patch 8.0.1272
Problem:    Warnings for unused variables in tiny build.
Solution:   Add #ifdef. (Dominique Pelle, closes #2288)
Files:      src/term.c

Patch 8.0.1273 (after 8.0.1271)
Problem:    Old test file remaining.
Solution:   Delete it.
Files:      src/testdir/test_search_mbyte.ok

Patch 8.0.1274
Problem:    setbufline() fails when using folding.
Solution:   Set "curwin" if needed. (Ozaki Kiichi, closes #2293)
Files:      src/evalfunc.c, src/testdir/test_bufline.vim
```

Patch 8.0.1275
Problem: CmdlineLeave autocmd prevents fold from opening. (Waivek)
Solution: Save and restore KeyTyped. (closes #2305)
Files: src/fileio.c

Patch 8.0.1276
Problem: Typed key is lost when the terminal window is closed in exit
            callback. (Gabriel Barta)
Solution: When the current window changes bail out of the wait loop. (closes
            #2302)
Files: src/misc2.c, src/terminal.c

Patch 8.0.1277
Problem: Terminal window CR-NL conversions may cause problems.
Solution: Avoid most conversions, only fetch the current backspace key value
            from the tty. (mostly by Ozaki Kiichi, closes #2278)
Files: src/terminal.c

Patch 8.0.1278
Problem: GUI window always resizes when adding/removing a scrollbar,
            toolbar, etc.
Solution: Add the 'k' flag in 'guioptions' to keep the GUI window size and
            change the number of lines/columns instead. (Ychin, closes #703)
Files: runtime/doc/options.txt, src/gui.c, src/gui_gtk_x11.c,
            src/gui_w32.c, src/option.h

Patch 8.0.1279
Problem: Initializing menus can be slow, especially when there are many
            keymaps, color schemes, etc.
Solution: Do the globbing for runtime files lazily. (Ken Takata)
Files: runtime/doc/gui.txt, runtime/menu.vim

Patch 8.0.1280
Problem: Python None cannot be converted to a Vim type.
Solution: Convert it to v:none. (Ken Takata)
Files: src/if_py_both.h, src/testdir/test86.ok, src/testdir/test87.ok,
            runtime/doc/if_pyth.txt

Patch 8.0.1281
Problem: Loading file type detection slows down startup.
Solution: Move functions to an autoload script.
Files: runtime/filetype.vim, runtime/autoload/filetype.vim,
            runtime/scripts.vim

Patch 8.0.1282 (after 8.0.1281)
Problem: script-local variable defined in the wrong script
Solution: Move variable to autoload/filetype.vim.
Files: runtime/filetype.vim, runtime/autoload/filetype.vim

Patch 8.0.1283
Problem: Test 86 fails under ASAN.
Solution: Fix that an item was added to a dictionary twice.
Files: src/if_py_both.h

```
Patch 8.0.1284
Problem:    Loading file type detection slows down startup.
Solution:   Store the last pattern of an autocommand event to make appending
            quicker.
Files:      src/fileio.c

Patch 8.0.1285
Problem:    Distributed autoload files may clash with user files. (Andy
            Wokula)
Solution:   Use the "autoload/dist" directory.
Files:      runtime/filetype.vim, runtime/autoload/filetype.vim,
            runtime/autoload/dist/ft.vim, runtime/scripts.vim, Filelist,
            src/Makefile, nsis/gvim.nsi

Patch 8.0.1286
Problem:    Occasional crash when using a channel. (Marek)
Solution:   Decrement reference count later. (closes #2315)
Files:      src/channel.c

Patch 8.0.1287
Problem:    The temp file used when updating the viminfo file may have the
            wrong permissions if setting the group fails.
Solution:   Check if the group matches and reduce permissions if not.
Files:      src/ex_cmds.c

Patch 8.0.1288
Problem:    GUI: cannot drag the statusline of a terminal window.
Solution:   Handle the TERMINAL state. (Hirohito Higashi)
Files:      src/gui.c

Patch 8.0.1289
Problem:    Mkview always includes the local directory.
Solution:   Add the "curdir" value in 'viewoptions'. (Eric Roberts, closes
            #2316)
Files:      runtime/doc/options.txt, runtime/doc/starting.txt, src/ex_docmd.c,
            src/option.c

Patch 8.0.1290
Problem:    seq_cur of undotree() wrong after undo.
Solution:   Get the actual sequence number instead of decrementing the current
            one. (Ozaki Kiichi, closes #2319)
Files:      src/undo.c, src/testdir/test_undo.vim

Patch 8.0.1291
Problem:    C indent wrong when * immediately follows comment. (John Bowler)
Solution:   Do not see "/*" after "*" as a comment start. (closes #2321)
Files:      src/search.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 8.0.1292
Problem:    Quick clicks in the WinBar start Visual mode.
Solution:   Use a double click in the WinBar like a normal click.
Files:      src/ui.c
```

```
Patch 8.0.1293
Problem:    Setting a breakpoint in the terminal debugger sometimes fails.
Solution:   Interrupt the program if needed.  Set the interface to async.
Files:      runtime/pack/dist/opt/termdebug/plugin/termdebug.vim,
            runtime/doc/terminal.txt

Patch 8.0.1294
Problem:    GUI: get stuck when splitting a terminal window.
Solution:   Stop blinking when values become zero. (Hirohito Higashi)
Files:      src/gui.c

Patch 8.0.1295
Problem:    Cannot automatically get a server name in a terminal.
Solution:   Add the --enable-autoservername flag to configure. (Cimbali,
            closes #2317)
Files:      runtime/doc/eval.txt, runtime/doc/various.txt, src/config.h.in,
            src/configure.ac, src/auto/configure, src/evalfunc.c,
            src/feature.h, src/main.c, src/version.c, src/Makefile

Patch 8.0.1296 (after 8.0.1294)
Problem:    Checking the same condition twice. (John Marriott)
Solution:   Check blinkwait.
Files:      src/gui.c

Patch 8.0.1297
Problem:    +autoservername does not show enabled on MS-Windows.
Solution:   Always define the flag on MS-Windows. (Ken Takata)
Files:      src/feature.h

Patch 8.0.1298
Problem:    Missing test file.
Solution:   Add samples/test000. (Christian Brabandt)
Files:      src/testdir/samples/test000, Filelist

Patch 8.0.1299
Problem:    Bracketed paste does not work well in terminal window.
Solution:   Send translated string to job right away. (Ozaki Kiichi, closes
            #2341)
Files:      src/terminal.c

Patch 8.0.1300
Problem:    File permissions may end up wrong when writing.
Solution:   Use fchmod() instead of chmod() when possible.  Don't truncate
            until we know we can change the file.
Files:      src/os_unix.c, src/proto/os_unix.pro, src/configure.ac,
            src/auto/configure, src/config.h.in, src/fileio.c

Patch 8.0.1301
Problem:    Generated license file for NSIS has a modeline.
Solution:   Adjust the pattern for sed. (Ken Takata)
Files:      runtime/doc/Makefile

Patch 8.0.1302
Problem:    Still too many old style tests.
```

```
Solution:   Convert a few more tests to new style. (Yegappan Lakshmanan,
            closes #2326)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_vms.mms, src/testdir/runtest.vim,
            src/testdir/test68.in, src/testdir/test68.ok,
            src/testdir/test73.in, src/testdir/test73.ok,
            src/testdir/test_close_count.in, src/testdir/test_close_count.ok,
            src/testdir/test_close_count.vim,
            src/testdir/test_erasebackword.in,
            src/testdir/test_erasebackword.ok,
            src/testdir/test_erasebackword.vim,
            src/testdir/test_find_complete.vim, src/testdir/test_fixeol.in,
            src/testdir/test_fixeol.ok, src/testdir/test_fixeol.vim,
            src/testdir/test_listchars.in, src/testdir/test_listchars.ok,
            src/testdir/test_listchars.vim, src/testdir/test_textformat.vim

Patch 8.0.1303
Problem:    'ttymouse' is not set to "sgr" for Terminal.app and Iterm2.
Solution:   Recognize Iterm2 by the termresponse.
Files:      src/term.c

Patch 8.0.1304
Problem:    CTRL-G/CTRL-T don't work with incsearch and empty pattern.
Solution:   Use the last search pattern. (Christian Brabandt, closes #2292)
Files:      src/ex_getln.c, src/proto/search.pro, src/search.c,
            src/testdir/test_search.vim

Patch 8.0.1305
Problem:    Writefile() never calls fsync().
Solution:   Follow the 'fsync' option with override to enable or disable.
Files:      src/fileio.c, src/evalfunc.c, runtime/doc/eval.txt, src/globals.h,
            src/testdir/test_writefile.vim

Patch 8.0.1306
Problem:    ASAN error stack trace is not useful.
Solution:   Add "asan_symbolize". (James McCoy, closes #2344)
Files:      .travis.yml

Patch 8.0.1307 (after 8.0.1300)
Problem:    Compiler warning for ignoring return value of ftruncate(). (Tony
            Mechelynck)
Solution:   Assign returned value to "ignore".
Files:      src/fileio.c

Patch 8.0.1308
Problem:    The "Reading from stdin" message may be undesired and there is no
            easy way to skip it.
Solution:   Don't show the message with --not-a-term was used.
Files:      src/fileio.c

Patch 8.0.1309
Problem:    Cannot use 'balloonexpr' in a terminal.
Solution:   Add 'balloonevalterm' and add code to handle mouse movements in a
            terminal. Initial implementation for Unix with GUI.
```

```
Files:      src/option.c, src/option.h, src/os_unix.c, src/proto/os_unix.pro,
            src/feature.h, src/misc2.c, src/keymap.h, src/edit.c,
            src/ex_getln.c, src/message.c, src/misc1.c, src/normal.c,
            src/terminal.c, src/getchar.c, src/ex_cmds2.c, src/gui_beval.c,
            src/proto/gui_beval.pro, src/evalfunc.c, src/popupmnu.c,
            src/proto/popupmnu.pro, src/version.c, src/globals.h, src/gui.c,
            runtime/doc/options.txt, src/term.c,
            runtime/pack/dist/opt/termdebug/plugin/termdebug.vim

Patch 8.0.1310
Problem:    Cproto generates errors because of missing type.
Solution:   Define _Float128 when generating prototypes.
Files:      src/vim.h

Patch 8.0.1311
Problem:    No test for strpart().
Solution:   Add a test. (Dominique Pelle, closes #2347)
Files:      src/testdir/test_functions.vim

Patch 8.0.1312 (after 8.0.1309)
Problem:    balloon_show() only works in terminal when compiled with the GUI.
Solution:   Add FEAT_BEVAL_GUI and refactor to move common code out of the GUI
            specific file.
Files:      src/feature.h, src/evalfunc.c, src/gui.c, src/gui_athena.c,
            src/gui_beval.c, src/proto/gui_beval.pro, src/beval.c,
            src/proto/beval.pro, src/gui_motif.c, src/gui_w32.c,
            src/gui_x11.c, src/integration.c, src/workshop.c, src/menu.c,
            src/netbeans.c, src/option.c, src/os_unix.c, src/os_win32.c,
            src/syntax.c, src/version.c, src/gui.h, src/gui_beval.h,
            src/vim.h, src/beval.h, src/option.h, src/ex_cmds2.c, src/ui.c,
            src/getchar.c, src/normal.c, src/popupmnu.c, src/globals.h,
            src/Makefile, src/Make_cyg_ming.mak, src/Make_mvc.mak,
            src/Make_vms.mms, Filelist

Patch 8.0.1313 (after 8.0.1312)
Problem:    Missing dependencies cause parallel make to fail.
Solution:   Update dependencies.
Files:      src/Makefile

Patch 8.0.1314 (after 8.0.1312)
Problem:    Build fails on Mac. (chdiza)
Solution:   Add #ifdef around GUI fields.
Files:      src/beval.h

Patch 8.0.1315 (after 8.0.1312)
Problem:    Build still fails on Mac. (chdiza)
Solution:   Remove bogus typedef.
Files:      src/os_macosx.m

Patch 8.0.1316 (after 8.0.1312)
Problem:    Build still still fails on Mac. (chdiza)
Solution:   Remove another bogus typedef.
Files:      src/os_mac_conv.c
```

Patch 8.0.1317
Problem: Accessing freed memory in term_wait(). (Dominique Pelle)
Solution: Check that the buffer still exists.
Files: src/terminal.c

Patch 8.0.1318
Problem: Terminal balloon only shows one line.
Solution: Split into several lines in a clever way. Add balloon_split().
            Make balloon_show() accept a list in the terminal.
Files: src/popupmnu.c, src/proto/popupmnu.pro, src/evalfunc.c,
            src/beval.c, src/proto/beval.pro, src/testdir/test_popup.vim,
            runtime/doc/eval.txt,
            runtime/pack/dist/opt/termdebug/plugin/termdebug.vim

Patch 8.0.1319
Problem: Can't build GUI on MS-Windows.
Solution: Don't define the balloon_split() function in a GUI-only build.
Files: src/evalfunc.c, runtime/doc/eval.txt

Patch 8.0.1320
Problem: Popup test fails on GUI-only build.
Solution: Don't test balloon_split() when it's not available.
Files: src/testdir/test_popup.vim

Patch 8.0.1321
Problem: Can't build huge version with Athena. (Mark Kelly)
Solution: Move including beval.h to before structs.h. Include beval.pro like
            other proto files.
Files: src/vim.h, src/beval.h, src/proto.h

Patch 8.0.1322
Problem: Textformat test isn't run. (Yegappan Lakshmanan)
Solution: Add target to the list of tests.
Files: src/testdir/Make_all.mak

Patch 8.0.1323
Problem: Mouse events in a terminal window may cause endless loop.
Solution: Adjust position computation. Don't stuff a mouse event when
            coming from normal_cmd().
Files: src/normal.c, src/terminal.c

Patch 8.0.1324
Problem: Some xterm sends different mouse move codes.
Solution: Also accept 0x80 as a move event.
Files: src/term.c

Patch 8.0.1325
Problem: More tests are not run.
Solution: Add targets to the list of tests. (Yegappan Lakshmanan)
Files: src/testdir/Make_all.mak

Patch 8.0.1326
Problem: Largefile test fails on CI, glob test on MS-Windows.
Solution: Remove largefile test from list of all tests. Don't run

```
            Test_glob() on non-unix systems.  More cleanup. (Yegappan
            Lakshmanan, closes #2354)
Files:      src/testdir/Make_all.mak, src/testdir/test_escaped_glob.vim,
            src/testdir/test_plus_arg_edit.vim

Patch 8.0.1327
Problem:    New proto file missing from distribution.
Solution:   Add it. (closes #2355)
Files:      Filelist

Patch 8.0.1328
Problem:    Trouble when using ":term ++close" with autocmd. (Gabriel Barta)
Solution:   Use aucmd_prepbuf() and aucmd_restbuf() instead of setting curbuf.
            (closes #2339)
Files:      src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.1329
Problem:    When a flaky test fails it also often fails the second time.
Solution:   Sleep a couple of seconds before the second try.
Files:      src/testdir/runtest.vim

Patch 8.0.1330
Problem:    MS-Windows: job in terminal can't get back to Vim.
Solution:   set VIM_SERVERNAME in the environment. (Yasuhiro Matsumoto, closes
            #2360)
Files:      runtime/doc/terminal.txt, src/os_win32.c, src/proto/os_win32.pro,
            src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.1331
Problem:    Possible crash when window can be zero lines high. (Joseph
            Dornisch)
Solution:   Only set w_fraction if the window is at least two lines high.
Files:      src/window.c

Patch 8.0.1332
Problem:    Highlighting in quickfix window could be better. (Axel Bender)
Solution:   Use the qfSeparator highlight item. (Yegappan Lakshmanan)
Files:      src/quickfix.c

Patch 8.0.1333
Problem:    Some tests are run twice.
Solution:   Invoked most utf8 tests only from test_alot_utf8. (Yegappan
            Lakshmanan, closes #2369)
Files:      src/testdir/Make_all.mak, src/testdir/test_alot_utf8.vim,
            src/testdir/test_mksession_utf8.vim

Patch 8.0.1334
Problem:    Splitting a window with a WinBar damages window layout.
            (Lifepillar)
Solution:   Take the winbar into account when computing the new window
            position.  Add WINBAR_HEIGHT().
Files:      src/vim.h, src/window.c

Patch 8.0.1335
```

```
Problem:    Writefile() using fsync() may give an error for a device.
            (Yasuhiro Matsumoto)
Solution:   Ignore fsync() failing. (closes #2373)
Files:      src/evalfunc.c

Patch 8.0.1336
Problem:    Cannot use imactivatefunc() unless compiled with +xim.
Solution:   Allow using imactivatefunc() when not compiled with +xim.
            (Yasuhiro Matsumoto, closes #2349)
Files:      runtime/doc/options.txt, runtime/doc/mbyte.txt, src/mbyte.c,
            src/option.c, src/option.h, src/structs.h,
            src/testdir/test_iminsert.vim, src/Makefile,
            src/testdir/Make_all.mak, src/vim.h

Patch 8.0.1337 (after 8.0.1336)
Problem:    Typo in #ifdef.
Solution:   Fix the #if line.
Files:      src/mbyte.c

Patch 8.0.1338 (after 8.0.1337)
Problem:    USE_IM_CONTROL is confusing and incomplete.
Solution:   Just use FEAT_MBYTE.  Call 'imactivatefunc' also without GUI.
Files:      src/vim.h, src/edit.c, src/ex_getln.c, src/getchar.c, src/gui.c,
            src/gui_mac.c, src/gui_w32.c, src/mbyte.c, src/normal.c,
            src/option.c, src/ui.c, src/globals.h, src/option.h

Patch 8.0.1339
Problem:    No test for what 8.0.1335 fixes.
Solution:   Add a test. (Yasuhiro Matsumoto, closes #2373)
Files:      src/testdir/test_writefile.vim

Patch 8.0.1340
Problem:    MS-Windows: cannot build GUI without IME.
Solution:   Define im_get_status() and im_set_active() when IME is not used.
Files:      src/mbyte.c

Patch 8.0.1341
Problem:    'imactivatefunc' test fails on MS-Windows.
Solution:   Skip the text.
Files:      src/testdir/test_iminsert.vim, runtime/doc/options.txt

Patch 8.0.1342
Problem:    Cannot build with Motif and multi-byte. (Mohamed Boughaba)
Solution:   Use the right input method status flag. (closes #2374)
Files:      src/mbyte.c

Patch 8.0.1343
Problem:    MS-Windows: does not show colored emojis.
Solution:   Implement colored emojis. Improve drawing speed. Make 'taamode'
            work. (Taro Muraoka, Yasuhiro Matsumoto, Ken Takata, close #2375)
Files:      appveyor.yml, runtime/doc/options.txt, src/gui_dwrite.cpp,
            src/gui_dwrite.h, src/gui_w32.c, src/proto/gui_w32.pro

Patch 8.0.1344
```

```
Problem:    Using 'imactivatefunc' in the GUI does not work.
Solution:   Do not use 'imactivatefunc' and 'imstatusfunc' in the GUI.
Files:      runtime/doc/options.txt, src/mbyte.c,
            src/testdir/test_iminsert.vim

Patch 8.0.1345
Problem:    Race condition between stat() and open() for the viminfo temp
            file. (Simon Ruderich)
Solution:   use open() with O_EXCL to atomically check if the file exists.
            Don't try using a temp file, renaming it will fail anyway.
Files:      src/ex_cmds.c

Patch 8.0.1346
Problem:    Crash when passing 50 char string to balloon_split().
Solution:   Fix off-by-one error.
Files:      src/testdir/test_popup.vim, src/popupmnu.c

Patch 8.0.1347
Problem:    MS-Windows: build broken by misplaced curly.
Solution:   Move curly after #endif.
Files:      src/ex_cmds.c

Patch 8.0.1348
Problem:    Make testclean deletes script file on MS-Windows.
Solution:   Rename file to avoid it starting with an "x".
Files:      src/testdir/xterm_ramp.vim, src/testdir/color_ramp.vim, Filelist

Patch 8.0.1349
Problem:    Options test fails when using Motif or GTK GUI.
Solution:   Use "fixed" instead of "fixedsys" for Unix. Don't try "xxx" for
            guifonteset.  Don't set 'termencoding' to anything but "utf-8" for
            GTK.  Give an error if 'termencoding' can't be converted.
Files:      src/testdir/gen_opt_test.vim, src/option.c

Patch 8.0.1350
Problem:    Cannot build with +eval and -multi_byte.
Solution:   Adjust #ifdefs. (John Marriott)  Always include the multi_byte
            feature when an input method feature is enabled.
Files:      src/mbyte.c, src/feature.h

Patch 8.0.1351
Problem:    Warning for unused variables building with MinGW.
Solution:   Change a few #ifdefs (suggested by John Marriott). Remove
            superfluous checks of FEAT_MBYTE.
Files:      src/gui_w32.c

Patch 8.0.1352
Problem:    Dead URLs in the help go unnoticed.
Solution:   Add a script to check URLs in the help files. (Christian Brabandt)
Files:      runtime/doc/Makefile, runtime/doc/test_urls.vim, Filelist

Patch 8.0.1353
Problem:    QuickFixCmdPost is not used consistently.
Solution:   Invoke QuickFixCmdPost consistently after QuickFixCmdPre.
```

```
            (Yegappan Lakshmanan, closes #2377)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.1354
Problem:    Shift-Insert doesn't always work in MS-Windows console.
Solution:   Handle K_NUL differently. (Yasuhiro Matsumoto, closes #2381)
Files:      src/os_win32.c

Patch 8.0.1355 (after 8.0.1354)
Problem:    Cursor keys don't work in MS-Windows console.
Solution:   Revert the previous patch.  Also delete dead code.
Files:      src/os_win32.c

Patch 8.0.1356
Problem:    Using simalt in a GUIEnter autocommand inserts strange characters.
            (Chih-Long Chang)
Solution:   Ignore K_NOP in Insert mode. (closes #2379)
Files:      src/edit.c, src/ex_getln.c

Patch 8.0.1357
Problem:    Startup test fails on OpenBSD. (Edd Barrett)
Solution:   Check for "BSD" instead of "FreeBSD" being defined. (James McCoy,
            closes #2376, closes #2378)
Files:      src/vim.h

Patch 8.0.1358
Problem:    Undercurl is not used in the terminal. (Kovid Goyal)
Solution:   Only fall back to underline when undercurl highlighting is not
            defined. (closes #1306)
Files:      src/screen.c

Patch 8.0.1359
Problem:    Libvterm ANSI colors can not always be recognized from the RGB
            values. The default color is wrong when t_RB is empty.
Solution:   Add the ANSI color index to VTermColor.
Files:      src/libvterm/include/vterm.h, src/libvterm/src/pen.c,
            src/terminal.c

Patch 8.0.1360
Problem:    The Terminal highlighting doesn't work in a terminal. (Ozaki
            Kiichi)
Solution:   Use the Terminal highlighting when the cterm index is zero.
Files:      src/terminal.c

Patch 8.0.1361
Problem:    Some users don't want to diff with hidden buffers.
Solution:   Add the "hiddenoff" item to 'diffopt'. (Alisue, closes #2394)
Files:      runtime/doc/options.txt, src/buffer.c, src/diff.c,
            src/proto/diff.pro, src/testdir/test_diffmode.vim

Patch 8.0.1362
Problem:    Terminal window colors wrong when using Terminal highlighting.
Solution:   Set ansi_index when setting the default color.  Also cache the
            color index for Terminal. (Ozaki Kiichi, closes #2393)
```

```
Files:      src/libvterm/src/pen.c, src/proto/terminal.pro, src/syntax.c,
            src/terminal.c

Patch 8.0.1363
Problem:    Recovering does not work when swap file ends in .stz.
Solution:   Check for all possible swap file names. (Elfling, closes #2395,
            closes #2396)
Files:      src/memline.c

Patch 8.0.1364
Problem:    There is no easy way to get the window position.
Solution:   Add win_screenpos().
Files:      src/evalfunc.c, src/testdir/test_window_cmd.vim,
            runtime/doc/eval.txt

Patch 8.0.1365
Problem:    When one channel test fails others fail as well.
Solution:   Stop the job after a failure.  Also add a couple of tests to the
            list of flaky tests.
Files:      src/testdir/test_channel.vim, src/testdir/runtest.vim

Patch 8.0.1366
Problem:    Balloon shows when cursor is in WinBar.
Solution:   Don't show the balloon when row is negative.
Files:      src/beval.c

Patch 8.0.1367
Problem:    terminal test hangs, executing abcde. (Stucki)
Solution:   Rename abcde to abxde.
Files:      src/testdir/test_terminal.vim

Patch 8.0.1368
Problem:    Cannot drag status line or vertical separator of new terminal
            window. (UncleBill)
Solution:   Adjust mouse row and column computation. (Yasuhiro Matsumoto,
            closes #2410)
Files:      src/terminal.c

Patch 8.0.1369
Problem:    MS-Windows: drawing underline, curl and strikethrough is slow,
            mFallbackDC not properly updated.
Solution:   Several performance improvements. (Ken Takata, Taro Muraoka,
            Yasuhiro Matsumoto, closes #2401)
Files:      runtime/doc/options.txt, src/gui_dwrite.cpp, src/gui_dwrite.h,
            src/gui_w32.c

Patch 8.0.1370
Problem:    Channel test for callback is flaky.
Solution:   Add the test to the list of flaky tests.
Files:      src/testdir/runtest.vim

Patch 8.0.1371
Problem:    Shift-Insert doesn't always work in MS-Windows console.
Solution:   Handle K_NUL differently if the second character is more than one
```

```
            byte. (Yasuhiro Matsumoto, closes #2381)
Files:      src/os_win32.c

Patch 8.0.1372
Problem:    Profile log may be truncated halfway a character.
Solution:   Find the start of the character. (Ozaki Kiichi, closes #2385)
Files:      src/ex_cmds2.c, src/testdir/test_profile.vim

Patch 8.0.1373
Problem:    No error when setting 'renderoptions' to an invalid value before
            starting the GUI.
Solution:   Always check the value. (Ken Takata, closes #2413)
Files:      src/gui_w32.c, src/option.c

Patch 8.0.1374
Problem:    CTRL-A does not work with an empty line. (Alex)
Solution:   Decrement the end only once. (Hirohito Higashi, closes #2387)
Files:      src/ops.c, src/testdir/test_increment.vim

Patch 8.0.1375
Problem:    Window size wrong after maximizing with WinBar. (Lifepillar)
Solution:   Fix height computations. Redraw window when it is zero height but
            has a WinBar. (closes #2356)
Files:      src/window.c, src/screen.c, src/vim.h

Patch 8.0.1376
Problem:    Cursor in terminal not always updated.
Solution:   Call gui_mch_flush(). (Ken Takata)
Files:      src/terminal.c

Patch 8.0.1377
Problem:    Cannot call a dict function in autoloaded dict.
Solution:   Call get_lval() passing the read-only flag.
Files:      src/userfunc.c, src/eval.c, src/testdir/sautest/autoload/foo.vim,
            src/testdir/sautest/autoload/globone.vim,
            src/testdir/sautest/autoload/globtwo.vim,
            src/testdir/test_escaped_glob.vim, src/Makefile,
            src/testdir/test_autoload.vim, src/Makefile,
            src/testdir/Make_all.mak

Patch 8.0.1378
Problem:    Autoload script sources itself when defining function.
Solution:   Pass TFN_NO_AUTOLOAD to trans_function_name(). (Yasuhiro
            Matsumoto, closes #2423)
Files:      src/userfunc.c, src/testdir/test_autoload.vim,
            src/testdir/sautest/autoload/sourced.vim

Patch 8.0.1379
Problem:    Configure check for selinux does not check for header file.
Solution:   Add an AC_CHECK_HEADER(). (Benny Siegert)
Files:      src/configure.ac, src/auto/configure

Patch 8.0.1380
Problem:    When recovering a file with "vim -r swapfile" the hit-enter prompt
```

```
            is at the top of the window.
Solution:   Invalidate the cursor position.
Files:      src/term.c

Patch 8.0.1381
Problem:    ch_readraw() waits for NL if channel mode is NL.
Solution:   Pass a "raw" flag to channel_read_block(). (Yasuhiro Matsumoto)
Files:      src/channel.c, src/proto/channel.pro,
            src/testdir/test_channel.vim, src/testdir/test_channel_pipe.py

Patch 8.0.1382
Problem:    Get "no write since last change" message if a terminal is open.
            (Fritz mehner)
Solution:   Don't consider a buffer changed if it's a terminal window.
Files:      src/ex_cmds.c, src/undo.c, src/proto/undo.pro

Patch 8.0.1383
Problem:    Local additions in help skips some files. (joshklod)
Solution:   Check the base file name length equals.
Files:      src/ex_cmds.c, src/testdir/test_help.vim

Patch 8.0.1384
Problem:    Not enough quickfix help; confusing winid.
Solution:   Add more examples in the help. When the quickfix window is not
            present, return zero for getqflist() with 'winid'. Add more tests
            for jumping to quickfix list entries. (Yegappan Lakshmanan, closes
            #2427)
Files:      runtime/doc/eval.txt, runtime/doc/quickfix.txt, src/quickfix.c,
            src/testdir/test_quickfix.vim

Patch 8.0.1385
Problem:    Python 3.5 is getting old.
Solution:   Make Python 3.6 the default. (Ken Takata, closes #2429)
Files:      runtime/doc/if_pyth.txt, src/INSTALLpc.txt, src/Make_cyg_ming.mak,
            src/Make_mvc.mak, src/bigvim.bat

Patch 8.0.1386
Problem:    Cannot select modified buffers with getbufinfo().
Solution:   Add the "bufmodified" flag. (Yegappan Lakshmanan, closes #2431)
Files:      runtime/doc/eval.txt, src/evalfunc.c,
            src/testdir/test_bufwintabinfo.vim

Patch 8.0.1387
Problem:    Wordcount test is old style.
Solution:   Change into a new style test. (Yegappan Lakshmanan, closes #2434)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_vms.mms, src/testdir/test_wordcount.in,
            src/testdir/test_wordcount.ok, src/testdir/test_wordcount.vim

Patch 8.0.1388
Problem:    Char not overwritten with ambiguous width char, if the ambiguous
            char is single width but we reserve double-width space.
Solution:   First clear the screen cells. (Ozaki Kiichi, closes #2436)
Files:      src/screen.c
```

```
Patch 8.0.1389
Problem:    getqflist() items are missing if not set, that makes it more
            difficult to handle the values.
Solution:   When a value is not available return zero or another invalid
            value. (Yegappan Lakshmanan, closes #2430)
Files:      runtime/doc/eval.txt, src/quickfix.c,
            src/testdir/test_quickfix.vim

Patch 8.0.1390
Problem:    DirectX scrolling can be slow, vertical positioning is off.
Solution:   Make scroll slightly faster when using "scrlines:1". Fix y
            position of displayed text. Fix DirectX with non-utf8 encoding.
            (Ken Takata, closes #2440)
Files:      src/INSTALLpc.txt, src/Make_cyg_ming.mak, src/Make_mvc.mak,
            src/gui_dwrite.cpp, src/gui_w32.c

Patch 8.0.1391
Problem:    Encoding empty string to JSON sometimes gives "null".
Solution:   Handle NULL string as empty string. (closes #2446)
Files:      src/testdir/test_json.vim, src/json.c

Patch 8.0.1392
Problem:    Build fails with --with-features=huge --disable-channel.
Solution:   Don't enable the terminal feature when the channel feature is
            missing. (Dominique Pelle, closes #2453)
Files:      src/configure.ac, src/auto/configure

Patch 8.0.1393
Problem:    Too much highlighting with 'hlsearch' and 'incsearch' set.
Solution:   Do not highlight matches when the pattern matches everything.
Files:      src/ex_getln.c

Patch 8.0.1394
Problem:    Cannot intercept a yank command.
Solution:   Add the TextYankPost autocommand event. (Philippe Vaucher et al.,
            closes #2333)
Files:      runtime/doc/autocmd.txt, runtime/doc/eval.txt, src/dict.c,
            src/eval.c, src/fileio.c, src/ops.c, src/proto/dict.pro,
            src/proto/eval.pro, src/proto/fileio.pro,
            src/testdir/test_autocmd.vim, src/vim.h

Patch 8.0.1395
Problem:    It is not easy to see if a colorscheme is well written.
Solution:   Add a script that checks for common mistakes. (Christian Brabandt)
Files:      runtime/colors/check_colors.vim, runtime/colors/README.txt

Patch 8.0.1396
Problem:    Memory leak when CTRL-G in search command line fails.
Solution:   Move restore_last_search_pattern to after "if".
Files:      src/ex_getln.c

Patch 8.0.1397
Problem:    Pattern with \& following nothing gives an error.
```

```
Solution:   Emit an empty node when needed.
Files:      src/regexp_nfa.c, src/testdir/test_search.vim

Patch 8.0.1398
Problem:    :packadd does not load packages from the "start" directory.
            (Alejandro Hernandez)
Solution:   Make :packadd look in the "start" directory if those packages were
            not loaded on startup.
Files:      src/ex_cmds2.c, src/testdir/test_packadd.vim

Patch 8.0.1399
Problem:    Warnings and errors when building tiny version. (Tony Mechelynck)
Solution:   Add #ifdefs.
Files:      src/ex_getln.c, src/ops.c

Patch 8.0.1400
Problem:    Color scheme check script shows up as color scheme.
Solution:   Move it to the "tools" subdirectory. (closes #2457)
Files:      Filelist, runtime/colors/check_colors.vim,
            runtime/colors/tools/check_colors.vim, runtime/colors/README.txt

Patch 8.0.1401
Problem:    Cannot build with GTK but without XIM. (Guido)
Solution:   Adjust #ifdef. (closes #2461)
Files:      src/gui.c

Patch 8.0.1402
Problem:    Crash with nasty autocommand. (gy741, Dominique Pelle)
Solution:   Check that the new current buffer isn't wiped out. (closes #2447)
Files:      src/buffer.c, src/testdir/test_autocmd.vim

Patch 8.0.1403
Problem:    Using freed buffer in grep command. (gy741, Dominique Pelle)
Solution:   Lock the dummy buffer to avoid autocommands wiping it out.
Files:      src/quickfix.c, src/testdir/test_autocmd.vim

Patch 8.0.1404
Problem:    Invalid memory access on exit when autocommands wipe out a buffer.
            (gy741, Dominique Pelle)
Solution:   Check if the buffer is still valid. (closes #2449)
Files:      src/main.c

Patch 8.0.1405
Problem:    Duplicated code for getting a typed character. CursorHold is
            called too often in the GUI. (lilydjwg)
Solution:   Refactor code to move code up from mch_inchar().  Don't fire
            CursorHold if feedkeys() was used. (closes #2451)
Files:      src/gui.c, src/proto/gui.pro, src/main.c, src/ui.c,
            src/proto/ui.pro, src/os_unix.c

Patch 8.0.1406
Problem:    Difficult to track changes to a quickfix list.
Solution:   Add a "changedtick" value. (Yegappan Lakshmanan, closes #2460)
Files:      runtime/doc/eval.txt, runtime/doc/quickfix.txt, src/quickfix.c,
```

```
            src/testdir/test_quickfix.vim

Patch 8.0.1407
Problem:    GUI: CursorHold may trigger before 'updatetime' when using timers.
Solution:   Check that 'updatetime' has passed.
Files:      src/gui.c

Patch 8.0.1408
Problem:    Crash in setqflist().
Solution:   Check for string to be NULL. (Dominique Pelle, closes #2464)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.1409
Problem:    Buffer overflow in :tags command.
Solution:   Use vim_snprintf(). (Dominique Pelle, closes #2471, closes #2475)
            Add a test.
Files:      src/testdir/test_taglist.vim, src/tag.c

Patch 8.0.1410
Problem:    Hang when using count() with an empty string.
Solution:   Return zero for an empty string. (Dominique Pelle, closes #2465)
Files:      runtime/doc/eval.txt, src/evalfunc.c,
            src/testdir/test_functions.vim

Patch 8.0.1411
Problem:    Reading invalid memory with CTRL-W :.
Solution:   Correct the command characters. (closes #2469)
Files:      src/normal.c, src/testdir/test_window_cmd.vim, src/ops.c

Patch 8.0.1412
Problem:    Using free memory using setloclist(). (Dominique Pelle)
Solution:   Mark location list context as still in use when needed. (Yegappan
            Lakshmanan, closes #2462)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.1413
Problem:    Accessing freed memory in :cbuffer.
Solution:   Get quickfix list after executing autocmds. (closes #2470)
Files:      src/quickfix.c, src/testdir/test_autocmd.vim

Patch 8.0.1414
Problem:    Accessing freed memory in :lfile.
Solution:   Get the current window after executing autocommands. (Yegappan
            Lakshmanan, closes #2473)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.1415
Problem:    Warning for unused function without timers feature.
Solution:   Add #ifdef. (John Marriott)
Files:      src/gui.c

Patch 8.0.1416
Problem:    Crash when searching for a sentence.
Solution:   Return NUL when getting character at MAXCOL. (closes #2468)
```

```
Files:      src/misc1.c, src/misc2.c, src/testdir/test_search.vim,
            src/ex_docmd.c

Patch 8.0.1417
Problem:    Test doesn't search for a sentence. Still fails when searching for
            start of sentence. (Dominique Pelle)
Solution:   Add paren. Check for MAXCOL in dec().
Files:      src/testdir/test_search.vim, src/misc2.c

Patch 8.0.1418
Problem:    No test for expanding backticks.
Solution:   Add a test. (Dominique Pelle, closes #2479)
Files:      src/testdir/test_normal.vim

Patch 8.0.1419
Problem:    Cursor column is not updated after ]s. (Gary Johnson)
Solution:   Set the curswant flag.
Files:      src/testdir/test_spell.vim, src/normal.c, src/evalfunc.c

Patch 8.0.1420
Problem:    Accessing freed memory in vimgrep.
Solution:   Check that the quickfix list is still valid. (Yegappan Lakshmanan,
            closes #2474)
Files:      src/quickfix.c, src/testdir/test_autocmd.vim,
            src/testdir/test_quickfix.vim

Patch 8.0.1421
Problem:    Accessing invalid memory with overlong byte sequence.
Solution:   Check for NUL character. (test by Dominique Pelle, closes #2485)
Files:      src/misc2.c, src/testdir/test_functions.vim

Patch 8.0.1422
Problem:    No fallback to underline when undercurl is not set. (Ben Jackson)
Solution:   Check for the value to be empty instead of NULL. (closes #2424)
Files:      src/screen.c

Patch 8.0.1423
Problem:    Error in return not caught by try/catch.
Solution:   Call update_force_abort(). (Yasuhiro Matsumoto, closes #2483)
Files:      src/testdir/test_eval.in, src/testdir/test_eval_stuff.vim,
            src/Makefile, src/testdir/Make_all.mak, src/userfunc.c

Patch 8.0.1424
Problem:    The timer_pause test is flaky on Travis.
Solution:   Accept a longer sleep time on Mac.
Files:      src/testdir/test_timers.vim

Patch 8.0.1425
Problem:    execute() does not work in completion of user command. (thinca)
Solution:   Switch off redir_off and restore it. (Ozaki Kiichi, closes #2492)
Files:      src/evalfunc.c, src/testdir/test_usercommands.vim

Patch 8.0.1426
Problem:    "gf" and <cfile> don't accept ? and & in URL. (Dmitrii Tcyganok)
```

```
Solution:   Check for a URL and allow for extra characters. (closes #2493)
Files:      src/window.c, src/testdir/test_gf.vim

Patch 8.0.1427
Problem:    The :leftabove modifier doesn't work for :copen.
Solution:   Respect the split modifier. (Yegappan Lakshmanan, closes #2496)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.1428
Problem:    Compiler warning on 64 bit MS-Windows system.
Solution:   Change type from "int" to "size_t". (Mike Williams)
Files:      src/ex_getln.c

Patch 8.0.1429
Problem:    Crash when calling term_start() with empty argument.
Solution:   Check for invalid argument. (Yasuhiro Matsumoto, closes #2503)
            Fix memory leak.
Files:      src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.1430 (after 8.0.1429)
Problem:    Crash when term_start() fails.
Solution:   Initialize winpty_err.
Files:      src/terminal.c

Patch 8.0.1431
Problem:    MS-Windows: vimtutor fails if %TMP% has special chars.
Solution:   Add quotes. (Tamce, closes #2561)
Files:      vimtutor.bat

Patch 8.0.1432
Problem:    After ":copen" can't get the window-ID of the quickfix window.
            (FalacerSelene)
Solution:   Make it work without a quickfix list.  Add a test. (Yegappan
            Lakshmanan, closes #2541)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.1433
Problem:    Illegal memory access after undo. (Dominique Pelle)
Solution:   Avoid the column becomes negative. (Christian Brabandt,
            closes #2533)
Files:      src/mbyte.c, src/testdir/test_undo.vim

Patch 8.0.1434
Problem:    GTK: :promtfind does not put focus on text input. (Adam Novak)
Solution:   When re-opening the dialog put focus on the text input. (Kazunobu
            Kuriyama, closes #2563)
Files:      src/gui_gtk.c

Patch 8.0.1435
Problem:    Memory leak in test_arabic.
Solution:   Free the from and to parts. (Christian Brabandt, closes #2569)
Files:      src/buffer.c, src/digraph.c, src/proto/digraph.pro

Patch 8.0.1436
```

```
Problem:    Not enough information about what Python version may work.
Solution:   Add "python_compiled", "python3_compiled", "python_dynamic" and
            "python3_dynamic" values for has().
Files:      src/evalfunc.c, runtime/doc/eval.txt

Patch 8.0.1437
Problem:    Pkg-config doesn't work with cross compiling.
Solution:   Use AC_PATH_TOOL() instead of AC_PATH_PROG(). (James McCoy,
            closes #2513)
Files:      src/configure.ac, src/auto/configure

Patch 8.0.1438
Problem:    Filetype detection test not updated for change.
Solution:   Update the test.
Files:      src/testdir/test_filetype.vim

Patch 8.0.1439
Problem:    If cscope fails a search Vim may hang.
Solution:   Bail out when a search error is encountered. (Safouane Baroudi,
            closes #2598)
Files:      src/if_cscope.c

Patch 8.0.1440
Problem:    Terminal window: some vterm responses are delayed.
Solution:   After writing input. check if there is output to read. (Ozaki
            Kiichi, closes #2594)
Files:      src/terminal.c, src/testdir/test_search.vim,
            src/testdir/test_terminal.vim

Patch 8.0.1441
Problem:    Using ":undo 0" leaves undo in wrong state.
Solution:   Instead of searching for state 1 and go above, just use the start.
            (Ozaki Kiichi, closes #2595)
Files:      src/undo.c, src/testdir/test_undo.vim

Patch 8.0.1442 (after 8.0.1439)
Problem:    Using pointer before it is set.
Solution:   Search in whole buffer instead of next token.
Files:      src/if_cscope.c

Patch 8.0.1443 (after 8.0.1441)
Problem:    Compiler complains about uninitialized variable. (Tony Mechelynck)
Solution:   Assign a value to the variable.
Files:      src/undo.c

Patch 8.0.1444
Problem:    Missing -D_FILE_OFFSET_BITS=64 may cause problems if a library is
            compiled with it.
Solution:   Include -D_FILE_OFFSET_BITS if some CFLAGS has it. (James McCoy,
            closes #2600)
Files:      src/configure.ac, src/auto/configure

Patch 8.0.1445
Problem:    Cannot act on edits in the command line.
```

```
Solution:   Add the CmdlineChanged autocommand event. (xtal8, closes #2603,
            closes #2524)
Files:      runtime/doc/autocmd.txt, src/ex_getln.c, src/fileio.c,
            src/testdir/test_autocmd.vim, src/vim.h

Patch 8.0.1446
Problem:    Accessing freed memory after window command in auto command.
            (gy741)
Solution:   Adjust the pointer in the parent frame. (Christian Brabandt,
            closes #2467)
Files:      src/window.c, src/testdir/test_window_cmd.vim

Patch 8.0.1447
Problem:    Still too many old style tests.
Solution:   Turn a few tests into new style. (Yegappan Lakshmanan,
            closes #2509)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/Make_vms.mms,
            src/testdir/main.aap, src/testdir/test15.in,
            src/testdir/test15.ok, src/testdir/test36.in,
            src/testdir/test36.ok, src/testdir/test50.in,
            src/testdir/test50.ok, src/testdir/test_regex_char_classes.vim,
            src/testdir/test_shortpathname.vim,
            src/testdir/test_textformat.vim

Patch 8.0.1448
Problem:    Segmentation fault when Ruby throws an exception inside :rubyfile
            command.
Solution:   Use rb_protect() instead of rb_load_protect(). (ujihisa,
            closes #2147, greywolf, closes #2512, #2511)
Files:      src/if_ruby.c, src/testdir/test_ruby.vim

Patch 8.0.1449
Problem:    Slow redrawing with DirectX.
Solution:   Avoid calling gui_mch_flush() unnecessarily, especially when
            updating the cursor. (Ken Takata, closes #2560)
Files:      runtime/doc/options.txt, src/channel.c, src/edit.c, src/getchar.c,
            src/gui.c, src/gui_dwrite.cpp, src/gui_dwrite.h, src/gui_w32.c,
            src/macros.h, src/main.c, src/message.c, src/netbeans.c,
            src/proto/gui.pro, src/proto/term.pro, src/screen.c, src/search.c,
            src/term.c, src/ui.c

Patch 8.0.1450
Problem:    Endless loop when gui_mch_stop_blink() is called while blink_state
            is BLINK_OFF. (zdohnal)
Solution:   Avoid calling gui_update_cursor() recursively.
Files:      src/gui.c, src/gui_gtk_x11.c, src/proto/gui_gtk_x11.pro,
            src/gui_mac.c, src/proto/gui_mac.pro, src/gui_photon.c,
            src/proto/gui_photon.pro, src/gui_w32.c, src/proto/gui_w32.pro,
            src/gui_x11.c, src/proto/gui_x11.pro

Patch 8.0.1451
Problem:    It is difficult to set the python home directory properly for
            Python 2.7 and 3.5 since both use $PYTHONHOME.
Solution:   Add the 'pythonhome' and 'pythonthreehome' options. (Kazuki
```

```
            Sakamoto, closes #1266)
Files:      runtime/doc/options.txt, runtime/doc/quickref.txt,
            runtime/optwin.vim, src/if_python.c, src/if_python3.c,
            src/option.c, src/option.h

Patch 8.0.1452
Problem:    Terminal test fails on some systems. (jonathonf)
Solution:   Use "cat" instead of Python to produce the input.  Add a delay.
            (closes #2607)
Files:      src/testdir/test_terminal.vim

Patch 8.0.1453
Problem:    Terminal test fails on some slow terminals.
Solution:   Increase timeout to 10 seconds.
Files:      src/testdir/test_terminal.vim

Patch 8.0.1454
Problem:    When in silent mode too much output is buffered.
Solution:   Use line buffering instead of fully buffered. (Brian M. Carlson,
            closes #2537)
Files:      src/main.c

Patch 8.0.1455
Problem:    If $SHELL contains a space then the default value of 'shell' is
            incorrect. (Matthew Horan)
Solution:   Escape spaces in $SHELL. (Christian Brabandt, closes #459)
Files:      src/option.c, runtime/doc/options.txt,
            src/testdir/test_startup.vim

Patch 8.0.1456
Problem:    Timer test on travis Mac is still flaky.
Solution:   Increase time range a bit more.
Files:      src/testdir/test_timers.vim

Patch 8.0.1457
Problem:    Clojure now supports a shebang line.
Solution:   Detect clojure script from the shebang line. (David Burgin,
            closes #2570)
Files:      runtime/scripts.vim

Patch 8.0.1458
Problem:    Filetype detection test does not check all scripts.
Solution:   Add most scripts to the test
Files:      src/testdir/test_filetype.vim

Patch 8.0.1459
Problem:    Cannot handle change of directory.
Solution:   Add the DirChanged autocommand event. (Andy Massimino,
            closes #888)  Avoid changing directory for 'autochdir' too often.
Files:      runtime/doc/autocmd.txt, src/buffer.c, src/ex_docmd.c,
            src/fileio.c, src/main.c, src/vim.h, src/proto/misc2.pro,
            src/gui_mac.c, src/netbeans.c, src/os_win32.c,
            src/testdir/test_autocmd.vim
```

```
Patch 8.0.1460 (after 8.0.1459)
Problem:    Missing file in patch.
Solution:   Add changes to missing file.
Files:      src/misc2.c

Patch 8.0.1461 (after 8.0.1459)
Problem:    Missing another file in patch.
Solution:   Add changes to missing file.
Files:      src/ex_cmds.c

Patch 8.0.1462 (after 8.0.1459)
Problem:    Missing yet another file in patch.
Solution:   Add changes to missing file.
Files:      src/gui.c

Patch 8.0.1463
Problem:    Test fails without 'autochdir' option.
Solution:   Skip test if 'autochdir' is not supported.
Files:      src/testdir/test_autocmd.vim

Patch 8.0.1464
Problem:    Completing directory after :find does not add slash.
Solution:   Adjust the flags for globpath(). (Genki Sky)
Files:      src/misc1.c, src/testdir/test_find_complete.vim

Patch 8.0.1465
Problem:    Python2 and python3 detection not tested. (Matej Cepl)
Solution:   Add test for detecting python2 and python3.  Also detect a script
            using "js" as javascript.
Files:      runtime/scripts.vim, src/testdir/test_filetype.vim

Patch 8.0.1466
Problem:    Older GTK versions don't have gtk_entry_get_text_length().
Solution:   Add a function with #ifdefs to take care of GTK version
            differences. (Kazunobu Kuriyama, closes #2605)
Files:      src/gui_gtk.c

Patch 8.0.1467
Problem:    Libvterm doesn't handle illegal byte sequence correctly.
Solution:   After the invalid code check if there is space to store another
            character.  Allocate one more character. (zhykzhykzhyk, closes
            #2614, closes #2613)
Files:      src/libvterm/src/encoding.c, src/libvterm/src/state.c

Patch 8.0.1468
Problem:    Illegal memory access in del_bytes().
Solution:   Check for negative byte count. (Christian Brabandt, closes #2466)
Files:      src/message.c, src/misc1.c

Patch 8.0.1469
Problem:    When package path is a symlink adding it to 'runtimepath' happens
            at the end.
Solution:   Do not resolve symlinks before locating the position in
            'runtimepath'. (Ozaki Kiichi, closes #2604)
```

```
Files:      src/ex_cmds2.c, src/testdir/test_packadd.vim

Patch 8.0.1470
Problem:    Integer overflow when using regexp pattern. (geeknik)
Solution:   Use a long instead of int. (Christian Brabandt, closes #2251)
Files:      src/regexp_nfa.c

Patch 8.0.1471 (after 8.0.1401)
Problem:    On MS-Windows CursorIM highlighting no longer works.
Solution:   Adjust #if statements. (Ken Takata)
Files:      src/gui.c

Patch 8.0.1472
Problem:    MS-Windows: nsis installer is a bit slow.
Solution:   Use ReserveFile for vimrc.ini. (Ken Takata, closes #2522)
Files:      nsis/gvim.nsi

Patch 8.0.1473
Problem:    MS-Windows: D&D fails between 32 and 64 bit apps.
Solution:   Add the /HIGHENTROPYVA:NO linker option. (Ken Takata, closes #2504)
Files:      src/Make_mvc.mak

Patch 8.0.1474
Problem:    Visual C 2017 has multiple MSVCVER numbers.
Solution:   Assume the 2017 version if MSVCVER >= 1910. (Leonardo Valeri
            Manera, closes #2619)
Files:      src/Make_mvc.mak

Patch 8.0.1475
Problem:    Invalid memory access in read_redo(). (gy741)
Solution:   Convert the replacement character back from a negative number to
            CR or NL. (hint by Dominique Pelle, closes #2616)
Files:      src/testdir/test_undo.vim, src/normal.c, src/vim.h, src/ops.c

Patch 8.0.1476
Problem:    Screen isn't always updated right away.
Solution:   Adjust #ifdef: Call out_flush() when not running the GUI.
Files:      src/screen.c

Patch 8.0.1477
Problem:    Redraw flicker when moving the mouse outside of terminal window.
Solution:   Instead of updating the cursor color and shape every time leaving
            and entering a terminal window, only update when different from
            the previously used cursor.
Files:      src/terminal.c

Patch 8.0.1478
Problem:    Unnecessary condition for "len" being zero.
Solution:   Remove the condition. (Dominique Pelle)
Files:      src/regexp_nfa.c

Patch 8.0.1479
Problem:    Insert mode completion state is confusing.
Solution:   Move ctrl_x_mode into edit.c.  Add CTRL_X_NORMAL for zero.
```

```
Files:      src/edit.c, src/globals.h, src/proto/edit.pro, src/search.c,
            src/getchar.c

Patch 8.0.1480 (after 8.0.1479)
Problem:    Patch missing change.
Solution:   Add missing change.
Files:      src/evalfunc.c

Patch 8.0.1481
Problem:    Clearing a pointer takes two lines.
Solution:   Add vim_clear() to free and clear the pointer.
Files:      src/misc2.c, src/proto/misc2.pro, src/edit.c

Patch 8.0.1482
Problem:    Using feedkeys() does not work to test Insert mode completion.
            (Lifepillar)
Solution:   Do not check for typed keys when executing :normal or feedkeys().
            Fix thesaurus completion not working when 'complete' is empty.
Files:      src/edit.c, src/testdir/test_ins_complete.vim,
            src/testdir/test_popup.vim, src/testdir/test_edit.vim

Patch 8.0.1483
Problem:    Searchpair() might return an invalid value on timeout.
Solution:   When the second search times out, do not accept a match from the
            first search. (Daniel Hahler, closes #2552)
Files:      src/search.c

Patch 8.0.1484
Problem:    Redundant conditions.
Solution:   Remove them. (Dominique Pelle)
Files:      src/terminal.c

Patch 8.0.1485
Problem:    Weird autocmd may cause arglist to be changed recursively.
Solution:   Prevent recursively changing the argument list. (Christian
            Brabandt, closes #2472)
Files:      src/ex_docmd.c, src/globals.h

Patch 8.0.1486
Problem:    Accessing invalid memory with "it". (Dominique Pelle)
Solution:   Avoid going over the end of the line. (Christian Brabandt,
            closes #2532)
Files:      src/search.c, src/testdir/test_textobjects.vim

Patch 8.0.1487 (after 8.0.1486)
Problem:    Test 14 fails.
Solution:   Fix of-by-one error.
Files:      src/search.c

Patch 8.0.1488 (after 8.0.1218)
Problem:    Emacs tags no longer work. (zdohnal)
Solution:   Do not skip over end of line.
Files:      src/tag.c, src/testdir/test_tagjump.vim
```

```
Patch 8.0.1489
Problem:    There is no easy way to get the global directory, esp. if some
            windows have a local directory.
Solution:   Make getcwd(-1) return the global directory. (Andy Massimino,
            closes #2606)
Files:      runtime/doc/eval.txt, src/evalfunc.c, src/testdir/test_getcwd.vim

Patch 8.0.1490
Problem:    Number of spell regions is spread out through the code.
Solution:   Define MAXREGIONS.
Files:      src/spell.h, src/spellfile.c

Patch 8.0.1491
Problem:    The minimum width of the popup menu is hard coded.
Solution:   Add the 'pumwidth' option. (Christian Brabandt, James McCoy,
            closes #2314)
Files:      runtime/doc/options.txt, src/option.c, src/option.h,
            src/popupmnu.c

Patch 8.0.1492
Problem:    Memory leak in balloon_split().
Solution:   Free the balloon lines. Free the balloon when exiting.
Files:      src/misc2.c, src/evalfunc.c

Patch 8.0.1493
Problem:    Completion items cannot be annotated.
Solution:   Add a "user_data" entry to the completion item. (Ben Jackson,
            closes #2608, closes #2508)
Files:      runtime/doc/insert.txt, src/edit.c, src/structs.h,
            src/testdir/test_ins_complete.vim

Patch 8.0.1494
Problem:    No autocmd triggered in Insert mode with visible popup menu.
Solution:   Add TextChangedP. (Prabir Shrestha, Christian Brabandt,
            closes #2372, closes #1691)
            Fix that the TextChanged autocommands are not always triggered
            when sourcing a script.
Files:      runtime/doc/autocmd.txt, src/edit.c, src/globals.h, src/structs.h,
            src/fileio.c, src/proto/fileio.pro, src/vim.h, src/main.c,
            src/testdir/test_autocmd.vim

Patch 8.0.1495
Problem:    Having 'pumwidth' default to zero has no merit.
Solution:   Make the default 15, as the actual default value.
Files:      src/popupmnu.c, src/option.c

Patch 8.0.1496
Problem:    Clearing a pointer takes two lines.
Solution:   Add VIM_CLEAR() and replace vim_clear(). (Hirohito Higashi,
            closes #2629)
Files:      src/buffer.c, src/channel.c, src/crypt.c, src/edit.c, src/eval.c,
            src/evalfunc.c, src/ex_cmds.c, src/ex_cmds2.c, src/ex_docmd.c,
            src/ex_getln.c, src/fileio.c, src/gui_gtk_x11.c, src/gui_photon.c,
            src/gui_w32.c, src/gui_x11.c, src/hardcopy.c, src/if_cscope.c,
```

```
            src/macros.h, src/main.c, src/mark.c, src/mbyte.c, src/memfile.c,
            src/memline.c, src/menu.c, src/message.c, src/misc1.c,
            src/misc2.c, src/netbeans.c, src/normal.c, src/ops.c,
            src/option.c, src/os_amiga.c, src/os_mac_conv.c, src/os_mswin.c,
            src/os_unix.c, src/os_win32.c, src/popupmnu.c,
            src/proto/misc2.pro, src/quickfix.c, src/regexp.c,
            src/regexp_nfa.c, src/screen.c, src/search.c, src/spell.c,
            src/spellfile.c, src/syntax.c, src/tag.c, src/term.c,
            src/terminal.c, src/ui.c, src/undo.c, src/userfunc.c, src/window.c

Patch 8.0.1497
Problem:    Getting the jump list requires parsing the output of :jumps.
Solution:   Add getjumplist(). (Yegappan Lakshmanan, closes #2609)
Files:      runtime/doc/eval.txt, runtime/doc/usr_41.txt, src/Makefile,
            src/evalfunc.c, src/list.c, src/proto/list.pro,
            src/testdir/Make_all.mak, src/testdir/test_jumplist.vim

Patch 8.0.1498 (after 8.0.1497)
Problem:    Getjumplist() returns duplicate entries. (lacygoill)
Solution:   Call cleanup_jumplist(). (Yegappan Lakshmanan)
Files:      src/evalfunc.c, src/mark.c, src/proto/mark.pro,
            src/testdir/test_jumplist.vim

Patch 8.0.1499
Problem:    Out-of-memory situation not correctly handled. (Coverity)
Solution:   Check for NULL value.
Files:      src/terminal.c

Patch 8.0.1500
Problem:    Possible NULL pointer dereference. (Coverity)
Solution:   Check for the pointer not being NULL.
Files:      src/quickfix.c

Patch 8.0.1501
Problem:    Out-of-memory situation not correctly handled. (Coverity)
Solution:   Check for NULL value.
Files:      src/ops.c

Patch 8.0.1502
Problem:    In out-of-memory situation character is not restored. (Coverity)
Solution:   Restore the character in all situations.
Files:      src/ex_getln.c

Patch 8.0.1503
Problem:    Access memory beyond end of string. (Coverity)
Solution:   Keep allocated memory in separate pointer.  Avoid outputting the
            NUL character.
Files:      src/hardcopy.c

Patch 8.0.1504
Problem:    Win32: the screen may be cleared on startup.
Solution:   Only call shell_resized() when the size actually changed. (Ken
            Takata, closes #2527)
Files:      src/os_win32.c
```

```
Patch 8.0.1505
Problem:    Debugger can't break on a condition. (Charles Campbell)
Solution:   Add ":breakadd expr". (Christian Brabandt, closes #859)
Files:      runtime/doc/repeat.txt, src/eval.c, src/evalfunc.c,
            src/userfunc.c, src/ex_cmds2.c, src/ex_docmd.c,
            src/proto/eval.pro, src/proto/ex_cmds2.pro, src/structs.h

Patch 8.0.1506
Problem:    New version of HP NonStop (Tandem) doesn't like the default header
            for setenv().
Solution:   Put a #ifdef around the setenv() entry. (Joachim Schmitz)
Files:      src/osdef2.h.in

Patch 8.0.1507
Problem:    Timer test is a bit flaky.
Solution:   Add it to the list of flaky tests.
Files:      src/testdir/runtest.vim

Patch 8.0.1508
Problem:    The :drop command is not always available.
Solution:   Include :drop in all builds. (Yasuhiro Matsumoto, closes #2639)
Files:      runtime/doc/windows.txt, src/ex_cmds.c, src/ex_cmds2.c,
            src/ex_docmd.c, src/testdir/test_normal.vim,
            src/testdir/test_tabpage.vim

Patch 8.0.1509 (after 8.0.1508)
Problem:    Test for failing drag-n-drop command no longer fails.
Solution:   Check for the "dnd" feature.
Files:      src/testdir/test_normal.vim

Patch 8.0.1510
Problem:    Cannot test if a command causes a beep.
Solution:   Add assert_beeps().
Files:      runtime/doc/eval.txt, src/evalfunc.c, src/eval.c,
            src/proto/eval.pro, src/misc1.c, src/globals.h,
            src/testdir/test_normal.vim, src/testdir/test_assert.vim

Patch 8.0.1511 (after 8.0.1505)
Problem:    Some code for the debugger watch expression is clumsy.
Solution:   Clean up the code.
Files:      src/ex_cmds2.c, src/eval.c, src/proto/eval.pro

Patch 8.0.1512
Problem:    Warning for possibly using NULL pointer. (Coverity)
Solution:   Skip using the pointer if it's NULL.
Files:      src/ex_cmds.c

Patch 8.0.1513
Problem:    The jumplist is not always properly cleaned up.
Solution:   Call fname2fnum() before cleanup_jumplist(). (Yegappan Lakshmanan)
Files:      src/evalfunc.c, src/mark.c, src/proto/mark.pro

Patch 8.0.1514
```

```
Problem:    Getting the list of changes is not easy.
Solution:   Add the getchangelist() function. (Yegappan Lakshmanan,
            closes #2634)
Files:      runtime/doc/eval.txt, runtime/doc/usr_41.txt, src/evalfunc.c,
            src/testdir/Make_all.mak, src/testdir/test_changelist.vim,
            src/Makefile

Patch 8.0.1515
Problem:    BufWinEnter event fired when opening hidden terminal.
Solution:   Do not fire BufWinEnter when the terminal is hidden and does not
            open a window. (Kenta Sato, closes #2636)
Files:      src/terminal.c

Patch 8.0.1516
Problem:    Errors for job options are not very specific.
Solution:   Add more specific error messages.
Files:      src/channel.c, src/globals.h

Patch 8.0.1517
Problem:    Invalid memory access with pattern using look-behind match.
            (Dominique Pelle)
Solution:   Get a pointer to the right line.
Files:      src/regexp.c

Patch 8.0.1518
Problem:    Error messages suppressed after ":silent! try". (Ben Reilly)
Solution:   Restore emsg_silent before executing :try. (closes #2531)
Files:      src/ex_docmd.c, src/testdir/test_eval_stuff.vim

Patch 8.0.1519
Problem:    Getchangelist() does not use argument as bufname().
Solution:   Use get_buf_tv(). (Yegappan Lakshmanan, closes #2641)
Files:      src/evalfunc.c, src/testdir/test_changelist.vim

Patch 8.0.1520
Problem:    Cursor is in the wrong line when using a WinBar in a Terminal
            window.
Solution:   Adjust the row number. (Christian Brabandt, closes #2362)
Files:      src/screen.c, src/terminal.c

Patch 8.0.1521
Problem:    Shift-Tab does not work in a terminal window.
Solution:   Recognize Shift-Tab key press. (Jsees Luehrs, closes #2644)
Files:      src/terminal.c

Patch 8.0.1522 (after 8.0.1491)
Problem:    Popup menu is positioned in the wrong place. (Davit Samvelyan,
            Boris Staletic)
Solution:   Correct computation of the column and the conditions for that.
            (Hirohito Higashi, closes #2640)
Files:      src/popupmnu.c

Patch 8.0.1523
Problem:    Cannot write and read terminal screendumps.
```

```
Solution:   Add term_dumpwrite(), term_dumpread() and term_dumpdiff().
            Also add assert_equalfile().
Files:      src/terminal.c, src/proto/terminal.pro, src/evalfunc.c,
            src/normal.c, src/eval.c, src/proto/eval.pro,
            runtime/doc/eval.txt, src/testdir/test_assert.vim

Patch 8.0.1524 (after 8.0.1523)
Problem:    Compiler warnings for uninitialized variables. (Tony Mechelynck)
Solution:   Initialize variables.
Files:      src/terminal.c

Patch 8.0.1525
Problem:    Using :wqa exits even if a job runs in a terminal window. (Jason
            Felice)
Solution:   Check if a terminal has a running job. (closes #2654)
Files:      src/ex_cmds2.c, src/buffer.c, src/proto/buffer.pro, src/ex_cmds.c,
            src/testdir/test_terminal.vim

Patch 8.0.1526
Problem:    No test using a screen dump yet.
Solution:   Add a test for C syntax highlighting.  Add helper functions.
Files:      src/terminal.c, src/testdir/test_syntax.vim,
            src/testdir/shared.vim, src/testdir/screendump.vim,
            src/testdir/dumps/Test_syntax_c_01.dump, runtime/doc/terminal.txt,
            src/testdir/README.txt

Patch 8.0.1527 (after 8.0.1526)
Problem:    Screen dump test fails on MS-Windows.
Solution:   Skip dump test on MS-Windows for now.
Files:      src/testdir/test_syntax.vim

Patch 8.0.1528
Problem:    Dead code found.
Solution:   Remove the useless lines. (CodeAi, closes #2656)
Files:      src/screen.c, src/spell.c, src/syntax.c, src/window.c

Patch 8.0.1529
Problem:    Assert_equalfile() does not close file descriptors. (Coverity)
Solution:   Close the file descriptors.
Files:      src/eval.c

Patch 8.0.1530
Problem:    Dump test fails when using a shadow directory.
Solution:   Add the directory to the list of symlinks to make (Elimar
            Riesebieter)
Files:      src/Makefile

Patch 8.0.1531
Problem:    Cannot use 24 bit colors in MS-Windows console.
Solution:   Add support for vcon. (Nobuhiro Takasaki, Ken Takata,
            fixes #1270, fixes #2060)
Files:      runtime/doc/options.txt, src/misc1.c, src/option.c,
            src/evalfunc.c, src/os_win32.c, src/proto/os_win32.pro,
            src/feature.h, src/proto/term.pro, src/screen.c, src/syntax.c,
```

```
            src/term.c, src/testdir/gen_opt_test.vim, src/version.c

Patch 8.0.1532
Problem:    Compiler warnings without termguicolors feature.
Solution:   Add #ifdef. (John Marriott)  Cleanup the code a bit.
Files:      src/term.c

Patch 8.0.1533
Problem:    Libterm doesn't support requesting fg and bg color.
Solution:   Implement t_RF and t_RB.
Files:      src/libvterm/src/vterm_internal.h, src/libvterm/src/state.c,
            src/libvterm/src/vterm.c

Patch 8.0.1534
Problem:    C syntax test fails when using gvim
Solution:   Force running in a terminal.  Check that 'background' is correct
            even when $COLORFGBG is set.
Files:      src/testdir/test_syntax.vim, src/testdir/screendump.vim

Patch 8.0.1535 (after 8.0.1534)
Problem:    C syntax test still fails when using gvim.
Solution:   Clear Normal cterm highlighting instead of setting it.
Files:      src/testdir/test_syntax.vim, src/testdir/screendump.vim,
            src/testdir/dumps/Test_syntax_c_01.dump

Patch 8.0.1536
Problem:    Quotestar test is flaky when using the GUI.
Solution:   Add check that the star register arrived at the server.  Increase
            timeouts.
Files:      src/testdir/test_quotestar.vim

Patch 8.0.1537
Problem:    Xxd does not skip NUL lines when using ebcdic.
Solution:   Check for a NUL before converting a character for ebcdic. (Tim
            Sell, closes #2668)
Files:      src/xxd/xxd.c

Patch 8.0.1538
Problem:    Popupmenu is too far left when completion is long. (Linwei)
Solution:   Adjust column computations. (Hirohito Higashi, closes #2661)
Files:      src/popupmnu.c

Patch 8.0.1539
Problem:    No test for the popup menu positioning.
Solution:   Add a screendump test for the popup menu.
Files:      src/terminal.c, src/testdir/test_syntax.vim,
            src/testdir/screendump.vim,
            src/testdir/test_popup.vim,
            src/testdir/dumps/Test_popup_position_01.dump,
            src/testdir/dumps/Test_popup_position_02.dump,
            src/testdir/dumps/Test_popup_position_03.dump,
            runtime/doc/eval.txt

Patch 8.0.1540
```

```
Problem:    Popup menu positioning fails with longer string.
Solution:   Only align with right side of window when width is less than
            'pumwidth' (closes #2661)
Files:      src/popupmnu.c, src/testdir/screendump.vim,
            src/testdir/test_popup.vim,
            src/testdir/dumps/Test_popup_position_04.dump

Patch 8.0.1541
Problem:    synpat_T is taking too much memory.
Solution:   Reorder members to reduce padding. (Dominique Pelle, closes #2671)
Files:      src/syntax.c

Patch 8.0.1542
Problem:    Terminal screen dump does not include cursor position.
Solution:   Mark the cursor position in the dump.
Files:      src/terminal.c,
            src/testdir/dumps/Test_popup_position_01.dump,
            src/testdir/dumps/Test_popup_position_02.dump,
            src/testdir/dumps/Test_popup_position_03.dump,
            src/testdir/dumps/Test_popup_position_04.dump,
            src/testdir/dumps/Test_syntax_c_01.dump

Patch 8.0.1543
Problem:    With 'termguicolors' Normal color doesn't work correctly.
Solution:   Set cterm_normal_bg_gui_color and cterm_normal_fg_color always.
            (Kazunobu Kuriyama, closes #981, closes #2332)
Files:      src/syntax.c

Patch 8.0.1544
Problem:    When using 'termguicolors' SpellBad doesn't show.
Solution:   When the GUI colors are not set fall back to the cterm colors.
Files:      src/syntax.c, src/screen.c, src/gui.h, src/structs.h

Patch 8.0.1545
Problem:    Screen dumps not included in distribution.
Solution:   Add dumps to the list of distributed files.
Files:      Filelist

Patch 8.0.1546
Problem:    Using feedkeys() in a terminal window may trigger mappings.
            (Charles Sheridan)
Solution:   Avoid triggering a mapping when peeking for a key.
Files:      src/getchar.c, src/terminal.c

Patch 8.0.1547
Problem:    Undo in the options window makes it empty.
Solution:   Set 'undolevels' while filling the buffer. (Yasuhiro Matsumoto,
            closes #2645)
Files:      runtime/optwin.vim

Patch 8.0.1548
Problem:    Screen dump test script not included in distribution.
Solution:   Add the script to the list of distributed files.
Files:      Filelist
```

```
Patch 8.0.1549
Problem:    Various small problems in test files.
Solution:   Include small changes.
Files:      src/testdir/test_channel.py, src/testdir/shared.vim,
            src/testdir/test_gui.vim, src/testdir/test_gui_init.vim

Patch 8.0.1550
Problem:    Various small problems in source files.
Solution:   Fix the problems.
Files:      src/README.txt, src/beval.c, src/json_test.c, src/mbyte.c,
            src/libvterm/include/vterm_keycodes.h, src/Makefile,
            src/gui_gtk.c, src/if_xcmdsrv.c, src/pty.c, src/if_python.c,
            src/if_py_both.h, uninstal.txt, src/dosinst.c, src/iscygpty.c,
            src/vimrun.c, src/os_vms.c

Patch 8.0.1551
Problem:    On Mac 'maxmemtot' is set to a weird value.
Solution:   For Mac use total memory and subtract system memory. For other
            systems accept both a 32 bit and 64 bit result. (Ozaki Kiichi,
            closes #2646)
Files:      src/os_unix.c

Patch 8.0.1552
Problem:    May leak file descriptors when executing job.
Solution:   Close more file descriptors. (Ozaki Kiichi, closes #2651)
Files:      src/os_unix.c, src/testdir/test_channel.vim

Patch 8.0.1553
Problem:    Cannot see what digraph is used to insert a character.
Solution:   Show the digraph with the "ga" command. (Christian Brabandt)
Files:      runtime/doc/various.txt, src/digraph.c, src/ex_cmds.c,
            src/proto/digraph.pro, src/testdir/shared.vim,
            src/testdir/test_matchadd_conceal.vim,
            src/testdir/test_digraph.vim, src/testdir/test_ga.vim,
            src/testdir/test_arabic.vim

Patch 8.0.1554
Problem:    Custom plugins loaded with --clean.
Solution:   Do not include the home directory in 'runtimepath'.
Files:      src/option.c, src/main.c, src/proto/option.pro, src/structs.h,
            src/os_unix.h, src/os_amiga.h, src/os_dos.h, src/os_mac.h,
            runtime/doc/starting.txt

Patch 8.0.1555
Problem:    Build error for some combination of features.
Solution:   Declare variable in more situations.
Files:      src/main.c

Patch 8.0.1556
Problem:    May not parse the t_RS response correctly, resulting in wrong
            characters in the input stream.
Solution:   When the t_RS response is partly received wait for more
            characters.
```

```
Files:      src/term.c

Patch 8.0.1557
Problem:    printf() does not work with only one argument. (Daniel Hahler)
Solution:   Allow using just the format. (Ken Takata, closes #2687)
Files:      src/evalfunc.c, src/testdir/test_expr.vim

Patch 8.0.1558
Problem:    No right-click menu in a terminal.
Solution:   Implement the right click menu for the terminal.
Files:      src/popupmnu.c, src/proto/popupmnu.pro, src/normal.c, src/menu.c,
            src/proto/menu.pro, src/feature.h

Patch 8.0.1559
Problem:    Build failure without GUI.
Solution:   Adjust #ifdef for get_fpos_of_mouse().
Files:      src/ui.c

Patch 8.0.1560
Problem:    Build failure without GUI on MS-Windows.
Solution:   Adjust #ifdef for vcol2col().
Files:      src/ui.c

Patch 8.0.1561
Problem:    Crash with rust syntax highlighting. (Edd Barrett)
Solution:   Avoid going past the end of an empty line.
Files:      src/syntax.c

Patch 8.0.1562
Problem:    The terminal debugger can't set a breakpoint with the mouse.
Solution:   Add popup menu entries.
Files:      runtime/pack/dist/opt/termdebug/plugin/termdebug.vim,
            runtime/doc/terminal.txt

Patch 8.0.1563
Problem:    Timeout of getwinposx() can be too short. (lilydjwg)
Solution:   Add getwinpos(). (closes #2689)
Files:      src/evalfunc.c, src/term.c, src/proto/term.pro, runtime/doc/eval.txt

Patch 8.0.1564
Problem:    Too many #ifdefs.
Solution:   Graduate the +autocmd feature. Takes away 450 #ifdefs and
            increases code size of tiny Vim by only 40 Kbyte.
Files:      src/buffer.c, src/diff.c, src/edit.c, src/eval.c, src/evalfunc.c,
            src/ex_cmds.c, src/ex_cmds2.c, src/ex_docmd.c, src/ex_getln.c,
            src/fileio.c, src/getchar.c, src/globals.h, src/gui.c,
            src/if_cscope.c, src/if_xcmdsrv.c, src/main.c, src/mbyte.c,
            src/memline.c, src/menu.c, src/misc1.c, src/gui_mac.c,
            src/misc2.c, src/move.c, src/netbeans.c, src/normal.c, src/ops.c,
            src/option.c, src/option.h, src/feature.h, src/vim.h,
            src/os_amiga.c, src/os_mswin.c, src/os_unix.c, src/os_win32.c,
            src/quickfix.c, src/screen.c, src/search.c, src/spell.c,
            src/structs.h, src/syntax.c, src/tag.c, src/term.c,
            src/terminal.c, src/ui.c, src/undo.c, src/userfunc.c,
```

```
            src/version.c, src/window.c

Patch 8.0.1565
Problem:    Can't build Mac version without GUI.
Solution:   Adjust when IME_WITHOUT_XIM is defined.
Files:      src/vim.h

Patch 8.0.1566
Problem:    Too many #ifdefs.
Solution:   Graduate FEAT_SCROLLBIND and FEAT_CURSORBIND.
Files:      src/buffer.c, src/diff.c, src/edit.c, src/evalfunc.c,
            src/ex_cmds.c, src/ex_cmds2.c, src/ex_docmd.c, src/gui.c,
            src/main.c, src/move.c, src/normal.c, src/option.c, src/term.c,
            src/version.c, src/window.c, src/globals.h, src/macros.h,
            src/option.h, src/structs.h

Patch 8.0.1567
Problem:    Cannot build Win32 GUI without IME. (John Marriott)
Solution:   Adjust when IME_WITHOUT_XIM and HAVE_INPUT_METHOD are defined and
            use it in a few more places.
Files:      src/vim.h, src/gui.c

Patch 8.0.1568
Problem:    Can't build on older Mac, header file is missing.
Solution:   Remove the header file. (Ozaki Kiichi, closes #2691)
Files:      src/os_unix.c

Patch 8.0.1569
Problem:    Warning for uninitialized variable from gcc.
Solution:   Initialize the variable.
Files:      src/quickfix.c

Patch 8.0.1570
Problem:    Can't use :popup for a menu in the terminal. (Wei Zhang)
Solution:   Make :popup work in the terminal.  Also fix that entries were
            included that don't work in the current state.
Files:      src/ex_docmd.c, src/popupmnu.c, src/proto/popupmnu.pro,
            src/menu.c, src/proto/menu.pro

Patch 8.0.1571 (after 8.0.1571)
Problem:    Can't build without GUI.
Solution:   Adjust #ifdef for gui_find_menu().
Files:      src/menu.c

Patch 8.0.1572
Problem:    Mac: getting memory size doesn't work everywhere.
Solution:   Use MACOS_X instead of MACOS_X_DARWIN. (Kazunobu Kuriyama)
Files:      src/os_unix.c

Patch 8.0.1573
Problem:    getwinpos(1) may cause response to be handled as command.
Solution:   Handle any cursor position report once one was requested. (partly
            by Hirohito Higashi)
Files:      src/term.c
```

```
Patch 8.0.1574
Problem:    Show cursor in wrong place when using popup menu. (Wei Zhang)
Solution:   Force updating the cursor position.  Fix skipping over unused
            entries.
Files:      src/screen.c, src/proto/screen.pro, src/popupmnu.c

Patch 8.0.1575
Problem:    Crash when using virtual replace.
Solution:   Adjust orig_line_count.  Add more tests. (Christian Brabandt)
Files:      src/edit.c, src/testdir/test_visual.vim

Patch 8.0.1576
Problem:    Perl VIM::Buffers() does not find every buffer.
Solution:   Also find unlisted buffer by number or name. (Chris Weyl,
            closes #2692)
Files:      src/if_perl.xs

Patch 8.0.1577
Problem:    Virtual replace test fails on MS-Windows.
Solution:   Make adding a termcap entry work for a builtin terminal.
            Restore terminal keys in a better way.
Files:      src/term.c, src/testdir/test_visual.vim

Patch 8.0.1578
Problem:    No test for :popup in terminal.
Solution:   Add a screen dump test.
Files:      src/testdir/test_popup.vim,
            src/testdir/dumps/Test_popup_command_01.dump,
            src/testdir/dumps/Test_popup_command_02.dump,
            src/testdir/dumps/Test_popup_command_03.dump

Patch 8.0.1579
Problem:    Virtual replace test fails in GUI.
Solution:   Don't save key options if they were not set.
Files:      src/testdir/test_visual.vim

Patch 8.0.1580
Problem:    FEAT_CURSORBIND and FEAT_SCROLLBIND are unused.
Solution:   Delete them.
Files:      src/feature.h

Patch 8.0.1581
Problem:    Cannot build Win32 GUI without +eval.
Solution:   Define HAVE_INPUT_METHOD without +eval. (Ken Takata)
Files:      src/vim.h

Patch 8.0.1582
Problem:    In the MS-Windows console mouse movement is not used.
Solution:   Pass mouse movement events when useful.
Files:      src/os_win32.c, src/proto/os_win32.pro, src/feature.h

Patch 8.0.1583
Problem:    Using C99 comment.
```

```
Solution:   Use old style comment. (Kazunobu Kuriyama)
Files:      src/quickfix.c

Patch 8.0.1584
Problem:    Using C99 in Mac file gives compiler warning messages.
Solution:   Add #pragmas to avoid the warnings. (Kazunobu Kuriyama)
Files:      src/os_macosx.m

Patch 8.0.1585
Problem:    Enabling beval_term feature in Win32 GUI.
Solution:   Only enable beval_term in Win32 console.
Files:      src/feature.h

Patch 8.0.1586
Problem:    Imactivatefunc does not work on non-GUI Mac.
Solution:   Fix logic in #ifdef.
Files:      src/vim.h

Patch 8.0.1587
Problem:    inserting from the clipboard doesn't work literally
Solution:   When pasting from the * or + register always assume literally.
Files:      src/ops.c, src/proto/ops.pro, src/testdir/test_paste.vim

Patch 8.0.1588
Problem:    Popup menu hangs after typing CTRL-C.
Solution:   Make CTRL-C exit the loop. (Ozaki Kiichi, closes #2697)
Files:      src/popupmnu.c

Patch 8.0.1589
Problem:    Error for setting 'modifiable' when resetting it.
Solution:   Check if 'modifiable' was actually set.
Files:      src/option.c

Patch 8.0.1590
Problem:    Padding in list type wastes memory.
Solution:   Reorder struct members to optimize padding. (Dominique Pelle,
            closes #2704)
Files:      src/structs.h

Patch 8.0.1591
Problem:    MS-Windows: when reparsing the arguments 'wildignore' matters.
Solution:   Save and reset 'wildignore'. (Yasuhiro Matsumoto, closes #2702)
Files:      src/os_win32.c

Patch 8.0.1592
Problem:    Terminal windows in a session are not properly restored.
Solution:   Add "terminal" in 'sessionoptions'.  When possible restore the
            command running in a terminal.
Files:      src/option.c, src/option.h, src/ex_docmd.c, src/terminal.c,
            src/proto/terminal.pro, src/evalfunc.c, src/structs.h,
            src/channel.c, src/testdir/test_terminal.vim,
            src/testdir/shared.vim, src/testdir/test_mksession.vim

Patch 8.0.1593
```

```
Problem:    :qall never exits with an active terminal window.
Solution:   Add a way to kill a job in a terminal window.
Files:      src/ex_cmds2.c, src/terminal.c, src/proto/terminal.pro,
            src/structs.h, src/channel.c, src/evalfunc.c,
            src/testdir/test_terminal.vim, runtime/doc/terminal.txt,
            runtime/doc/eval.txt

Patch 8.0.1594
Problem:    :confirm qall not tested with active terminal window.
Solution:   Add a test.
Files:      src/testdir/test_terminal.vim

Patch 8.0.1595
Problem:    No autocommand triggered before exiting.
Solution:   Add the ExitPre autocommand event.
Files:      src/ex_docmd.c, src/fileio.c, src/vim.h,
            src/testdir/test_exit.vim, src/Makefile, src/testdir/Make_all.mak,
            runtime/doc/autocmd.txt

Patch 8.0.1596
Problem:    No autocommand specifically for opening a terminal window.
Solution:   Add TerminalOpen. (Yasuhiro Matsumoto, closes #2484)
Files:      runtime/doc/autocmd.txt, src/fileio.c, src/terminal.c,
            src/testdir/test_terminal.vim, src/vim.h

Patch 8.0.1597
Problem:    Autocommand events are not sorted.
Solution:   Sort the autocommand events.
Files:      src/vim.h

Patch 8.0.1598
Problem:    Cannot select text in a terminal with the mouse.
Solution:   When a job in a terminal is not consuming mouse events, use them
            for modeless selection.  Also stop Insert mode when clicking in a
            terminal window.
Files:      src/libvterm/include/vterm.h, src/libvterm/src/state.c,
            src/libvterm/src/vterm_internal.h, src/terminal.c,
            src/proto/terminal.pro, src/ui.c

Patch 8.0.1599
Problem:    No error message when gdb does not support the terminal debugger.
Solution:   Check for the response to open the Machine Interface.
Files:      runtime/pack/dist/opt/termdebug/plugin/termdebug.vim

Patch 8.0.1600
Problem:    Crash when setting t_Co to zero when 'termguicolors' is set.
Solution:   Use IS_CTERM instead of checking the number of colors.
            (closes #2710)
Files:      src/screen.c, src/testdir/test_highlight.vim

Patch 8.0.1601
Problem:    Highlight test fails on Win32.
Solution:   Check for vtp and vcon support.
Files:      src/evalfunc.c, src/testdir/test_highlight.vim
```

```
Patch 8.0.1602
Problem:    Crash in parsing JSON.
Solution:   Fail when using array or dict as dict key. (Damien)
Files:      src/json.c, src/testdir/test_json.vim

Patch 8.0.1603
Problem:    Cannot build with +terminal but without +menu.
Solution:   Add #ifdef. (Damien)
Files:      src/terminal.c

Patch 8.0.1604
Problem:    Paste test may fail if $DISPLAY is not set.
Solution:   Add WorkingClipboard() and use it in the paste test.
Files:      src/testdir/shared.vim, src/testdir/test_paste.vim

Patch 8.0.1605
Problem:    Terminal test is a bit flaky.
Solution:   Check for the shell prompt.  Use more lambda functions.
Files:      src/testdir/test_terminal.vim

Patch 8.0.1606
Problem:    Singular/plural variants not translated.
Solution:   Add NGETTEXT argument to xgettext. (Sergey Alyoshin)
Files:      src/po/Make_cyg.mak, src/po/Make_ming.mak, src/po/Make_mvc.mak,
            src/po/Makefile

Patch 8.0.1607
Problem:    --clean loads user settings from .gvimrc.
Solution:   Behave like "-U NONE" was used. (Ken Takata)
Files:      src/main.c, runtime/doc/starting.txt

Patch 8.0.1608
Problem:    Win32: directx not enabled by default.
Solution:   Change Makefile to enable directx by default. (Ken Takata)
Files:      runtime/doc/various.txt, src/Make_cyg_ming.mak,
            src/Make_mvc.mak

Patch 8.0.1609
Problem:    Shell commands in the GUI use a dumb terminal.
Solution:   Add the "!" flag to 'guioptions' to execute system commands in a
            special terminal window.  Only for Unix now.
Files:      src/os_unix.c, src/option.h, src/evalfunc.c, src/terminal.c,
            src/proto/terminal.pro, src/channel.c, src/proto/channel.pro,
            src/vim.h, runtime/doc/options.txt

Patch 8.0.1610 (after 8.0.1609)
Problem:    Cannot build without GUI.
Solution:   Add #ifdef.
Files:      src/terminal.c

Patch 8.0.1611
Problem:    CTRL-W in system terminal does not go to job.
Solution:   Do not use CTRL-W as a terminal command in a system terminal.
```

```
Files:      src/terminal.c

Patch 8.0.1612
Problem:    Need to close terminal after shell stopped.
Solution:   Make :terminal without argument close the window by default.
Files:      src/terminal.c, src/testdir/test_terminal.vim,
            runtime/doc/terminal.txt

Patch 8.0.1613
Problem:    Warning for unused variable in tiny build. (Tony Mechelynck)
Solution:   Move declaration to inner block.
Files:      src/os_unix.c

Patch 8.0.1614
Problem:    "make tags" doesn't include libvterm.
Solution:   Add the libvterm sources to the tags command.
Files:      src/Makefile

Patch 8.0.1615
Problem:    term_dumpload() does not use the right colors.
Solution:   Initialize colors when not using create_vterm().
Files:      src/terminal.c

Patch 8.0.1616
Problem:    Win32: shell commands in the GUI open a new console.
Solution:   Use a terminal window for interactive use when 'guioptions'
            contains "!".
Files:      src/os_win32.c

Patch 8.0.1617 (after 8.0.1616)
Problem:    Win32: :shell command in the GUI crashes.
Solution:   Handle the situation that "cmd" is NULL. (Yasuhiro Matsumoto,
            closes #2721)
Files:      src/os_win32.c

Patch 8.0.1618
Problem:    Color Grey50, used for ToolbarLine, is missing in the compiled-in
            table.
Solution:   Add the color to the list. (Kazunobu Kuriyama)
Files:      src/term.c

Patch 8.0.1619
Problem:    Win32 GUI: crash when winpty is not installed and trying to use
            :shell in a terminal window.
Solution:   Check for NULL return form term_start(). (Yasuhiro Matsumoto,
            closes #2727)
Files:      src/os_win32.c

Patch 8.0.1620
Problem:    Reading spell file has no good EOF detection.
Solution:   Check for EOF at every character read for a length field.
Files:      src/misc2.c

Patch 8.0.1621
```

Problem: Using invalid default value for highlight attribute.
Solution: Use zero instead of -1.
Files: src/syntax.c

Patch 8.0.1622
Problem: Possible NULL pointer dereferencey. (Coverity)
Solution: Reverse the check for a NULL pointer.
Files: src/quickfix.c

Patch 8.0.1623
Problem: Terminal kill tests are flaky.
Solution: Instead of running Vim in a terminal, run it as a normal command.
Files: src/testdir/test_terminal.vim

Patch 8.0.1624
Problem: Options for term_dumpdiff() and term_dumpload() not implemented
            yet.
Solution: Implement the relevant options.
Files: src/terminal.c, runtime/doc/eval.txt

Patch 8.0.1625
Problem: Test_quotestar is flaky when run in GTK GUI.
Solution: Do not call lose_selection when invoked from
            selection_clear_event().
Files: src/gui_gtk_x11.c

Patch 8.0.1626
Problem: Compiler warning for possible loss of data.
Solution: Use size_t instead of int. (Christian Brabandt)
Files: src/terminal.c

Patch 8.0.1627
Problem: Compiler warning for visibility attribute not supported on MinGW
            builds.
Solution: Don't add the attribute when we don't expect it to work.
            (Christian Brabandt)
Files: src/libvterm/src/vterm_internal.h

Patch 8.0.1628
Problem: Channel log doesn't mention exiting.
Solution: Add a ch_log() call in getout().
Files: src/main.c

Patch 8.0.1629
Problem: Mac: getpagesize() is deprecated.
Solution: Use sysconf() instead. (Ozaki Kiichi, closes #2741)
Files: src/os_unix.c

Patch 8.0.1630
Problem: Trimming white space is not that easy.
Solution: Add the trim() function. (Bukn, Yasuhiro Matsumoto, closes #1280)
Files: src/evalfunc.c, runtime/doc/eval.txt,
            src/testdir/test_functions.vim

```
Patch 8.0.1631
Problem:    Testing with Vim running in terminal is a bit flaky.
Solution:   Delete any .swp file so that later tests don't fail.
Files:      src/testdir/screendump.vim

Patch 8.0.1632
Problem:    In a terminal dump NUL and space considered are different,
            although they are displayed the same.
Solution:   When encountering NUL handle it like space.
Files:      src/terminal.c

Patch 8.0.1633
Problem:    A TextChanged autocmd triggers when it is defined after creating a
            buffer.
Solution:   Set b_last_changedtick when opening a buffer. (Hirohito Higashi,
            closes #2742)
Files:      src/buffer.c, src/testdir/test_autocmd.vim

Patch 8.0.1634
Problem:    The ex_vimgrep() function is too long.
Solution:   Split it in smaller functions. (Yegappan Lakshmanan)
Files:      src/quickfix.c

Patch 8.0.1635
Problem:    Undefining _POSIX_THREADS causes problems with Python 3. (Micah
            Bucy, closes #2748)
Solution:   Remove the lines.
Files:      src/if_python3.c

Patch 8.0.1636
Problem:    No test for term_dumpload() and term_dumpdiff().
Solution:   Add tests.
Files:      src/testdir/test_terminal.vim

Patch 8.0.1637
Problem:    No test for term_dumpdiff() options argument.
Solution:   Add a test.
Files:      src/testdir/test_terminal.vim

Patch 8.0.1638
Problem:    Popup test fails depending on environment variable.
Solution:   Reset $COLORFGBG when running Vim in a terminal. (closes #2693)
Files:      src/testdir/screendump.vim

Patch 8.0.1639
Problem:    Libvterm code lags behind master.
Solution:   Sync to head, solve merge problems.
Files:      src/libvterm/README, src/libvterm/bin/unterm.c,
            src/libvterm/bin/vterm-ctrl.c, src/libvterm/bin/vterm-dump.c,
            src/libvterm/doc/URLs, src/libvterm/doc/seqs.txt,
            src/libvterm/include/vterm.h,
            src/libvterm/include/vterm_keycodes.h, src/libvterm/src/mouse.c,
            src/libvterm/src/parser.c, src/libvterm/src/pen.c,
            src/libvterm/src/screen.c, src/libvterm/src/state.c,
```

```
            src/libvterm/src/vterm.c, src/libvterm/src/vterm_internal.h,
            src/libvterm/t/10state_putglyph.test,
            src/libvterm/t/25state_input.test, src/libvterm/t/harness.c,
            src/libvterm/t/26state_query.test

Patch 8.0.1640
Problem:    Test_cwd() is flaky.
Solution:   Add to list of flaky tests.
Files:      src/testdir/runtest.vim

Patch 8.0.1641
Problem:    Job in terminal can't communicate with Vim.
Solution:   Add the terminal API.
Files:      src/terminal.c, src/buffer.c, src/testdir/test_terminal.vim,
            src/testdir/screendump.vim, runtime/doc/terminal.txt

Patch 8.0.1642
Problem:    Running Vim in terminal fails with two windows.
Solution:   Pass the number of rows to RunVimInTerminal().
Files:      src/testdir/screendump.vim, src/testdir/test_terminal.vim

Patch 8.0.1643
Problem:    Terminal API tests fail.
Solution:   Explicitly set 'title'.
Files:      src/testdir/test_terminal.vim

Patch 8.0.1644
Problem:    Terminal API tests still fail.
Solution:   Explicitly set 'title' in the terminal job. (Ozaki Kiichi,
            closes #2750)
Files:      src/testdir/test_terminal.vim, src/testdir/screendump.vim

Patch 8.0.1645
Problem:    Test for terminal response to escape sequence fails for some
            people. (toothpik)
Solution:   Run "cat" and let it echo the characters.
Files:      src/testdir/test_terminal.vim

Patch 8.0.1646
Problem:    MS-Windows: executable contains unreferenced functions and data.
Solution:   Add /opt:ref to the compiler command. (Ken Takata)
Files:      src/Make_mvc.mak

Patch 8.0.1647
Problem:    Terminal API may call a function not meant to be called by this
            API.
Solution:   Require the function to start with Tapi_.
Files:      runtime/doc/terminal.txt, src/terminal.c,
            src/testdir/test_terminal.vim

Patch 8.0.1648
Problem:    Resource fork tool doesn't work on Python 3.
Solution:   Use "print()" instead of "print". (Marius Gedminas)
Files:      src/dehqx.py
```

```
Patch 8.0.1649
Problem:    No completion for argument list commands.
Solution:   Add arglist completion. (Yegappan Lakshmanan, closes #2706)
Files:      runtime/doc/eval.txt, runtime/doc/map.txt, src/ex_cmds2.c,
            src/ex_docmd.c, src/ex_getln.c, src/proto/ex_cmds2.pro,
            src/testdir/test_cmdline.vim, src/vim.h

Patch 8.0.1650
Problem:    Too many #ifdefs.
Solution:   Graduate FEAT_LISTCMDS, no reason to leave out buffer commands.
Files:      runtime/doc/various.txt, src/buffer.c, src/charset.c,
            src/evalfunc.c, src/ex_cmds.c, src/ex_cmds2.c, src/ex_docmd.c,
            src/version.c, src/feature.h

Patch 8.0.1651
Problem:    Cannot filter :ls output for terminal buffers.
Solution:   Add flags for terminal buffers. (Marcin Szamotulski, closes #2751)
Files:      runtime/doc/windows.txt, src/buffer.c,
            src/testdir/test_terminal.vim

Patch 8.0.1652
Problem:    term_dumpwrite() does not output composing characters.
Solution:   Use the cell index.
Files:      src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.1653
Problem:    Screen dump is made too soon.
Solution:   Wait until the ruler is displayed. (Ozaki Kiichi, closes #2755)
Files:      src/testdir/dumps/Test_popup_command_01.dump,
            src/testdir/dumps/Test_popup_command_02.dump,
            src/testdir/screendump.vim, src/testdir/test_autocmd.vim,
            src/testdir/test_terminal.vim

Patch 8.0.1654
Problem:    Warnings for conversion of void to function pointer.
Solution:   Use a temp variable that is a function pointer.
Files:      src/if_python.c, src/if_python3.c

Patch 8.0.1655
Problem:    Outdated gdb message in terminal debugger unclear.
Solution:   Specifically mention the required gdb version.  Avoid getting
            stuck on pagination.
Files:      runtime/pack/dist/opt/termdebug/plugin/termdebug.vim

Patch 8.0.1656
Problem:    No option to have xxd produce upper case variable names.
Solution:   Add the -C argument. (Matt Panaro, closes #2772)
Files:      src/xxd/xxd.c

Patch 8.0.1657
Problem:    Crash when reading a channel.
Solution:   Clear the write flag before writing. (idea by Shinya Ohyanagi,
            closes #2769).
```

```
Files:      src/channel.c

Patch 8.0.1658
Problem:    Capitalize argument not available in long form.
Solution:   Recognize -capitalize.  Update man page.
Files:      src/xxd/xxd.c, runtime/doc/xxd.1, runtime/doc/xxd.man

Patch 8.0.1659
Problem:    Scroll events not recognized for some xterm emulators.
Solution:   Recognize mouse codes 0x40 and 0x41 as scroll events.
Files:      src/term.c

Patch 8.0.1660
Problem:    The terminal API "drop" command doesn't support options.
Solution:   Implement the options.
Files:      src/terminal.c, src/ex_docmd.c, src/proto/ex_docmd.pro,
            src/ex_cmds.h, src/eval.c, src/misc2.c, src/fileio.c,
            src/testdir/test_terminal.vim, runtime/doc/terminal.txt

Patch 8.0.1661
Problem:    Warnings from 64 bit compiler.
Solution:   Add type casts. (Mike Williams)
Files:      src/terminal.c

Patch 8.0.1662
Problem:    Showing dump diff doesn't mention both file names.
Solution:   Add the file name in the separator line.
Files:      src/terminal.c

Patch 8.0.1663 (after 8.0.1660)
Problem:    Cannot build without multi-byte feature.
Solution:   Add #ifdef.
Files:      src/ex_docmd.c

Patch 8.0.1664
Problem:    Test failure because of not allocating enough space.
Solution:   Allocate more bytes.
Files:      src/terminal.c

Patch 8.0.1665
Problem:    When running a terminal from the GUI 'term' is not useful.
Solution:   Use $TERM in the GUI if it starts with "xterm". (closes #2776)
Files:      src/os_unix.c, runtime/doc/terminal.txt

Patch 8.0.1666
Problem:    % argument in ch_log() causes trouble.
Solution:   Use string as third argument in internal ch_log(). (Dominique
            Pelle, closes #2784)
Files:      src/evalfunc.c, src/testdir/test_channel.vim

Patch 8.0.1667
Problem:    Terminal window tests are flaky.
Solution:   Increase the waiting time for Vim to start.
Files:      src/testdir/screendump.vim
```

```
Patch 8.0.1668
Problem:    Terminal debugger: can't re-open source code window.
Solution:   Add the :Source command.  Also create the window if needed when
            gdb stops at a source line.
Files:      runtime/pack/dist/opt/termdebug/plugin/termdebug.vim,
            runtime/doc/terminal.txt

Patch 8.0.1669
Problem:    :vimgrep may add entries to the wrong quickfix list.
Solution:   Use the list identifier. (Yegappan Lakshmanan)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.1670
Problem:    Terminal window tests are still a bit flaky.
Solution:   Increase the waiting time for the buffer to be created.
Files:      src/testdir/test_terminal.vim

Patch 8.0.1671
Problem:    Crash when passing non-dict argument as env to job_start().
Solution:   Check for valid argument. (Ozaki Kiichi, closes #2765)
Files:      src/channel.c, src/testdir/test_channel.vim

Patch 8.0.1672
Problem:    Error during completion causes command to be cancelled.
Solution:   Reset did_emsg before waiting for another character. (Tom M.)
Files:      src/ex_getln.c, src/testdir/test_cmdline.vim

Patch 8.0.1673
Problem:    Terminal window tests are still a bit flaky.
Solution:   Increase the waiting time even more. (Elimar Riesebieter)
Files:      src/testdir/test_terminal.vim

Patch 8.0.1674
Problem:    Libvterm can't handle a long OSC string that is split.
Solution:   When an incomplete OSC string is received copy it to the parser
            buffer. Increase the size of the parser buffer to be able to
            handle longer strings.
Files:      src/libvterm/src/parser.c, src/libvterm/src/vterm.c

Patch 8.0.1675
Problem:    Unused macro argument in libvterm. (Randall W. Morris)
Solution:   Remove the argument.
Files:      src/libvterm/src/parser.c

Patch 8.0.1676
Problem:    No compiler warning for wrong printf format.
Solution:   Add a printf attribute for gcc. Fix reported problems. (Dominique
            Pelle, closes #2789)
Files:      src/channel.c, src/vim.h, src/proto/channel.pro

Patch 8.0.1677
Problem:    No compiler warning for wrong format in vim_snprintf().
Solution:   Add printf attribute for gcc.  Fix reported problems.
```

```
Files:      src/vim.h, src/proto.h, src/eval.c, src/fileio.c, src/mbyte.c,
            src/ops.c, src/spellfile.c, src/undo.c, src/json.c

Patch 8.0.1678
Problem:    Errorformat "%r" implies "%>". (Jan Gosmann)
Solution:   Jump to before setting fmt_ptr. (Yegappan Lakshmanan,
            closes #2785)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.1679
Problem:    Compiler warning for printf format. (Chdiza)
Solution:   Change type to "long long". (closes #2791)
Files:      src/ops.c

Patch 8.0.1680
Problem:    Memory allocated by libvterm does not show up in profile.
Solution:   Pass allocator functions to vterm_new().
Files:      src/terminal.c

Patch 8.0.1681
Problem:    The format attribute fails with MinGW. (John Marriott)
Solution:   Don't use the format attribute with MinGW.
Files:      src/vim.h, src/proto.h, src/channel.c

Patch 8.0.1682
Problem:    Auto indenting breaks inserting a block.
Solution:   Do not check for cursor movement if indent was changed. (Christian
            Brabandt, closes #2778)
Files:      src/testdir/test_blockedit.vim, src/testdir/Make_all.mak,
            src/Makefile, src/ops.c

Patch 8.0.1683
Problem:    Python upgrade breaks Vim when defining PYTHON_HOME.
Solution:   Do not define PYTHON_HOME and PYTHON3_HOME in configure. (Naoki
            Inada, closes #2787)
Files:      src/configure.ac, src/auto/configure

Patch 8.0.1684
Problem:    ml_get errors when using terminal window for shell command.
            (Blay263)
Solution:   Do not change the size of the current window.
Files:      src/terminal.c

Patch 8.0.1685
Problem:    Can't set ANSI colors of a terminal window.
Solution:   Add term_setansicolors(), term_getansicolors() and
            g:term_ansi_colors. (Andy Massimino, closes #2747)
Files:      runtime/doc/eval.txt, runtime/doc/terminal.txt, src/channel.c,
            src/evalfunc.c, src/proto/terminal.pro, src/structs.h,
            src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.1686 (after 8.0.1683)
Problem:    Python does not work when configuring with specific dir. (Rajdeep)
Solution:   Do define PYTHON_HOME and PYTHON3_HOME in configure if the Python
```

```
            config dir was specified.
Files:      src/configure.ac, src/auto/configure

Patch 8.0.1687
Problem:    64 bit compiler warnings.
Solution:   change type, add type cast. (Mike Williams)
Files:      src/terminal.c

Patch 8.0.1688
Problem:    Some macros are used without a semicolon, causing auto-indent to be
            wrong.
Solution:   Use the do-while(0) trick. (Ozaki Kiichi, closes #2729)
Files:      src/buffer.c, src/dosinst.c, src/ex_cmds.c, src/gui_at_sb.c,
            src/macros.h, src/main.c, src/memline.c, src/option.c,
            src/os_vms.c, src/screen.c, src/window.c

Patch 8.0.1689
Problem:    No tests for xxd.
Solution:   Add a test. (Christian Brabandt)
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/Makefile,
            src/testdir/test_xxd.vim, src/testdir/runtest.vim

Patch 8.0.1690
Problem:    Not easy to run one test with gvim instead of vim.
Solution:   Add VIMTESTTARGET in Makefile.
Files:      src/Makefile

Patch 8.0.1691
Problem:    Xxd test sometimes fails.
Solution:   Wipe out the XXDfile buffer.
Files:      src/testdir/test_xxd.vim

Patch 8.0.1692 (after 8.0.1686)
Problem:    Python may not work when using statically linked library.
Solution:   Do not define PYTHON_HOME and PYTHON3_HOME in configure if the
            Python library is linked statically.
Files:      src/configure.ac, src/auto/configure

Patch 8.0.1693
Problem:    Xxd is excluded from coverage statistics.
Solution:   Don't skip the xxd directory. (Christian Brabandt)
Files:      .travis.yml

Patch 8.0.1694
Problem:    Terminal API test is a bit flaky.
Solution:   Wait longer for Vim to stop.
Files:      src/testdir/screendump.vim

Patch 8.0.1695
Problem:    Xxd test not run on MS-Windows.
Solution:   Use xxd.exe if it exists.
Files:      src/testdir/test_xxd.vim

Patch 8.0.1696
```

```
Problem:    Coverage statistics don't work.
Solution:   Include the xxd directory. (Christian Brabandt)
Files:      .travis.yml

Patch 8.0.1697
Problem:    Various tests are still a bit flaky.
Solution:   Increase the default wait time to five seconds.
Files:      src/testdir/shared.vim, src/testdir/screendump.vim,
            src/testdir/test_channel.vim, src/testdir/test_clientserver.vim,
            src/testdir/test_quotestar.vim, src/testdir/test_terminal.vim

Patch 8.0.1698
Problem:    Coverage statistics don't work on coveralls.
Solution:   Use curly braces for $SRCDIR.
Files:      .travis.yml

Patch 8.0.1699
Problem:    Leftover stuff for Python 1.4.
Solution:   Remove outdated Python 1.4 stuff. (Naoki Inada, closes #2794)
Files:      src/Makefile, src/config.aap.in, src/config.mk.in,
            src/configure.ac, src/auto/configure

Patch 8.0.1700
Problem:    Coverage statistics still don't work on coveralls.
Solution:   Exclude the xxd directory again.
Files:      .travis.yml

Patch 8.0.1701
Problem:    Can disable COLOR_EMOJI with MSVC but not MinGW.
Solution:   Add COLOR_EMOJI flag.  Also add some empty lines for readability.
Files:      src/Make_cyg_ming.mak

Patch 8.0.1702
Problem:    Leaking memory when autocommands make a quickfix list invalid.
Solution:   Call FreeWild(). (Yegappan Lakshmanan)
Files:      src/quickfix.c

Patch 8.0.1703
Problem:    In the tutor 'showcmd' is not set.
Solution:   Set 'showcmd' in the vimtutor script. (Ken Takata, closes #2792)
Files:      src/vimtutor

Patch 8.0.1704
Problem:    'backupskip' default doesn't work for Mac.
Solution:   Use "/private/tmp". (Rainer Müller, closes #2793)
Files:      src/option.c, src/testdir/test_options.vim,
            runtime/doc/options.txt

Patch 8.0.1705
Problem:    When making a vertical split the mode message isn't always
            updated, "VISUAL" remains. (Alexei Averchenko)
Solution:   Only reset clear_cmdline when filling all columns of the last
            screen line. (Tom M. closes #2611)
Files:      src/screen.c, src/testdir/test_window_cmd.vim
```

```
Patch 8.0.1706
Problem:    Cannot send CTRL-\ to a terminal window.
Solution:   Make CTRL-W CTRL-\ send CTRL-\ to a terminal window.
Files:      src/terminal.c, runtime/doc/terminal.txt

Patch 8.0.1707
Problem:    When 'wfh' is set ":bel 10new" scrolls window. (Andrew Pyatkov)
Solution:   Set the fraction before changing the window height. (closes #2798)
Files:      src/window.c

Patch 8.0.1708
Problem:    Mkdir with 'p' flag fails on existing directory, which is
            different from the mkdir shell command.
Solution:   Don't fail if the directory already exists. (James McCoy,
            closes #2775)
Files:      src/evalfunc.c, src/testdir/test_eval_stuff.vim,
            runtime/doc/eval.txt

Patch 8.0.1709
Problem:    Some non-C89 code may slip through.
Solution:   Enforce C89 in configure. Fix detected problems. (James McCoy,
            closes #2735)
Files:      src/channel.c, src/configure.ac, src/auto/configure,
            src/gui_gtk_x11.c, src/if_python3.c

Patch 8.0.1710
Problem:    Building with Ruby fails.
Solution:   Don't add -ansi when building with Ruby.
Files:      src/configure.ac, src/auto/configure

Patch 8.0.1711
Problem:    Term_setsize() is not implemented yet.
Solution:   Implement it.
Files:      src/evalfunc.c, src/terminal.c, src/proto/terminal.pro,
            src/testdir/test_terminal.vim, runtime/doc/eval.txt

Patch 8.0.1712
Problem:    Terminal scrollback is not limited.
Solution:   Add the 'terminalscroll' option.
Files:      src/terminal.c, src/option.h, src/option.c,
            runtime/doc/options.txt, runtime/doc/terminal.txt

Patch 8.0.1713
Problem:    Terminal debugger doesn't handle arguments.
Solution:   Use <f-args> and pass all the arguments to gdb, e.g. the core file
            or process number. (suggested by Christian Brabandt) Disallow
            starting the debugger twice.
Files:      runtime/pack/dist/opt/termdebug/plugin/termdebug.vim,
            runtime/doc/terminal.txt

Patch 8.0.1714
Problem:    Term_setsize() does not give an error in a normal buffer.
Solution:   Add an error message.
```

```
Files:      src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.1715
Problem:    Terminal buffer can be 1 more than 'terminalscroll' lines.
Solution:   Change > to >=.
Files:      src/terminal.c

Patch 8.0.1716
Problem:    Test for term_setsize() does not give a good error message.
Solution:   use assert_inrange().
Files:      src/testdir/test_terminal.vim

Patch 8.0.1717
Problem:    C89 check causes too much trouble.
Solution:   Remove enforcing C89 for now.
Files:      src/configure.ac, src/auto/configure

Patch 8.0.1718
Problem:    Terminal scrollback test fails on MS-Windows.
Solution:   Check for the last line of output anticipating there might be an
            empty line below it.
Files:      src/testdir/test_terminal.vim

Patch 8.0.1719
Problem:    Cannot specify which Python executable configure should use.
Solution:   Add --with-python-command and --with-python3-command.
Files:      src/configure.ac, src/auto/configure

Patch 8.0.1720
Problem:    When a timer is running a terminal window may not close after a
            shell has exited.
Solution:   Call job_status() more often.
Files:      src/terminal.c

Patch 8.0.1721
Problem:    No test for using the 'termsize' option.
Solution:   Add a test.
Files:      src/testdir/screendump.vim, src/testdir/test_terminal.vim

Patch 8.0.1722
Problem:    Cannot specify a minimal size for a terminal window.
Solution:   Support the "rows*cols" format for 'winsize'.
Files:      src/terminal.c, src/testdir/test_terminal.vim, src/option.c,
            runtime/doc/options.txt

Patch 8.0.1723
Problem:    Using one item array size declaration is misleading.
Solution:   Instead of using "[1]" and actually using a larger array, use
            "[]".  This is to verify that this C99 feature works for all
            compilers.
Files:      src/structs.h, src/getchar.c

Patch 8.0.1724
Problem:    Declarations cannot be halfway a block.
```

```
Solution:   Move one declaration to check if this works for all compilers.
Files:      src/main.c

Patch 8.0.1725
Problem:    Terminal debugger doesn't handle command arguments.
Solution:   Add the :TermdebugCommand command.  Use a ! to execute right away.
            (Christian Brabandt)
Files:      runtime/pack/dist/opt/termdebug/plugin/termdebug.vim,
            runtime/doc/terminal.txt

Patch 8.0.1726 (after 8.0.1724)
Problem:    Older MSVC doesn't support declarations halfway a block.
Solution:   Move the declaration back to the start of the block.
Files:      src/main.c

Patch 8.0.1727
Problem:    qf_get_properties() function is too long.
Solution:   Refactor the code. (Yegappan Lakshmanan, closes #2807)
Files:      src/quickfix.c

Patch 8.0.1728
Problem:    Condition always false, useless code.
Solution:   Remove the code. (Nikolai Pavlov, closes #2808)
Files:      src/message.c

Patch 8.0.1729
Problem:    No comma after last enum item.
Solution:   Add a few commas to check if this works for all compilers.  Also
            add a few // comments.
Files:      src/structs.h

Patch 8.0.1730
Problem:    No configure check for the used C99 features.
Solution:   Add a compilation check.  Tentatively document C99 features.
Files:      src/configure.ac, src/auto/configure, runtime/doc/develop.txt

Patch 8.0.1731
Problem:    Characters deleted on completion. (Adrià Farrés)
Solution:   Also check the last item for the ORIGINAL_TEXT flag. (Christian
            Brabandt, closes #1645)
Files:      src/edit.c, src/testdir/test_popup.vim

Patch 8.0.1732
Problem:    Crash when terminal API call deletes the buffer.
Solution:   Lock the buffer while calling a function. (closes #2813)
Files:      src/buffer.c, src/terminal.c, src/testdir/test_terminal.vim,
            src/testdir/test_autocmd.vim

Patch 8.0.1733
Problem:    Incomplete testing for completion fix. (Lifepillar)
Solution:   Add a test with CTRL-P.
Files:      src/testdir/test_popup.vim

Patch 8.0.1734
```

Problem: Package directory not added to 'rtp' if prefix matches.
Solution: Check the match is a full match. (Ozaki Kiichi, closes #2817)
            Also handle different ways of spelling a path.
Files: src/testdir/test_packadd.vim, src/ex_cmds2.c

Patch 8.0.1735 (after 8.0.1723 and 8.0.1730)
Problem: Flexible array member feature not supported by HP-UX. (John
            Marriott)
Solution: Do not use the flexible array member feature of C99.
Files: src/configure.ac, src/auto/configure, src/structs.h,
            src/getchar.c, runtime/doc/develop.txt

Patch 8.0.1736
Problem: Check for C99 features is incomplete.
Solution: Use AC_PROG_CC_C99 and when C99 isn't fully supported check the
            features we need. (James McCoy, closes #2820)
Files: src/configure.ac, src/auto/configure

Patch 8.0.1737
Problem: fchown() used when it is not supported.
Solution: Add #ifdef.
Files: src/fileio.c

Patch 8.0.1738
Problem: ":args" output is hard to read.
Solution: Make columns with the names if the output is more than one line.
Files: src/ex_cmds2.c, src/version.c, src/proto/version.pro,
            src/testdir/test_arglist.vim

Patch 8.0.1739
Problem: MS-Windows with msys2 cannot build Ruby statically.
Solution: Define RUBY_VERSION. (Gray Wolf, closes #2826)
Files: src/Make_cyg_ming.mak

Patch 8.0.1740
Problem: Warning for signed-unsigned incompatibility.
Solution: Change type from "char *" to "char_u *". (John Marriott)
Files: src/ex_cmds2.c

Patch 8.0.1741
Problem: MS-Windows with msys2 cannot build Ruby statically.
Solution: Add RUBY_VERSION to CFLAGS later. (Gray Wolf, closes #2833)
Files: src/Make_cyg_ming.mak

Patch 8.0.1742
Problem: Cannot get a list of all the jobs. Cannot get the command of
            the job.
Solution: When job_info() is called without an argument return a list of
            jobs. Otherwise, include the command that the job is running.
            (Yegappan Lakshmanan)
Files: runtime/doc/eval.txt, src/channel.c, src/evalfunc.c,
            src/proto/channel.pro, src/structs.h, src/testdir/test_channel.vim

Patch 8.0.1743

```
Problem:    Terminal window options are named inconsistently.
Solution:   prefix terminal window options with "termwin".  Keep the old names
            for now as an alias.
Files:      src/option.c, src/option.h, src/structs.h, src/terminal.c,
            src/testdir/test_terminal.vim, src/testdir/gen_opt_test.vim,
            runtime/doc/options.txt, runtime/doc/quickref.txt,
            runtime/doc/terminal.txt, runtime/optwin.vim

Patch 8.0.1744
Problem:    On some systems /dev/stdout isn't writable.
Solution:   Skip test if writing is not possible. (James McCoy, closes #2830)
Files:      src/testdir/test_writefile.vim

Patch 8.0.1745
Problem:    Build failure on MS-Windows.
Solution:   Build job arguments for MS-Windows. Fix allocating job twice.
Files:      src/structs.h, src/channel.c, src/os_unix.c, src/misc2.c,
            src/terminal.c, src/proto/misc2.pro

Patch 8.0.1746
Problem:    MS-Windows: channel tests fail.
Solution:   Make a copy of the command before splitting it.
Files:      src/channel.c

Patch 8.0.1747
Problem:    MS-Windows: term_start() does not set job_info() cmd.
Solution:   Share the code from job_start() to set jv_argv.
Files:      src/testdir/test_terminal.vim, src/channel.c, src/misc2.c,
            src/proto/misc2.pro, src/terminal.c

Patch 8.0.1748
Problem:    CmdlineEnter command uses backslash instead of slash.
Solution:   Don't treat the character as a file name. (closes #2837)
Files:      src/fileio.c, src/testdir/test_autocmd.vim

Patch 8.0.1749
Problem:    VMS: 100% CPU use, redefining mch_open() and mch_fopen() fails.
Solution:   Do not wait indefinitely in RealWaitForChar(). (Neil Rieck)
            Do not redefine mch_open() and mch_fopen() on VMS. (Zoltan
            Arpadffy)
Files:      src/os_vms.c, src/vim.h

Patch 8.0.1750
Problem:    Crash when clearing location list in autocommand.
Solution:   Check if "qi" equals "ql_info". (Yegappan Lakshmanan)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.1751
Problem:    #ifdef causes bad highlighting.
Solution:   Move code around. (Ozaki Kiichi, closes #2731)
Files:      src/ui.c

Patch 8.0.1752
Problem:    qf_set_properties() is to long.
```

```
Solution:   Refactor the function.  Define INVALID_QFIDX. (Yegappan
            Lakshmanan, closes #2812)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.1753
Problem:    Various warnings from a static analyser
Solution:   Add type casts, remove unneeded conditions. (Christian Brabandt,
            closes #2770)
Files:      src/evalfunc.c, src/ex_cmds2.c, src/fileio.c, src/getchar.c,
            src/normal.c, src/os_unix.c, src/search.c, src/term.c

Patch 8.0.1754
Problem:    ex_helpgrep() is too long.
Solution:   Refactor the function. (Yegappan Lakshmanan, closes #2766)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.1755
Problem:    MS-Windows GUI: high unicode char received as two utf-16 words.
Solution:   Keep the first word until the second word is received. (Chris
            Morgan, closes #2800)
Files:      src/gui_w32.c

Patch 8.0.1756
Problem:    GUI: after prompting for a number the mouse shape is sometimes
            wrong.
Solution:   Call setmouse() after setting "State". (Hirohito Higashi,
            closes #2709)
Files:      src/misc1.c

Patch 8.0.1757
Problem:    Unnecessary changes in libvterm.
Solution:   Bring back // comments and trailing comma in enums.
Files:      src/libvterm/bin/unterm.c, src/libvterm/bin/vterm-ctrl.c,
            src/libvterm/bin/vterm-dump.c, src/libvterm/include/vterm.h,
            src/libvterm/include/vterm_keycodes.h,
            src/libvterm/src/encoding.c, src/libvterm/src/keyboard.c,
            src/libvterm/src/parser.c, src/libvterm/src/pen.c,
            src/libvterm/src/screen.c, src/libvterm/src/state.c,
            src/libvterm/src/unicode.c, src/libvterm/src/utf8.h,
            src/libvterm/src/vterm.c, src/libvterm/src/vterm_internal.h

Patch 8.0.1758
Problem:    open_line() returns TRUE/FALSE for success/failure.
Solution:   Return OK or FAIL.
Files:      src/misc1.c, src/normal.c, src/edit.c

Patch 8.0.1759
Problem:    Memory leak from duplicate options. (Yegappan Lakshmanan)
Solution:   Don't set the default value twice.
Files:      src/option.c

Patch 8.0.1760
Problem:    Wrong number of arguments to vms_read().
Solution:   Drop the first argument. (Ozaki Kiichi)
```

```
Files:      src/ui.c

Patch 8.0.1761
Problem:    Job in terminal window with no output channel is killed.
Solution:   Keep the job running when the input is a tty. (Ozaki Kiichi,
            closes #2734)
Files:      src/channel.c, src/os_unix.c, src/testdir/test_channel.vim

Patch 8.0.1762
Problem:    Terminal debug logging is a bit complicated.
Solution:   Make log_tr() use variable arguments (Ozaki Kiichi, closes #2730)
Files:      src/term.c

Patch 8.0.1763
Problem:    :argedit does not reuse an empty unnamed buffer.
Solution:   Add the BLN_CURBUF flag and fix all the side effects. (Christian
            Brabandt, closes #2713)
Files:      src/buffer.c, src/ex_cmds2.c, src/proto/buffer.pro,
            src/testdir/test_arglist.vim, src/testdir/test_command_count.vim

Patch 8.0.1764
Problem:    Lgtm considers tutor.es to be EcmaScript.
Solution:   Add a config file for lgtm. (Bas van Schaik, closes #2844)
Files:      .lgtm.yml, Filelist

Patch 8.0.1765
Problem:    CTRL-G j in Insert mode is incorrect when 'virtualedit' is set.
Solution:   Take coladd into account. (Christian Brabandt, closes #2743)
Files:      src/charset.c, src/testdir/test_virtualedit.vim

Patch 8.0.1766 (after 8.0.1758)
Problem:    Expanding abbreviation doesn't work. (Tooth Pik)
Solution:   Return OK instead of FALSE and FAIL instead of TRUE. (Christian
            Brabandt)
Files:      src/edit.c, src/testdir/test_mapping.vim

Patch 8.0.1767
Problem:    With 'incsearch' text may jump up and down. ()
Solution:   Besides w_botline also save and restore w_empty_rows.
            (closes #2530)
Files:      src/ex_getln.c, src/testdir/test_search.vim,
            src/testdir/dumps/Test_incsearch_scrolling_01.dump

Patch 8.0.1768
Problem:    SET_NO_HLSEARCH() used in a wrong way.
Solution:   Make it a function. (suggested by Dominique Pelle,
            closes #2850)
Files:      src/vim.h, src/ex_docmd.c, src/proto/ex_docmd.pro, src/search.c,
            src/ex_getln.c, src/option.c, src/screen.c, src/tag.c

Patch 8.0.1769
Problem:    Repeated saving and restoring viewstate for 'incsearch'.
Solution:   Use a structure.
Files:      src/ex_getln.c
```

```
Patch 8.0.1770
Problem:    Assert functions don't return anything.
Solution:   Return non-zero when the assertion fails.
Files:      src/evalfunc.c, src/eval.c, src/proto/eval.pro,
            src/testdir/test_assert.vim, runtime/doc/eval.txt

Patch 8.0.1771
Problem:    In tests, when WaitFor() fails it doesn't say why. (James McCoy)
Solution:   Add WaitForAssert(), which produces an assert error when it fails.
Files:      src/testdir/shared.vim, src/testdir/test_terminal.vim,
            src/testdir/screendump.vim, src/testdir/test_autocmd.vim,
            src/testdir/test_channel.vim, src/testdir/test_clientserver.vim,
            src/testdir/test_job_fails.vim

Patch 8.0.1772
Problem:    Quickfix: mixup of FALSE and FAIL, returning -1.
Solution:   Use FAIL and INVALID_QFIDX. (Yegappan Lakshmanan)
Files:      src/quickfix.c

Patch 8.0.1773
Problem:    Dialog messages are not translated.
Solution:   Add N_() and _() where needed. (Sergey Alyoshin)
Files:      src/diff.c, src/ex_cmds2.c, src/ex_docmd.c, src/message.c,
            src/po/Make_cyg.mak, src/po/Make_ming.mak, src/po/Make_mvc.mak,
            src/po/Makefile, src/quickfix.c, src/vim.h

Patch 8.0.1774
Problem:    Reading very long lines can be slow.
Solution:   Read up to 1 Mbyte at a time to avoid a lot of copying.  Add a
            check for going over the column limit.
Files:      src/fileio.c

Patch 8.0.1775
Problem:    MS-Windows: warning for unused variable.
Solution:   Move declaration inside #ifdef. (Mike Williams)
Files:      src/channel.c

Patch 8.0.1776
Problem:    In tests, when WaitFor() fails it doesn't say why.
Solution:   Turn a few more WaitFor() into WaitForAssert().
Files:      src/testdir/test_popup.vim, src/testdir/test_quotestar.vim,
            src/testdir/test_search.vim, src/testdir/test_terminal.vim,
            src/testdir/test_timers.vim

Patch 8.0.1777
Problem:    Cannot cleanup before loading another colorscheme.
Solution:   Add the ColorSchemePre autocommand event.
Files:      src/fileio.c, src/syntax.c, src/vim.h, src/testdir/test_gui.vim,
            runtime/colors/README.txt

Patch 8.0.1778
Problem:    Script to check translations does not always work.
Solution:   Go to first line before searching for MIME.
```

```
Files:      src/po/check.vim

Patch 8.0.1779
Problem:    Deleting in a block selection causes problems.
Solution:   Check the length of the line before adding bd.textcol and
            bd.textlen. (Christian Brabandt, closes #2825)
Files:      src/ops.c, src/testdir/test_blockedit.vim

Patch 8.0.1780
Problem:    Test fails because Vim in a terminal uses wrong 'encoding'.
Solution:   Set encoding in the test where it matters. (James McCoy,
            closes #2847)
Files:      src/testdir/test_terminal.vim

Patch 8.0.1781
Problem:    File names in quickfix window are not always shortened.
Solution:   Shorten the file name when opening the quickfix window. (Yegappan
            Lakshmanan, closes #2851, closes #2846)
Files:      src/testdir/test_quickfix.vim, src/fileio.c, src/proto/fileio.pro,
            src/quickfix.c

Patch 8.0.1782
Problem:    No simple way to label quickfix entries.
Solution:   Add the "module" item, to be used instead of the file name for
            display purposes. (Marcin Szamotulski, closes #1757)
Files:      runtime/doc/eval.txt, runtime/doc/quickfix.txt, src/alloc.h,
            src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.1783
Problem:    Cannot use 256 colors in a MS-Windows console.
Solution:   Add 256 color support. (Nobuhiro Takasaki, closes #2821)
Files:      src/misc1.c, src/option.c, src/os_win32.c, src/proto/os_win32.pro,
            src/term.c, src/proto/term.pro, src/terminal.c

Patch 8.0.1784 (after 8.0.1782)
Problem:    Gvim test gets stuck in dialog.
Solution:   Rename the file used.
Files:      src/testdir/test_quickfix.vim

Patch 8.0.1785 (after 8.0.1783)
Problem:    Missing symbol in Win32 small build.
Solution:   Define VTERM_ANSI_INDEX_NONE without the terminal feature. Also
            fix unused function with #ifdef.
Files:      src/term.c, src/os_win32.c

Patch 8.0.1786
Problem:    No test for 'termwinkey'.
Solution:   Add a test.  Make feedkeys() handle terminal_loop() returning
            before characters are consumed.
Files:      src/testdir/test_terminal.vim, src/terminal.c, src/evalfunc.c,
            src/ex_docmd.c, src/getchar.c, src/keymap.h

Patch 8.0.1787
Problem:    Cannot insert the whole cursor line.
```

```
Solution:   Make CTRL-R CTRL-L work. (Andy Massimino, closes #2857)
Files:      runtime/doc/cmdline.txt, src/ex_getln.c, src/ops.c,
            src/testdir/test_cmdline.vim

Patch 8.0.1788
Problem:    Tool to check a color scheme is not installed.
Solution:   Update the install rule. (Christian Brabandt)
Files:      src/Makefile

Patch 8.0.1789
Problem:    BufWinEnter does not work well for a terminal window.
Solution:   Do not trigger BufWinEnter when opening a terminal window.
Files:      src/terminal.c, runtime/doc/autocmd.txt,
            src/testdir/test_terminal.vim

Patch 8.0.1790
Problem:    'winfixwidth' is not always respected by :close.
Solution:   Prefer a frame without 'winfixwidth' or 'winfixheight'. (Jason
            Franklin)
Files:      src/window.c, src/testdir/test_winbuf_close.vim

Patch 8.0.1791
Problem:    Using uint8_t does not work everywhere.
Solution:   Use char_u instead.
Files:      src/term.c, src/proto/term.pro, src/os_win32.c

Patch 8.0.1792
Problem:    MS-Windows users expect -? to work like --help.
Solution:   Add -?. (Christian Brabandt, closes #2867)
Files:      src/main.c

Patch 8.0.1793
Problem:    No test for "vim -g".
Solution:   Add a test for "-g" and "-y".
Files:      src/testdir/shared.vim, src/testdir/test_gui.vim

Patch 8.0.1794
Problem:    Duplicate term options after renaming.
Solution:   Remove the old names 'termkey', 'termsize' and 'terminalscroll'.
Files:      src/option.c, src/terminal.c, src/option.h,
            src/testdir/gen_opt_test.vim, src/testdir/screendump.vim

Patch 8.0.1795
Problem:    Lose contact with jobs when :gui forks.
Solution:   Don't fork when there is a running job. Make log message for a
            died job clearer.  Also close the terminal when stderr and stdout
            are the same FD.
Files:      src/gui.h, src/gui.c, src/channel.c, src/proto/channel.pro,
            src/os_unix.c, src/terminal.c

Patch 8.0.1796
Problem:    GUI: click on tab fails when the focus is in a terminal window.
Solution:   Handle K_TABLINE.
Files:      src/terminal.c
```

```
Patch 8.0.1797
Problem:    Terminal window is redrawn too often and scrolling is repeated.
Solution:   Don't scroll immediately but only when redrawing.  Avoid redrawing
            the whole terminal window on every change.
Files:      src/terminal.c, src/screen.c, src/proto/terminal.pro

Patch 8.0.1798
Problem:    MS-Windows: file considered read-only when another program has
            opened it.
Solution:   Pass file sharing flag to CreateFile(). (Linwei, closes #2860)
Files:      src/os_win32.c

Patch 8.0.1799
Problem:    No test for :registers command.
Solution:   Add a test. (Dominique Pelle, closes #2880)
Files:      src/testdir/test_registers.vim

Patch 8.0.1800
Problem:    X11: getting color is slow.
Solution:   Avoid using sprintf() and XParseColor(), put the RGB values in
            XColor directly.
Files:      src/gui_x11.c

Patch 8.0.1801
Problem:    MS-Windows: redirecting terminal output does not work.
Solution:   Intercept the text written to the terminal and write it to the
            file.
Files:      src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.1802 (after 8.0.1802)
Problem:    MS-Windows: terminal test fails.
Solution:   Close redirected output file earlier.
Files:      src/terminal.c

Patch 8.0.1803
Problem:    Warning for uninitialized variable. (Tony Mechelynck)
Solution:   Initialize it.
Files:      src/terminal.c

Patch 8.0.1804
Problem:    Using :normal in terminal window causes problems. (Dominique
            Pelle)
Solution:   Don't call terminal_loop() for :normal. (closes #2886)
Files:      src/ex_docmd.c, src/proto/ex_docmd.pro, src/evalfunc.c

Patch 8.0.1805
Problem:    qf_parse_line() is too long.
Solution:   Split it in parts.  Properly handle vim_realloc() failing.
            (Yegappan Lakshmanan, closes #2881)
Files:      src/quickfix.c

Patch 8.0.1806
Problem:    InsertCharPre causes problems for autocomplete. (Lifepillar)
```

```
Solution:   Check for InsertCharPre before calling vpeekc(). (Christian
            Brabandt, closes #2876)
Files:      src/edit.c, src/testdir/test_popup.vim

Patch 8.0.1807
Problem:    Function to set terminal name is too long.
Solution:   Refactor the function.  Fix typo in test.
Files:      src/term.c, src/testdir/test_options.vim

Patch 8.0.1808 (after 8.0.1807)
Problem:    Can't build without TGETENT.
Solution:   Add #ifdef
Files:      src/term.c

Patch 8.0.1809
Problem:    Various typos.
Solution:   Correct the mistakes, change "cursur" to "cursor". (closes #2887)
Files:      src/edit.c, src/normal.c, src/screen.c, src/proto/screen.pro,
            src/ui.c

Patch 8.0.1810
Problem:    Buffer of a terminal only updated in Terminal-Normal mode.
Solution:   Copy the terminal window content to the buffer when in
            Terminal-Job mode.
Files:      src/terminal.c, src/proto/terminal.pro, src/ex_cmds2.c,
            src/proto/ex_cmds2.pro

Patch 8.0.1811
Problem:    No test for winrestcmd().
Solution:   Add a test. (Dominique Pelle, closes #2894)
Files:      src/testdir/test_window_cmd.vim

Patch 8.0.1812
Problem:    The qf_jump_to_usable_window() function is too long.
Solution:   Split it in parts. (Yegappan Lakshmanan, closes #2891)
Files:      src/quickfix.c

Patch 8.0.1813
Problem:    Windows installer doesn't install terminal debugger.
Solution:   Add the package to the list of files to install.
Files:      nsis/gvim.nsi

Patch 8.0.1814
Problem:    Crash with terminal window and with 'lazyredraw' set. (Antoine)
Solution:   Check the terminal still exists after update_screen().
Files:      src/terminal.c

Patch 8.0.1815 (after 8.0.1814)
Problem:    Still a crash with terminal window and with 'lazyredraw' set.
            (Antoine)
Solution:   Do not wipe out the buffer when updating the screen.
Files:      src/terminal.c, src/proto/terminal.pro, src/screen.c,
            src/proto/screen.pro, src/ui.c
```

Patch 8.0.1816
Problem: No test for setcmdpos().
Solution: Add a test. (Dominique Pelle, closes #2901)
Files: src/testdir/test_cmdline.vim

Patch 8.0.1817
Problem: A timer may change v:count unexpectedly.
Solution: Save and restore v:count and similar variables when a timer
            callback is invoked. (closes #2897)
Files: src/eval.c, src/proto/eval.pro, src/ex_cmds2.c, src/structs.h,
            src/testdir/test_timers.vim

Patch 8.0.1818 (after 8.0.1810)
Problem: Lines remove from wrong buffer when using terminal window.
Solution: Make sure to use tl_buffer.
Files: src/terminal.c

Patch 8.0.1819
Problem: Swap file warning for a file in a non-existing directory, if there
            is another with the same file name. (Juergen Weigert)
Solution: When expanding the file name fails compare the file names.
Files: src/testdir/test_swap.vim, src/memline.c

Patch 8.0.1820
Problem: Terminal window redirecting stdout does not show stderr. (Matéo
            Zanibelli)
Solution: When stdout is not connected to pty_master_fd then use it for
            stderr. (closes #2903)
Files: src/os_unix.c, src/testdir/test_terminal.vim

Patch 8.0.1821
Problem: Cursor in terminal window moves when pressing CTRL-W. (Dominique
            Pelle)
Solution: Do not more the cursor or redraw when not in Terminal-Normal mode.
            (closes #2904)
Files: src/terminal.c

Patch 8.0.1822
Problem: Make uninstall does not remove colors/tools.
Solution: Add a line to delete the tools directory. (Kazunobu Kuriyama)
Files: src/Makefile

Patch 8.0.1823
Problem: Test for terminal stdout redirection is flaky.
Solution: Wait for the job to finish.
Files: src/testdir/test_terminal.vim

Patch 8.0.1824
Problem: Coverity warns for variable that may be uninitialized.
Solution: Initialize the variable.
Files: src/terminal.c

Patch 8.0.1825
Problem: Might use NULL pointer when out of memory. (Coverity)

```
Solution:   Handle NULL pointer better.
Files:      src/getchar.c

Patch 8.0.1826
Problem:    Configure uses old compiler flag.
Solution:   Remove _DARWIN_C_SOURCE. (Kazunobu Kuriyama)
Files:      src/configure.ac, src/auto/configure

Patch 8.0.1827
Problem:    Compiler warning for signed/unsigned char pointers. (Cesar Romani)
Solution:   Change the type of jv_argv.
Files:      src/channel.c, src/structs.h

Patch 8.0.1828
Problem:    Get no clue why :gui does not fork.
Solution:   Add a channel log message.
Files:      src/channel.c

Patch 8.0.1829
Problem:    MS-Windows: script for vimdiff can't handle ! chars.
Solution:   Escape the ! chars. (Hans Ginzel, closes #2896)
Files:      src/dosinst.c

Patch 8.0.1830
Problem:    Switching to Terminal-Normal mode does not redraw. (Dominique
            Pelle)
Solution:   Also redraw when not updating the snapshot. (closes #2904)
Files:      src/terminal.c

Patch 8.0.1831
Problem:    Sometimes the quickfix title is incorrectly prefixed with ':'.
Solution:   Prepend the colon in another way. (Yegappan Lakshmanan, closes
            #2905)
Files:      src/evalfunc.c, src/quickfix.c, src/testdir/test_quickfix.vim

Patch 8.0.1832
Problem:    Cannot use :unlet for an environment variable.
Solution:   Make it work.  Use unsetenv() if available. (Yasuhiro Matsumoto,
            closes #2855)
Files:      runtime/doc/eval.txt, src/config.h.in, src/configure.ac,
            src/auto/configure, src/eval.c, src/misc1.c, src/proto/misc1.pro,
            src/testdir/test_unlet.vim

Patch 8.0.1833
Problem:    X11: ":echo 3.14" gives E806.
Solution:   set LC_NUMERIC to "C". (Dominique Pelle, closes #2368)
Files:      src/gui_x11.c

Patch 8.0.1834
Problem:    GUI: find/replace dialog does not handle some chars properly.
Solution:   Escape '?' when needed.  Always escape backslash. (closes #2418,
            closes #2435)
Files:      src/gui.c
```

```
Patch 8.0.1835
Problem:    Print document name does not support multi-byte.
Solution:   Use StartDocW() if needed. (Yasuhiro Matsumoto, closes #2478)
Files:      src/os_mswin.c

Patch 8.0.1836
Problem:    Buffer-local window options may not be recent if the buffer is
            still open in another window.
Solution:   Copy the options from the window instead of the outdated window
            options. (Bjorn Linse, closes #2336)
Files:      src/buffer.c, src/testdir/test_options.vim

Patch 8.0.1837
Problem:    One character cmdline abbreviation not triggered after '<,'>.
Solution:   Skip over the special range. (Christian Brabandt, closes #2320)
Files:      src/ex_getln.c, src/testdir/test_mapping.vim

Patch 8.0.1838
Problem:    Cursor in wrong position when switching to Terminal-Normal mode.
            (Dominique Pelle)
Solution:   Move to the end of the line if coladvance() fails.  Do not take a
            snapshot a second time.
Files:      src/terminal.c

Patch 8.0.1839
Problem:    Script to check .po file doesn't check for plural header.
Solution:   Add a check that the plural header is present when needed.
Files:      src/po/check.vim

Patch 8.0.1840
Problem:    getwinpos() is not tested.
Solution:   Add a test. (Dominique Pelle, closes #2911)
Files:      src/testdir/test_gui.vim

Patch 8.0.1841
Problem:    HP-UX does not have setenv().
Solution:   Use vim_setenv(). (John Marriott)
Files:      src/misc1.c

Patch 8.0.1842
Problem:    Popup menu inside terminal window isn't cleared.
Solution:   Use NOT_VALID in pum_undisplay(). (suggested by Christian
            Brabandt, closes #2908)
Files:      src/popupmnu.c

Patch 8.0.1843
Problem:    Entry for 'wrap' in options window is wrong. (John Little)
Solution:   Make the change apply locally.
Files:      runtime/optwin.vim

Patch 8.0.1844
Problem:    Superfluous quickfix code, missing examples.
Solution:   Remove unneeded code.  Add a few examples.  Add a bit more
            testing. (Yegappan Lakshmanan, closes #2916)
```

```
Files:      runtime/doc/quickfix.txt, src/quickfix.c,
            src/testdir/test_quickfix.vim

Patch 8.0.1845
Problem:    Various comment updates needed, missing white space.
Solution:   Update comments, add white space.
Files:      src/getchar.c, src/testdir/test_cscope.vim, src/gui_mac.c

Patch 8.0.1846
Problem:    Python interface is incompatible with lldb.
Solution:   For OutputType set the base to be PyFile_Type. (Boxu Zhang)
            Partly disabled to avoid a crash.
Files:      src/if_py_both.h, src/if_python.c, src/if_python3.c

Patch 8.0.1847
Problem:    Some build options don't have an example.
Solution:   Add a couple more examples and compiler flags.
Files:      src/Makefile

Patch 8.0.1848
Problem:    'termwinscroll' does not work properly. (Dominique Pelle)
Solution:   Subtract removed scrollback from the scrollback count.  Add a test
            for 'termwinscroll'. (closes #2909)
Files:      src/terminal.c, src/testdir/test_terminal.vim

Patch 8.0.1849
Problem:    Compiler warning for unused arguments and missing prototype.
Solution:   Add UNUSED.  Add static.
Files:      src/mbyte.c, src/if_ruby.c

Patch 8.0.1850
Problem:    Todo items in source code not visible for users.
Solution:   Move the todo items to the help file.
Files:      src/terminal.c

```

os_390.txt	For Vim version 8.1. Last change: 2016 Feb 27

VIM REFERENCE MANUAL	by Ralf Schandl

zOS z/OS OS390 os390 MVS

This file contains the particulars for the z/OS UNIX version of Vim.

Contributors:
The port to z/OS UNIX was done by Ralf Schandl for the Redbook mentioned
below.

Changes, bug-reports, or both by:

	David Moore
	Anthony Giorgio
	and others

==
1. ASCII/EBCDIC dependent scripts	OS390-has-ebcdic zOS-has-ebcdic

For the internal script language the feature "ebcdic" was added. With this
you can fix ASCII dependent scripts like this:

```
    if has("ebcdic")
        let space = 64
    else
        let space = 32
    endif
```

==
2. PuTTY and Colors	OS390-PuTTY zOS-PuTTY

If you see problems with syntax highlighting or screen corruptions when you
connect to z/OS using Putty, try the following:

- Configure Putty as "vt220" terminal (Connection->Data)
- Add the following 3 lines to your vimrc:

```
    set t_AB=?[4%p1%dm
    set t_AF=?[3%p1%dm
    set t_CO=8
```

Note: ? is one character use <C-V><Esc> to enter it.

==
3. Motif Problems   OS390-Motif   zOS-Motif

Note: Seen with Vim 6.*, never tested since.

It seems that in porting the Motif library to z/OS, a translation from EBCDIC
to ASCII for the accelerator characters of the pull-down menus was forgotten.
Even after I tried to hand convert the menus, the accelerator keys continued
to only work for the opening of menus (like <Alt-F> to open the file menu).
They still do not work for the menu items themselves (like <Alt-F>O to open
the file browser).

There is no solution for this yet.

==
4. Bugs   OS390-bugs   zOS-Bugs

- Vim will consistently hang when a large amount of text is selected in
  visual block mode. This may be due to a memory corruption issue. Note that
  this occurs in both the terminal and gui versions.

==
5. Limitations   OS390-limitations   zOS-limitations

- No binary search in tag files.
  The program /bin/sort sorts by ASCII value by default. This program is
  normally used by ctags to sort the tags. There might be a version of
  ctags out there, that does it right, but we can't be sure. So this seems to
  be a permanent restriction.

- The cscope interface (cscope) doesn't work for the version of cscope
  that we use on our mainframe. We have a copy of version 15.0b12, and it
  causes Vim to hang when using the "cscope add" command. I'm guessing that
  the binary format of the cscope database isn't quite what Vim is expecting.
  I've tried to port the current version of cscope (15.3) to z/OS, without
  much success. If anyone is interested in trying, drop me a line if you
  make any progress.

- No glib/gtk support. I have not been able to successfully compile glib on
  z/OS UNIX. This means you'll have to live without the pretty gtk toolbar.

Disabled at compile time:
    - Multibyte support   (multibyte)
    - Right-to-left mode   (rileft)
    - Farsi key map   (Farsi)
    - Arabic language support   (Arabic)
    - Spell checking   (spell)

Never tested:
    - Perl interface   (perl)
    - Hangul input   (hangul)
    - Encryption support   (encryption)
    - Langmap   ('langmap')

```
    - Python support            ( Python )
    - Right-to-left mode        ( 'rightleft' )
    - TCL interface             ( tcl )
    ...

==============================================================================
6. Open source on z/OS UNIX              OS390-open-source   zOS-open-source

If you are interested in other Open Source Software on z/OS UNIX, have a
look at the following Redbook:

    Mike MacIsaac et al
    "Open Source Software for z/OS and OS/390 UNIX"
    IBM Form Number: SG24-5944-01
    ISBN: 0738424633
    http://www-03.ibm.com/systems/resources/servers_eserver_zseries_zos_unix_redbook_sg245

Also look at:
    http://www.redbooks.ibm.com
    http://www-03.ibm.com/systems/z/os/zos/features/unix/
    http://www-03.ibm.com/systems/z/os/zos/features/unix/library/IBM+Redbooks/index.html

os_amiga.txt For Vim version 8.1. Last change: 2010 Aug 14

VIM REFERENCE MANUAL by Bram Moolenaar

Amiga

This file contains the particularities for the Amiga version of Vim.
There is also a section specifically for MorphOS below.

NOTE: The Amiga code is still included, but has not been maintained or tested.

Installation on the Amiga:
- Assign "VIM:" to the directory where the Vim "doc" directory is. Vim will look for the file "VIM:doc/help.txt" (for the help command).
  Setting the environment variable $VIM also works. And the other way around: when $VIM used and it is not defined, "VIM:" is used.
- With DOS 1.3 or earlier: Put "arp.library" in "libs:". Vim must have been compiled with the +ARP feature enabled. Make sure that newcli and run are in "C:" (for executing external commands).
- Put a shell that accepts a command with "-c" (e.g. "Csh" from Fish disk 624) in "c:" or in any other directory that is in your search path (for executing external commands).

If you have sufficient memory you can avoid startup delays by making Vim and csh resident with the command "rez csh vim". You will have to put "rezlib.library" in your "libs:" directory. Under 2.0 you will need rez version 0.5.

If you do not use digraphs, you can save some memory by recompiling without the +digraphs feature. If you want to use Vim with other terminals you can recompile with the TERMCAP option. Vim compiles with Manx 5.x and SAS 6.x. See the makefiles and feature.h.

If you notice Vim crashes on some files when syntax highlighting is on, or when using a search pattern with nested wildcards, it might be that the stack is too small. Try increasing the stack size. In a shell use the Stack command before launching Vim. On the Workbench, select the Vim icon, use the workbench "Info" menu and change the Stack field in the form.

If you want to use different colors set the termcap codes:
```
        t_mr (for inverted text)
        t_md (for bold text)
        t_me (for normal text after t_mr and t_md)
        t_so (for standout mode)
        t_se (for normal text after t_so)
        t_us (for underlined text)
        t_ue (for normal text after t_us)
        t_ZH (for italic text)
        t_ZR (for normal text after t_ZH)
```

Standard ANSI escape sequences are used. The codes are:
```
30 grey char   40 grey cell   >0 grey background    0 all attributes off
31 black char  41 black cell  >1 black background   1 boldface
```

```
32 white char  42 white cell  >2 white background   2 faint
33 blue char   43 blue cell   >3 blue background    3 italic
34 grey char   44 grey cell   >4 grey background    4 underscore
35 black char  45 black cell  >5 black background   7 reverse video
36 white char  46 white cell  >6 white background   8 invisible
37 blue char   47 blue cell   >7 blue background
```

The codes with '>' must be the last. The cell and background color should be the same. The codes can be combined by separating them with a semicolon. For example to get white text on a blue background:

```
:set t_me=^V<Esc>[0;32;43;>3m
:set t_se=^V<Esc>[0;32;43;>3m
:set t_ue=^V<Esc>[0;32;43;>3m
:set t_ZR=^V<Esc>[0;32;43;>3m
:set t_md=^V<Esc>[1;32;43;>3m
:set t_mr=^V<Esc>[7;32;43;>3m
:set t_so=^V<Esc>[0;31;43;>3m
:set t_us=^V<Esc>[4;32;43;>3m
:set t_ZH=^V<Esc>[3;32;43;>3m
```

When using multiple commands with a filter command, e.g.

```
:r! echo this; echo that
```

Only the output of the last command is used. To fix this you have to group the commands. This depends on the shell you use (that is why it is not done automatically in Vim). Examples:

```
:r! (echo this; echo that)
:r! {echo this; echo that}
```

Commands that accept a single file name allow for embedded spaces in the file name. However, when using commands that accept several file names, embedded spaces need to be escaped with a backslash.

Vim for MorphOS MorphOS

[this section mostly by Ali Akcaagac]

For the latest info about the MorphOS version:
http://www.akcaagac.com/index_vim.html

Problems

There are a couple of problems which are not MorphOS related but more Vim and UN*X related. When starting up Vim in ram: it complains with a nag requester from MorphOS please simply ignore it. Another problem is when running Vim as is some plugins will cause a few problems which you can ignore as well. Hopefully someone will be fixing it over the time.

To pass all these problems for now you can either run:

```
vim <file to be edited>
```

or if you want to run Vim plain and enjoy the motion of Helpfiles etc. it then

would be better to enter:

```
vim --noplugins <of course you can add a file>
```

Installation

1) Please copy the binary 'VIM' file to c:
2) Get the Vim runtime package from:

```
ftp://ftp.vim.org/pub/vim/amiga/vim62rt.tgz
```

   and unpack it in your 'Apps' directory of the MorphOS installation. For me
   this would create following directory hierarchy:

```
MorphOS:Apps/Vim/Vim62/...
```

3) Add the following lines to your s:shell-startup (Important!).

```
;Begin VIM
Set VIM=MorphOS:Apps/Vim/Vim62
Assign HOME: ""
;End VIM
```

4) Copy the '.vimrc' file to s:

5) There is also a file named 'color-sequence' included in this archive. This
   will set the MorphOS Shell to show ANSI colors. Please copy the file to s:
   and change the s:shell-startup to:

```
;Begin VIM
Set VIM=MorphOS:Apps/Vim/Vim62
Assign HOME: ""
Execute S:Color-Sequence
Cls
;End VIM
```

vim:tw=78:ts=8:noet:ft=help:norl:

os_beos.txt For Vim version 8.1. Last change: 2016 Mar 28

VIM REFERENCE MANUAL by Bram Moolenaar

BeOS BeBox

This is a port of Vim 5.1 to the BeOS Preview Release 2 (also known as PR2) or later.

This file contains the particularities for the BeBox/BeOS version of Vim. For matters not discussed in this file, Vim behaves very much like the Unix os_unix.txt version.

1. General beos-general

The default syntax highlighting mostly works with different foreground colors to highlight items. This works best if you set your Terminal window to a darkish background and light letters. Some middle-grey background (for instance (r,g,b)=(168,168,168)) with black letters also works nicely. If you use the default light background and dark letters, it may look better to simply reverse the notion of foreground and background color settings. To do this, add this to your .vimrc file (where <Esc> may need to be replaced with the escape character):

```
:if &term == "beos-ansi"
:    set t_AB=<Esc>[3%dm
:    set t_AF=<Esc>[4%dm
:endif
```

2. Compiling Vim beos-compiling

From the Advanced Access Preview Release (AAPR) on, Vim can be configured with the standard configure script. To get the compiler and its flags right, use the following command-line in the shell (you can cut and paste it in one go):

```
CC=$BE_C_COMPILER CFLAGS="$BE_DEFAULT_C_FLAGS -O7" \
```

```
    ./configure --prefix=/boot/home/config
```

$BE_C_COMPILER is usually "mwcc", $BE_DEFAULT_C_FLAGS is usually "-I- -I."

When configure has run, and you wish to enable GUI support, you must edit the config.mk file so that the lines with GUI_xxx refer to $(BEOSGUI_xxx) instead of $(NONE_xxx).
Alternatively you can make this change in the Makefile; it will have a more permanent effect. Search for "NONE_".

After compilation you need to add the resources to the binary. Add the following few lines near the end (before the line with "exit $exit_value") of the link.sh script to do this automatically.

```
    rmattr BEOS:TYPE vim
    copyres os_beos.rsrc vim
    mimeset vim
```

Also, create a dummy file "strip":

```
    #!/bin/sh
    mimeset $1
    exit 0
```

You will need it when using "make install" to install Vim.

Now type "make" to compile Vim, then "make install" to install it.

If you want to install Vim by hand, you must copy Vim to $HOME/config/bin, and create a bunch of symlinks to it ({g,r,rg}{vim,ex,view}). Furthermore you must copy Vim's configuration files to $HOME/config/share/vim:
vim-5.0s/{*.vim,doc,syntax}. For completeness, you should also copy the nroff manual pages to $HOME/config/man/man1. Don't forget ctags/ctags and xxd/xxd!

Obviously, you need the unlimited linker to actually link Vim. See http://www.metrowerks.com for purchasing the CodeWarrior compiler for BeOS.
There are currently no other linkers that can do the job.

This won't be able to include the Perl or Python interfaces even if you have the appropriate files installed. beos-perl

3. Timeout in the Terminal   beos-timeout

Because some POSIX/UNIX features are still missing[1], there is no direct OS support for read-with-timeout in the Terminal. This would mean that you cannot use :mappings of more than one character, unless you also :set notimeout.
 'timeout'

To circumvent this problem, I added a workaround to provide the necessary input with timeout by using an extra thread which reads ahead one character.
As a side effect, it also makes Vim recognize when the Terminal window resizes.

Function keys are not supported in the Terminal since they produce very indistinctive character sequences.

These problems do not exist in the GUI.

[1]: there is no select() on file descriptors; also the termios VMIN and VTIME settings do not seem to work properly. This has been the case since DR7 at least and still has not been fixed as of PR2.

4. Unicode vs. Latin1 beos-unicode beos-utf8

BeOS uses Unicode and UTF-8 for text strings (16-bit characters encoded to 8-bit characters). Vim assumes ISO-Latin1 or other 8-bit character codes. This does not produce the desired results for non-ASCII characters. Try the command :digraphs to see. If they look messed up, use :set isprint=@ to (slightly) improve the display of ISO-Latin1 characters 128-255. This works better in the GUI, depending on which font you use (below).

You may also use the /boot/bin/xtou command to convert UTF-8 files from (xtou -f iso1 filename) or to (xtou -t iso1 filename) ISO-Latin1 characters.

5. The BeOS GUI beos-gui

The BeOS GUI is no longer included. It was not maintained for a while and most likely didn't work. If you want to work on this: get the Vim 6.x version and merge it back in.

6. The $VIM directory beos-vimdir

$VIM is the symbolic name for the place where Vims support files are stored. The default value for $VIM is set at compile time and can be determined with

```
:version
```

The normal value is /boot/home/config/share/vim. If you don't like it you can set the VIM environment variable to override this, or set 'helpfile' in your .vimrc:

```
:if version >= 500
:    set helpfile=~/vim/vim54/doc/help.txt
:    syntax on
:endif
```

7. Drag & Drop beos-dragndrop

You can drop files and directories on either the Vim icon (starts a new Vim session, unless you use the File Types application to set Vim to be "Single Launch") or on the Vim window (starts editing the files). Dropping a folder sets Vim's current working directory. :cd :pwd If you drop files or folders with either SHIFT key pressed, Vim changes directory to the folder

that contains the first item dropped. When starting Vim, there is no need to press shift: Vim behaves as if you do.

Files dropped set the current argument list. argument-list

8. Single Launch vs. Multiple Launch beos-launch

As distributed Vim's Application Flags (as seen in the FileTypes preference) are set to Multiple Launch. If you prefer, you can set them to Single Launch instead. Attempts to start a second copy of Vim will cause the first Vim to open the files instead. This works from the Tracker but also from the command line. In the latter case, non-file (option) arguments are not supported.

NB: Only the GUI version has a BApplication (and hence Application Flags). This section does not apply to the GUI-less version, should you compile one.

9. Fonts beos-fonts

Set fonts with

```
:set guifont=Courier10_BT/Roman/10
```

where the first part is the font family, the second part the style, and the third part the size. You can use underscores instead of spaces in family and style.

Best results are obtained with monospaced fonts (such as Courier). Vim attempts to use all fonts in B_FIXED_SPACING mode but apparently this does not work for proportional fonts (despite what the BeBook says).

Vim also tries to use the B_ISO8859_1 encoding, also known as ISO Latin 1. This also does not work for all fonts. It does work for Courier, but not for ProFontISOLatin1/Regular (strangely enough). You can verify this by giving the

```
:digraphs
```

command, which lists a bunch of characters with their ISO Latin 1 encoding. If, for instance, there are "box" characters among them, or the last character isn't a dotted-y, then for this font the encoding does not work.

If the font you specify is unavailable, you get the system fixed font.

Standard fixed-width system fonts are:

```
ProFontISOLatin1/Regular
    Courier10_BT/Roman
    Courier10_BT/Italic
    Courier10_BT/Bold
    Courier10_BT/Bold_Italic
```

Standard proportional system fonts are:

```
                    Swis721_BT/Roman
                    Swis721_BT/Italic
                    Swis721_BT/Bold
                    Swis721_BT/Bold_Italic
                Dutch801_Rm_BT/Roman
                Dutch801_Rm_BT/Italic
                Dutch801_Rm_BT/Bold
                Dutch801_Rm_BT/Bold_Italic
                   Baskerville/Roman
                   Baskerville/Italic
                   Baskerville/Bold
                   Baskerville/Bold_Italic
                 SymbolProp_BT/Regular
```

Try some of them, just for fun.

10. The meta key modifier beos-meta

The META key modifier is obtained by the left or right OPTION keys. This is because the ALT (aka COMMAND) keys are not passed to applications.

11. Mouse key mappings beos-mouse

Vim calls the various mouse buttons LeftMouse, MiddleMouse and RightMouse. If you use the default Mouse preference settings these names indeed correspond to reality. Vim uses this mapping:

```
    Button 1 -> LeftMouse,
    Button 2 -> RightMouse,
    Button 3 -> MiddleMouse.
```

If your mouse has fewer than 3 buttons you can provide your own mapping from mouse clicks with modifier(s) to other mouse buttons. See the swapmouse package for an example: gui-mouse-mapping
$VIMRUNTIME/pack/dist/opt/swapmouse/plugin/swapmouse.vim

12. Color names beos-colors

Vim has a number of color names built-in. Additional names are read from the file $VIMRUNTIME/rgb.txt, if present. This file is basically the color database from X. Names used from this file are cached for efficiency.

13. Compiling with Perl beos-perl

Compiling with Perl support enabled is slightly tricky. The Metrowerks compiler has some strange ideas where to search for include files. Since several include files with Perl have the same names as some Vim header files, the wrong ones get included. To fix this, run the following Perl script while in the vim-5.0/src directory:

```
preproc.pl > perl.h

 #!/bin/env perl
 # Simple #include expander, just good enough for the Perl header files.

 use strict;
 use IO::File;
 use Config;

 sub doinclude
 {
     my $filename = $_[0];
     my $fh = new IO::File($filename, "r");
     if (defined $fh) {
         print "/* Start of $filename */\n";

         while (<$fh>) {
             if (/^#include "(.*)"/) {
                 doinclude($1);
                 print "/* Back in $filename */\n";
             } else {
                 print $_;
             }
         }
         print "/* End of $filename */\n";

         undef $fh;
     } else {
         print "/* Cannot open $filename */\n";
         print "#include \"$filename\"\n";
     }
 }

 chdir     $Config{installarchlib}."/CORE";
 doinclude "perl.h";
```

It expands the "perl.h" header file, using only other Perl header files.

Now you can configure & make Vim with the --enable-perlinterp option.
Be warned though that this adds about 616 kilobytes to the size of Vim!
Without Perl, Vim with default features and GUI is about 575K, with Perl
it is about 1191K.

-Olaf Seibert

vim:tw=78:ts=8:noet:ft=help:norl:

os_dos.txt For Vim version 8.1. Last change: 2006 Mar 30

VIM REFERENCE MANUAL by Bram Moolenaar

dos DOS

This file documents the common particularities of the MS-DOS and Win32 versions of Vim. Also see os_win32.txt and os_msdos.txt .

==

1. File locations dos-locations

If you keep the Vim executable in the directory that contains the help and syntax subdirectories, there is no need to do anything special for Vim to work. No registry entries or environment variables need to be set. Just make sure that the directory is in your search path, or use a shortcut on the desktop.

Your vimrc files ("_vimrc" and "_gvimrc") are normally located one directory up from the runtime files. If you want to put them somewhere else, set the environment variable $VIM to the directory where you keep them. Example:

```
set VIM=C:\user\piet
```

Will find "c:\user\piet_vimrc".
Note: This would only be needed when the computer is used by several people. Otherwise it's simpler to keep your _vimrc file in the default place.

If you move the executable to another location, you also need to set the $VIM environment variable. The runtime files will be found in "$VIM/vim{version}". Example:

```
set VIM=E:\vim
```

Will find the version 5.4 runtime files in "e:\vim\vim54".
Note: This is _not_ recommended. The preferred way is to keep the executable in the runtime directory.

If you move your executable AND want to put your "_vimrc" and "_gvimrc" files somewhere else, you must set $VIM to where you vimrc files are, and set $VIMRUNTIME to the runtime files. Example:

```
set VIM=C:\usr\piet
set VIMRUNTIME=E:\vim\vim54
```

Will find "c:\user\piet_vimrc" and the runtime files in "e:\vim\vim54".

See $VIM and $VIMRUNTIME for more information.

Under Windows 95, you can set $VIM in your C:\autoexec.bat file. For
example:
  set VIM=D:\vim
Under Windows NT, you can set environment variables for each user separately
under "Start/Settings/Control Panel->System", or through the properties in the
menu of "My Computer", under the Environment Tab.

==
2. Using backslashes   dos-backslash

Using backslashes in file names can be a problem. Vi halves the number of
backslashes for some commands. Vim is a bit more tolerant and does not remove
backslashes from a file name, so ":e c:\foo\bar" works as expected. But when
a backslash occurs before a special character (space, comma, backslash, etc.),
Vim removes the backslash. Use slashes to avoid problems: ":e c:/foo/bar"
works fine. Vim replaces the slashes with backslashes internally to avoid
problems with some MS-DOS programs and Win32 programs.

When you prefer to use forward slashes, set the 'shellslash' option. Vim will
then replace backslashes with forward slashes when expanding file names. This
is especially useful when using a Unix-like 'shell'.

==
3. Standard mappings   dos-standard-mappings

The mappings for CTRL-PageUp and CTRL-PageDown have been removed, they now
jump to the next or previous tab page <C-PageUp> <C-PageDown>

If you want them to move to the first and last screen line you can use these
mappings:

key	key code	Normal/Visual mode	Insert mode
CTRL-PageUp	<M-N><M-C-D>	H	<C-O>H
CTRL-PageDown	<M-N>v	L$	<C-O>L<C-O>$

Additionally, these keys are available for copy/cut/paste. In the Win32
and DJGPP versions, they also use the clipboard.

Shift-Insert	paste text (from clipboard)	<S-Insert>
CTRL-Insert	copy Visual text (to clipboard)	<C-Insert>
CTRL-Del	cut Visual text (to clipboard)	<C-Del>
Shift-Del	cut Visual text (to clipboard)	<S-Del>
CTRL-X	cut Visual text (to clipboard)	

These mappings accomplish this (Win32 and DJGPP versions of Vim):

key	key code	Normal	Visual	Insert
Shift-Insert	<M-N><M-T>	"*P	"-d"*P	<C-R><C-O>*
CTRL-Insert	<M-N><M-U>		"*y	
Shift-Del	<M-N><M-W>		"*d	
CTRL-Del	<M-N><M-X>		"*d	
CTRL-X	<C-X>		"*d	

Or these mappings (non-Win32 version of Vim):

key	key code	Normal	Visual	Insert
Shift-Insert	<M-N><M-T>	P	"-dP	<C-R><C-O>"
CTRL-Insert	<M-N><M-U>		y	
Shift-Del	<M-N><M-W>		d	
CTRL-Del	<M-N><M-X>		d	

When the clipboard is supported, the "* register is used.

==
4. Screen output and colors   dos-colors

The default output method for the screen is to use bios calls. This works right away on most systems. You do not need ansi.sys. You can use ":mode" to set the current screen mode. See :mode .

To change the screen colors that Vim uses, you can use the :highlight command. The Normal highlight group specifies the colors Vim uses for normal text. For example, to get grey text on a blue background:

```
:hi Normal ctermbg=Blue ctermfg=grey
```

See highlight-groups for other groups that are available.

A DOS console does not support attributes like bold and underlining. You can set the color used in five modes with nine terminal options. Note that this is not necessary since you can set the color directly with the ":highlight" command; these options are for backward compatibility with older Vim versions. The 'highlight' option specifies which of the five modes is used for which action.

```
:set t_mr=^V^[\|xxm             start of invert mode
:set t_md=^V^[\|xxm             start of bold mode
:set t_me=^V^[\|xxm             back to normal text

:set t_so=^V^[\|xxm             start of standout mode
:set t_se=^V^[\|xxm             back to normal text

:set t_us=^V^[\|xxm             start of underline mode
:set t_ue=^V^[\|xxm             back to normal text

:set t_ZH=^V^[\|xxm             start of italics mode
:set t_ZR=^V^[\|xxm             back to normal text
```

^V is CTRL-V
^[is <Esc>
You must replace xx with a decimal code, which is the foreground color number and background color number added together:

COLOR	FOREGROUND	BACKGROUND
Black	0	0
DarkBlue	1	16
DarkGreen	2	32
DarkCyan	3	48
DarkRed	4	64
DarkMagenta	5	80

```
Brown, DarkYellow           6             96
LightGray                   7            112
DarkGray                    8            128 *
Blue, LightBlue             9            144 *
Green, LightGreen          10            160 *
Cyan, LightCyan            11            176 *
Red, LightRed              12            192 *
Magenta, LightMagenta      13            208 *
Yellow, LightYellow        14            224 *
White                      15            240 *

* Depending on the display mode, the color codes above 128 may not be
  available, and code 128 will make the text blink.

When you use 0, the color is reset to the one used when you started Vim
(usually 7, lightgray on black, but you can override this.  If you have
overridden the default colors in a command prompt, you may need to adjust
some of the highlight colors in your vimrc---see below).
This is the default for t_me.

The defaults for the various highlight modes are:
        t_mr    112      reverse mode: Black text (0) on LightGray (112)
        t_md     15      bold mode: White text (15) on Black (0)
        t_me      0      normal mode (revert to default)

        t_so     31      standout mode: White (15) text on DarkBlue (16)
        t_se      0      standout mode end (revert to default)

        t_czh   225      italic mode: DarkBlue text (1) on Yellow (224)
        t_czr     0      italic mode end (revert to default)

        t_us     67      underline mode: DarkCyan text (3) on DarkRed (64)
        t_ue      0      underline mode end (revert to default)

These colors were chosen because they also look good when using an inverted
display, but you can change them to your liking.

Example:
  :set t_mr=^V^[\|97m   " start of invert mode: DarkBlue (1) on Brown (96)
  :set t_md=^V^[\|67m   " start of bold mode: DarkCyan (3) on DarkRed (64)
  :set t_me=^V^[\|112m  " back to normal mode: Black (0) on LightGray (112)

  :set t_so=^V^[\|37m   " start of standout mode: DarkMagenta (5) on DarkGreen
                                                                        (32)
  :set t_se=^V^[\|112m  " back to normal mode: Black (0) on LightGray (112)

==============================================================================
5. File formats                                          dos-file-formats

If the 'fileformat' option is set to "dos" (which is the default), Vim accepts
a single <NL> or a <CR><NL> pair for end-of-line (<EOL>).  When writing a
file, Vim uses <CR><NL>.  Thus, if you edit a file and write it, Vim replaces
<NL> with <CR><NL>.
```

If the 'fileformat' option is set to "unix", Vim uses a single <NL> for <EOL>
and shows <CR> as ^M.

You can use Vim to replace <NL> with <CR><NL> by reading in any mode and
writing in Dos mode (":se ff=dos").
You can use Vim to replace <CR><NL> with <NL> by reading in Dos mode and
writing in Unix mode (":se ff=unix").

Vim sets 'fileformat' automatically when 'fileformats' is not empty (which is
the default), so you don't really have to worry about what you are doing.
                                        'fileformat'   'fileformats'

If you want to edit a script file or a binary file, you should set the
'binary' option before loading the file. Script files and binary files may
contain single <NL> characters which Vim would replace with <CR><NL>. You can
set 'binary' automatically by starting Vim with the "-b" (binary) option.

==
6. :cd command   dos-:cd

The ":cd" command recognizes the drive specifier and changes the current
drive. Use ":cd c:" to make drive C the active drive. Use ":cd d:\foo" to go
to the directory "foo" in the root of drive D. Vim also recognizes UNC names
if the system supports them; e.g., ":cd \\server\share\dir".   :cd

==
7. Interrupting   dos-CTRL-Break

Use CTRL-Break instead of CTRL-C to interrupt searches. Vim does not detect
the CTRL-C until it tries to read a key.

==
8. Temp files   dos-temp-files

Only for the 16 bit and 32 bit DOS version:
Vim puts temporary files (for filtering) in the first of these directories
that exists and in which Vim can create a file:
        $TMP
        $TEMP
        C:\TMP
        C:\TEMP
        current directory

For the Win32 version (both console and GUI):
Vim uses standard Windows functions to obtain a temporary file name (for
filtering). The first of these directories that exists and in which Vim can
create a file is used:
        $TMP
        $TEMP
        current directory

==
9. Shell option default   dos-shell

The default for the 'sh' ('shell') option is "command.com" on Windows 95 and "cmd.exe" on Windows NT. If SHELL is defined, Vim uses SHELL instead, and if SHELL is not defined but COMSPEC is, Vim uses COMSPEC. Vim starts external commands with "<shell> /c <command_name>". Typing CTRL-Z starts a new command subshell. Return to Vim with "exit".   'shell'   CTRL-Z

If you are running a third-party shell, you may need to set the 'shellcmdflag' ('shcf') and 'shellquote' ('shq') or 'shellxquote' ('sxq') options. Unfortunately, this also depends on the version of Vim used. For example, with the MKS Korn shell or with bash, the values of the options should be:

```
                DOS 16 bit          DOS 32 bit          Win32
'shellcmdflag'      -c                  -c               -c
'shellquote'        "
'shellxquote'                                            "
```

For Dos 16 bit this starts the shell as:
```
        <shell> -c "command name" >file
```
For Win32 as:
```
        <shell> -c "command name >file"
```
For DOS 32 bit, DJGPP does this internally somehow.

When starting up, Vim checks for the presence of "sh" anywhere in the 'shell' option. If it is present, Vim sets the 'shellcmdflag' and 'shellquote' or 'shellxquote' options will be set as described above.

```
 vim:tw=78:ts=8:noet:ft=help:norl:
```

os_mac.txt	For Vim version 8.1. Last change: 2018 Jan 21

# VIM REFERENCE MANUAL	by Bram Moolenaar et al.

mac	Mac	macintosh	Macintosh

This file documents the particularities of the Macintosh version of Vim.

NOTE: This file is a bit outdated. You might find more useful info here:
	http://macvim.org/

There was a Mac port for version 3.0 of Vim. Here are the first few lines
from the old file:

VIM Release Notes
Initial Macintosh release, VIM version 3.0
19 October 1994

Eric Fischer
<enf1@midway.uchicago.edu>, <eric@jcp.uchicago.edu>, <etaoin@uchicago.edu>
5759 N. Guilford Ave
Indianapolis IN 46220 USA

==
## 1. Filename Convention	mac-filename

Starting with Vim version 7 you can just use the unix path separators with
Vim. In order to determine if the specified filename is relative to the
current folder or absolute (i.e. relative to the "Desktop"), the following
algorithm is used:

	If the path start by a "/", the path is absolute
	If the path start by a ":", the path is relative
	If the path doesn't start by neither a "/" nor ":",
	  and a ":" is found before a "/" then the path is absolute

		:e /HD/text
		:e HD:text
	Edit the file "text" of the disk "HD"
		:e :src:main.c
		:e src/main.c
	Edit the file "main.c" in the folder "src" in the current folder
		:e os_mac.c

Edit the file "os_mac.c" in the current folder.

You can use the $VIM and $VIMRUNTIME variable.

```
:so $VIMRUNTIME:syntax:syntax.vim
```

==
2. .vimrc and .vim files mac-vimfile

It is recommended to use Unix style line separators for Vim scripts, thus a single newline character.

When starting up Vim will load the $VIMRUNTIME/macmap.vim script to define default command-key mappings.

On older systems files starting with a dot "." are discouraged, thus the rc files are named "vimrc" or "_vimrc" and "gvimrc" or "_gvimrc". These files can be in any format (mac, dos or unix). Vim can handle any file format when the 'nocompatible' option is set, otherwise it will only handle mac format files.

==
3. Standard mappings mac-standard-mappings

The following mappings are available for cut/copy/paste from/to clipboard.

key	Normal	Visual	Insert	Description	
Command-v	"*P	"-d"*P	<C-R>*	paste text	<D-v>
Command-c		"*y		copy Visual text	<D-c>
Command-x		"*d		cut Visual text	<D-x>
Backspace		"*d		cut Visual text	

==
4. Mac FAQ mac-faq

On the internet: http://macvim.org/OSX/index.php#FAQ

Q: I can't enter non-ASCII character in Apple Terminal.
A: Under Window Settings, Emulation, make sure that "Escape non-ASCII characters" is not checked.

Q: How do I start the GUI from the command line?
A: Assuming that Vim.app is located in /Applications:

```
open /Applications/Vim.app
```

Or:

```
/Applications/Vim.app/Contents/MacOS/Vim -g {arguments}
```

Q: How can I set $PATH to something reasonable when I start Vim.app from the GUI or with open?
A: The following trick works with most shells. Put it in your vimrc file. This is included in the system vimrc file included with the binaries distributed at macvim.org .

```
let s:path = system("echo echo VIMPATH'${PATH}' | $SHELL -l")
let $PATH = matchstr(s:path, 'VIMPATH\zs.\{-}\ze\n')
```

==
5. Mac Lack   mac-lack

In a terminal CTRL-^ needs to be entered as Shift-Control-6. CTRL-@ as
Shift-Control-2.

==
6. Mac Bug Report   mac-bug

When reporting any Mac specific bug or feature change, please use the vim-mac
maillist vim-mac . However, you need to be subscribed. An alternative is to
send a message to the current MacVim maintainers:

        mac@vim.org

==
7. Compiling Vim   mac-compile

See the file "src/INSTALLmac.txt" that comes with the source files.

==
8. The Darwin Feature   mac-darwin-feature

If you have a Mac that isn't very old, you will be running OS X, also called
Darwin. The last pre-Darwin OS was Mac OS 9. The darwin feature makes Vim
use Darwin-specific properties.

What is accomplished with this feature is two-fold:

- Make Vim interoperable with the system clipboard.
- Incorporate into Vim a converter module that bridges the gap between some
  character encodings specific to the platform and those known to Vim.

Needless to say, both are not to be missed for any decent text editor to work
nicely with other applications running on the same desktop environment.

As Vim is not an application dedicated only to macOS, we need an extra feature
to add in order for it to offer the same user experience that our users on
other platforms enjoy to people on macOS.

For brevity, the feature is referred to as "darwin" to signify it one of the
Vim features that are specific to that particular platform.

The feature is a configuration option. Accordingly, whether it is enabled or
not is determined at build time; once it is selected to be enabled, it is
compiled in and hence cannot be disabled at runtime.

The feature is enabled by default. For most macOS users, that should be
sufficient unless they have specific needs mentioned briefly below.

If you want to disable it, pass `--disable-darwin` to the configure script:

    ./configure --disable-darwin <other options>

and then run `make` to build Vim. The order of the options doesn't matter.

To make sure at runtime whether or not the darwin feature is compiled in, you can use `has('osxdarwin')` which returns 1 if the feature is compiled in; 0 otherwise. For backward compatibility, you can still use `macunix` instead of `osxdarwin`.

Notable use cases where `--disable-darwin` is turned out to be useful are:

- When you want to use x11-selection instead of the system clipboard.
- When you want to use x11-clientserver .

Since both have to make use of X11 inter-client communication for them to work properly, and since the communication mechanism can come into conflict with the system clipboard, the darwin feature should be disabled to prevent Vim from hanging at runtime.

 vim:tw=78:ts=8:noet:ft=help:norl:

os_mint.txt For Vim version 8.1. Last change: 2005 Mar 29

VIM REFERENCE MANUAL by Jens M. Felderhoff

MiNT Atari

This file contains the particularities for the Atari MiNT version of Vim.

For compiling Vim on the Atari running MiNT see "INSTALL" and "Makefile"
in the src directory.

Vim for MiNT behaves almost exactly like the Unix version.
The Unix behavior described in the documentation also refers to the
MiNT version of Vim unless explicitly stated otherwise.

For wildcard expansion of <~> (home directory) you need a shell that
expands the tilde. The vanilla Bourne shell doesn't recognize it.
With csh and ksh it should work OK.

The MiNT version of vim needs the termcap file /etc/termcap with the
terminal capabilities of your terminal. Builtin termcaps are
supported for the vt52 terminal. Termcap entries for the TOSWIN window
manager and the virtual console terminals have been appended to the
termcap file that comes with the Vim distribution.

If you should encounter problems with swapped <BS> and <Del> keys, see
:fixdel .

Because terminal updating under MiNT is often slow (e.g. serial line
terminal), the 'showcmd' and 'ruler' options are default off.
If you have a fast terminal, try setting them on. You might
also want to set 'ttyfast'.

Send bug reports to

Jens M. Felderhoff, e-mail: <jmf@infko.uni-koblenz.de>

vim:tw=78:ts=8:noet:ft=help:norl:

os_msdos.txt For Vim version 8.1. Last change: 2016 Feb 26

VIM REFERENCE MANUAL by Bram Moolenaar

msdos ms-dos MSDOS MS-DOS

This file used to contain the particularities for the MS-DOS version of Vim.
MS-DOS support was removed in patch 7.4.1399. If you want to use it you will
need to get a version older than that. Note that the MS-DOS version doesn't
work, there is not enough memory. The DOS32 version (using DJGPP) might still
work on older systems.

vim:tw=78:ts=8:noet:ft=help:norl:

os_os2.txt For Vim version 8.1. Last change: 2015 Dec 31

VIM REFERENCE MANUAL by Paul Slootman

os2 OS2 OS/2

This file used to contain the particularities for the OS/2 version of Vim.

The OS/2 support was removed in patch 7.4.1008.

vim:tw=78:ts=8:noet:ft=help:norl:

os_qnx.txt For Vim version 8.1. Last change: 2005 Mar 29

VIM REFERENCE MANUAL by Julian Kinraid

QNX qnx

==

1. General qnx-general

Vim on QNX behaves much like other unix versions. os_unix.txt

2. Compiling Vim qnx-compiling

Vim can be compiled using the standard configure/make approach. If you want to compile for X11, pass the --with-x option to configure. Otherwise, running ./configure without any arguments or passing --enable-gui=photon, will compile vim with the Photon gui support. Run ./configure --help , to find out other features you can enable/disable.

3. Terminal support qnx-terminal

Vim has support for the mouse and clipboard in a pterm, if those options are compiled in, which they are normally.

The options that affect mouse support are 'mouse' and 'ttymouse' . When using the mouse, only simple left and right mouse clicking/dragging is supported. If you hold down shift, ctrl, or alt while using the mouse, pterm will handle the mouse itself. It will make a selection, separate from what vim's doing.

When the mouse is in use, you can press Alt-RightMouse to open the pterm menu. To turn the mouse off in vim, set the mouse option to nothing, set mouse=

4. Photon GUI photon-gui

To start the gui for vim, you need to run either gvim or vim -g, otherwise the terminal version will run. For more info - gui-x11-start

Supported features:
        :browse command :browse
        :confirm command :confirm

```
        Cursor blinking                                 'guicursor'
        Menus, popup menus and menu priorities          :menu
                                                        popup-menu
                                                        menu-priority
        Toolbar                                         gui-toolbar
                                                        'toolbar'
        Font selector (:set guifont=*)                  photon-fonts
        Mouse focus                                     'mousefocus'
        Mouse hide                                      'mousehide'
        Mouse cursor shapes                             'mouseshape'
        Clipboard                                       gui-clipboard

Unfinished features:
        Various international support, such as Farsi & Hebrew support,
        different encodings, etc.

        This help file

Unsupported features:
        Find & Replace window                           :promptfind
        Tearoff menus

        Other things which I can't think of so I can't list them

5. Fonts                                                photon-fonts

You set fonts in the gui with the guifont option
        :set guifont=Lucida\ Terminal

The font must be a monospace font, and any spaces in the font name must be
escaped with a '\'.  The default font used is PC Terminal, size 8.  Using
'*' as the font name will open a standard Photon font selector where you can
select a font.

Following the name, you can include optional settings to control the size and
style of the font, each setting separated by a ':'.  Not all fonts support the
various styles.

The options are,
    s{size}     Set the size of the font to {size}
    b           Bold style
    a           Use antialiasing
    i           Italic style

Examples:

Set the font to monospace size 10 with antialiasing
        :set guifont=monospace:s10:a

Set the font to Courier size 12, with bold and italics
        :set guifont=Courier:s12:b:i

Select a font with the requester
```

```
        :set guifont=*
```

6. Bugs & things To Do

Known problems:

- Vim hangs sometimes when running an external program. Workaround: put this line in your vimrc file:

```
      set noguipty
```

Bugs:

- Still a slight problem with menu highlighting.
- When using phditto/phinows/etc., if you are using a font that doesn't support the bold attribute, when vim attempts to draw bold text it will be all messed up.
- The cursor can sometimes be hard to see.
- A number of minor problems that can fixed. :)

Todo:

- Improve multi-language support.
- Options for setting the fonts used in the menu and toolbar.
- Find & Replace dialog.
- The clientserver features.
- Maybe tearoff menus.

- Replace usage of fork() with spawn() when launching external programs.

```

```

os_risc.txt For Vim version 8.1. Last change: 2011 May 10

VIM REFERENCE MANUAL by Thomas Leonard

riscos RISCOS RISC-OS

The RISC OS support has been removed from Vim with patch 7.3.187.
If you would like to use Vim on RISC OS get the files from before that patch.

vim:tw=78:ts=8:noet:ft=help:norl:

os_unix.txt For Vim version 8.1. Last change: 2005 Mar 29

VIM REFERENCE MANUAL by Bram Moolenaar

unix Unix

This file contains the particularities for the Unix version of Vim.

For compiling Vim on Unix see "INSTALL" and "Makefile" in the src directory.

The default help file name is "/usr/local/lib/vim/help.txt"
The files "$HOME/.vimrc" and "$HOME/.exrc" are used instead of "s:.vimrc" and
"s:.exrc". Additionally "/usr/local/etc/vimrc" is used first.
If "/usr/local/share" exists it is used instead of "/usr/local/lib".

Temporary files (for filtering) are put in "/tmp". If you want to place them
somewhere else, set the environment variable $TMPDIR to the directory you
prefer.

With wildcard expansion you can use '~' (home directory) and '$'
(environment variable).

fork spoon

For executing external commands fork()/exec() is used when possible, otherwise
system() is used, which is a bit slower. The output of ":version" includes
+fork when fork()/exec() is used, +system() when system() is used. This
can be changed at compile time.
(For forking of the GUI version see gui-fork .)

Because terminal updating under Unix is often slow (e.g. serial line
terminal, shell window in suntools), the 'showcmd' and 'ruler' options
are default off. If you have a fast terminal, try setting them on. You might
also want to set 'ttyfast'.

When using Vim in an xterm the mouse clicks can be used by Vim by setting
'mouse' to "a". If there is access to an X-server gui style copy/paste will
be used and visual feedback will be provided while dragging with the mouse.
If you then still want the xterm copy/paste with the mouse, press the shift
key when using the mouse. See mouse-using . Visual feedback while dragging
can also be achieved via the 'ttymouse' option if your xterm is new enough.

terminal-colors

To use colors in Vim you can use the following example (if your terminal
supports colors, but "T_Co" is empty or zero):

```
   :set t_me=^[[0;1;36m     " normal mode (undoes t_mr and t_md)
   :set t_mr=^[[0;1;33;44m  " reverse (invert) mode
   :set t_md=^[[1;33;41m    " bold mode
   :set t_se=^[[1;36;40m    " standout end
   :set t_so=^[[1;32;45m    " standout mode
   :set t_ue=^[[0;1;36m     " underline end
   :set t_us=^[[1;32m       " underline mode start
```

[the ^[is an <Esc>, type CTRL-V <Esc> to enter it]

For real color terminals the ":highlight" command can be used.

The file "tools/vim132" is a shell script that can be used to put Vim in 132
column mode on a vt100 and lookalikes.

 vim:tw=78:ts=8:noet:ft=help:norl:

os_vms.txt For Vim version 8.1. Last change: 2018 May 06

VIM REFERENCE MANUAL

VMS vms

This file contains the particularities for the VMS version of Vim.
You can reach this information file by typing :help VMS in Vim command
prompt.

==

1. Getting started vms-started

Vim (Vi IMproved) is a Vi-compatible text editor that runs on nearly every
operating system known to humanity. Now use Vim on OpenVMS too, in character
or X/Motif environment. It is fully featured and absolutely compatible with
Vim on other operating systems.

==

2. Download files vms-download

You can download the Vim source code by ftp from the official Vim site:
        ftp://ftp.vim.org/pub/vim/
Or use one of the mirrors:
        ftp://ftp.vim.org/pub/vim/MIRRORS

You can download precompiled executables from:
        http://www.polarhome.com/vim/
        ftp://ftp.polarhome.com/pub/vim/

To use the precompiled binary version, you need one of these archives:

vim-XX-exe-ia64-gui.zip	IA64 GUI/Motif executables
vim-XX-exe-ia64-gtk.zip	IA64 GUI/GTK executables
vim-XX-exe-ia64-term.zip	IA64 console executables
vim-XX-exe-axp-gui.zip	Alpha GUI/Motif executables
vim-XX-exe-axp-gtk.zip	Alpha GUI/GTK executables
vim-XX-exe-axp-term.zip	Alpha console executables
vim-XX-exe-vax-gui.zip	VAX GUI executables
vim-XX-exe-vax-term.zip	VAX console executables

and of course (optional)
  vim-XX-runtime.zip   runtime files

The binary archives contain: vim.exe, ctags.exe, xxd.exe files.

For GTK executables you will need GTKLIB that is available for
Alpha and IA64 platform.

==

3. Compiling   vms-compiling

See the file [.SRC]INSTALLVMS.TXT.

==

4. Problems   vms-problems

The code has been tested under Open VMS 6.2 - 8.2 on Alpha, VAX and IA64
platforms with the DEC C compiler. It should work without big problems.
If your system does not have some include libraries you can tune up in
OS_VMS_CONF.H file.

If you decided to build Vim with +perl, +python, etc. options, first you need
to download OpenVMS distributions of Perl and Python. Build and deploy the
libraries and change adequate lines in MAKE_VMS.MMS file. There should not be
a problem from Vim side.

Also GTK, XPM library paths should be configured in MAKE_VMS.MMS

Note: Under VAX it should work with the DEC C compiler without problems. The
VAX C compiler is not fully ANSI C compatible in pre-processor directives
semantics, therefore you have to use a converter program that will do the lion
part of the job. For detailed instructions read file INSTALLvms.txt

MMS_VIM.EXE is build together with VIM.EXE, but for XXD.EXE you should
change to a subdirectory and build it separately.

CTAGS is not part of the Vim source distribution anymore, however the OpenVMS
specific source might contain CTAGS source files as described above.
You can find more information about CTAGS on VMS at
http://www.polarhome.com/ctags/

Advanced users may try some acrobatics in FEATURE.H file as well.

It is possible to compile with +xfontset +xim options too, but then you have
to set up GUI fonts etc. correctly. See :help xim from Vim command prompt.

You may want to use GUI with GTK icons, then you have to download and install
GTK for OpenVMS or at least runtime shareable images - LIBGTK from
polarhome.com

For more advanced questions, please send your problem to Vim on VMS mailing

list <vim-vms@polarhome.com>
More about the vim-vms list can be found at:
http://www.polarhome.com/mailman/listinfo/vim-vms

==

5. Deploy   vms-deploy

Vim uses a special directory structure to hold the document and runtime files:

```
   vim (or wherever)
    |- tmp
    |- vim57
    |----- doc
    |----- syntax
    |- vim62
    |----- doc
    |----- syntax
    |- vim64
    |----- doc
    |----- syntax
    vimrc    (system rc files)
    gvimrc
```

Use:

```
        define/nolog VIM        device:[path.vim]
        define/nolog VIMRUNTIME device:[path.vim.vim60]
        define/nolog TMP        device:[path.tmp]
```

To get vim.exe to find its document, filetype, and syntax files, and to
specify a directory where temporary files will be located. Copy the "runtime"
subdirectory of the Vim distribution to vimruntime.

Logicals $VIMRUNTIME and $TMP are optional.

If $VIMRUNTIME is not set, Vim will guess and try to set up automatically.
Read more about it at :help runtime

If $TMP is not set, you will not be able to use some functions as CTAGS,
XXD, printing etc. that use temporary directory for normal operation.
The $TMP directory should be readable and writable by the user(s).
The easiest way to set up $TMP is to define a logical:

```
        define/nolog TMP SYS$SCRATCH
```
or as:
```
        define/nolog TMP SYS$LOGIN
```

==

6. Practical usage   vms-usage

Usually, you want to run just one version of Vim on your system, therefore
it is enough to dedicate one directory for Vim.

Copy the whole Vim runtime directory structure to the deployment position.
Add the following lines to your LOGIN.COM (in SYS$LOGIN directory).
Set up the logical $VIM as:

```
$ define VIM device:<path>
```

Set up some symbols:

```
$ ! vi starts Vim in chr. mode.
$ vi*m  :== mcr VIM:VIM.EXE

$ !gvi starts Vim in GUI mode.
$ gv*im :== spawn/nowait mcr VIM:VIM.EXE -g
```

Please, check the notes for customization and configuration of symbols.

You may want to create .vimrc and .gvimrc files in your home directory
(SYS$LOGIN) to overwrite default settings.

The easiest way is just rename example files. You may leave the menu file
(MENU.VIM) and files vimrc and gvimrc in the original $VIM directory. It will
be the default setup for all users, and for users it is enough to just have
their own additions or resetting in their home directory in files .vimrc and
.gvimrc. It should work without problems.

Note: Remember, system rc files (default for all users) don't have a leading
".". So, system rc files are:

```
$VIM:vimrc
$VIM:gvimrc
$VIM:menu.vim
```

and user customized rc files are:

```
sys$login:.vimrc
sys$login:.gvimrc
```

You can check that everything is at the right place with the :version command.

Example LOGIN.COM:

```
$ define/nolog VIM RF10:[UTIL.VIM]
$ vi*m :== mcr VIM:VIM.EXE
$ gv*im:== spawn/nowait/input=NLA0 mcr VIM:VIM.EXE -g -GEOMETRY 80x40
$ set disp/create/node=192.168.5.223/trans=tcpip
```

Note: This set-up should be enough, if you are working on a standalone server or
clustered environment, but if you want to use Vim as an internode editor in
DECNET environment, it will satisfy as well.
You just have to define the "whole" path:

```
$ define VIM "<server_name>[""user password""]::device:<path>"
$ vi*m :== "mcr VIM:VIM.EXE"
```

For example:

```
$ define VIM "PLUTO::RF10:[UTIL.VIM]"
$ define VIM "PLUTO""ZAY mypass"":RF10:[UTIL.VIM]" ! if passwd required
```

You can also use the $VIMRUNTIME logical to point to the proper version of Vim if you have installed more versions at the same time. If $VIMRUNTIME is not defined Vim will borrow its value from the $VIM logical. You can find more information about the $VIMRUNTIME logical by typing :help runtime as a Vim command.

System administrators might want to set up a system wide Vim installation, then add to the SYS$STARTUP:SYLOGICALS.COM

```
$ define/nolog/sys VIM device:<path>
$ define/nolog/sys TMP SYS$SCRATCH
```

And to the SYS$STARTUP:SYLOGIN.COM

```
$ vi*m :== mcr VIM:VIM.EXE
$ gv*im:== spawn/nowait/input=NLA0 mcr VIM:VIM.EXE -g -GEOMETRY 80x40
```

It will set up a normal Vim work environment for every user on the system.

IMPORTANT: Vim on OpenVMS (and on other case insensitive system) command line parameters are assumed to be lowercase. In order to indicate that a command line parameter is uppercase "/" sign must be used.

Examples:

```
vim -R  filename  ! means: -r List swap files and exit
vim -/r filename  ! means: -R Readonly mode (like "view")
vim -u  <vimrc>   ! means: -u Use <vimrc> instead of any .vimrc
vim -/u <gvimrc>  ! means: -U Use <gvimrc> instead of any .gvimrc
```

==========

7. GUI mode questions vms-gui

OpenVMS is a real mainframe OS, therefore even if it has a GUI console, most of the users do not use a native X/Window environment during normal operation. It is not possible to start Vim in GUI mode "just like that". But anyhow it is not too complicated either.

First of all: you will need an executable that is built with the GUI enabled.

Second: you need to have installed DECW/Motif on your VMS server, otherwise you will get errors that some shareable libraries are missing.

Third: If you choose to run Vim with extra features such as GUI/GTK then you need a GTK installation too or at least a GTK runtime environment (LIBGTK can be downloaded from http://www.polarhome.com/vim/).

1) If you are working on the VMS X/Motif console:
   Start Vim with the command:

```
$ mc device:<path>VIM.EXE -g
```

   or type :gui as a command to the Vim command prompt. For more info :help
   gui

2) If you are working on some other X/Window environment like Unix or a remote
   X VMS console. Set up display to your host with:

```
$ set disp/create/node=<your IP address>/trans=<transport-name>
```

   and start Vim as in point 1. You can find more help in VMS documentation or
   type: help set disp in VMS prompt.
   Examples:

```
$ set disp/create/node=192.168.5.159             ! default trans is DECnet
$ set disp/create/node=192.168.5.159/trans=tcpip ! TCP/IP network
$ set disp/create/node=192.168.5.159/trans=local ! display on the same node
```

Note: you should define just one of these.
For more information type $help set disp in VMS prompt.

3) Another elegant solution is XDM if you have installed on OpenVMS box.
   It is possible to work from XDM client as from GUI console.

4) If you are working on MS-Windows or some other non X/Window environment
   you need to set up one X server and run Vim as in point 2.
   For MS-Windows there are available free X servers as MIX, Omni X etc.,
   as well as excellent commercial products as eXcursion or ReflectionX with
   built-in DEC support.

Please note, that executables without GUI are slightly faster during startup
than with enabled GUI in character mode. Therefore, if you do not use GUI
features, it is worth to choose non GUI executables.

==

8. Useful notes vms-notes

8.14 VIMTUTOR for beginners
8.15 Slow start in console mode issue
8.16 Common VIM directory - different architectures

8.1 Backspace/delete

There are backspace/delete key inconsistencies with VMS.
:fixdel doesn't do the trick, but the solution is:

```
:inoremap ^? ^H         " for terminal mode
:inoremap <Del> ^H      " for gui mode
```

Read more in ch: 8.6 (Terminal problems).
(Bruce Hunsaker <BNHunsaker@chq.byu.edu> Vim 5.3)

8.2 Filters

Vim supports filters, i.e., if you have a sort program that can handle
input/output redirection like Unix (<infile >outfile), you could use

```
:map \s 0!'aqsort<CR>
```

(Charles E. Campbell, Jr. <cec@gryphon.gsfc.nasa.gov> Vim 5.4)

8.3 VMS file version numbers

Vim is saving files into a new file with the next higher file version
number, try these settings.

```
:set nobackup        " does not create *.*_ backup files
:set nowritebackup   " does not have any purpose on VMS.  It's the
                     " default.
```

Recovery is working perfectly as well from the default swap file.
Read more with :help swapfile

(Claude Marinier <ClaudeMarinier@xwavesolutions.com> Vim 5.5, Zoltan Arpadffy
Vim 5.6)

8.4 Directory conversion

Vim will internally convert any unix-style paths and even mixed unix/VMS
paths into VMS style paths. Some typical conversions resemble:

```
/abc/def/ghi            -> abc:[def]ghi.
/abc/def/ghi.j          -> abc:[def]ghi.j
/abc/def/ghi.j;2        -> abc:[def]ghi.j;2
/abc/def/ghi/jkl/mno    -> abc:[def.ghi.jkl]mno.
abc:[def.ghi]jkl/mno    -> abc:[def.ghi.jkl]mno.
  ./                    -> current directory
  ../                   -> relative parent directory
```

```
          [.def.ghi]            -> relative child directory
           ./def/ghi            -> relative child directory
```

Note: You may use <,> brackets as well (device:<path>file.ext;version) as rf10:<user.zay.work>test.c;1

(David Elins <delins@foliage.com>, Jerome Lauret <JLAURET@mail.chem.sunysb.edu> Vim 5.6)

8.5 Remote host invocation

It is possible to use Vim as an internode editor.
1. Edit some file from remote node:

```
vi "<server>""username passwd""::<device>:<path><filename>;<version>"
```

Example:

```
vi "pluto""zay passwd""::RF10:<USER.ZAY.WORK>TEST.C;1"
```

Note: syntax is very important, otherwise VMS will recognize more parameters instead of one (resulting with: file not found)

2. Set up Vim as your internode editor. If Vim is not installed on your host, just set up your IP address, the full Vim path including the server name and run the command procedure below:

```
$ if (p1 .eqs. "") .OR. (p2 .eqs. "") then goto usage
$ set disp/create/node=<your_IP_here>/trans=tcpip
$ define "VIM "<vim_server>""''p1' ''p2'""::<device>:<vim_path>"
$  vi*m :== "mcr VIM:VIM.EXE"
$ gv*im :== "spawn/nowait mcr VIM:VIM.EXE -g"
$ goto end
$ usage:
$ write sys$output " Please enter username and password as a parameter."
$ write sys$output " Example: @SETVIM.COM username passwd"
$ end:
```

Note: Never use it in a clustered environment (you do not need it), loading could be very-very slow, but even faster than a local Emacs. :-)

(Zoltan Arpadffy, Vim 5.6)

8.6 Terminal problems

If your terminal name is not known to Vim and it is trying to find the default one you will get the following message during start-up:

```
---
Terminal entry not found in termcap
'unknown-terminal' not known.  Available built-in terminals are:
    builtin_gui
    builtin_riscos
    builtin_amiga
```

```
    builtin_beos-ansi
    builtin_ansi
    builtin_vt320
    builtin_vt52
    builtin_pcansi
    builtin_win32
    builtin_xterm
    builtin_iris-ansi
    builtin_debug
    builtin_dumb
defaulting to 'vt320'
---
```

The solution is to define the default terminal name:

```
        $ ! unknown terminal name.  Let us use vt320 or ansi instead.
        $ ! Note: it's case sensitive
        $ define term "vt320"
```

Terminals from VT100 to VT320 (as V300, VT220, VT200) do not need any extra keyboard mappings. They should work perfectly as they are, including arrows, Ins, Del buttons etc., except Backspace in GUI mode. To solve it, add to .gvimrc:

```
        inoremap <Del> <BS>
```

Vim will also recognize that they are fast terminals.

If you have some annoying line jumping on the screen between windows add to your .vimrc file:

```
        set ttyfast     " set fast terminal
```

Note: if you're using Vim on remote host or through a very slow connection, it's recommended to avoid the fast terminal option with:

```
        set nottyfast   " set terminal to slow mode
```

(Zoltan Arpadffy, Vim 5.6)

8.7 Hex-editing and other external tools

A very important difference between OpenVMS and other systems is that VMS uses special commands to execute executables:

```
        RUN <path>filename
        MCR <path>filename <parameters>
```

OpenVMS users always have to be aware that the Vim command :! "just" drop them to DCL prompt. This feature is possible to use without any problem with all DCL commands, but if we want to execute some programs such as XXD, CTAGS, JTAGS, etc. we're running into trouble if we follow the Vim documentation (see: help xxd).

Solution: Execute with the MC command and add the full path to the executable.
Example: Instead of :%!xxd command use:

```
:%!mc vim:xxd
```

... or in general:

```
:!mc <path>filename <parameters>
```

Note: You can use XXD and CTAGS from GUI menu.

To customize ctags it is possible to define the logical $CTAGS with standard parameters as:

```
define/nolog CTAGS "--totals -o sys$login:tags"
```

For additional information, please read :help tagsearch and CTAGS documentation at http://ctags.sourceforge.net/ctags.html.

(Zoltan Arpadffy, Vim 5.6-70)

8.8 Sourcing vimrc and gvimrc

If you want to use your .vimrc and .gvimrc from other platforms (e.g. Windows) you can get in trouble if you ftp that file(s): VMS has different end-of-line indication.
The symptom is that Vim is not sourcing your .vimrc/.gvimrc, even if you say:

```
:so sys$login:.vimrc
```

One trick is to compress (e.g. zip) the files on the other platform and uncompress it on VMS; if you have the same symptom, try to create the files with copy-paste (for this you need both op. systems reachable from one machine, e.g. an Xterm on Windows or telnet to Windows from VMS).

(Sandor Kopanyi, <sandor.kopanyi@mailbox.hu> Vim 6.0a)

8.9 Printing from Vim

To be able to print from Vim (running in GUI mode) under VMS you have to set up $TMP logical which should point to some temporary directory and logical SYS$PRINT to your default print queue.
Example:

```
$define SYS$PRINT HP5ANSI
```

You can print out the whole buffer or just the marked area.
More info under :help hardcopy

(Zoltan Arpadffy, Vim 6.0c)

8.10 Setting up the symbols

When I use gvim this way and press CTRL-Y in the parent terminal, gvim exits.
I now use a different symbol that seems to work OK and fixes the problem.
I suggest this instead:

```
$ GV*IM:==SPAWN/NOWAIT/INPUT=NLA0: MCR VIM:VIM.EXE -G -GEOMETRY 80X40
```

The /INPUT=NLA0: separates the standard input of the gvim process from the
parent terminal, to block signals from the parent window.
Without the -GEOMETRY, the gvim window size will be minimal and the menu
will be confused after a window-resize.

(Carlo Mekenkamp, Coen Engelbarts, Vim 6.0ac)

8.11 diff and other GNU programs

From 6.0 diff functionality has been implemented, but OpenVMS does not use
GNU/Unix like diff therefore built in diff does not work.
There is a simple solution to solve this anomaly. Install a Unix like diff
and Vim will work perfectly in diff mode too. You just have to redefine your
diff program as:

```
define /nolog diff <GNU_PATH>diff.exe
```

Another, more sophisticated solution is described below (8.12 diff-mode)
There are other programs such as patch, make etc that may cause the same
problems. At www.polarhome.com is possible to download an GNU package for
Alpha and VAX boxes that is meant to solve GNU problems on OpenVMS.
(Zoltan Arpadffy, Vim 6.1)

8.12 diff-mode

Vim 6.0 and higher supports Vim diff-mode (See new-diff-mode , diff-mode
and 08.7). This uses the external program 'diff' and expects a Unix-like
output format from diff. The standard VMS diff has a different output
format. To use Vim on VMS in diff-mode, you need to:

1. Install a Unix-like diff program, e.g. GNU diff
2. Tell Vim to use the Unix-like diff for diff-mode.

You can download GNU diff from the VIM-VMS website, it is one of the GNU
tools in http://www.polarhome.com/vim/files/gnu_tools.zip. I suggest to
unpack it in a separate directory "GNU" and create a logical GNU: that
points to that directory, e.g:

```
DEFINE GNU    <DISK>:[<DIRECTORY>.BIN.GNU]
```

You may also want to define a symbol GDIFF, to use the GNU diff from the DCL
prompt:

```
GDIFF :==     $GNU:DIFF.EXE
```

Now you need to tell Vim to use the new diff program. Take the example

settings from diff-diffexpr and change the call to the external diff
program to the new diff on VMS. Add this to your .vimrc file:

```
" Set up vimdiff options
  if v:version >= 600
   " Use GNU diff on VMS
   set diffexpr=MyDiff()
   function MyDiff()
      let opt = ""
      if &diffopt =~ "icase"
        let opt = opt . "-i "
      endif
      if &diffopt =~ "iwhite"
        let opt = opt . "-b "
      endif
      silent execute "!mc GNU:diff.exe -a " . opt . v:fname_in . " " .  v:fname_new .
           \  " > " . v:fname_out
    endfunction
  endif
```

You can now use Vim in diff-mode, e.g. to compare two files in read-only
mode:

```
$ VIM -D/R <FILE1> <FILE2>
```

You can also define new symbols for vimdiff, e.g.:

```
$ VIMDIFF     :== 'VIM' -D/R
$ GVIMDIFF    :== 'GVIM' -D/R
```

You can now compare files in 4 ways:

```
1. VMS  diff:  $ DIFF     <FILE1> <FILE2>
2. GNU  diff:  $ GDIFF    <FILE1> <FILE2>
3. VIM  diff:  $ VIMDIFF  <FILE1> <FILE2>
4. GVIM diff:  $ GVIMDIFF <FILE1> <FILE2>
```

(Coen Engelbarts, Vim 6.1)

8.13 Allow '$' in C keywords

DEC C uses many identifiers with '$' in them. This is not allowed in ANSI C,
and Vim recognises the '$' as the end of the identifier. You can change this
with the 'iskeyword' option.
Add this command to your .vimrc file:

```
autocmd FileType c,cpp,cs  set iskeyword+=$
```

You can also create the file(s) $VIM/FTPLUGIN/C.VIM (and/or CPP.VIM and
CS.VIM) and add this command:

```
    set iskeyword+=$
```

Now word-based commands, e.g. the '*'-search-command and the CTRL-]
tag-lookup, work on the whole identifier. (Ctags on VMS also supports '$' in
C keywords since ctags version 5.1.)

(Coen Engelbarts, Vim 6.1)

8.14 VIMTUTOR for beginners

The VIMTUTOR.COM DCL script can help Vim beginners to learn/make their first
steps with Vim on OpenVMS. Depending of binary distribution you may start it
with:

```
        @vim:vimtutor
```

(Thomas.R.Wyant III, Vim 6.1)

8.16 Slow start in console mode issue

As GUI/GTK Vim works equally well in console mode, many administrators
deploy those executables system wide.
Unfortunately, on a remote slow connections GUI/GTK executables behave rather
slow when user wants to run Vim just in the console mode - because of X
environment detection timeout.

Luckily, there is a simple solution for that. Administrators need to deploy
both GUI/GTK build and just console build executables, like below:

```
    |- vim73
    |----- doc
    |----- syntax
       vimrc    (system rc files)
       gvimrc
       gvim.exe (the renamed GUI or GTK built vim.exe)
       vim.exe  (the console only executable)
```

Define system symbols like below in for ex in LOGIN.COM or SYLOGIN.COM:

```
        $ define/nolog VIM RF10:[UTIL.VIM73] ! where you VIM directory is
        $ vi*m  :== mcr VIM:VIM.EXE
        $ gvi*m :== mcr VIM:GVIM.EXE
        $ ! or you can try to spawn with
        $ gv*im :== spawn/nowait/input=NLA0 mcr VIM:GVIM.EXE -g -GEOMETRY 80x40
```

Like this, users that do not have X environment and want to use Vim just in
console mode can avoid performance problems.

(Zoltan Arpadffy, Vim 7.2)

8.15 Common VIM directory - different architectures

In a cluster that contains nodes with different architectures like below:

$show cluster

```
View of Cluster from system ID 11655  node: TOR
+---------------------------------+
|        SYSTEMS        | MEMBERS |
+-----------------------+---------|
|  NODE  |   SOFTWARE   |  STATUS |
+--------+--------------+---------|
| TOR    | VMS V7.3-2   | MEMBER  |
| TITAN2 | VMS V8.3     | MEMBER  |
| ODIN   | VMS V7.3-2   | MEMBER  |
+---------------------------------+
```

It is convenient to have a common VIM directory but execute different executables.
There are several solutions for this problem:

Solution 1. All executables in the same directory with different names
This is easily done with the following script that can be added
to the login.com or sylogin.com:

```
$ if f$getsyi("NODE_HWTYPE") .eqs. "VAX"
$ then
$       say "VAX platform"
$       vi*m:== mcr vim:VIM.EXE_VAX
$ endif
$ if f$getsyi("NODE_HWTYPE") .eqs. "ALPH"
$ then
$       say "ALPHA platform"
$       vi*m :== mcr vim:VIM.EXE_AXP
$ endif
$ if f$getsyi("ARCH_NAME") .eqs. "IA64"
$ then
$      say "IA64 platform"
$      vi*m :== mcr vim:VIM.EXE_IA64
$ endif
```

Solution 2. Different directories:

```
$ if f$getsyi("NODE_HWTYPE") .eqs. "VAX"
$ then
$       say "VAX platform"
$       define/nolog VIM RF10:[UTIL.VAX_EXE] ! VAX executables
$ endif
$ if f$getsyi("NODE_HWTYPE") .eqs. "ALPH"
$ then
$       say "ALPHA platform"
$       define/nolog VIM RF10:[UTIL.AXP_EXE] ! AXP executables
$ endif
$ if f$getsyi("ARCH_NAME") .eqs. "IA64"
$ then
$      say "IA64 platform"
$      define/nolog VIM RF10:[UTIL.IA64_EXE] ! IA64 executables
$ endif
$! VIMRUNTIME must be defined in order to find runtime files
$ define/nolog VIMRUNTIME RF10:[UTIL.VIM73]
```

A good example for this approach is the [GNU]gnu_tools.com script from
GNU_TOOLS.ZIP package downloadable from http://www.polarhome.com/vim/

(Zoltan Arpadffy, Vim 7.2)

==

9. VMS related changes   vms-changes

Version 7.4
- Undo: VMS can not handle more than one dot in the filenames use "dir/name" -> "dir/_un_na
  add _un_ at the beginning to keep the extension
- correct swap file name wildcard handling
- handle iconv usage correctly
- do not optimize on vax - otherwise it hangs compiling crypto files
- fileio.c fix the comment
- correct RealWaitForChar
- after 7.4-119 use different functions lib$cvtf_to_internal_time because Alpha and VAX hav
  G_FLOAT but IA64 uses IEEE float otherwise Vim crashes
- guard against crashes that are caused by mixed filenames
- [TESTDIR]make_vms.mms changed to see the output files
- Improve tests, update known issues
- minor compiler warnings fixed
- CTAGS 5.8 +regex included

Version 7.3
- CTAGS 5.8 included
- VMS compile warnings fixed - floating-point overflow warning corrected on VAX
- filepath completion corrected - too many chars were escaped in filename
  and shell commands
- the following plugins are included into VMS runtime:
        genutils 2.4, multiselect 2.2, multvals 3.1, selectbuf 4.3,
        bufexplorer 7.1.7, taglist 4.5
- minor changes in vimrc (just in VMS runtime)
- make_vms.mms - HUGE model is the default
- [TESTDIR]make_vms.mms include as many tests possible
- modify test30 and test54 for VMS
- enable FLOAT feature in VMS port
- os_vms.txt updated

Version 7.2 (2008 Aug 9)
- VCF files write corrected
- CTAGS 5.7 included
- corrected make_vms.mms (on VAX gave syntax error)

Version 7.1 (2007 Jun 15)
- create TAGS file from menu

Version 7 (2006 May 8)
- Improved low level char input (affects just console mode)
- Fixed plugin bug
- CTAGS 5.6 included

Version 6.4 (2005 Oct 15)
- GTKLIB and Vim build on IA64
- colors in terminal mode
- syntax highlighting in terminal mode
- write problem fixed (extra CR)
- ESC and ESC sequence recognition in terminal mode
- make file changed to support new MMS version
- env variable expansion in path corrected
- printing problems corrected
- help text added for case insensitive arguments

Version 6.3 (2004 May 10)
- Improved vms_read function
- CTAGS v5.5.4 included
- Documentation corrected and updated

Version 6.2 (2003 May 7)
- Corrected VMS system call results
- Low level character input is rewritten
- Correction in tag and quickfix handling
- First GTK build
- Make file changes
    - GTK feature added
    - Define for OLD_VMS
    - OpenVMS version 6.2 or older
- Documentation updated with GTK features
- CTAGS v5.5 included
- VMS VIM tutor created

Version 6.1 (2002 Mar 25)
- TCL init_tcl() problem fixed
- CTAGS v5.4 included
- GNU tools binaries for OpenVMS
- Make file changes
    - PERL, PYTHON and TCL support improved
    - InstallVMS.txt has a detailed description HOWTO build
- VMS/Unix file handling rewritten
- Minor casting and bug fixes

Version 6.0 (2001 Sep 28)
- Unix and VMS code has been merged
        - separated "really" VMS related code
        - included all possible Unix functionality
        - simplified or deleted the configuration files
        - makefile MAKE_VMS.MMS reviewed
- menu changes (fixed printing, CTAGS and XXD usage)
- fixed variable RMS record format handling anomaly
- corrected syntax, ftplugin etc files load
- changed expand_wildcards and expandpath functions to work more general
- created OS_VMS_FILTER.COM - DECC->VAXC pre-processor directive convert
  script.
- Improved code's VAXC and new DECC compilers compatibility
- changed quickfix parameters:
        - errormessage format to suite DECC

        - search, make and other commands to suite VMS system
- updated and renamed MMS make files for Vim and CTAGS.
- CTAGS has been removed from source distribution of Vim but it will remain
  in OpenVMS binary distributions.
- simplified build/configuration procedure
- created INSTALLvms.txt - detailed compiling instructions under VMS.
- updated test scripts.

Version 5.8 (2001 Jun 1)
- OS_VMS.TXT updated with new features.
- other minor fixes.
- documentation updated
- this version had been tested much more than any other OpenVMS version
  earlier

Version 5.7 (2000 Jun 24)
- New CTAGS v5.0 in distribution
- Documentation updated

Version 5.6 (2000 Jan 17)
- VMS filename related changes:
        - version handling (open everything, save to new version)
        - correct file extension matching for syntax (version problem)
        - handle <,> characters and passwords in directory definition
        - handle internode/remote invocation and editing with passwords
        - OpenVMS files will be treated case insensitive from now
        - corrected response of expand("%:.") etc path related functions
        (in one word: VMS directory handling internally)
- version command
        - corrected (+,-) information data
        - added compiler and OS version
        - added user and host information
        - resolving $VIM and $VIMRUNTIME logicals
- VMS port is in MAX_FEAT (maximum features) club with Unix, Win32 and OS/2.
        - enabled farsi, rightleft etc. features
        - undo level raised up to 1000
- Updated OS_VMS.MMS file.
        - maximum features ON is default
        - Vim is compilable with +perl, +python and +tcl features.
        - improved MMK compatibility
- Created MAKEFILE_VMS.MMS, makefile for testing Vim during development.
- Defined DEC terminal VT320
        - compatibility for VT3*0, VT2*0 and VT1*0 - ANSI terminals
          backwards, but not VT340 and newer with colour capability.
        - VT320 is default terminal for OpenVMS
        - these new terminals are also fast ttys (default for OpenVMS).
        - allowed dec_mouse ttym
- Updated files vimrc and gvimrc with VMS specific suggestions.
- OS_VMS.TXT updated with new features.

Version 5.5 (1999 Dec 3)
- Popup menu line crash corrected.
- Handle full file names with version numbers.
- Directory handling (CD command etc.)

- Corrected file name conversion VMS to Unix and v.v.
- Correct response of expand wildcards
- Recovery is working from this version under VMS as well.
- Improved terminal and signal handing.
- Improved OS_VMS.TXT

Version 5.4 (1999 Sep 9)
- Cut and paste mismatch corrected.
- Motif directories during open and save are corrected.

Version 5.3 (1998 Oct 12)
- Minor changes in the code
- Standard distribution with +GUI option

Version 5.1 (1998 Apr 21)
- Syntax and DEC C changes in the code
- Fixing problems with the /doc subdirectory
- Improve OS_VMS.MMS

Version 4.5 (1996 Dec 16)
- First VMS port by Henk Elbers <henk@xs4all.nl>

os_win32.txt For Vim version 8.1. Last change: 2017 Mar 21

VIM REFERENCE MANUAL by George Reilly

win32 Win32 MS-Windows

This file documents the idiosyncrasies of the Win32 version of Vim.

The Win32 version of Vim works on Windows XP, Vista, 7, 8 and 10. There are
both console and GUI versions.

The 32 bit version also runs on 64 bit MS-Windows systems.

Credits:
The Win32 version was written by George V. Reilly <george@reilly.org>.
The original Windows NT port was done by Roger Knobbe <RogerK@wonderware.com>.
The GUI version was made by George V. Reilly and Robert Webb.

For compiling see "src/INSTALLpc.txt". win32-compiling

==
1. Known problems win32-problems

When doing file name completion, Vim also finds matches for the short file
name. But Vim will still find and use the corresponding long file name. For
example, if you have the long file name "this_is_a_test" with the short file
name "this_i~1", the command ":e *1" will start editing "this_is_a_test".

==
2. Startup win32-startup

Current directory win32-curdir

If Vim is started with a single file name argument, and it has a full path (starts with "x:\"), Vim assumes it was started from the file explorer and will set the current directory to where that file is. To avoid this when typing a command to start Vim, use a forward slash instead of a backslash. Example:

```
vim c:\text\files\foo.txt
```

Will change to the "C:\text\files" directory.

```
vim c:/text\files\foo.txt
```

Will use the current directory.

Term option win32-term

The only kind of terminal type that the Win32 version of Vim understands is "win32", which is built-in. If you set 'term' to anything else, you will probably get very strange behavior from Vim. Therefore Vim does not obtain the default value of 'term' from the environment variable "TERM".

$PATH win32-PATH

The directory of the Vim executable is appended to $PATH. This is mostly to make "!xxd" work, as it is in the Tools menu. And it also means that when executable() returns 1 the executable can actually be executed.

Command line arguments win32-cmdargs

Analysis of a command line into parameters is not standardised in MS Windows. Vim and gvim used to use different logic to parse it (before 7.4.432), and the logic was also depended on what it was compiled with. Now Vim and gvim both use the CommandLineToArgvW() Win32 API, so they behave in the same way.

The basic rules are: win32-backslashes

a) A parameter is a sequence of graphic characters.
b) Parameters are separated by white space.
c) A parameter can be enclosed in double quotes to include white space.
d) A sequence of zero or more backslashes (\) and a double quote (") is special. The effective number of backslashes is halved, rounded down. An even number of backslashes reverses the acceptability of spaces and tabs, an odd number of backslashes produces a literal double quote.

So:

```
"       is a special double quote
\"      is a literal double quote
\\"     is a literal backslash and a special double quote
\\\"    is a literal backslash and a literal double quote
\\\\"   is 2 literal backslashes and a special double quote
\\\\\"  is 2 literal backslashes and a literal double quote
etc.
```

Example:
	vim "C:\My Music\freude" +"set ignorecase" +/"\"foo\\" +\"bar\\\"

opens "C:\My Music\freude" and executes the line mode commands:
	set ignorecase; /"foo\ and /bar\"

These rules are also described in the reference of the CommandLineToArgvW API:
    https://msdn.microsoft.com/en-us/library/windows/desktop/bb776391.aspx

                                                        win32-quotes
There are additional rules for quotes (which are not well documented).
As described above, quotes inside a file name (or any other command line
argument) can be escaped with a backslash. E.g.
	vim -c "echo 'foo\"bar'"

Alternatively use three quotes to get one:
	vim -c "echo 'foo"""bar'"

The quotation rules are:

1. A `"` starts quotation.
2. Another `"` or `"""` ends quotation. If the quotation ends with `"""`, a `"`
   is produced at the end of the quoted string.

Examples, with [] around an argument:
	"foo" -> [foo]
	"foo"" -> [foo"]
	"foo"bar -> [foobar]
	"foo" bar -> [foo], [bar]
	"foo""bar -> [foo"bar]
	"foo"" bar -> [foo"], [bar]
	"foo"""bar" -> [foo"bar]

==
3. Restore screen contents   win32-restore

When 'restorescreen' is set (which is the default), Vim will restore the
original contents of the console when exiting or when executing external
commands. If you don't want this, use ":set nors".   'restorescreen'

==
4. Using the mouse   win32-mouse

The Win32 version of Vim supports using the mouse. If you have a two-button
mouse, the middle button can be emulated by pressing both left and right
buttons simultaneously - but note that in the Win32 GUI, if you have the right
mouse button pop-up menu enabled (see 'mouse'), you should err on the side of
pressing the left button first.   mouse-using

When the mouse doesn't work, try disabling the "Quick Edit Mode" feature of
the console.

==
5. Running under Windows 95   win32-win95
                                                windows95 windows98 windowsme

Windows 95/98/ME support was removed in patch 8.0.0029 If you want to use it
you will need to get a version older than that.

==
6. Running under Windows 3.1   win32-win3.1

                                        win32s windows-3.1 gui-w32s win16

There was a special version of gvim that runs under Windows 3.1 and 3.11.
Support was removed in patch 7.4.1363.

==
7. Win32 mini FAQ   win32-faq

Q. How do I change the font?
A. In the GUI version, you can use the 'guifont' option. Example:
        :set guifont=Lucida_Console:h15:cDEFAULT
   In the console version, you need to set the font of the console itself.
   You cannot do this from within Vim.

Q. How do I type dead keys on Windows NT?
A. Dead keys work on NT 3.51. Just type them as you would in any other
   application.
   On NT 4.0, you need to make sure that the default locale (set in the
   Keyboard part of the Control Panel) is the same as the currently active
   locale. Otherwise the NT code will get confused and crash! This is a NT
   4.0 problem, not really a Vim problem.

Q. I'm using Vim to edit a symbolically linked file on a Unix NFS file server.
   When I write the file, Vim does not "write through" the symlink. Instead,
   it deletes the symbolic link and creates a new file in its place. Why?
A. On Unix, Vim is prepared for links (symbolic or hard). A backup copy of
   the original file is made and then the original file is overwritten. This
   assures that all properties of the file remain the same. On non-Unix
   systems, the original file is renamed and a new file is written. Only the
   protection bits are set like the original file. However, this doesn't work
   properly when working on an NFS-mounted file system where links and other
   things exist. The only way to fix this in the current version is not
   making a backup file, by ":set nobackup nowritebackup"   'writebackup'

Q. I'm using Vim to edit a file on a Unix file server through Samba. When I
   write the file, the owner of the file is changed. Why?
A. When writing a file Vim renames the original file, this is a backup (in
   case writing the file fails halfway). Then the file is written as a new
   file. Samba then gives it the default owner for the file system, which may
   differ from the original owner.
   To avoid this set the 'backupcopy' option to "yes". Vim will then make a
   copy of the file for the backup, and overwrite the original file. The
   owner isn't changed then.

Q. How do I get to see the output of ":make" while it's running?
A. Basically what you need is to put a tee program that will copy its input

(the output from make) to both stdout and to the errorfile. You can find a copy of tee (and a number of other GNU tools) at http://gnuwin32.sourceforge.net or http://unxutils.sourceforge.net Alternatively, try the more recent Cygnus version of the GNU tools at http://www.cygwin.com Other Unix-style tools for Win32 are listed at http://directory.google.com/Top/Computers/Software/Operating_Systems/Unix/Win32/ When you do get a copy of tee, you'll need to add

```
:set shellpipe=\|\ tee
```

to your _vimrc.

Q. I'm storing files on a remote machine that works with VisionFS, and files disappear!

A. VisionFS can't handle certain dot (.) three letter extension file names. SCO declares this behavior required for backwards compatibility with 16bit DOS/Windows environments. The two commands below demonstrate the behavior:

```
echo Hello > file.bat~
dir > file.bat
```

The result is that the "dir" command updates the "file.bat~" file, instead of creating a new "file.bat" file. This same behavior is exhibited in Vim when editing an existing file named "foo.bat" because the default behavior of Vim is to create a temporary file with a '~' character appended to the name. When the file is written, it winds up being deleted.

Solution: Add this command to your _vimrc file:

```
:set backupext=.temporary
```

Q. How do I change the blink rate of the cursor?

A. You can't! This is a limitation of the NT console. NT 5.0 is reported to be able to set the blink rate for all console windows at the same time.

:!start

Q. How can I asynchronously run an external command or program, or open a document or URL with its default program?

A. When using :! to run an external command, you can run it with "start". For example, to run notepad:

```
:!start notepad
```

To open "image.jpg" with the default image viewer:

```
:!start image.jpg
```

To open the folder of the current file in Windows Explorer:

```
:!start %:h
```

To open the Vim home page with the default browser:

```
:!start http://www.vim.org/
```

Using "start" stops Vim switching to another screen, opening a new console, or waiting for the program to complete; it indicates that you are running a program that does not affect the files you are editing. Programs begun with :!start do not get passed Vim's open file handles, which means they do not have to be closed before Vim.
To avoid this special treatment, use ":! start".
There are two optional arguments (see the next Q):

```
/min  the window will be minimized
/b    no console window will be opened
```

You can use only one of these flags at a time. A second one will be
treated as the start of the command.

Q. How do I avoid getting a window for programs that I run asynchronously?
A. You have two possible solutions depending on what you want:
1) You may use the /min flag in order to run program in a minimized state
with no other changes. It will work equally for console and GUI
applications.
2) You can use the /b flag to run console applications without creating a
console window for them (GUI applications are not affected). But you
should use this flag only if the application you run doesn't require any
input. Otherwise it will get an EOF error because its input stream
(stdin) would be redirected to \\.\NUL (stdout and stderr too).

Example for a console application, run Exuberant ctags:
:!start /min ctags -R .
When it has finished you should see file named "tags" in your current
directory. You should notice the window title blinking on your taskbar.
This is more noticeable for commands that take longer.
Now delete the "tags" file and run this command:
:!start /b ctags -R .
You should have the same "tags" file, but this time there will be no
blinking on the taskbar.
Example for a GUI application:
:!start /min notepad
:!start /b notepad
The first command runs notepad minimized and the second one runs it
normally.

windows-icon

Q. I don't like the Vim icon, can I change it?
A. Yes, place your favorite icon in bitmaps/vim.ico in a directory of
'runtimepath'. For example ~/vimfiles/bitmaps/vim.ico.

vim:tw=78:fo=tcq2:ts=8:noet:ft=help:norl:

pi_getscript.txt For Vim version 8.1. Last change: 2017 Aug 01

GETSCRIPT REFERENCE MANUAL by Charles E. Campbell

Authors: Charles E. Campbell <NdrOchip@ScampbellPfamilyA.Mbiz>
(remove NOSPAM from the email address)

GetLatestVimScripts-copyright

Getscript is a plugin that simplifies retrieval of the latest versions of the scripts that you yourself use! Typing :GLVS will invoke getscript; it will then use the <GetLatestVimScripts.dat> (see GetLatestVimScripts_dat) file to get the latest versions of scripts listed therein from http://vim.sf.net/.

==========

1. Contents glvs-contents glvs getscript GetLatestVimScripts

==========

2. GetLatestVimScripts -- Getting Started getscript-start getlatestvimscripts-install

VERSION FROM VIM DISTRIBUTION glvs-dist-install

Vim 7.0 does not include the GetLatestVimScripts.dist file which serves as an example and a template. So, you'll need to create your own! See GetLatestVimScripts_dat .

VERSION FROM VIM SF NET glvs-install

NOTE: The last step, that of renaming/moving the GetLatestVimScripts.dist file, is for those who have just downloaded GetLatestVimScripts.tar.bz2 for the first time.

The GetLatestVimScripts.dist file serves as an example and a template for your own personal list. Feel free to remove all the scripts mentioned within it; the "important" part of it is the first two lines.

Your computer needs to have wget or curl for GetLatestVimScripts to do its work.

1. if compressed: gunzip getscript.vba.gz
2. Unix:
```
vim getscript.vba
:so %
:q
cd ~/.vim/GetLatest
mv GetLatestVimScripts.dist GetLatestVimScripts.dat
(edit GetLatestVimScripts.dat to install your own personal
list of desired plugins -- see  GetLatestVimScripts_dat )
```
3. Windows:
```
vim getscript.vba
:so %
:q
cd **path-to-vimfiles**/GetLatest
mv GetLatestVimScripts.dist GetLatestVimScripts.dat
(edit GetLatestVimScripts.dat to install your own personal
list of desired plugins -- see  GetLatestVimScripts_dat )
```

==========
3. GetLatestVimScripts Usage glvs-usage :GLVS

Unless it has been defined elsewhere,

```
:GLVS
```

will invoke GetLatestVimScripts(). If some other plugin has defined that command, then you may type

```
:GetLatestVimScripts
```

The script will attempt to update and, if permitted, will automatically install scripts from http://vim.sourceforge.net/. To do so it will peruse a file,

```
.vim/GetLatest/GetLatestVimScripts.dat                    (unix)
```

or

```
..wherever..\vimfiles\GetLatest\GetLatestVimScripts.dat   (windows)
```

(see glvs-data), and examine plugins in your [.vim|vimfiles]/plugin directory (see glvs-plugins).

Scripts which have been downloaded will appear in the ~/.vim/GetLatest (unix) or ..wherever..\vimfiles\GetLatest (windows) subdirectory. GetLatestVimScripts will attempt to automatically install them if you have the following line in your <.vimrc>:

```
        let g:GetLatestVimScripts_allowautoinstall=1
```

The <GetLatestVimScripts.dat> file will be automatically be updated to
reflect the latest version of script(s) so downloaded.
(also see glvs-options)

==
4. GetLatestVimScripts Data File   getscript-data glvs-data
                                                :GetLatestVimScripts_dat
The data file <GetLatestVimScripts.dat> must have for its first two lines
the following text:

```
        ScriptID SourceID Filename
        --------------------------
```

Following those two lines are three columns; the first two are numeric
followed by a text column. The GetLatest/GetLatestVimScripts.dist file
contains an example of such a data file. Anything following a #... is
ignored, so you may embed comments in the file.

The first number on each line gives the script's ScriptID. When you're about
to use a web browser to look at scripts on http://vim.sf.net/, just before you
click on the script's link, you'll see a line resembling

```
        http://vim.sourceforge.net/scripts/script.php?script_id=40
```

The "40" happens to be a ScriptID that GetLatestVimScripts needs to
download the associated page, and is assigned by vim.sf.net itself
during initial uploading of the plugin.

The second number on each line gives the script's SourceID. The SourceID
records the count of uploaded scripts as determined by vim.sf.net; hence it
serves to indicate "when" a script was uploaded. Setting the SourceID to 1
insures that GetLatestVimScripts will assume that the script it has is
out-of-date.

The SourceID is extracted by GetLatestVimScripts from the script's page on
vim.sf.net; whenever it is greater than the one stored in the
GetLatestVimScripts.dat file, the script will be downloaded
(see GetLatestVimScripts_dat).

If your script's author has included a special comment line in his/her plugin,
the plugin itself will be used by GetLatestVimScripts to build your
<GetLatestVimScripts.dat> file, including any dependencies on other scripts it
may have. As an example, consider:

```
        " GetLatestVimScripts: 884  1 :AutoInstall: AutoAlign.vim
```

This comment line tells getscript.vim to check vimscript #884 and that the
script is automatically installable. Getscript will also use this line to
help build the GetLatestVimScripts.dat file, by including a line such as:

```
        884 1 :AutoInstall: AutoAlign.vim
```

assuming that such a line isn't already in GetLatestVimScripts.dat file. See glvs-plugins for more. Thus, GetLatestVimScripts thus provides a comprehensive ability to keep your plugins up-to-date!

In summary:

* Optionally tell getscript that it is allowed to build/append a GetLatestVimScripts.dat file based upon already installed plugins:
  `let g:GetLatestVimScripts_allowautoinstall=1`

* A line such as
  `" GetLatestVimScripts: 884 1 :AutoInstall: AutoAlign.vim`
  in an already-downloaded plugin constitutes the concurrence of the plugin author that getscript may do AutoInstall. Not all plugins may be AutoInstall-able, and the plugin's author is best situated to know whether or not his/her plugin will AutoInstall properly.

* A line such as
  `884 1 :AutoInstall: AutoAlign.vim`
  in your GetLatestVimScripts.dat file constitutes your permission to getscript to do AutoInstall. AutoInstall requires both your and the plugin author's permission. See GetLatestVimScripts_dat .

GetLatestVimScripts_dat

As an example of a <GetLatestVimScripts.dat> file:

```
    ScriptID SourceID Filename
    --------------------------
    294 1 :AutoInstall: Align.vim
    120 2 Decho.vim
     40 3 DrawIt.tar.gz
    451 4 EasyAccents.vim
    195 5 engspchk.vim
    642 6 GetLatestVimScripts.vim
    489 7 Manpageview.vim
```

Note: the first two lines are required, but essentially act as comments.

==

5. GetLatestVimScripts Friendly Plugins getscript-plugins glvs-plugins

(this section is for plugin authors)

If a plugin author includes the following comment anywhere in their plugin, GetLatestVimScripts will find it and use it to automatically build the user's GetLatestVimScripts.dat files:

```
                                src_id
                                  v
        " GetLatestVimScripts: ### ### yourscriptname
```

```
                                ^
                             scriptid
```

As an author, you should include such a line in to refer to your own script
plus any additional lines describing any plugin dependencies it may have.
Same format, of course!

If your command is auto-installable (see glvs-autoinstall), and most scripts
are, then you may include :AutoInstall: just before "yourscriptname":

```
                                src_id
                                  v
        " GetLatestVimScripts: ### ### :AutoInstall: yourscriptname
                                ^
                             scriptid
```

NOTE: The :AutoInstall: feature requires both the plugin author's and
      the user's permission to operate!

GetLatestVimScripts commands for those scripts are then appended, if not
already present, to the user's GetLatest/GetLatestVimScripts.dat file. It is
a relatively painless way to automate the acquisition of any scripts your
plugins depend upon.

Now, as an author, you probably don't want GetLatestVimScripts to download
your own scripts atop your own copy, thereby overwriting your not-yet-released
hard work. GetLatestVimScripts provides a solution for this: put

```
        0 0 yourscriptname
```

into your <GetLatestVimScripts.dat> file and GetLatestVimScripts will skip
examining the "yourscriptname" scripts for those GetLatestVimScripts comment
lines. As a result, those lines won't be inadvertently installed into your
<GetLatestVimScripts.dat> file and subsequently used to download your own
scripts. This is especially important to do if you've included the
:AutoInstall: option.

Be certain to use the same "yourscriptname" in the "0 0 yourscriptname" line
as you've used in your GetLatestVimScripts comment!

==
6. GetLatestVimScripts AutoInstall   getscript-autoinstall
                                                      glvs-autoinstall

GetLatestVimScripts now supports "AutoInstall". Not all scripts are
supportive of auto-install, as they may have special things you need to do to
install them (please refer to the script's "install" directions). On the
other hand, most scripts will be auto-installable.

To let GetLatestVimScripts do an autoinstall, the data file's comment field
should begin with (surrounding blanks are ignored):

```
        :AutoInstall:
```

Both colons are needed, and it should begin the comment (yourscriptname)
field.

One may prevent any autoinstalling by putting the following line in your
<.vimrc>:

```
let g:GetLatestVimScripts_allowautoinstall= 0
```

With :AutoInstall: enabled, as it is by default, files which end with

```
---.tar.bz2  : decompressed & untarred in .vim/ directory
---.vba.bz2  : decompressed in .vim/ directory, then vimball handles it
---.vim.bz2  : decompressed & moved into .vim/plugin directory
---.tar.gz   : decompressed & untarred in .vim/ directory
---.vba.gz   : decompressed in .vim/ directory, then vimball handles it
---.vim.gz   : decompressed & moved into .vim/plugin directory
---.vba      : unzipped in .vim/ directory
---.vim      : moved to .vim/plugin directory
---.zip      : unzipped in .vim/ directory
```

and which merely need to have their components placed by the untar/gunzip or
move-to-plugin-directory process should be auto-installable. Vimballs, of
course, should always be auto-installable.

When is a script not auto-installable? Let me give an example:

```
.vim/after/syntax/blockhl.vim
```

The <blockhl.vim> script provides block highlighting for C/C++ programs; it is
available at:

```
http://vim.sourceforge.net/scripts/script.php?script_id=104
```

Currently, vim's after/syntax only supports by-filetype scripts (in
blockhl.vim's case, that's after/syntax/c.vim). Hence, auto-install would
possibly overwrite the current user's after/syntax/c.vim file.

In my own case, I use <aftersyntax.vim> (renamed to after/syntax/c.vim) to
allow a after/syntax/c/ directory:

```
http://vim.sourceforge.net/scripts/script.php?script_id=1023
```

The script allows multiple syntax files to exist separately in the
after/syntax/c subdirectory. I can't bundle aftersyntax.vim in and build an
appropriate tarball for auto-install because of the potential for the
after/syntax/c.vim contained in it to overwrite a user's c.vim.

==
7. GetLatestVimScripts Options glvs-options

```
g:GetLatestVimScripts_wget
default= "wget"
```

This variable holds the name of the command for obtaining
scripts.

g:GetLatestVimScripts_options
default= "-q -O"
This variable holds the options to be used with the
g:GetLatestVimScripts_wget command.

g:GetLatestVimScripts_allowautoinstall
default= 1
This variable indicates whether GetLatestVimScripts is allowed
to attempt to automatically install scripts. Furthermore, the
plugin author has to have explicitly indicated that his/her
plugin is automatically installable (via the :AutoInstall:
keyword in the GetLatestVimScripts comment line).

g:GetLatestVimScripts_autoinstalldir
default= $HOME/.vim (linux)
default= $HOME/vimfiles (windows)
Override where :AutoInstall: scripts will be installed.
Doesn't override vimball installation.

g:GetLatestVimScripts_scriptaddr
default='http://vim.sourceforge.net/script.php?script_id='
Override this if your system needs
... ='http://vim.sourceforge.net/script/script.php?script_id='

==
8. GetLatestVimScripts Algorithm glvs-algorithm glvs-alg

The Vim sourceforge page dynamically creates a page by keying off of the
so-called script-id. Within the webpage of

http://vim.sourceforge.net/scripts/script.php?script_id=40

is a line specifying the latest source-id (src_id). The source identifier
numbers are always increasing, hence if the src_id is greater than the one
recorded for the script in GetLatestVimScripts then it's time to download a
newer copy of that script.

GetLatestVimScripts will then download the script and update its internal
database of script ids, source ids, and scriptnames.

The AutoInstall process will:

Move the file from GetLatest/ to the following directory
Unix : $HOME/.vim
Windows: $HOME\vimfiles
if the downloaded file ends with ".bz2"
bunzip2 it
else if the downloaded file ends with ".gz"
gunzip it
if the resulting file ends with ".zip"
unzip it

```
        else if the resulting file ends with ".tar"
                tar -oxvf it
        else if the resulting file ends with ".vim"
                move it to the plugin subdirectory

==============================================================================
9. GetLatestVimScripts History          getscript-history   glvs-hist  {{{1

v36 Apr 22, 2013 : * (glts) suggested use of plugin/**/*.vim instead of
                     plugin/*.vim in globpath() call.
                   * (Andy Wokula) got warning message when setting
                     g:loaded_getscriptPlugin
v35 Apr 07, 2012 : * (MengHuan Yu) pointed out that the script URL has
                     changed (somewhat).  However, it doesn't work, and
                     the original one does (under Linux). I'll make it
                     yet-another-option.
v34 Jun 23, 2011 : * handles additional decompression options for tarballs
                     (tgz taz tbz txz)
v33 May 31, 2011 : * using fnameescape() instead of escape()
                   * *.xz support
v32 Jun 19, 2010 : * (Jan Steffens) added support for xz compression
v31 Jun 29, 2008 : * (Bill McCarthy) fixed having hls enabled with getscript
                   * (David Schaefer) the acd option interferes with vimballs
                     Solution: bypass the acd option
v30 Jun 13, 2008 : * GLVS now checks for existence of fnameescape() and will
                     issue an error message if it is not supported
v29 Jan 07, 2008 : * Bram M pointed out that cpo is a global option and that
                     getscriptPlugin.vim was setting it but not restoring it.
v28 Jan 02, 2008 : * improved shell quoting character handling, cygwin
                     interface, register-a bypass
    Oct 29, 2007   * Bill McCarthy suggested a change to getscript that avoids
                     creating pop-up windows
v24 Apr 16, 2007 : * removed save&restore of the fo option during script
                     loading
v23 Nov 03, 2006 : * ignores comments (#...)
                   * handles vimballs
v22 Oct 13, 2006 : * supports automatic use of curl if wget is not
                     available
v21 May 01, 2006 : * now takes advantage of autoloading.
v20 Dec 23, 2005 : * Eric Haarbauer found&fixed a bug with unzip use;
                     unzip needs the -o flag to overwrite.
v19 Nov 28, 2005 : * v18's GetLatestVimScript line accessed the wrong
                     script! Fixed.
v18 Mar 21, 2005 : * bugfix to automatic database construction
                   * bugfix - nowrapscan caused an error
                     (tnx to David Green for the fix)
    Apr 01, 2005   * if shell is bash, "mv" instead of "ren" used in
                     :AutoInstall:s, even though its o/s is windows
    Apr 01, 2005   * when downloading errors occurred, GLVS was
                     terminating early.  It now just goes on to trying
                     the next script (after trying three times to
                     download a script description page)
    Apr 20, 2005   * bugfix - when a failure to download occurred,
```

```
                    GetLatestVimScripts would stop early and claim that
                    everything was current.  Fixed.
v17 Aug 25, 2004 : * g:GetLatestVimScripts_allowautoinstall, which
                    defaults to 1, can be used to prevent all
                    :AutoInstall:
v16 Aug 25, 2004 : * made execution of bunzip2/gunzip/tar/zip silent
                  * fixed bug with :AutoInstall: use of helptags
v15 Aug 24, 2004 : * bugfix: the "0 0 comment" download prevention wasn't
                    always preventing downloads (just usually).  Fixed.
v14 Aug 24, 2004 : * bugfix -- helptags was using dotvim, rather than
                    s:dotvim.  Fixed.
v13 Aug 23, 2004 : * will skip downloading a file if its scriptid or srcid
                    is zero.  Useful for script authors; that way their
                    own GetLatestVimScripts activity won't overwrite
                    their scripts.
v12 Aug 23, 2004 : * bugfix - a "return" got left in the distribution that
                    was intended only for testing.  Removed, now works.
                  * :AutoInstall: implemented
v11 Aug 20, 2004 : * GetLatestVimScripts is now a plugin:
                  * :GetLatestVimScripts command
                  * (runtimepath)/GetLatest/GetLatestVimScripts.dat
                    now holds scripts that need updating
v10 Apr 19, 2004 : * moved history from script to doc
v9  Jan 23, 2004 :   windows (win32/win16/win95) will use
                    double quotes ("") whereas other systems will use
                    single quotes ('') around the urls in calls via wget
v8  Dec 01, 2003 :   makes three tries at downloading
v7  Sep 02, 2003 :   added error messages if "Click on..." or "src_id="
                    not found in downloaded webpage
                    Uses t_ti, t_te, and rs to make progress visible
v6  Aug 06, 2003 :   final status messages now display summary of work
                    ( "Downloaded someqty scripts" or
                      "Everything was current")
                    Now GetLatestVimScripts is careful about downloading
                    GetLatestVimScripts.vim itself!
                    (goes to <NEW_GetLatestVimScripts.vim>)
v5  Aug 04, 2003 :   missing an endif near bottom
v4  Jun 17, 2003 :   redraw! just before each "considering" message
v3  May 27, 2003 :   Protects downloaded files from errant shell
                    expansions with single quotes: '...'
v2  May 14, 2003 :   extracts name of item to be obtained from the
                    script file.  Uses it instead of comment field
                    for output filename; comment is used in the
                    "considering..." line and is now just a comment!
                  * Fixed a bug: a string-of-numbers is not the
                    same as a number, so I added zero to them
                    and they became numbers.  Fixes comparison.

==============================================================================
vim:tw=78:ts=8:noet:ft=help:fdm=marker
```

pi_gzip.txt For Vim version 8.1. Last change: 2016 Nov 06

VIM REFERENCE MANUAL by Bram Moolenaar

Editing compressed files with Vim gzip bzip2 compress

1. Autocommands gzip-autocmd

The functionality mentioned here is a standard-plugin .
This plugin is only available if 'compatible' is not set.
You can avoid loading this plugin by setting the "loaded_gzip" variable:

```
:let loaded_gzip = 1
```

{Vi does not have any of this}

==
1. Autocommands gzip-autocmd

The plugin installs autocommands to intercept reading and writing of files
with these extensions:

extension	compression
*.Z	compress (Lempel-Ziv)
*.gz	gzip
*.bz2	bzip2
*.lzma	lzma
*.xz	xz
*.lz	lzip
*.zst	zstd

That's actually the only thing you need to know. There are no options.

After decompressing a file, the filetype will be detected again. This will
make a file like "foo.c.gz" get the "c" filetype.

If you have 'patchmode' set, it will be appended after the extension for
compression. Thus editing the patchmode file will not give you the automatic
decompression. You have to rename the file if you want this.

Author: Charles E. Campbell <NdrOchip@ScampbellPfamily.AbizM>

==========

1. Contents logiPat logiPat-contents

==========

2. LogiPat Manual logiPat-manual logiPat-man

logiPat-arg logiPat-input logiPat-pattern logiPat-operators

Boolean logic patterns are composed of

```
operators  ! = not
           | = logical-or
           & = logical-and
grouping   ( ... )
patterns   "pattern"
```

:LogiPat {boolean-logic pattern} :LogiPat

:LogiPat is a command which takes a boolean-logic argument (logiPat-arg).

:LP {boolean-logic pattern} :LP

:LP is a shorthand command version of :LogiPat

:LPE {boolean-logic pattern} :LPE

No search is done, but the conversion from the boolean logic pattern to the regular expression is performed and echoed onto the display.

:LogiPatFlags {search flags} LogiPat-flags

:LogiPatFlags {search flags}
LogiPat uses the search() command. The flags passed to that call to search() may be specified by the :LogiPatFlags command.

:LPF {search flags} :LPF

:LPF is a shorthand version of :LogiPatFlags.

:let pat=LogiPat({boolean-logic pattern}) LogiPat()

If one calls LogiPat() directly, no search is done, but the transformation from the boolean

logic pattern into a regular expression pattern
is performed and returned.

To get a " inside a pattern, as opposed to having it delimit
the pattern, double it.

==
3. LogiPat Examples logiPat-examples

LogiPat takes Boolean logic arguments and produces a regular
expression which implements the choices. A series of examples
follows:

:LogiPat "abc"
will search for lines containing the string :abc:

:LogiPat "ab""cd"
will search for lines containing the string :ab"c:

:LogiPat !"abc"
will search for lines which don't contain the string :abc:

:LogiPat "abc"|"def"
will search for lines which contain either the string
:abc: or the string :def:

:LogiPat !("abc"|"def")
will search for lines which don't contain either
of the strings :abc: or :def:

:LogiPat "abc"&"def"
will search for lines which contain both of the strings
:abc: and :def:

:let pat= LogiPat('!"abc"')
will return the regular expression which will match
all lines not containing :abc: . The double quotes
are needed to pass normal patterns to LogiPat, and
differentiate such patterns from boolean logic
operators.

==
4. Caveat logiPat-caveat

The "not" operator may be fragile; ie. it may not always play well
with the & (logical-and) and | (logical-or) operators. Please try out
your patterns, possibly with :set hls, to insure that what is matching
is what you want.

==
3. LogiPat History logiPat-history

```
        v4 Jun 22, 2015 * LogiPat has been picked up by Bram M for standard
                          plugin distribution; hence the name change
        v3 Sep 25, 2006 * LP_Or() fixed; it now encapsulates its output
                          in \%(...\) parentheses
           Dec 12, 2011 *  :LPE  added
                        * "" is mapped to a single " and left inside patterns
        v2 May 31, 2005 * LPF and LogiPatFlags commands weren't working
        v1 May 23, 2005 * initial release

NETRW REFERENCE MANUAL by Charles E. Campbell

Author: Charles E. Campbell <NdrOchip@ScampbellPfamily.AbizM>
(remove NOSPAM from Campbell's email first)

netrw
dav ftp netrw-file rcp scp
davs http netrw.vim rsync sftp
fetch network

==========

1. Contents netrw-contents {{{1

{Vi does not have any of this}

==
2. Starting With Netrw   netrw-start {{{1

Netrw makes reading files, writing files, browsing over a network, and
local browsing easy! First, make sure that you have plugins enabled, so
you'll need to have at least the following in your <.vimrc>:
(or see netrw-activate)

```
        set nocp                    " 'compatible' is not set
        filetype plugin on          " plugins are enabled
```

(see 'cp' and :filetype-plugin-on)

Netrw supports "transparent" editing of files on other machines using urls
(see netrw-transparent). As an example of this, let's assume you have an
account on some other machine; if you can use scp, try:

```
        vim scp://hostname/path/to/file
```

Want to make ssh/scp easier to use? Check out netrw-ssh-hack !

So, what if you have ftp, not ssh/scp? That's easy, too; try

```
        vim ftp://hostname/path/to/file
```

Want to make ftp simpler to use? See if your ftp supports a file called
<.netrc> -- typically it goes in your home directory, has read/write
permissions for only the user to read (ie. not group, world, other, etc),
and has lines resembling

```
        machine HOSTNAME login USERID password "PASSWORD"
        machine HOSTNAME login USERID password "PASSWORD"
        ...
        default          login USERID password "PASSWORD"
```

Windows' ftp doesn't support .netrc; however, one may have in one's .vimrc:

```
   let g:netrw_ftp_cmd= 'c:\Windows\System32\ftp -s:C:\Users\MyUserName\MACHINE'
```

Netrw will substitute the host's machine name for "MACHINE" from the URL it is
attempting to open, and so one may specify

```
        userid
        password
```

for each site in a separate file: c:\Users\MyUserName\MachineName.

Now about browsing -- when you just want to look around before editing a
file. For browsing on your current host, just "edit" a directory:

```
vim .
vim /home/userid/path
```

For browsing on a remote host, "edit" a directory (but make sure that
the directory name is followed by a "/"):

```
vim scp://hostname/
vim ftp://hostname/path/to/dir/
```

See netrw-browse for more!

There are more protocols supported by netrw than just scp and ftp, too: see the
next section, netrw-externapp , on how to use these external applications with
netrw and vim.

PREVENTING LOADING netrw-noload

If you want to use plugins, but for some reason don't wish to use netrw, then
you need to avoid loading both the plugin and the autoload portions of netrw.
You may do so by placing the following two lines in your <.vimrc>:

```
:let g:loaded_netrw       = 1
:let g:loaded_netrwPlugin = 1
```

==========

3. Netrw Reference netrw-ref {{{1

Netrw supports several protocols in addition to scp and ftp as mentioned
in netrw-start . These include dav, fetch, http,... well, just look
at the list in netrw-externapp . Each protocol is associated with a
variable which holds the default command supporting that protocol.

EXTERNAL APPLICATIONS AND PROTOCOLS netrw-externapp {{{2

Protocol	Variable	Default Value	
dav:	g:netrw_dav_cmd	= "cadaver"	if cadaver is executable
dav:	g:netrw_dav_cmd	= "curl -o"	elseif curl is available
fetch:	g:netrw_fetch_cmd	= "fetch -o"	if fetch is available
ftp:	g:netrw_ftp_cmd	= "ftp"	
http:	g:netrw_http_cmd	= "elinks"	if elinks is available
http:	g:netrw_http_cmd	= "links"	elseif links is available
http:	g:netrw_http_cmd	= "curl"	elseif curl is available
http:	g:netrw_http_cmd	= "wget"	elseif wget is available
http:	g:netrw_http_cmd	= "fetch"	elseif fetch is available
http:	g:netrw_http_put_cmd	= "curl -T"	
rcp:	g:netrw_rcp_cmd	= "rcp"	
rsync:	g:netrw_rsync_cmd	= "rsync"	(see g:netrw_rsync_sep)
scp:	g:netrw_scp_cmd	= "scp -q"	

```
  sftp:    g:netrw_sftp_cmd      = "sftp"
  file:    g:netrw_file_cmd      = "elinks" or "links"
```

g:netrw_http_xcmd : the option string for http://... protocols are specified via this variable and may be independently overridden. By default, the option arguments for the http-handling commands are:

```
            elinks : "-source >"
            links  : "-dump >"
            curl   : "-L -o"
            wget   : "-q -O"
            fetch  : "-o"
```

For example, if your system has elinks, and you'd rather see the page using an attempt at rendering the text, you may wish to have

```
        let g:netrw_http_xcmd= "-dump >"
```

in your .vimrc.

g:netrw_http_put_cmd: this option specifies both the executable and any needed options. This command does a PUT operation to the url.

READING netrw-read netrw-nread {{{2

Generally, one may just use the URL notation with a normal editing command, such as

```
        :e ftp://[user@]machine/path
```

Netrw also provides the Nread command:

```
:Nread ?                                        give help
:Nread "machine:path"                           uses rcp
:Nread "machine path"                           uses ftp w/ <.netrc>
:Nread "machine id password path"               uses ftp
:Nread "dav://machine[:port]/path"              uses cadaver
:Nread "fetch://[user@]machine/path"            uses fetch
:Nread "ftp://[user@]machine[[:#]port]/path"    uses ftp w/ <.netrc>
:Nread "http://[user@]machine/path"             uses http  uses wget
:Nread "rcp://[user@]machine/path"              uses rcp
:Nread "rsync://[user@]machine[:port]/path"     uses rsync
:Nread "scp://[user@]machine[[:#]port]/path"    uses scp
:Nread "sftp://[user@]machine/path"             uses sftp
```

WRITING netrw-write netrw-nwrite {{{2

One may just use the URL notation with a normal file writing command, such as

```
        :w ftp://[user@]machine/path
```

Netrw also provides the Nwrite command:

```
:Nwrite ?                                       give help
```

```
:Nwrite "machine:path"                          uses rcp
:Nwrite "machine path"                          uses ftp w/ <.netrc>
:Nwrite "machine id password path"              uses ftp
:Nwrite "dav://machine[:port]/path"             uses cadaver
:Nwrite "ftp://[user@]machine[[:#]port]/path"   uses ftp w/ <.netrc>
:Nwrite "rcp://[user@]machine/path"             uses rcp
:Nwrite "rsync://[user@]machine[:port]/path"    uses rsync
:Nwrite "scp://[user@]machine[[:#]port]/path"   uses scp
:Nwrite "sftp://[user@]machine/path"            uses sftp
http: not supported!
```

SOURCING netrw-source {{{2

One may just use the URL notation with the normal file sourcing command, such as

```
:so ftp://[user@]machine/path
```

Netrw also provides the Nsource command:

```
:Nsource ?                                      give help
:Nsource "dav://machine[:port]/path"            uses cadaver
:Nsource "fetch://[user@]machine/path"          uses fetch
:Nsource "ftp://[user@]machine[[:#]port]/path"  uses ftp w/ <.netrc>
:Nsource "http://[user@]machine/path"           uses http  uses wget
:Nsource "rcp://[user@]machine/path"            uses rcp
:Nsource "rsync://[user@]machine[:port]/path"   uses rsync
:Nsource "scp://[user@]machine[[:#]port]/path"  uses scp
:Nsource "sftp://[user@]machine/path"           uses sftp
```

DIRECTORY LISTING netrw-trailingslash netrw-dirlist {{{2

One may browse a directory to get a listing by simply attempting to edit the directory:

```
:e scp://[user]@hostname/path/
:e ftp://[user]@hostname/path/
```

For remote directory listings (ie. those using scp or ftp), that trailing "/" is necessary (the slash tells netrw to treat the argument as a directory to browse instead of as a file to download).

The Nread command may also be used to accomplish this (again, that trailing slash is necessary):

```
:Nread [protocol]://[user]@hostname/path/
```

CHANGING USERID AND PASSWORD netrw-login netrw-password netrw-chgup netrw-userpass {{{2

Attempts to use ftp will prompt you for a user-id and a password. These will be saved in global variables g:netrw_uid and s:netrw_passwd ; subsequent use of ftp will re-use those two strings, thereby simplifying use of ftp. However, if you need to use a

different user id and/or password, you'll want to call NetUserPass() first. To work around the need to enter passwords, check if your ftp supports a <.netrc> file in your home directory. Also see netrw-passwd (and if you're using ssh/scp hoping to figure out how to not need to use passwords for scp, look at netrw-ssh-hack).

```
:NetUserPass [uid [password]]          -- prompts as needed
:call NetUserPass()                    -- prompts for uid and password
:call NetUserPass("uid")               -- prompts for password
:call NetUserPass("uid","password")    -- sets global uid and password
```

(Related topics: ftp netrw-userpass netrw-start)

NETRW VARIABLES AND SETTINGS netrw-variables {{{2

(Also see:
netrw-browser-var : netrw browser option variables
netrw-protocol : file transfer protocol option variables
netrw-settings : additional file transfer options
netrw-browser-options : these options affect browsing directories
)

Netrw provides a lot of variables which allow you to customize netrw to your preferences. One way to look at them is via the command :NetrwSettings (see netrw-settings) which will display your current netrw settings. Most such settings are described below, in netrw-browser-options , and in netrw-externapp :

b:netrw_lastfile — last file Network-read/written retained on a per-buffer basis (supports plain :Nw)

g:netrw_bufsettings — the settings that netrw buffers have (default) noma nomod nonu nowrap ro nobl

g:netrw_chgwin — specifies a window number where subsequent file edits will take place. (also see netrw-C) (default) -1

g:Netrw_funcref — specifies a function (or functions) to be called when netrw edits a file. The file is first edited, and then the function reference (Funcref) is called. This variable may also hold a List of Funcrefs. (default) not defined. (the capital in g:Netrw... is required by its holding a function reference)

```
Example: place in .vimrc; affects all file opening
fun! MyFuncRef()
endfun
let g:Netrw_funcref= function("MyFuncRef")
```

g:Netrw_UserMaps — specifies a function or List of functions which can be used to set up user-specified maps and functionality. See netrw-usermaps

```
g:netrw_ftp             if it doesn't exist, use default ftp
                      =0 use default ftp                    (uid password)
                      =1 use alternate ftp method      (user uid password)
                         If you're having trouble with ftp, try changing the
                         value of this variable to see if the alternate ftp
                         method works for your setup.

g:netrw_ftp_options       Chosen by default, these options are supposed to
                       turn interactive prompting off and to restrain ftp
                       from attempting auto-login upon initial connection.
                       However, it appears that not all ftp implementations
                       support this (ex. ncftp).
                      ="-i -n"

g:netrw_ftpextracmd   default: doesn't exist
                      If this variable exists, then any string it contains
                      will be placed into the commands set to your ftp
                      client.  As an example:
                         ="passive"

g:netrw_ftpmode       ="binary"                                  (default)
                      ="ascii"

g:netrw_ignorenetrc   =0 (default for linux, cygwin)
                      =1 If you have a <.netrc> file but it doesn't work and
                         you want it ignored, then set this variable as
                         shown. (default for Windows + cmd.exe)

g:netrw_menu          =0 disable netrw's menu
                      =1 (default) netrw's menu enabled

g:netrw_nogx          if this variable exists, then the "gx" map will not
                      be available (see  netrw-gx )

g:netrw_uid           (ftp) user-id,      retained on a per-vim-session basis
s:netrw_passwd        (ftp) password,     retained on a per-vim-session basis

g:netrw_preview       =0 (default) preview window shown in a horizontally
                         split window
                      =1 preview window shown in a vertically split window.
                         Also affects the "previous window" (see  netrw-P )
                         in the same way.
                      The  g:netrw_alto  variable may be used to provide
                      additional splitting control:
                              g:netrw_preview g:netrw_alto result
                                       0             0      :aboveleft
                                       0             1      :belowright
                                       1             0      :topleft
                                       1             1      :botright
                      To control sizing, see  g:netrw_winsize

g:netrw_scpport       = "-P" : option to use to set port for scp
g:netrw_sshport       = "-p" : option to use to set port for ssh
```

```
  g:netrw_sepchr        =\0xff
                        =\0x01 for enc == euc-jp (and perhaps it should be for
                           others, too, please let me know)
                           Separates priority codes from filenames internally.
                           See  netrw-p12 .

   g:netrw_silent       =0 : transfers done normally
                        =1 : transfers done silently

  g:netrw_use_errorwindow  =1 : messages from netrw will use a separate one
                              line window.  This window provides reliable
                              delivery of messages. (default)
                           =0 : messages from netrw will use echoerr ;
                              messages don't always seem to show up this
                              way, but one doesn't have to quit the window.

  g:netrw_win95ftp      =1 if using Win95, will remove four trailing blank
                           lines that o/s's ftp "provides" on transfers
                        =0 force normal ftp behavior (no trailing line removal)

  g:netrw_cygwin        =1 assume scp under windows is from cygwin. Also
                           permits network browsing to use ls with time and
                           size sorting (default if windows)
                        =0 assume Windows' scp accepts windows-style paths
                           Network browsing uses dir instead of ls
                           This option is ignored if you're using unix

  g:netrw_use_nt_rcp    =0 don't use the rcp of WinNT, Win2000 and WinXP
                        =1 use WinNT's rcp in binary mode         (default)
```

PATHS netrw-path {{{2

Paths to files are generally user-directory relative for most protocols.
It is possible that some protocol will make paths relative to some
associated directory, however.

```
        example:  vim scp://user@host/somefile
        example:  vim scp://user@host/subdir1/subdir2/somefile
```

where "somefile" is in the "user"'s home directory. If you wish to get a
file using root-relative paths, use the full path:

```
        example:  vim scp://user@host//somefile
        example:  vim scp://user@host//subdir1/subdir2/somefile
```

==========

4. Network-Oriented File Transfer netrw-xfer {{{1

Network-oriented file transfer under Vim is implemented by a vim script
(<netrw.vim>) using plugin techniques. It currently supports both reading and
writing across networks using rcp, scp, ftp or ftp+<.netrc>, scp, fetch,
dav/cadaver, rsync, or sftp.

http is currently supported read-only via use of wget or fetch.

<netrw.vim> is a standard plugin which acts as glue between Vim and the
various file transfer programs. It uses autocommand events (BufReadCmd,
FileReadCmd, BufWriteCmd) to intercept reads/writes with url-like filenames.

        ex. vim ftp://hostname/path/to/file

The characters preceding the colon specify the protocol to use; in the
example, it's ftp. The <netrw.vim> script then formulates a command or a
series of commands (typically ftp) which it issues to an external program
(ftp, scp, etc) which does the actual file transfer/protocol. Files are read
from/written to a temporary file (under Unix/Linux, /tmp/...) which the
<netrw.vim> script will clean up.

Now, a word about Jan Minář's "FTP User Name and Password Disclosure"; first,
ftp is not a secure protocol. User names and passwords are transmitted "in
the clear" over the internet; any snooper tool can pick these up; this is not
a netrw thing, this is a ftp thing. If you're concerned about this, please
try to use scp or sftp instead.

Netrw re-uses the user id and password during the same vim session and so long
as the remote hostname remains the same.

Jan seems to be a bit confused about how netrw handles ftp; normally multiple
commands are performed in a "ftp session", and he seems to feel that the
uid/password should only be retained over one ftp session. However, netrw
does every ftp operation in a separate "ftp session"; so remembering the
uid/password for just one "ftp session" would be the same as not remembering
the uid/password at all. IMHO this would rapidly grow tiresome as one
browsed remote directories, for example.

On the other hand, thanks go to Jan M. for pointing out the many
vulnerabilities that netrw (and vim itself) had had in handling "crafted"
filenames. The shellescape() and fnameescape() functions were written in
response by Bram Moolenaar to handle these sort of problems, and netrw has
been modified to use them. Still, my advice is, if the "filename" looks like
a vim command that you aren't comfortable with having executed, don't open it.

                                netrw-putty netrw-pscp netrw-psftp
One may modify any protocol's implementing external application by setting a
variable (ex. scp uses the variable g:netrw_scp_cmd, which is defaulted to
"scp -q"). As an example, consider using PuTTY:

        let g:netrw_scp_cmd = '"c:\Program Files\PuTTY\pscp.exe" -q -batch'
        let g:netrw_sftp_cmd= '"c:\Program Files\PuTTY\psftp.exe"'

(note: it has been reported that windows 7 with putty v0.6's "-batch" option
       doesn't work, so its best to leave it off for that system)

See netrw-p8 for more about putty, pscp, psftp, etc.

Ftp, an old protocol, seems to be blessed by numerous implementations.
Unfortunately, some implementations are noisy (ie., add junk to the end of the

file). Thus, concerned users may decide to write a NetReadFixup() function
that will clean up after reading with their ftp. Some Unix systems (ie.,
FreeBSD) provide a utility called "fetch" which uses the ftp protocol but is
not noisy and more convenient, actually, for <netrw.vim> to use.
Consequently, if "fetch" is available (ie. executable), it may be preferable
to use it for ftp://... based transfers.

For rcp, scp, sftp, and http, one may use network-oriented file transfers
transparently; ie.

        vim rcp://[user@]machine/path
        vim scp://[user@]machine/path

If your ftp supports <.netrc>, then it too can be transparently used
if the needed triad of machine name, user id, and password are present in
that file. Your ftp must be able to use the <.netrc> file on its own, however.

        vim ftp://[user@]machine[[:#]portnumber]/path

Windows provides an ftp (typically c:\Windows\System32\ftp.exe) which uses
an option, -s:filename (filename can and probably should be a full path)
which contains ftp commands which will be automatically run whenever ftp
starts. You may use this feature to enter a user and password for one site:
        userid
        password
                                netrw-windows-netrc   netrw-windows-s
If g:netrw_ftp_cmd contains -s:[path/]MACHINE, then (on Windows machines
only) netrw will substitute the current machine name requested for ftp
connections for MACHINE. Hence one can have multiple machine.ftp files
containing login and password for ftp. Example:

    let g:netrw_ftp_cmd= 'c:\Windows\System32\ftp -s:C:\Users\Myself\MACHINE'
    vim ftp://myhost.somewhere.net/

will use a file

        C:\Users\Myself\myhost.ftp

Often, ftp will need to query the user for the userid and password.
The latter will be done "silently"; ie. asterisks will show up instead of
the actually-typed-in password. Netrw will retain the userid and password
for subsequent read/writes from the most recent transfer so subsequent
transfers (read/write) to or from that machine will take place without
additional prompting.

                                                              netrw-urls

+==================================+==============================+============+
```

(*1) For an absolute path use scp://machine//path.

(*2) if <.netrc> is present, it is assumed that it will
work with your ftp client. Otherwise the script will
prompt for user-id and password.

(*3) for ftp, "machine" may be machine#port or machine:port
if a different port is needed than the standard ftp port

(*4) for http:..., if wget is available it will be used. Otherwise,
if fetch is available it will be used.

Both the :Nread and the :Nwrite ex-commands can accept multiple filenames.

NETRC netrw-netrc

The <.netrc> file, typically located in your home directory, contains lines therein which map a hostname (machine name) to the user id and password you prefer to use with it.

The typical syntax for lines in a <.netrc> file is given as shown below. Ftp under Unix usually supports <.netrc>; ftp under Windows usually doesn't.

```
machine {full machine name} login {user-id} password "{password}"
default login {user-id} password "{password}"
```

Your ftp client must handle the use of <.netrc> on its own, but if the <.netrc> file exists, an ftp transfer will not ask for the user-id or password.

> Note:
> Since this file contains passwords, make very sure nobody else can read this file! Most programs will refuse to use a .netrc that is readable for others. Don't forget that the system administrator can still read the file! Ie. for Linux/Unix: chmod 600 .netrc

Even though Windows' ftp clients typically do not support .netrc, netrw has a work-around: see netrw-windows-s .

PASSWORD netrw-passwd

The script attempts to get passwords for ftp invisibly using inputsecret() , a built-in Vim function. See netrw-userpass for how to change the password after one has set it.

Unfortunately there doesn't appear to be a way for netrw to feed a password to scp. Thus every transfer via scp will require re-entry of the password. However, netrw-ssh-hack can help with this problem.

---

5. Activation netrw-activate {{{1

Network-oriented file transfers are available by default whenever Vim's 'nocompatible' mode is enabled. Netrw's script files reside in your system's plugin, autoload, and syntax directories; just the plugin/netrwPlugin.vim script is sourced automatically whenever you bring up vim. The main script in autoload/netrw.vim is only loaded when you actually use netrw. I suggest that, at a minimum, you have at least the following in your <.vimrc> customization file:

```
set nocp
if version >= 600
  filetype plugin indent on
endif
```

By also including the following lines in your .vimrc, one may have netrw immediately activate when using [g]vim without any filenames, showing the current directory:

```
" Augroup VimStartup:
augroup VimStartup
  au!
  au VimEnter * if expand("%") == "" | e . | endif
augroup END
```

==========

6. Transparent Remote File Editing netrw-transparent {{{1

Transparent file transfers occur whenever a regular file read or write (invoked via an :autocmd for BufReadCmd , BufWriteCmd , or SourceCmd events) is made. Thus one may read, write, or source files across networks just as easily as if they were local files!

```
vim ftp://[user@]machine/path
...
:wq
```

See netrw-activate for more on how to encourage your vim to use plugins such as netrw.

==========

7. Ex Commands netrw-ex {{{1

The usual read/write commands are supported. There are also a few additional commands available. Often you won't need to use Nwrite or Nread as shown in netrw-transparent (ie. simply use

```
  :e URL
  :r URL
  :w URL
```

instead, as appropriate) -- see netrw-urls . In the explanations below, a {netfile} is a URL to a remote file.

:Nwrite :Nw

:[range]Nw[rite] Write the specified lines to the current file as specified in b:netrw_lastfile. (related: netrw-nwrite)

:[range]Nw[rite] {netfile} [{netfile}]...
Write the specified lines to the {netfile}.

:Nread :Nr

:Nr[ead] Read the lines from the file specified in b:netrw_lastfile into the current buffer. (related: netrw-nread)

:Nr[ead] {netfile} {netfile}...
Read the {netfile} after the current line.

:Nsource :Ns
:Ns[ource] {netfile}
Source the {netfile}.
To start up vim using a remote .vimrc, one may use
the following (all on one line) (tnx to Antoine Mechelynck)
vim -u NORC -N
--cmd "runtime plugin/netrwPlugin.vim"
--cmd "source scp://HOSTNAME/.vimrc"
(related: netrw-source)

:call NetUserPass() NetUserPass()
If g:netrw_uid and s:netrw_passwd don't exist,
this function will query the user for them.
(related: netrw-userpass)

:call NetUserPass("userid")
This call will set the g:netrw_uid and, if
the password doesn't exist, will query the user for it.
(related: netrw-userpass)

:call NetUserPass("userid","passwd")
This call will set both the g:netrw_uid and s:netrw_passwd.
The user-id and password are used by ftp transfers. One may
effectively remove the user-id and password by using empty
strings (ie. "").
(related: netrw-userpass)

:NetrwSettings This command is described in netrw-settings -- used to
display netrw settings and change netrw behavior.

==========

8. Variables and Options netrw-var netrw-settings {{{1

(also see: netrw-options netrw-variables netrw-protocol
netrw-browser-settings netrw-browser-options)

The <netrw.vim> script provides several variables which act as options to
affect <netrw.vim>'s file transfer behavior. These variables typically may be
set in the user's <.vimrc> file: (see also netrw-settings netrw-protocol)
netrw-options

Netrw Options

Option	Meaning
b:netrw_col	Holds current cursor position (during NetWrite)
g:netrw_cygwin	=1 assume scp under windows is from cygwin (default/windows)
	=0 assume scp under windows accepts windows style paths (default/else)

```
g:netrw_ftp             =0 use default ftp           (uid password)
g:netrw_ftpmode         ="binary"                    (default)
                        ="ascii"                     (your choice)
g:netrw_ignorenetrc     =1                           (default)
                           if you have a <.netrc> file but you don't
                           want it used, then set this variable.  Its
                           mere existence is enough to cause <.netrc>
                           to be ignored.
b:netrw_lastfile        Holds latest method/machine/path.
b:netrw_line            Holds current line number    (during NetWrite)
g:netrw_silent          =0 transfers done normally
                        =1 transfers done silently
g:netrw_uid             Holds current user-id for ftp.
g:netrw_use_nt_rcp      =0 don't use WinNT/2K/XP's rcp (default)
                        =1 use WinNT/2K/XP's rcp, binary mode
g:netrw_win95ftp        =0 use unix-style ftp even if win95/98/ME/etc
                        =1 use default method to do ftp
------------------------------------------------------------------------
```

netrw-internal-variables

The script will also make use of the following variables internally, albeit temporarily.

Temporary Variables

Variable	Meaning
b:netrw_method	Index indicating rcp/ftp+.netrc/ftp
w:netrw_method	(same as b:netrw_method)
g:netrw_machine	Holds machine name parsed from input
b:netrw_fname	Holds filename being accessed

netrw-protocol

Netrw supports a number of protocols. These protocols are invoked using the variables listed below, and may be modified by the user.

Protocol Control Options

Option	Type	Setting	Meaning
netrw_ftp	variable	=doesn't exist	userid set by "user userid"
		=0	userid set by "user userid"
		=1	userid set by "userid"
NetReadFixup	function	=doesn't exist	no change
		=exists	Allows user to have files read via ftp automatically transformed however they wish by NetReadFixup()
g:netrw_dav_cmd	var	="cadaver"	if cadaver is executable

```
    g:netrw_dav_cmd      var   ="curl -o"      elseif curl is executable
    g:netrw_fetch_cmd    var   ="fetch -o"     if fetch is available
    g:netrw_ftp_cmd      var   ="ftp"
    g:netrw_http_cmd     var   ="fetch -o"     if      fetch is available
    g:netrw_http_cmd     var   ="wget -O"      else if wget  is available
    g:netrw_http_put_cmd var   ="curl -T"
     g:netrw_list_cmd      var   ="ssh USEPORT HOSTNAME ls -Fa"
    g:netrw_rcp_cmd      var   ="rcp"
    g:netrw_rsync_cmd    var   ="rsync"
     g:netrw_rsync_sep     var   ="/"            used to separate the hostname
                                                from the file spec
    g:netrw_scp_cmd      var   ="scp -q"
    g:netrw_sftp_cmd     var   ="sftp"
    ------------------------------------------------------------------------
```

The g:netrw_..._cmd options (g:netrw_ftp_cmd and g:netrw_sftp_cmd) specify the external program to use handle the ftp protocol. They may include command line options (such as -p for passive mode). Example:

```
        let g:netrw_ftp_cmd= "ftp -p"
```

Browsing is supported by using the g:netrw_list_cmd ; the substring "HOSTNAME" will be changed via substitution with whatever the current request is for a hostname.

Two options (g:netrw_ftp and netrw-fixup) both help with certain ftp's that give trouble . In order to best understand how to use these options if ftp is giving you troubles, a bit of discussion is provided on how netrw does ftp reads.

For ftp, netrw typically builds up lines of one of the following formats in a temporary file:

```
  IF g:netrw_ftp !exists or is not 1     IF g:netrw_ftp exists and is 1
  ----------------------------------     ------------------------------

       open machine [port]                    open machine [port]
       user userid password                   userid password
       [g:netrw_ftpmode]                      password
       [g:netrw_ftpextracmd]                  [g:netrw_ftpmode]
       get filename tempfile                  [g:netrw_extracmd]
                                              get filename tempfile
  ------------------------------------------------------------------------
```

The g:netrw_ftpmode and g:netrw_ftpextracmd are optional.

Netrw then executes the lines above by use of a filter:

```
        :%! {g:netrw_ftp_cmd} -i [-n]
```

where

```
        g:netrw_ftp_cmd is usually "ftp",
```

```
        -i tells ftp not to be interactive
        -n means don't use netrc and is used for Method #3 (ftp w/o <.netrc>)
```

If <.netrc> exists it will be used to avoid having to query the user for
userid and password. The transferred file is put into a temporary file.
The temporary file is then read into the main editing session window that
requested it and the temporary file deleted.

If your ftp doesn't accept the "user" command and immediately just demands a
userid, then try putting "let netrw_ftp=1" in your <.vimrc>.

netrw-cadaver

To handle the SSL certificate dialog for untrusted servers, one may pull
down the certificate and place it into /usr/ssl/cert.pem. This operation
renders the server treatment as "trusted".

netrw-fixup netreadfixup

If your ftp for whatever reason generates unwanted lines (such as AUTH
messages) you may write a NetReadFixup() function:

```
    function! NetReadFixup(method,line1,line2)
      " a:line1: first new line in current file
      " a:line2: last  new line in current file
      if     a:method == 1 "rcp
      elseif a:method == 2 "ftp + <.netrc>
      elseif a:method == 3 "ftp + machine,uid,password,filename
      elseif a:method == 4 "scp
      elseif a:method == 5 "http/wget
      elseif a:method == 6 "dav/cadaver
      elseif a:method == 7 "rsync
      elseif a:method == 8 "fetch
      elseif a:method == 9 "sftp
      else                 " complain
      endif
    endfunction
```

The NetReadFixup() function will be called if it exists and thus allows you to
customize your reading process. As a further example, <netrw.vim> contains
just such a function to handle Windows 95 ftp. For whatever reason, Windows
95's ftp dumps four blank lines at the end of a transfer, and so it is
desirable to automate their removal. Here's some code taken from <netrw.vim>
itself:

```
    if has("win95") && g:netrw_win95ftp
     fun! NetReadFixup(method, line1, line2)
       if method == 3   " ftp (no <.netrc>)
        let fourblanklines= line2 - 3
        silent fourblanklines.",".line2."g/^\s*/d"
       endif
     endfunction
    endif
```

==
9. Browsing   netrw-browsing   netrw-browse   netrw-help {{{1
                         netrw-browser   netrw-dir   netrw-list

INTRODUCTION TO BROWSING   netrw-intro-browse {{{2
        (Quick References: netrw-quickmaps   netrw-quickcoms)

Netrw supports the browsing of directories on your local system and on remote
hosts; browsing includes listing files and directories, entering directories,
editing files therein, deleting files/directories, making new directories,
moving (renaming) files and directories, copying files and directories, etc.
One may mark files and execute any system command on them! The Netrw browser
generally implements the previous explorer's maps and commands for remote
directories, although details (such as pertinent global variable names)
necessarily differ. To browse a directory, simply "edit" it!

        vim /your/directory/
        vim .
        vim c:\your\directory\

(Related topics: netrw-cr   netrw-o   netrw-p   netrw-P   netrw-t
                  netrw-mf   netrw-mx   netrw-D   netrw-R   netrw-v)

The Netrw remote file and directory browser handles two protocols: ssh and
ftp. The protocol in the url, if it is ftp, will cause netrw also to use ftp
in its remote browsing. Specifying any other protocol will cause it to be
used for file transfers; but the ssh protocol will be used to do remote
browsing.

To use Netrw's remote directory browser, simply attempt to read a "file" with
a trailing slash and it will be interpreted as a request to list a directory:

        vim [protocol]://[user@]hostname/path/

where [protocol] is typically scp or ftp. As an example, try:

        vim ftp://ftp.home.vim.org/pub/vim/

For local directories, the trailing slash is not required. Again, because it's
easy to miss: to browse remote directories, the URL must terminate with a
slash!

If you'd like to avoid entering the password repeatedly for remote directory
listings with ssh or scp, see netrw-ssh-hack . To avoid password entry with
ftp, see netrw-netrc (if your ftp supports it).

There are several things you can do to affect the browser's display of files:

        * To change the listing style, press the "i" key (netrw-i).
          Currently there are four styles: thin, long, wide, and tree.
          To make that change "permanent", see g:netrw_liststyle .

        * To hide files (don't want to see those xyz~ files anymore?) see
           netrw-ctrl-h .

* Press s to sort files by name, time, or size.

See netrw-browse-cmds for all the things you can do with netrw!

netrw-getftype netrw-filigree netrw-ftype

The getftype() function is used to append a bit of filigree to indicate filetype to locally listed files:

```
directory  : /
executable : *
fifo       : |
links      : @

BANNER DISPLAY                                                  netrw-I

One may toggle the displaying of the banner by pressing "I".

Also See:  g:netrw_banner

BOOKMARKING A DIRECTORY          netrw-mb   netrw-bookmark   netrw-bookmarks  {{{2

One may easily "bookmark" the currently browsed directory by using

        mb

                                                                  .netrwbook
Bookmarks are retained in between sessions of vim in a file called .netrwbook
as a  List , which is typically stored in the first directory on the user's
```

' runtimepath '; entries are kept in sorted order.

If there are marked files and/or directories, mb will add them to the bookmark list.

netrw-:NetrwMB

Addtionally, one may use :NetrwMB to bookmark files or directories.

:NetrwMB[!] [files/directories]

No bang: enters files/directories into Netrw's bookmark system

```
  No argument and in netrw buffer:
    if there are marked files        : bookmark marked files
    otherwise                        : bookmark file/directory under cursor
  No argument and not in netrw buffer: bookmarks current open file
  Has arguments                      :  glob() s each arg and bookmarks them
```

With bang: deletes files/directories from Netrw's bookmark system

The :NetrwMB command is available outside of netrw buffers (once netrw has been invoked in the session).

The file ".netrwbook" holds bookmarks when netrw (and vim) is not active. By default, its stored on the first directory on the user's 'runtimepath' .

Related Topics:

- netrw-gb how to return (go) to a bookmark

- g:netrw_home controls where .netrwbook is kept

BROWSING netrw-enter netrw-cr {{{2

Browsing is simple: move the cursor onto a file or directory of interest. Hitting the <cr> (the return key) will select the file or directory. Directories will themselves be listed, and files will be opened using the protocol given in the original read request.

> CAVEAT: There are four forms of listing (see netrw-i). Netrw assumes that two or more spaces delimit filenames and directory names for the long and wide listing formats. Thus, if your filename or directory name has two or more sequential spaces embedded in it, or any trailing spaces, then you'll need to use the "thin" format to select it.

The g:netrw_browse_split option, which is zero by default, may be used to cause the opening of files to be done in a new window or tab instead of the default. When the option is one or two, the splitting will be taken horizontally or vertically, respectively. When the option is set to three, a <cr> will cause the file to appear in a new tab.

When using the gui (gvim), one may select a file by pressing the <leftmouse>

button. In addition, if

 * g:netrw_retmap == 1   AND   (its default value is 0)
 * in a netrw-selected file, AND
 * the user doesn't already have a <2-leftmouse> mapping defined before
   netrw is loaded

then a doubly-clicked leftmouse button will return to the netrw browser window.

Netrw attempts to speed up browsing, especially for remote browsing where one may have to enter passwords, by keeping and re-using previously obtained directory listing buffers. The g:netrw_fastbrowse variable is used to control this behavior; one may have slow browsing (no buffer re-use), medium speed browsing (re-use directory buffer listings only for remote directories), and fast browsing (re-use directory buffer listings as often as possible). The price for such re-use is that when changes are made (such as new files are introduced into a directory), the listing may become out-of-date. One may always refresh directory listing buffers by pressing ctrl-L (see netrw-ctrl-l).

netrw-s-cr

Squeezing the Current Tree-Listing Directory

When the tree listing style is enabled (see netrw-i) and one is using gvim, then the <s-cr> mapping may be used to squeeze (close) the directory currently containing the cursor.

Otherwise, one may remap a key combination of one's own choice to get this effect:

```
nmap <buffer> <silent> <nowait> YOURKEYCOMBO  <Plug>NetrwTreeSqueeze
```

Put this line in $HOME/ftplugin/netrw/netrw.vim; it needs to be generated for netrw buffers only.

g:netrw_ssh_cmd	g:netrw_use_noswf

BROWSING WITH A HORIZONTALLY SPLIT WINDOW netrw-o netrw-horiz {{{2

Normally one enters a file or directory using the <cr>. However, the "o" map allows one to open a new window to hold the new directory listing or file. A horizontal split is used. (for vertical splitting, see netrw-v)

Normally, the o key splits the window horizontally with the new window and cursor at the top.

Associated setting variables: g:netrw_alto   g:netrw_winsize

Related topics:
        netrw-ctrl-r   netrw-o   netrw-p
        netrw-P   netrw-t   netrw-v
Associated setting variables:
    g:netrw_alto   control above/below splitting
    g:netrw_winsize control initial sizing

BROWSING WITH A NEW TAB netrw-t {{{2

Normally one enters a file or directory using the <cr>. The "t" map
allows one to open a new window holding the new directory listing or file in
a new tab.

If you'd like to have the new listing in a background tab, use gT .

Related topics:
        netrw-ctrl-r   netrw-o   netrw-p
        netrw-P   netrw-t   netrw-v
Associated setting variables:
    g:netrw_winsize control initial sizing

BROWSING WITH A VERTICALLY SPLIT WINDOW netrw-v {{{2

Normally one enters a file or directory using the <cr>. However, the "v" map
allows one to open a new window to hold the new directory listing or file. A
vertical split is used. (for horizontal splitting, see netrw-o)

Normally, the v key splits the window vertically with the new window and
cursor at the left.

There is only one tree listing buffer; using "v" on a displayed subdirectory
will split the screen, but the same buffer will be shown twice.

Related topics:
        netrw-ctrl-r   netrw-o   netrw-p
        netrw-P   netrw-t   netrw-v
Associated setting variables:
    g:netrw_altv   control right/left splitting
    g:netrw_winsize control initial sizing

BROWSING USING A GVIM SERVER netrw-ctrl-r {{{2

One may keep a browsing gvim separate from the gvim being used to edit.
Use the <c-r> map on a file (not a directory) in the netrw browser, and it
will use a gvim server (see g:netrw_servername). Subsequent use of <cr>
(see netrw-cr) will re-use that server for editing files.

Related topics:
        netrw-ctrl-r   netrw-o   netrw-p
        netrw-P   netrw-t   netrw-v

Associated setting variables:
        g:netrw_servername   : sets name of server
        g:netrw_browse_split : controls how <cr> will open files

CHANGE LISTING STYLE (THIN LONG WIDE TREE) netrw-i {{{2

The "i" map cycles between the thin, long, wide, and tree listing formats.

The thin listing format gives just the files' and directories' names.

The long listing is either based on the "ls" command via ssh for remote directories or displays the filename, file size (in bytes), and the time and date of last modification for local directories. With the long listing format, netrw is not able to recognize filenames which have trailing spaces. Use the thin listing format for such files.

The wide listing format uses two or more contiguous spaces to delineate filenames; when using that format, netrw won't be able to recognize or use filenames which have two or more contiguous spaces embedded in the name or any trailing spaces. The thin listing format will, however, work with such files. The wide listing format is the most compact.

The tree listing format has a top directory followed by files and directories preceded by one or more "|"s, which indicate the directory depth. One may open and close directories by pressing the <cr> key while atop the directory name.

One may make a preferred listing style your default; see g:netrw_liststyle .
As an example, by putting the following line in your .vimrc,

```
let g:netrw_liststyle= 3
```

the tree style will become your default listing style.

One typical way to use the netrw tree display is to:

```
vim .
(use i until a tree display shows)
navigate to a file
v  (edit as desired in vertically split window)
ctrl-w h  (to return to the netrw listing)
P (edit newly selected file in the previous window)
ctrl-w h  (to return to the netrw listing)
P (edit newly selected file in the previous window)
...etc...
```

Associated setting variables: g:netrw_liststyle g:netrw_maxfilenamelen
                               g:netrw_timefmt   g:netrw_list_cmd

CHANGE FILE PERMISSION netrw-gp {{{2

"gp" will ask you for a new permission for the file named under the cursor.
Currently, this only works for local files.

Associated setting variables: g:netrw_chgperm

CHANGING TO A BOOKMARKED DIRECTORY netrw-gb {{{2

To change directory back to a bookmarked directory, use

        {cnt}gb

Any count may be used to reference any of the bookmarks.
Note that netrw-qb shows both bookmarks and history; to go
to a location stored in the history see netrw-u and netrw-U .

Related Topics:
         netrw-mB how to delete bookmarks
         netrw-mb how to make a bookmark
         netrw-qb how to list bookmarks

CHANGING TO A PREDECESSOR DIRECTORY netrw-u netrw-updir {{{2

Every time you change to a new directory (new for the current session), netrw
will save the directory in a recently-visited directory history list (unless
 g:netrw_dirhistmax is zero; by default, it holds ten entries). With the "u"
map, one can change to an earlier directory (predecessor). To do the
opposite, see netrw-U .

The "u" map also accepts counts to go back in the history several slots. For
your convenience, qb (see netrw-qb) lists the history number which may be
used in that count.

                                                .netrwhist
See g:netrw_dirhistmax for how to control the quantity of history stack
slots. The file ".netrwhist" holds history when netrw (and vim) is not
active. By default, its stored on the first directory on the user's
 'runtimepath' .

Related Topics:
         netrw-U changing to a successor directory
         g:netrw_home controls where .netrwhist is kept

CHANGING TO A SUCCESSOR DIRECTORY netrw-U netrw-downdir {{{2

With the "U" map, one can change to a later directory (successor).
This map is the opposite of the "u" map. (see netrw-u) Use the
qb map to list both the bookmarks and history. (see netrw-qb)

The "U" map also accepts counts to go forward in the history several slots.

See g:netrw_dirhistmax for how to control the quantity of history stack
slots.

CHANGING TREE TOP netrw-ntree :Ntree netrw-gn {{{2

One may specify a new tree top for tree listings using

        :Ntree [dirname]

Without a "dirname", the current line is used (and any leading depth
information is elided).
With a "dirname", the specified directory name is used.

The "gn" map will take the word below the cursor and use that for
changing the top of the tree listing.

NETRW CLEAN netrw-clean :NetrwClean {{{2

With :NetrwClean one may easily remove netrw from one's home directory;
more precisely, from the first directory on your 'runtimepath' .

With :NetrwClean!, netrw will attempt to remove netrw from all directories on
your 'runtimepath' . Of course, you have to have write/delete permissions
correct to do this.

With either form of the command, netrw will first ask for confirmation
that the removal is in fact what you want to do. If netrw doesn't have
permission to remove a file, it will issue an error message.

CUSTOMIZING BROWSING WITH A SPECIAL HANDLER netrw-gx netrw-x netrw-handler {{{2 (also see netrw_filehandler)

Certain files, such as html, gif, jpeg, (word/office) doc, etc, files, are
best seen with a special handler (ie. a tool provided with your computer's
operating system). Netrw allows one to invoke such special handlers by:

        * when Exploring, hit the "x" key
        * when editing, hit gx with the cursor atop the special filename
         (latter not available if the g:netrw_nogx variable exists)

Netrw determines which special handler by the following method:

  * if g:netrw_browsex_viewer exists, then it will be used to attempt to
    view files. Examples of useful settings (place into your <.vimrc>):

        :let g:netrw_browsex_viewer= "kfmclient exec"
   or
        :let g:netrw_browsex_viewer= "xdg-open"

    If g:netrw_browsex_viewer == '-', then netrwFileHandlers#Invoke() will be
    used instead (see netrw_filehandler).

  * for Windows 32 or 64, the URL and FileProtocolHandler dlls are used.
  * for Gnome (with gnome-open): gnome-open is used.
  * for KDE (with kfmclient)   : kfmclient is used
  * for Mac OS X   : open is used.

  * otherwise the netrwFileHandler plugin is used.

The file's suffix is used by these various approaches to determine an
appropriate application to use to "handle" these files. Such things as
OpenOffice (*.sfx), visualization (*.jpg, *.gif, etc), and PostScript (*.ps,
*.eps) can be handled.

The gx mapping extends to all buffers; apply "gx" while atop a word and netrw
will apply a special handler to it (like "x" works when in a netrw buffer).
One may also use visual mode (see visual-start) to select the text that the
special handler will use. Normally gx uses expand("<cfile>") to pick up the
text under the cursor; one may change what expand() uses via the
 g:netrw_gx variable (options include "<cword>", "<cWORD>"). Note that
expand("<cfile>") depends on the 'isfname' setting. Alternatively, one may
select the text to be used by gx by making a visual selection (see
 visual-block) and then pressing gx.

Associated setting variables:
         g:netrw_gx   control how gx picks up the text under the cursor
         g:netrw_nogx   prevent gx map while editing
         g:netrw_suppress_gx_mesg controls gx's suppression of browser messages

                                                          netrw_filehandler

When g:netrw_browsex_viewer exists and is "-", then netrw will attempt to
handle the special file with a vim function. The "x" map applies a function
to a file, based on its extension. Of course, the handler function must exist
for it to be called!

 Ex. mypgm.html   x -> NFH_html("scp://user@host/some/path/mypgm.html")

       Users may write their own netrw File Handler functions to
        support more suffixes with special handling. See
        <autoload/netrwFileHandlers.vim> for examples on how to make
        file handler functions.   As an example:

        " NFH_suffix(filename)
        fun! NFH_suffix(filename)
        ..do something special with filename..
        endfun

These functions need to be defined in some file in your .vim/plugin
(vimfiles\plugin) directory. Vim's function names may not have punctuation
characters (except for the underscore) in them. To support suffices that
contain such characters, netrw will first convert the suffix using the
following table:

    @ -> AT   ! -> EXCLAMATION   % -> PERCENT
    : -> COLON   = -> EQUAL   ? -> QUESTION
    , -> COMMA   - -> MINUS   ; -> SEMICOLON
    $ -> DOLLAR   + -> PLUS   ~ -> TILDE

So, for example:

```
        file.rcs,v  ->  NFH_rcsCOMMAv()

If more such translations are necessary, please send me email:
                NdrOchip at ScampbellPfamily.AbizM - NOSPAM
with a request.

Associated setting variable:  g:netrw_browsex_viewer
```

DELETING BOOKMARKS

netrw-curdir
netrw-mB {{{2

To delete a bookmark, use

```
        {cnt}mB
```

If there are marked files, then mB will remove them from the
bookmark list.

Alternatively, one may use :NetrwMB! (see netrw-:NetrwMB).

```
        :NetrwMB! [files/directories]
```

Related Topics:
- netrw-gb how to return (go) to a bookmark
- netrw-mb how to make a bookmark
- netrw-qb how to list bookmarks

DELETING FILES OR DIRECTORIES netrw-delete netrw-D netrw-del {{{2

If files have not been marked with netrw-mf : (local marked file list)

    Deleting/removing files and directories involves moving the cursor to the
    file/directory to be deleted and pressing "D". Directories must be empty
    first before they can be successfully removed. If the directory is a
    softlink to a directory, then netrw will make two requests to remove the
    directory before succeeding. Netrw will ask for confirmation before doing
    the removal(s). You may select a range of lines with the "V" command
    (visual selection), and then pressing "D".

If files have been marked with netrw-mf : (local marked file list)

    Marked files (and empty directories) will be deleted; again, you'll be
    asked to confirm the deletion before it actually takes place.

A further approach is to delete files which match a pattern.

    * use :MF pattern (see netrw-:MF); then press "D".

    * use mr (see netrw-mr) which will prompt you for pattern.
      This will cause the matching files to be marked. Then,
      press "D".

If your vim has 7.4 with patch#1107, then g:netrw_localrmdir no longer

```
```

is used to remove directories; instead, vim's delete() is used with
the "d" option. Please note that only empty directories may be deleted
with the "D" mapping. Regular files are deleted with delete() , too.

The g:netrw_rm_cmd , g:netrw_rmf_cmd , and g:netrw_rmdir_cmd variables are
used to control the attempts to remove remote files and directories. The
g:netrw_rm_cmd is used with files, and its default value is:

```
        g:netrw_rm_cmd: ssh HOSTNAME rm
```

The g:netrw_rmdir_cmd variable is used to support the removal of directories.
Its default value is:

```
         g:netrw_rmdir_cmd : ssh HOSTNAME rmdir
```

If removing a directory fails with g:netrw_rmdir_cmd, netrw then will attempt
to remove it again using the g:netrw_rmf_cmd variable. Its default value is:

```
         g:netrw_rmf_cmd : ssh HOSTNAME rm -f
```

Related topics: netrw-d

DIRECTORY EXPLORATION COMMANDS {{{2

```
     :[N]Explore[!]  [dir]... Explore directory of current file       :Explore
     :[N]Hexplore[!] [dir]... Horizontal Split & Explore              :Hexplore
     :[N]Lexplore[!] [dir]... Left Explorer Toggle                    :Lexplore
     :[N]Sexplore[!] [dir]... Split&Explore current file's directory  :Sexplore
     :[N]Vexplore[!] [dir]... Vertical   Split & Explore              :Vexplore
     :Texplore       [dir]... Tab & Explore                           :Texplore
     :Rexplore            ... Return to/from Explorer                 :Rexplore

     Used with :Explore **/pattern : (also see netrw-starstar )
     :Nexplore.............. go to next matching file                :Nexplore
     :Pexplore.............. go to previous matching file            :Pexplore
```

netrw-:Explore

```
:Explore  will open the local-directory browser on the current file's
          directory (or on directory [dir] if specified).  The window will be
          split only if the file has been modified and  'hidden'  is not set,
          otherwise the browsing window will take over that window.  Normally
          the splitting is taken horizontally.
          Also see:  netrw-:Rexplore
:Explore! is like :Explore, but will use vertical splitting.
```

netrw-:Hexplore

```
:Hexplore  [dir] does an :Explore with  :belowright  horizontal splitting.
:Hexplore! [dir] does an :Explore with  :aboveleft   horizontal splitting.
```

netrw-:Lexplore

:[N]Lexplore [dir] toggles a full height Explorer window on the left hand side of the current tab. It will open a netrw window on the current directory if [dir] is omitted; a :Lexplore [dir] will show the specified directory in the left-hand side browser display no matter from which window the command is issued.

By default, :Lexplore will change an uninitialized g:netrw_chgwin to 2; edits will thus preferentially be made in window#2.

The [N] specifies a g:netrw_winsize just for the new :Lexplore window.

Those who like this method often also like tree style displays; see g:netrw_liststyle .

:[N]Lexplore! [dir] is similar to :Lexplore, except that the full-height Explorer window will open on the right hand side and an uninitialized g:netrw_chgwin will be set to 1 (eg. edits will preferentially occur in the leftmost window).

Also see: netrw-C g:netrw_browse_split g:netrw_wiw
netrw-p netrw-P g:netrw_chgwin
netrw-c-tab g:netrw_winsize

netrw-:Sexplore

:[N]Sexplore will always split the window before invoking the local-directory browser. As with Explore, the splitting is normally done horizontally.
:[N]Sexplore! [dir] is like :Sexplore, but the splitting will be done vertically.

netrw-:Texplore

:Texplore [dir] does a :tabnew before generating the browser window

netrw-:Vexplore

:[N]Vexplore [dir] does an :Explore with :leftabove vertical splitting.
:[N]Vexplore! [dir] does an :Explore with :rightbelow vertical splitting.

The optional parameters are:

[N]: This parameter will override g:netrw_winsize to specify the quantity of rows and/or columns the new explorer window should have. Otherwise, the g:netrw_winsize variable, if it has been specified by the user, is used to control the quantity of rows and/or columns new explorer windows should have.

[dir]: By default, these explorer commands use the current file's directory. However, one may explicitly provide a directory (path) to use instead; ie.

:Explore /some/path

netrw-:Rexplore

:Rexplore This command is a little different from the other Explore commands

as it doesn't necessarily open an Explorer window.

Return to Explorer
When one edits a file using netrw which can occur, for example, when pressing <cr> while the cursor is atop a filename in a netrw browser window, a :Rexplore issued while editing that file will return the display to that of the last netrw browser display in that window.

Return from Explorer
Conversely, when one is editing a directory, issuing a :Rexplore will return to editing the file that was last edited in that window.

The <2-leftmouse> map (which is only available under gvim and cooperative terms) does the same as :Rexplore.

Also see: g:netrw_alto g:netrw_altv g:netrw_winsize

netrw-star netrw-starpat netrw-starstar netrw-starstarpat netrw-grep
EXPLORING WITH STARS AND PATTERNS {{{2

When Explore, Sexplore, Hexplore, or Vexplore are used with one of the following four patterns Explore generates a list of files which satisfy the request for the local file system. These exploration patterns will not work with remote file browsing.

```
    */filepat   files in current directory which satisfy filepat
    **/filepat  files in current directory or below which satisfy the
                file pattern
    *//pattern  files in the current directory which contain the
                pattern (vimgrep is used)
    **//pattern files in the current directory or below which contain
                the pattern (vimgrep is used)
```

<
The cursor will be placed on the first file in the list. One may then continue to go to subsequent files on that list via :Nexplore or to preceding files on that list with :Pexplore . Explore will update the directory and place the cursor appropriately.

A plain

```
        :Explore
```

will clear the explore list.

If your console or gui produces recognizable shift-up or shift-down sequences, then you'll likely find using shift-downarrow and shift-uparrow convenient. They're mapped by netrw as follows:

```
        <s-down>  == Nexplore, and
        <s-up>    == Pexplore.
```

As an example, consider

```
:Explore */*.c
:Nexplore
:Nexplore
:Pexplore
```

The status line will show, on the right hand side of the status line, a message like "Match 3 of 20".

Associated setting variables:

g:netrw_fastbrowse	g:netrw_ftp_browse_reject
g:netrw_ftp_list_cmd	g:netrw_ftp_sizelist_cmd
g:netrw_ftp_timelist_cmd	g:netrw_list_cmd
g:netrw_liststyle	

DISPLAYING INFORMATION ABOUT FILE netrw-qf {{{2

With the cursor atop a filename, pressing "qf" will reveal the file's size and last modification timestamp. Currently this capability is only available for local files.

EDIT FILE OR DIRECTORY HIDING LIST netrw-ctrl-h netrw-edithide {{{2

The "<ctrl-h>" map brings up a requestor allowing the user to change the file/directory hiding list contained in g:netrw_list_hide . The hiding list consists of one or more patterns delimited by commas. Files and/or directories satisfying these patterns will either be hidden (ie. not shown) or be the only ones displayed (see netrw-a).

The "gh" mapping (see netrw-gh) quickly alternates between the usual hiding list and the hiding of files or directories that begin with ".".

As an example,

```
let g:netrw_list_hide= '\(^\|\s\s\)\zs\.\S\+'
```

Effectively, this makes the effect of a netrw-gh command the initial setting. What it means:

```
\(^\|\s\s\)   : if the line begins with the following, -or-
                two consecutive spaces are encountered
\zs           : start the hiding match now
\.            : if it now begins with a dot
\S\+          : and is followed by one or more non-whitespace
                characters
```

Associated setting variables: g:netrw_hide g:netrw_list_hide
Associated topics: netrw-a netrw-gh netrw-mh

EDITING THE SORTING SEQUENCE netrw-sort-sequence netrw-S netrw-sortsequence {{{2

When "Sorted by" is name, one may specify priority via the sorting sequence (g:netrw_sort_sequence). The sorting sequence typically prioritizes the

name-listing by suffix, although any pattern will do. Patterns are delimited by commas. The default sorting sequence is (all one line):

For Unix:
```
'[\/]$,\<core\%(\.\d\+\)\=,\.[a-np-z]$,\.h$,\.c$,\.cpp$,*,\.o$,\.obj$,
\.info$,\.swp$,\.bak$,\~$'
```

Otherwise:
```
'[\/]$,\.[a-np-z]$,\.h$,\.c$,\.cpp$,*,\.o$,\.obj$,\.info$,
\.swp$,\.bak$,\~$'
```

The lone * is where all filenames not covered by one of the other patterns will end up. One may change the sorting sequence by modifying the g:netrw_sort_sequence variable (either manually or in your <.vimrc>) or by using the "S" map.

Related topics: netrw-s netrw-S
Associated setting variables: g:netrw_sort_sequence g:netrw_sort_options

EXECUTING FILE UNDER CURSOR VIA SYSTEM() netrw-X {{{2

Pressing X while the cursor is atop an executable file will yield a prompt using the filename asking for any arguments. Upon pressing a [return], netrw will then call system() with that command and arguments. The result will be displayed by :echomsg , and so :messages will repeat display of the result. Ansi escape sequences will be stripped out.

See cmdline-window for directions for more on how to edit the arguments.

FORCING TREATMENT AS A FILE OR DIRECTORY netrw-gd netrw-gf {{{2

Remote symbolic links (ie. those listed via ssh or ftp) are problematic in that it is difficult to tell whether they link to a file or to a directory.

To force treatment as a file: use
```
gf
```

To force treatment as a directory: use
```
gd
```

GOING UP netrw-- {{{2

To go up a directory, press "-" or press the <cr> when atop the ../ directory entry in the listing.

Netrw will use the command in g:netrw_list_cmd to perform the directory listing operation after changing HOSTNAME to the host specified by the user-prpvided url. By default netrw provides the command as:

```
ssh HOSTNAME ls -FLa
```

where the HOSTNAME becomes the [user@]hostname as requested by the attempt to read. Naturally, the user may override this command with whatever is preferred. The NetList function which implements remote browsing expects that directories will be flagged by a trailing slash.

HIDING FILES OR DIRECTORIES netrw-a netrw-hiding {{{2

Netrw's browsing facility allows one to use the hiding list in one of three ways: ignore it, hide files which match, and show only those files which match.

If no files have been marked via netrw-mf :

The "a" map allows the user to cycle through the three hiding modes.

The g:netrw_list_hide variable holds a comma delimited list of patterns based on regular expressions (ex. ^.*\.obj$,^\.) which specify the hiding list. (also see netrw-ctrl-h) To set the hiding list, use the <c-h> map. As an example, to hide files which begin with a ".", one may use the <c-h> map to set the hiding list to '^\..*' (or one may put let g:netrw_list_hide= '^\..*' in one's <.vimrc>). One may then use the "a" key to show all files, hide matching files, or to show only the matching files.

```
        Example: \.[ch]$
                This hiding list command will hide/show all *.c and *.h files.

        Example: \.c$,\.h$
                This hiding list command will also hide/show all *.c and *.h
                files.
```

Don't forget to use the "a" map to select the mode (normal/hiding/show) you want!

If files have been marked using netrw-mf , then this command will:

```
  if showing all files or non-hidden files:
   modify the g:netrw_list_hide list by appending the marked files to it
   and showing only non-hidden files.

  else if showing hidden files only:
   modify the g:netrw_list_hide list by removing the marked files from it
   and showing only non-hidden files.
  endif
```

netrw-gh netrw-hide

As a quick shortcut, one may press

```
        gh
```

to toggle between hiding files which begin with a period (dot) and not hiding them.

Associated setting variables: g:netrw_list_hide g:netrw_hide
Associated topics: netrw-a netrw-ctrl-h netrw-mh

netrw-gitignore

Netrw provides a helper function 'netrw_gitignore#Hide()' that, when used with g:netrw_list_hide automatically hides all git-ignored files.

'netrw_gitignore#Hide' searches for patterns in the following files:

```
'./.gitignore'
'./.git/info/exclude'
global gitignore file: `git config --global core.excludesfile`
system gitignore file: `git config --system core.excludesfile`
```

Files that do not exist, are ignored.
Git-ignore patterns are taken from existing files, and converted to patterns for hiding files. For example, if you had '*.log' in your '.gitignore' file, it would be converted to '.*\.log'.

To use this function, simply assign its output to g:netrw_list_hide option.

```
Example: let g:netrw_list_hide= netrw_gitignore#Hide()
        Git-ignored files are hidden in Netrw.

Example: let g:netrw_list_hide= netrw_gitignore#Hide('my_gitignore_file')
        Function can take additional files with git-ignore patterns.

Example: g:netrw_list_hide= netrw_gitignore#Hide() . '.*\.swp$'
        Combining 'netrw_gitignore#Hide' with custom patterns.
```

IMPROVING BROWSING

netrw-listhack netrw-ssh-hack {{{2

Especially with the remote directory browser, constantly entering the password is tedious.

For Linux/Unix systems, the book "Linux Server Hacks - 100 industrial strength tips & tools" by Rob Flickenger (O'Reilly, ISBN 0-596-00461-3) gives a tip for setting up no-password ssh and scp and discusses associated security issues. It used to be available at http://hacks.oreilly.com/pub/h/66 , but apparently that address is now being redirected to some "hackzine". I'll attempt a summary based on that article and on a communication from Ben Schmidt:

1. Generate a public/private key pair on the local machine (ssh client):
   ```
   ssh-keygen -t rsa
   (saving the file in ~/.ssh/id_rsa as prompted)
   ```

2. Just hit the <CR> when asked for passphrase (twice) for no passphrase. If you do use a passphrase, you will also need to use ssh-agent so you only have to type the passphrase once per session. If you don't use a passphrase, simply logging onto your local computer or getting access to the keyfile in any way will suffice to access any ssh servers which have that key authorized for login.

3. This creates two files:
        ~/.ssh/id_rsa
        ~/.ssh/id_rsa.pub

4. On the target machine (ssh server):
        cd
        mkdir -p .ssh
        chmod 0700 .ssh

5. On your local machine (ssh client): (one line)
        ssh {serverhostname}
          cat '>>' '~/.ssh/authorized_keys2' < ~/.ssh/id_rsa.pub

   or, for OpenSSH, (one line)
        ssh {serverhostname}
          cat '>>' '~/.ssh/authorized_keys' < ~/.ssh/id_rsa.pub

You can test it out with
        ssh {serverhostname}
and you should be log onto the server machine without further need to type
anything.

If you decided to use a passphrase, do:
        ssh-agent $SHELL
        ssh-add
        ssh {serverhostname}
You will be prompted for your key passphrase when you use ssh-add, but not
subsequently when you use ssh. For use with vim, you can use
        ssh-agent vim
and, when next within vim, use
        :!ssh-add
Alternatively, you can apply ssh-agent to the terminal you're planning on
running vim in:
        ssh-agent xterm &
and do ssh-add whenever you need.

For Windows, folks on the vim mailing list have mentioned that Pageant helps
with avoiding the constant need to enter the password.

Kingston Fung wrote about another way to avoid constantly needing to enter
passwords:

    In order to avoid the need to type in the password for scp each time, you
    provide a hack in the docs to set up a non password ssh account. I found a
    better way to do that: I can use a regular ssh account which uses a
    password to access the material without the need to key-in the password
    each time. It's good for security and convenience. I tried ssh public key
    authorization + ssh-agent, implementing this, and it works! Here are two
    links with instructions:

    http://www.ibm.com/developerworks/library/l-keyc2/
    http://sial.org/howto/openssh/publickey-auth/

Ssh hints:

Thomer Gil has provided a hint on how to speed up netrw+ssh:
http://thomer.com/howtos/netrw_ssh.html

Alex Young has several hints on speeding ssh up:
http://usevim.com/2012/03/16/editing-remote-files/

LISTING BOOKMARKS AND HISTORY netrw-qb netrw-listbookmark {{{2

Pressing "qb" (query bookmarks) will list both the bookmarked directories and directory traversal history.

Related Topics:

netrw-gb	how to return (go) to a bookmark
netrw-mb	how to make a bookmark
netrw-mB	how to delete bookmarks
netrw-u	change to a predecessor directory via the history stack
netrw-U	change to a successor directory via the history stack

MAKING A NEW DIRECTORY netrw-d {{{2

With the "d" map one may make a new directory either remotely (which depends on the global variable g:netrw_mkdir_cmd) or locally (which depends on the global variable g:netrw_localmkdir). Netrw will issue a request for the new directory's name. A bare <CR> at that point will abort the making of the directory. Attempts to make a local directory that already exists (as either a file or a directory) will be detected, reported on, and ignored.

Related topics: netrw-D
Associated setting variables: g:netrw_localmkdir g:netrw_mkdir_cmd g:netrw_remote_mkdir netrw-%

MAKING THE BROWSING DIRECTORY THE CURRENT DIRECTORY netrw-cd {{{2

By default, g:netrw_keepdir is 1. This setting means that the current directory will not track the browsing directory. (done for backwards compatibility with v6's file explorer).

Setting g:netrw_keepdir to 0 tells netrw to make vim's current directory track netrw's browsing directory.

However, given the default setting for g:netrw_keepdir of 1 where netrw maintains its own separate notion of the current directory, in order to make the two directories the same, use the "c" map (just type c). That map will set Vim's notion of the current directory to netrw's current browsing directory.

netrw-c : This map's name has been changed from "c" to cd (see netrw-cd). This change was done to allow for netrw-cb and netrw-cB maps.

Associated setting variable: g:netrw_keepdir

MARKING FILES netrw-:MF netrw-mf {{{2

(also see netrw-mr)

Netrw provides several ways to mark files:

* One may mark files with the cursor atop a filename and then pressing "mf".

* With gvim, in addition one may mark files with <s-leftmouse>. (see netrw-mouse)

* One may use the :MF command, which takes a list of files (for local directories, the list may include wildcards -- see glob())

```
:MF *.c
```

(Note that :MF uses <f-args> to break the line at spaces)

* Mark files using the argument-list (netrw-mA)

* Mark files based upon a location-list (netrw-qL)

* Mark files based upon the quickfix list (netrw-qF) (quickfix-error-lists)

The following netrw maps make use of marked files:

netrw-a	Hide marked files/directories
netrw-D	Delete marked files/directories
netrw-ma	Move marked files' names to arglist
netrw-mA	Move arglist filenames to marked file list
netrw-mb	Append marked files to bookmarks
netrw-mB	Delete marked files from bookmarks
netrw-mc	Copy marked files to target
netrw-md	Apply vimdiff to marked files
netrw-me	Edit marked files
netrw-mF	Unmark marked files
netrw-mg	Apply vimgrep to marked files
netrw-mm	Move marked files to target
netrw-mp	Print marked files
netrw-ms	Netrw will source marked files
netrw-mt	Set target for netrw-mm and netrw-mc
netrw-mT	Generate tags using marked files
netrw-mv	Apply vim command to marked files
netrw-mx	Apply shell command to marked files
netrw-mX	Apply shell command to marked files, en bloc
netrw-mz	Compress/Decompress marked files
netrw-O	Obtain marked files
netrw-R	Rename marked files

One may unmark files one at a time the same way one marks them; ie. place

the cursor atop a marked file and press "mf". This process also works
with <s-leftmouse> using gvim. One may unmark all files by pressing
"mu" (see netrw-mu).

Marked files are highlighted using the "netrwMarkFile" highlighting group,
which by default is linked to "Identifier" (see Identifier under
 group-name). You may change the highlighting group by putting something
like

```
        highlight clear netrwMarkFile
        hi link netrwMarkFile ..whatever..
```

into $HOME/.vim/after/syntax/netrw.vim .

If the mouse is enabled and works with your vim, you may use <s-leftmouse> to
mark one or more files. You may mark multiple files by dragging the shifted
leftmouse. (see netrw-mouse)

                        markfilelist   global_markfilelist   local_markfilelist
All marked files are entered onto the global marked file list; there is only
one such list. In addition, every netrw buffer also has its own buffer-local
marked file list; since netrw buffers are associated with specific
directories, this means that each directory has its own local marked file
list. The various commands which operate on marked files use one or the other
of the marked file lists.

Known Problem: if one is using tree mode (g:netrw_liststyle) and several
directories have files with the same name, then marking such a file will
result in all such files being highlighted as if they were all marked. The
 markfilelist , however, will only have the selected file in it. This problem
is unlikely to be fixed.

UNMARKING FILES netrw-mF {{{2

        (also see netrw-mf , netrw-mu)

The "mF" command will unmark all files in the current buffer. One may also use
mf (netrw-mf) on a specific, already marked, file to unmark just that file.

MARKING FILES BY LOCATION LIST netrw-qL {{{2

        (also see netrw-mf)

One may convert location-list s into a marked file list using "qL".
You may then proceed with commands such as me (netrw-me) to edit them.

MARKING FILES BY QUICKFIX LIST netrw-qF {{{2

        (also see netrw-mf)

One may convert quickfix-error-lists into a marked file list using "qF".
You may then proceed with commands such as me (netrw-me) to edit them.
Quickfix error lists are generated, for example, by calls to :vimgrep .

MARKING FILES BY REGULAR EXPRESSION netrw-mr {{{2

(also see netrw-mf)

One may also mark files by pressing "mr"; netrw will then issue a prompt, "Enter regexp: ". You may then enter a shell-style regular expression such as *.c$ (see glob()). For remote systems, glob() doesn't work -- so netrw converts "*" into ".*" (see regexp) and marks files based on that. In the future I may make it possible to use regexp s instead of glob()-style expressions (yet-another-option).

See cmdline-window for directions on more on how to edit the regular expression.

MARKED FILES, ARBITRARY VIM COMMAND netrw-mv {{{2

(See netrw-mf and netrw-mr for how to mark files)
(uses the local marked-file list)

The "mv" map causes netrw to execute an arbitrary vim command on each file on the local marked file list, individually:

* 1split
* sil! keepalt e file
* run vim command
* sil! keepalt wq!

A prompt, "Enter vim command: ", will be issued to elicit the vim command you wish used. See cmdline-window for directions for more on how to edit the command.

MARKED FILES, ARBITRARY SHELL COMMAND netrw-mx {{{2

(See netrw-mf and netrw-mr for how to mark files)
(uses the local marked-file list)

Upon activation of the "mx" map, netrw will query the user for some (external) command to be applied to all marked files. All "%"s in the command will be substituted with the name of each marked file in turn. If no "%"s are in the command, then the command will be followed by a space and a marked filename.

Example:

```
(mark files)
mx
Enter command: cat

The result is a series of shell commands:
cat 'file1'
cat 'file2'
...
```

MARKED FILES, ARBITRARY SHELL COMMAND, EN BLOC netrw-mX {{{2

(See netrw-mf and netrw-mr for how to mark files)
(uses the global marked-file list)

Upon activation of the 'mX' map, netrw will query the user for some (external)
command to be applied to all marked files on the global marked file list. The
"en bloc" means that one command will be executed on all the files at once:

```
command files
```

This approach is useful, for example, to select files and make a tarball:

```
(mark files)
mX
Enter command: tar cf mynewtarball.tar
```

The command that will be run with this example:

```
tar cf mynewtarball.tar 'file1' 'file2' ...
```

MARKED FILES: ARGUMENT LIST netrw-ma netrw-mA
(See netrw-mf and netrw-mr for how to mark files)
(uses the global marked-file list)

Using ma, one moves filenames from the marked file list to the argument list.
Using mA, one moves filenames from the argument list to the marked file list.

See Also: netrw-cb netrw-cB netrw-qF argument-list :args

MARKED FILES: BUFFER LIST netrw-cb netrw-cB
(See netrw-mf and netrw-mr for how to mark files)
(uses the global marked-file list)

Using cb, one moves filenames from the marked file list to the buffer list.
Using cB, one copies filenames from the buffer list to the marked file list.

See Also: netrw-ma netrw-mA netrw-qF buffer-list :buffers

MARKED FILES: COMPRESSION AND DECOMPRESSION netrw-mz {{{2
(See netrw-mf and netrw-mr for how to mark files)
(uses the local marked file list)

If any marked files are compressed, then "mz" will decompress them.
If any marked files are decompressed, then "mz" will compress them
using the command specified by g:netrw_compress ; by default,
that's "gzip".

For decompression, netrw uses a Dictionary of suffices and their
associated decompressing utilities; see g:netrw_decompress .

Remember that one can mark multiple files by regular expression
(see netrw-mr); this is particularly useful to facilitate compressing and
decompressing a large number of files.

Associated setting variables: g:netrw_compress   g:netrw_decompress

MARKED FILES: COPYING   netrw-mc {{{2
            (See netrw-mf and netrw-mr for how to mark files)
                      (Uses the global marked file list)

Select a target directory with mt (netrw-mt). Then change directory,
select file(s) (see netrw-mf), and press "mc". The copy is done
from the current window (where one does the mf) to the target.

If one does not have a target directory set with netrw-mt , then netrw
will query you for a directory to copy to.

One may also copy directories and their contents (local only) to a target
directory.

Associated setting variables:
         g:netrw_localcopycmd   g:netrw_localcopycmdopt
         g:netrw_localcopydircmd   g:netrw_localcopydircmdopt
         g:netrw_ssh_cmd

MARKED FILES: DIFF   netrw-md {{{2
            (See netrw-mf and netrw-mr for how to mark files)
                      (uses the global marked file list)

Use vimdiff to visualize difference between selected files (two or
three may be selected for this). Uses the global marked file list.

MARKED FILES: EDITING   netrw-me {{{2
            (See netrw-mf and netrw-mr for how to mark files)
                      (uses the global marked file list)

The "me" command will place the marked files on the arglist and commence
editing them. One may return the to explorer window with :Rexplore .
(use :n and :p to edit next and previous files in the arglist)

MARKED FILES: GREP   netrw-mg {{{2
            (See netrw-mf and netrw-mr for how to mark files)
                      (uses the global marked file list)

The "mg" command will apply :vimgrep to the marked files.
The command will ask for the requested pattern; one may then enter:

        /pattern/[g][j]
        ! /pattern/[g][j]
        pattern

With /pattern/, editing will start with the first item on the quickfix list
that vimgrep sets up (see :copen , :cnext , :cprevious , :cclose). The :vimgrep
command is in use, so without 'g' each line is added to quickfix list only
once; with 'g' every match is included.

With /pattern/j, "mg" will winnow the current marked file list to just those
marked files also possessing the specified pattern. Thus, one may use

```
        mr ...file-pattern...
        mg /pattern/j
```

to have a marked file list satisfying the file-pattern but also restricted to
files containing some desired pattern.

MARKED FILES: HIDING AND UNHIDING BY SUFFIX netrw-mh {{{2
            (See netrw-mf and netrw-mr for how to mark files)
                      (uses the local marked file list)

The "mh" command extracts the suffices of the marked files and toggles their
presence on the hiding list. Please note that marking the same suffix
this way multiple times will result in the suffix's presence being toggled
for each file (so an even quantity of marked files having the same suffix
is the same as not having bothered to select them at all).

Related topics: netrw-a   g:netrw_list_hide

MARKED FILES: MOVING netrw-mm {{{2
            (See netrw-mf and netrw-mr for how to mark files)
                      (uses the global marked file list)

        WARNING: moving files is more dangerous than copying them.
        A file being moved is first copied and then deleted; if the
        copy operation fails and the delete succeeds, you will lose
        the file. Either try things out with unimportant files
        first or do the copy and then delete yourself using mc and D.
        Use at your own risk!

Select a target directory with mt (netrw-mt). Then change directory,
select file(s) (see netrw-mf), and press "mm". The move is done
from the current window (where one does the mf) to the target.

Associated setting variable: g:netrw_localmovecmd   g:netrw_ssh_cmd

MARKED FILES: PRINTING netrw-mp {{{2
            (See netrw-mf and netrw-mr for how to mark files)
                      (uses the local marked file list)

When "mp" is used, netrw will apply the :hardcopy command to marked files.
What netrw does is open each file in a one-line window, execute hardcopy, then
close the one-line window.

MARKED FILES: SOURCING netrw-ms {{{2
            (See netrw-mf and netrw-mr for how to mark files)
                      (uses the local marked file list)

With "ms", netrw will source the marked files (using vim's :source command)

MARKED FILES: SETTING THE TARGET DIRECTORY netrw-mt {{{2

(See netrw-mf and netrw-mr for how to mark files)

Set the marked file copy/move-to target (see netrw-mc and netrw-mm):

* If the cursor is atop a file name, then the netrw window's currently displayed directory is used for the copy/move-to target.

* Also, if the cursor is in the banner, then the netrw window's currently displayed directory is used for the copy/move-to target. Unless the target already is the current directory. In which case, typing "mf" clears the target.

* However, if the cursor is atop a directory name, then that directory is used for the copy/move-to target

* One may use the :MT [directory] command to set the target netrw-:MT This command uses <q-args> , so spaces in the directory name are permitted without escaping.

* With mouse-enabled vim or with gvim, one may select a target by using <c-leftmouse>

There is only one copy/move-to target at a time in a vim session; ie. the target is a script variable (see s:var) and is shared between all netrw windows (in an instance of vim).

When using menus and gvim, netrw provides a "Targets" entry which allows one to pick a target from the list of bookmarks and history.

MARKED FILES: TAGGING netrw-mT {{{2
(See netrw-mf and netrw-mr for how to mark files)
(uses the global marked file list)

The "mT" mapping will apply the command in g:netrw_ctags (by default, it is "ctags") to marked files. For remote browsing, in order to create a tags file netrw will use ssh (see g:netrw_ssh_cmd), and so ssh must be available for this to work on remote systems. For your local system, see ctags on how to get a version. I myself use hdrtags, currently available at http://www.drchip.org/astronaut/src/index.html , and have

```
let g:netrw_ctags= "hdrtag"
```

in my <.vimrc>.

When a remote set of files are tagged, the resulting tags file is "obtained"; ie. a copy is transferred to the local system's directory. The now local tags file is then modified so that one may use it through the network. The

modification made concerns the names of the files in the tags; each filename is
preceded by the netrw-compatible URL used to obtain it. When one subsequently
uses one of the go to tag actions (tags), the URL will be used by netrw to
edit the desired file and go to the tag.

Associated setting variables: g:netrw_ctags   g:netrw_ssh_cmd

MARKED FILES: TARGET DIRECTORY USING BOOKMARKS   netrw-Tb {{{2

Sets the marked file copy/move-to target.

The netrw-qb map will give you a list of bookmarks (and history).
One may choose one of the bookmarks to become your marked file
target by using [count]Tb (default count: 1).

Related topics:
      Copying files to target.......................... netrw-mc

      Moving files to target........................... netrw-mm

MARKED FILES: UNMARKING   netrw-mu {{{2
     (See netrw-mf , netrw-mF)

The "mu" mapping will unmark all currently marked files. This command differs
from "mF" as the latter only unmarks files in the current directory whereas
"mu" will unmark global and all buffer-local marked files.
(see netrw-mF)

                          netrw-browser-settings
NETRW BROWSER VARIABLES   netrw-browser-options   netrw-browser-var {{{2

(if you're interested in the netrw file transfer settings, see netrw-options
 and netrw-protocol)

The <netrw.vim> browser provides settings in the form of variables which
you may modify; by placing these settings in your <.vimrc>, you may customize
your browsing preferences. (see also: netrw-settings)

Var	Explanation
g:netrw_altfile	some like CTRL-^ to return to the last edited file. Choose that by setting this parameter to 1. Others like CTRL-^ to return to the netrw browsing buffer. Choose that by setting this parameter to 0. default: =0
g:netrw_alto	change from above splitting to below splitting by setting this variable (see netrw-o) default: =&sb (see 'sb')
g:netrw_altv	change from left splitting to right splitting by setting this variable (see netrw-v) default: =&spr (see 'spr')
g:netrw_banner	enable/suppress the banner =0: suppress the banner =1: banner is enabled (default)
g:netrw_bannerbackslash	if this variable exists and is not zero, the banner will be displayed with backslashes rather than forward slashes.
g:netrw_browse_split	when browsing, <cr> will open the file by: =0: re-using the same window (default) =1: horizontally splitting the window first =2: vertically splitting the window first =3: open file in new tab =4: act like "P" (ie. open previous window) Note that g:netrw_preview may be used to get vertical splitting instead of horizontal splitting. =[servername,tab-number,window-number] Given a List such as this, a remote server named by the "servername" will be used for editing. It will also use the specified tab and window numbers to perform editing (see clientserver , netrw-ctrl-r) This option does not affect the production of :Lexplore windows. Related topics:

g:netrw_alto g:netrw_altv
netrw-C netrw-cr
netrw-ctrl-r

g:netrw_browsex_viewer specify user's preference for a viewer:
"kfmclient exec"
"gnome-open"
If
"-"
is used, then netrwFileHandler() will look for a script/function to handle the given extension. (see netrw_filehandler).

g:netrw_chgperm Unix/Linux: "chmod PERM FILENAME"
Windows: "cacls FILENAME /e /p PERM"
Used to change access permission for a file.

g:netrw_compress ="gzip"
Will compress marked files with this command

g:Netrw_corehandler Allows one to specify something additional to do when handling <core> files via netrw's browser's "x" command (see netrw-x). If present, g:Netrw_corehandler specifies either one or more function references (see Funcref). (the capital g:Netrw... is required its holding a function reference)

g:netrw_ctags ="ctags"
The default external program used to create tags

g:netrw_cursor = 2 (default)
This option controls the use of the 'cursorline' (cul) and 'cursorcolumn' (cuc) settings by netrw:

Value	Thin-Long-Tree	Wide
=0	u-cul u-cuc	u-cul u-cuc
=1	u-cul u-cuc	cul u-cuc
=2	cul u-cuc	cul u-cuc
=3	cul u-cuc	cul cuc
=4	cul cuc	cul cuc

Where
u-cul : user's 'cursorline' setting used
u-cuc : user's 'cursorcolumn' setting used
cul : 'cursorline' locally set
cuc : 'cursorcolumn' locally set

g:netrw_decompress = { ".gz" : "gunzip" ,
".bz2" : "bunzip2" ,

```
                        ".zip" : "unzip" ,
                        ".tar" : "tar -xf"}
                    A dictionary mapping suffices to
                    decompression programs.

g:netrw_dirhistmax      =10: controls maximum quantity of past
                         history.  May be zero to supppress
                         history.
                         (related:  netrw-qb   netrw-u   netrw-U )

g:netrw_dynamic_maxfilenamelen  =32: enables dynamic determination of
                          g:netrw_maxfilenamelen , which affects
                        local file long listing.

g:netrw_errorlvl        =0: error levels greater than or equal to
                        this are permitted to be displayed
                        0: notes
                        1: warnings
                        2: errors

g:netrw_fastbrowse      =0: slow speed directory browsing;
                        never re-uses directory listings;
                        always obtains directory listings.
                    =1: medium speed directory browsing;
                        re-use directory listings only
                        when remote directory browsing.
                        (default value)
                    =2: fast directory browsing;
                        only obtains directory listings when the
                        directory hasn't been seen before
                        (or  netrw-ctrl-l  is used).

                    Fast browsing retains old directory listing
                    buffers so that they don't need to be
                    re-acquired.  This feature is especially
                    important for remote browsing.  However, if
                    a file is introduced or deleted into or from
                    such directories, the old directory buffer
                    becomes out-of-date.  One may always refresh
                    such a directory listing with  netrw-ctrl-l .
                    This option gives the user the choice of
                    trading off accuracy (ie. up-to-date listing)
                    versus speed.

g:netrw_ffkeep          (default: doesn't exist)
                    If this variable exists and is zero, then
                    netrw will not do a save and restore for
                     'fileformat' .

g:netrw_fname_escape    =' ?&;%'
                    Used on filenames before remote reading/writing

g:netrw_ftp_browse_reject   ftp can produce a number of errors and warnings
                    that can show up as "directories" and "files"
```

```
                        in the listing.  This pattern is used to
                        remove such embedded messages.  By default its
                        value is:
                         '^total\s\+\d\+$\|
                         ^Trying\s\+\d\+.*$\|
                         ^KERBEROS_V\d rejected\|
                         ^Security extensions not\|
                         No such file\|
                         : connect to address [0-9a-fA-F:]*
                         : No route to host$'

g:netrw_ftp_list_cmd    options for passing along to ftp for directory
                        listing.  Defaults:
                         unix or g:netrw_cygwin set: : "ls -lF"
                         otherwise                   "dir"

g:netrw_ftp_sizelist_cmd options for passing along to ftp for directory
                        listing, sorted by size of file.
                        Defaults:
                         unix or g:netrw_cygwin set: : "ls -slF"
                         otherwise                   "dir"

g:netrw_ftp_timelist_cmd options for passing along to ftp for directory
                        listing, sorted by time of last modification.
                        Defaults:
                         unix or g:netrw_cygwin set: : "ls -tlF"
                         otherwise                   "dir"

g:netrw_glob_escape     ='[]*?`{~$'  (unix)
                        ='[]*?`{$'  (windows
                        These characters in directory names are
                        escaped before applying glob()

g:netrw_gx              ="<cfile>"
                        This option controls how gx ( netrw-gx ) picks
                        up the text under the cursor.  See  expand()
                        for possibilities.

g:netrw_hide            Controlled by the "a" map (see  netrw-a )
                        =0 : show all
                        =1 : show not-hidden files
                        =2 : show hidden files only
                         default: =0

g:netrw_home            The home directory for where bookmarks and
                        history are saved (as .netrwbook and
                        .netrwhist).
                        Netrw uses  expand() on the string.
                         default: the first directory on the
                                  'runtimepath'

g:netrw_keepdir         =1 (default) keep current directory immune from
                           the browsing directory.
```

```
                        =0 keep the current directory the same as the
                           browsing directory.
                        The current browsing directory is contained in
                        b:netrw_curdir (also see  netrw-c )

g:netrw_keepj           ="keepj" (default) netrw attempts to keep the
                                  :jumps  table unaffected.
                        =""       netrw will not use  :keepjumps  with
                                  exceptions only for the
                                  saving/restoration of position.

g:netrw_list_cmd        command for listing remote directories
                         default: (if ssh is executable)
                                  "ssh HOSTNAME ls -FLa"

g:netrw_list_cmd_options If this variable exists, then its contents are
                        appended to the g:netrw_list_cmd.  For
                        example, use "2>/dev/null" to get rid of banner
                        messages on unix systems.

g:netrw_liststyle       Set the default listing style:
                        = 0: thin listing (one file per line)
                        = 1: long listing (one file per line with time
                             stamp information and file size)
                        = 2: wide listing (multiple files in columns)
                        = 3: tree style listing

g:netrw_list_hide       comma separated pattern list for hiding files
                        Patterns are regular expressions (see  regexp )
                        There's some special support for git-ignore
                        files: you may add the output from the helper
                        function 'netrw_gitignore#Hide() automatically
                        hiding all gitignored files.
                        For more details see  netrw-gitignore .

                        Examples:
                         let g:netrw_list_hide= '.*\.swp$'
                         let g:netrw_list_hide= netrw_gitignore#Hide().'.*\.swp$'
                        default: ""

g:netrw_localcopycmd    ="cp"           Linux/Unix/MacOS/Cygwin
                        =expand("$COMSPEC")             Windows
                        Copies marked files ( netrw-mf ) to target
                        directory ( netrw-mt ,  netrw-mc )

g:netrw_localcopycmdopt ='' Linux/Unix/MacOS/Cygwin
                        =' \c copy'                     Windows
                        Options for the  g:netrw_localcopycmd

g:netrw_localcopydircmd ="cp"           Linux/Unix/MacOS/Cygwin
                        =expand("$COMSPEC")             Windows
                        Copies directories to target directory.
                        ( netrw-mc ,  netrw-mt )
```

g:netrw_localcopydircmdopt =" -R"   Linux/Unix/MacOS/Cygwin
=" /c xcopy /e /c /h/ /i /k"   Windows
Options for g:netrw_localcopydircmd

g:netrw_localmkdir ="mkdir"   Linux/Unix/MacOS/Cygwin

=" /c mkdir"   Windows
Options for g:netrw_localmkdir

g:netrw_localmovecmd ="mv"   Linux/Unix/MacOS/Cygwin
=expand("$COMSPEC")   Windows
Moves marked files (netrw-mf) to target
directory (netrw-mt , netrw-mm)

g:netrw_localmovecmdopt ==""   Linux/Unix/MacOS/Cygwin
=" /c move"   Windows
Options for g:netrw_localmovecmd

g:netrw_localrmdir ="rmdir"   Linux/Unix/MacOS/Cygwin
=expand("$COMSPEC")   Windows
Remove directory command (rmdir)
This variable is only used if your vim is
earlier than 7.4 or if your vim doesn't
have patch#1107. Otherwise, delete()
is used with the "d" option.

g:netrw_localrmdiropt ==""   Linux/Unix/MacOS/Cygwin
=" /c rmdir"   Windows
Options for g:netrw_localrmdir

g:netrw_maxfilenamelen =32 by default, selected so as to make long
listings fit on 80 column displays.
If your screen is wider, and you have file
or directory names longer than 32 bytes,
you may set this option to keep listings
columnar.

g:netrw_mkdir_cmd command for making a remote directory
via ssh (also see g:netrw_remote_mkdir)
default: "ssh USEPORT HOSTNAME mkdir"

g:netrw_mousemaps =1 (default) enables mouse buttons while
browsing to:
leftmouse   : open file/directory
shift-leftmouse : mark file
middlemouse   : same as P
rightmouse   : remove file/directory
=0: disables mouse maps

g:netrw_nobeval doesn't exist (default)

```
                        If this variable exists, then balloon
                        evaluation will be suppressed
                        (see  'balooneval' )

g:netrw_sizestyle       not defined: actual bytes (default)
                        ="b" : actual bytes       (default)
                        ="h" : human-readable (ex. 5k, 4m, 3g)
                               uses 1000 base
                        ="H" : human-readable (ex. 5K, 4M, 3G)
                               uses 1024 base
                        The long listing ( netrw-i ) and query-file
                        maps ( netrw-qf ) will display file size
                        using the specified style.

 g:netrw_usetab         if this variable exists and is non-zero, then
                        the <tab> map supporting shrinking/expanding a
                        Lexplore or netrw window will be enabled.
                        (see  netrw-c-tab )

 g:netrw_remote_mkdir   command for making a remote directory
                        via ftp  (also see  g:netrw_mkdir_cmd )
                         default: "mkdir"

 g:netrw_retmap         if it exists and is set to one, then:
                         * if in a netrw-selected file, AND
                         * no normal-mode <2-leftmouse> mapping exists,
                        then the <2-leftmouse> will be mapped for easy
                        return to the netrw browser window.
                         example: click once to select and open a file,
                                  double-click to return.

                        Note that one may instead choose to:
                         * let g:netrw_retmap= 1, AND
                         * nmap <silent> YourChoice <Plug>NetrwReturn
                        and have another mapping instead of
                        <2-leftmouse> to invoke the return.

                        You may also use the  :Rexplore  command to do
                        the same thing.

                          default: =0

 g:netrw_rm_cmd         command for removing remote files
                         default: "ssh USEPORT HOSTNAME rm"

 g:netrw_rmdir_cmd      command for removing remote directories
                         default: "ssh USEPORT HOSTNAME rmdir"

 g:netrw_rmf_cmd        command for removing remote softlinks
                         default: "ssh USEPORT HOSTNAME rm -f"

 g:netrw_servername     use this variable to provide a name for
                         netrw-ctrl-r  to use for its server.
                         default: "NETRWSERVER"
```

```
g:netrw_sort_by             sort by "name", "time", "size", or
                            "exten".
                             default: "name"

g:netrw_sort_direction      sorting direction: "normal" or "reverse"
                             default: "normal"

g:netrw_sort_options        sorting is done using  :sort ; this
                            variable's value is appended to the
                            sort command.  Thus one may ignore case,
                            for example, with the following in your
                            .vimrc:
                                    let g:netrw_sort_options="i"
                            default: ""

g:netrw_sort_sequence       when sorting by name, first sort by the
                            comma-separated pattern sequence.  Note that
                            any filigree added to indicate filetypes
                            should be accounted for in your pattern.
                             default: '[\/]$,*,\.bak$,\.o$,\.h$,
                                      \.info$,\.swp$,\.obj$'

g:netrw_special_syntax      If true, then certain files will be shown
                            using special syntax in the browser:

                                    netrwBak     : *.bak
                                    netrwCompress: *.gz *.bz2 *.Z *.zip
                                    netrwData    : *.dat
                                    netrwHdr     : *.h
                                    netrwLib     : *.a *.so *.lib *.dll
                                    netrwMakefile: [mM]akefile *.mak
                                    netrwObj     : *.o *.obj
                                    netrwTags    : tags ANmenu ANtags
                                    netrwTilde   : *
                                    netrwTmp     : tmp* *tmp

                            In addition, those groups mentioned in
                             'suffixes'  are also added to the special
                            file highlighting group.
                             These syntax highlighting groups are linked
                            to netrwGray or Folded by default
                            (see  hl-Folded ), but one may put lines like
                                    hi link netrwCompress Visual
                           into one's <.vimrc> to use one's own
                            preferences.  Alternatively, one may
                            put such specifications into
                                    .vim/after/syntax/netrw.vim.
                            The netrwGray highlighting is set up by
                            netrw when
                                    * netrwGray has not been previously
                                      defined
                                    * the gui is running
                            As an example, I myself use a dark-background
```

colorscheme with the following in
.vim/after/syntax/netrw.vim:

```
hi netrwCompress term=NONE cterm=NONE gui=NONE ctermfg=10 guifg=green  ctermbg=0 guibg=bla
hi netrwData     term=NONE cterm=NONE gui=NONE ctermfg=9 guifg=blue ctermbg=0 guibg=black

hi netrwSymLink  term=NONE cterm=NONE gui=NONE ctermfg=220 ctermbg=27 guifg=grey60
```

g:netrw_ssh_browse_reject

ssh can sometimes produce unwanted lines,
messages, banners, and whatnot that one doesn't
want masquerading as "directories" and "files".
Use this pattern to remove such embedded
messages. By default its value is:
'^total\s\+\d\+$'

g:netrw_ssh_cmd

One may specify an executable command
to use instead of ssh for remote actions
such as listing, file removal, etc.
default: ssh

g:netrw_suppress_gx_mesg

=1 : browsers sometimes produce messages
which are normally unwanted intermixed
with the page.
However, when using links, for example,
those messages are what the browser produces.
By setting this option to 0, netrw will not
suppress browser messages.

g:netrw_tmpfile_escape

=' &;'
escape() is applied to all temporary files
to escape these characters.

g:netrw_timefmt

specify format string to vim's strftime().
The default, "%c", is "the preferred date
and time representation for the current
locale" according to my manpage entry for
strftime(); however, not all are satisfied
with it. Some alternatives:
"%a %d %b %Y %T",
" %a %Y-%m-%d %I-%M-%S %p"
default: "%c"

g:netrw_use_noswf

netrw normally avoids writing swapfiles
for browser buffers. However, under some
systems this apparently is causing nasty
ml_get errors to appear; if you're getting

ml_get errors, try putting
  let g:netrw_use_noswf= 0
in your .vimrc.
  default: 1

g:netrw_winsize — specify initial size of new windows made with "o" (see netrw-o), "v" (see netrw-v), :Hexplore or :Vexplore. The g:netrw_winsize is an integer describing the percentage of the current netrw buffer's window to be used for the new window.
If g:netrw_winsize is less than zero, then the absolute value of g:netrw_winsize lines or columns will be used for the new window.
If g:netrw_winsize is zero, then a normal split will be made (ie. 'equalalways' will take effect, for example).
default: 50 (for 50%)

g:netrw_wiw — =1 specifies the minimum window width to use when shrinking a netrw/Lexplore window (see netrw-c-tab).

g:netrw_xstrlen — Controls how netrw computes string lengths, including multi-byte characters' string length. (thanks to N Weibull, T Mechelynck)
=0: uses Vim's built-in strlen()
=1: number of codepoints (Latin a + combining circumflex is two codepoints) (DEFAULT)
=2: number of spacing codepoints (Latin a + combining circumflex is one spacing codepoint; a hard tab is one; wide and narrow CJK are one each; etc.)
=3: virtual length (counting tabs as anything between 1 and 'tabstop', wide CJK as 2 rather than 1, Arabic alif as zero when immediately preceded by lam, one otherwise, etc)

g:NetrwTopLvlMenu — This variable specifies the top level menu name; by default, it's "Netrw.". If you wish to change this, do so in your .vimrc.

NETRW BROWSING AND OPTION INCOMPATIBILITIES netrw-incompatible {{{2

Netrw has been designed to handle user options by saving them, setting the options to something that's compatible with netrw's needs, and then restoring them. However, the autochdir option:

```
:set acd
```

is problematic. Autochdir sets the current directory to that containing the file you edit; this apparently also applies to directories. In other words, autochdir sets the current directory to that containing the "file" (even if that "file" is itself a directory).

NETRW SETTINGS WINDOW netrw-settings-window {{{2

With the NetrwSettings.vim plugin,
        :NetrwSettings
will bring up a window with the many variables that netrw uses for its settings. You may change any of their values; when you save the file, the settings therein will be used. One may also press "?" on any of the lines for help on what each of the variables do.

(also see: netrw-browser-var netrw-protocol netrw-variables)

==
OBTAINING A FILE netrw-obtain netrw-O {{{2

If there are no marked files:

    When browsing a remote directory, one may obtain a file under the cursor (ie. get a copy on your local machine, but not edit it) by pressing the O key.

If there are marked files:

    The marked files will be obtained (ie. a copy will be transferred to your local machine, but not set up for editing).

Only ftp and scp are supported for this operation (but since these two are available for browsing, that shouldn't be a problem). The status bar will then show, on its right hand side, a message like "Obtaining filename". The statusline will be restored after the transfer is complete.

Netrw can also "obtain" a file using the local browser. Netrw's display of a directory is not necessarily the same as Vim's "current directory", unless g:netrw_keepdir is set to 0 in the user's <.vimrc>. One may select a file using the local browser (by putting the cursor on it) and pressing "O" will then "obtain" the file; ie. copy it to Vim's current directory.

Related topics:
 * To see what the current directory is, use :pwd
 * To make the currently browsed directory the current directory, see netrw-c
 * To automatically make the currently browsed directory the current directory, see g:netrw_keepdir .

OPEN A NEW FILE IN NETRW'S CURRENT DIRECTORY netrw-newfile netrw-createfile netrw-% {{{2

To open a new file in netrw's current directory, press "%". This map will query the user for a new filename; an empty file by that name will be placed in the netrw's current directory (ie. b:netrw_curdir).

Related topics: netrw-d

PREVIEW WINDOW netrw-p netrw-preview {{{2

One may use a preview window by using the "p" key when the cursor is atop the desired filename to be previewed. The display will then split to show both the browser (where the cursor will remain) and the file (see :pedit). By default, the split will be taken horizontally; one may use vertical splitting if one has set g:netrw_preview first.

An interesting set of netrw settings is:

```
let g:netrw_preview   = 1
let g:netrw_liststyle = 3
let g:netrw_winsize   = 30
```

These will:

1. Make vertical splitting the default for previewing files
2. Make the default listing style "tree"
3. When a vertical preview window is opened, the directory listing will use only 30% of the columns available; the rest of the window is used for the preview window.

Related: if you like this idea, you may also find :Lexplore (netrw-:Lexplore) or g:netrw_chgwin of interest

Also see: g:netrw_chgwin netrw-P 'previewwindow' CTRL-W_z :pclose

PREVIOUS WINDOW netrw-P netrw-prvwin {{{2

To edit a file or directory under the cursor in the previously used (last accessed) window (see :he CTRL-W_p), press a "P". If there's only one window, then the one window will be horizontally split (by default).

If there's more than one window, the previous window will be re-used on the selected file/directory. If the previous window's associated buffer has been modified, and there's only one window with that buffer, then the user will be asked if s/he wishes to save the buffer first (yes, no, or cancel).

Related Actions netrw-cr netrw-o netrw-t netrw-v
Associated setting variables:

g:netrw_alto	control above/below splitting
g:netrw_altv	control right/left splitting
g:netrw_preview	control horizontal vs vertical splitting
g:netrw_winsize	control initial sizing

Also see: g:netrw_chgwin netrw-p

REFRESHING THE LISTING netrw-refresh netrw-ctrl-l netrw-ctrl_l {{{2

To refresh either a local or remote directory listing, press ctrl-l (<c-l>) or hit the <cr> when atop the ./ directory entry in the listing. One may also

refresh a local directory by using ":e .".

REVERSING SORTING ORDER netrw-r netrw-reverse {{{2

One may toggle between normal and reverse sorting order by pressing the
"r" key.

Related topics: netrw-s
Associated setting variable: g:netrw_sort_direction

RENAMING FILES OR DIRECTORIES netrw-move netrw-rename netrw-R {{{2

If there are no marked files: (see netrw-mf)

    Renaming files and directories involves moving the cursor to the
    file/directory to be moved (renamed) and pressing "R". You will then be
    queried for what you want the file/directory to be renamed to. You may
    select a range of lines with the "V" command (visual selection), and then
    press "R"; you will be queried for each file as to what you want it
    renamed to.

If there are marked files: (see netrw-mf)

    Marked files will be renamed (moved). You will be queried as above in
    order to specify where you want the file/directory to be moved.

    If you answer a renaming query with a "s/frompattern/topattern/", then
    subsequent files on the marked file list will be renamed by taking each
    name, applying that substitute, and renaming each file to the result.
    As an example :

        mr [query: reply with *.c]
        R   [query: reply with s/^\(.*\)\.c$/\1.cpp/]

    This example will mark all *.c files and then rename them to *.cpp
    files.

    The ctrl-X character has special meaning for renaming files:

        <c-x>   : a single ctrl-x tells netrw to ignore the portion of the response
                     lying between the last '/' and the ctrl-x.

        <c-x><c-x> : a pair of contiguous ctrl-x's tells netrw to ignore any
                     portion of the string preceding the double ctrl-x's.

    WARNING:

    Note that moving files is a dangerous operation; copies are safer. That's
    because a "move" for remote files is actually a copy + delete -- and if
    the copy fails and the delete succeeds you may lose the file.
    Use at your own risk.

The g:netrw_rename_cmd variable is used to implement remote renaming. By default its value is:

```
ssh HOSTNAME mv
```

One may rename a block of files and directories by selecting them with V (linewise-visual) when using thin style.

See cmdline-editing for more on how to edit the command line; in particular, you'll find <ctrl-f> (initiates cmdline window editing) and <ctrl-c> (uses the command line under the cursor) useful in conjunction with the R command.

SELECTING SORTING STYLE netrw-s netrw-sort {{{2

One may select the sorting style by name, time, or (file) size. The "s" map allows one to circulate amongst the three choices; the directory listing will automatically be refreshed to reflect the selected style.

Related topics: netrw-r netrw-S
Associated setting variables: g:netrw_sort_by g:netrw_sort_sequence

SETTING EDITING WINDOW netrw-editwindow netrw-C netrw-:NetrwC {{{2

One may select a netrw window for editing with the "C" mapping, using the :NetrwC [win#] command, or by setting g:netrw_chgwin to the selected window number. Subsequent selection of a file to edit (netrw-cr) will use that window.

* C : by itself, will select the current window holding a netrw buffer for subsequent editing via netrw-cr . The C mapping is only available while in netrw buffers.

* [count]C : the count will be used as the window number to be used for subsequent editing via netrw-cr .

* :NetrwC will set g:netrw_chgwin to the current window

* :NetrwC win# will set g:netrw_chgwin to the specified window number

Using

```
let g:netrw_chgwin= -1
```

will restore the default editing behavior
(ie. subsequent editing will use the current window).

Associated setting variables: g:netrw_chgwin

SHRINKING OR EXPANDING A NETRW OR LEXPLORE WINDOW netrw-c-tab {{{2

The <c-tab> key will toggle a netrw or :Lexplore window's width,

but only if g:netrw_usetab exists and is non-zero (and, of course,
only if your terminal supports differentiating <c-tab> from a plain
<tab>).

  * If the current window is a netrw window, toggle its width
    (between g:netrw_wiw and its original width)

  * Else if there is a :Lexplore window in the current tab, toggle
    its width

  * Else bring up a :Lexplore window

If g:netrw_usetab exists and is zero, or if there is a pre-existing mapping
for <c-tab>, then the <c-tab> will not be mapped. One may map something other
than a <c-tab>, too: (but you'll still need to have had g:netrw_usetab set).

        nmap <unique> (whatever)   <Plug>NetrwShrink

Related topics: :Lexplore
Associated setting variable: g:netrw_usetab

USER SPECIFIED MAPS   netrw-usermaps {{{1

One may make customized user maps. Specify a variable, g:Netrw_UserMaps ,
to hold a List of lists of keymap strings and function names:

        [["keymap-sequence","ExampleUserMapFunc"],...]

When netrw is setting up maps for a netrw buffer, if g:Netrw_UserMaps
exists, then the internal function netrw#UserMaps(islocal) is called.
This function goes through all the entries in the g:Netrw_UserMaps list:

        * sets up maps:
                nno <buffer> <silent> KEYMAP-SEQUENCE
                :call s:UserMaps(islocal,"ExampleUserMapFunc")
       * refreshes if result from that function call is the string
         "refresh"
        * if the result string is not "", then that string will be
          executed (:exe result)
        * if the result is a List, then the above two actions on results
          will be taken for every string in the result List

The user function is passed one argument; it resembles

        fun! ExampleUserMapFunc(islocal)

where a:islocal is 1 if its a local-directory system call or 0 when
remote-directory system call.

                                netrw-call   netrw-expose   netrw-modify
Use netrw#Expose("varname")   to access netrw-internal (script-local)
                                     variables.
Use netrw#Modify("varname",newvalue) to change netrw-internal variables.

Use netrw#Call("funcname"[,args])   to call a netrw-internal function with
                                     specified arguments.

Example: Get a copy of netrw's marked file list:

```
let netrwmarkfilelist= netrw#Expose("netrwmarkfilelist")
```

Example: Modify the value of netrw's marked file list:

```
call netrw#Modify("netrwmarkfilelist",[])
```

Example: Clear netrw's marked file list via a mapping on gu

```
" ExampleUserMap: {{{2
fun! ExampleUserMap(islocal)
  call netrw#Modify("netrwmarkfilelist",[])
  call netrw#Modify('netrwmarkfilemtch_{bufnr("%")}',"")
  let retval= ["refresh"]
  return retval
endfun
let g:Netrw_UserMaps= [["gu","ExampleUserMap"]]
```

10. Problems and Fixes netrw-problems {{{1

(This section is likely to grow as I get feedback)
(also see netrw-debug)

netrw-p1

P1. I use windows 95, and my ftp dumps four blank lines at the end of every read.

See netrw-fixup , and put the following into your <.vimrc> file:

```
let g:netrw_win95ftp= 1
```

netrw-p2

P2. I use Windows, and my network browsing with ftp doesn't sort by time or size! -or- The remote system is a Windows server; why don't I get sorts by time or size?

Windows' ftp has a minimal support for ls (ie. it doesn't accept sorting options). It doesn't support the -F which gives an explanatory character (ABC/ for "ABC is a directory"). Netrw then uses "dir" to get both its thin and long listings. If you think your ftp does support a full-up ls, put the following into your <.vimrc>:

```
let g:netrw_ftp_list_cmd    = "ls -lF"
let g:netrw_ftp_timelist_cmd= "ls -tlF"
let g:netrw_ftp_sizelist_cmd= "ls -slF"
```

Alternatively, if you have cygwin on your Windows box, put into your <.vimrc>:

```
let g:netrw_cygwin= 1
```

This problem also occurs when the remote system is Windows.
In this situation, the various g:netrw_ftp_[time|size]list_cmds
are as shown above, but the remote system will not correctly
modify its listing behavior.

netrw-p3

P3. I tried rcp://user@host/ (or protocol other than ftp) and netrw used ssh! That wasn't what I asked for...

Netrw has two methods for browsing remote directories: ssh
and ftp. Unless you specify ftp specifically, ssh is used.
When it comes time to do download a file (not just a directory
listing), netrw will use the given protocol to do so.

netrw-p4

P4. I would like long listings to be the default.

Put the following statement into your .vimrc :

```
let g:netrw_liststyle= 1
```

Check out netrw-browser-var for more customizations that
you can set.

netrw-p5

P5. My times come up oddly in local browsing

Does your system's strftime() accept the "%c" to yield dates
such as "Sun Apr 27 11:49:23 1997"? If not, do a
"man strftime" and find out what option should be used. Then
put it into your .vimrc :

```
let g:netrw_timefmt= "%X"  (where X is the option)
```

netrw-p6

P6. I want my current directory to track my browsing.
How do I do that?

Put the following line in your .vimrc :

```
let g:netrw_keepdir= 0
```

netrw-p7

P7. I use Chinese (or other non-ascii) characters in my filenames, and netrw (Explore, Sexplore, Hexplore, etc) doesn't display them!

(taken from an answer provided by Wu Yongwei on the vim
mailing list)
I now see the problem. Your code page is not 936, right? Vim
seems only able to open files with names that are valid in the
current code page, as are many other applications that do not

use the Unicode version of Windows APIs. This is an OS-related issue. You should not have such problems when the system locale uses UTF-8, such as modern Linux distros.

(...it is one more reason to recommend that people use utf-8!)

netrw-p8

P8. I'm getting "ssh is not executable on your system" -- what do I do?

(Dudley Fox) Most people I know use putty for windows ssh. It is a free ssh/telnet application. You can read more about it here:

http://www.chiark.greenend.org.uk/~sgtatham/putty/ Also:

(Marlin Unruh) This program also works for me. It's a single executable, so he/she can copy it into the Windows\System32 folder and create a shortcut to it.

(Dudley Fox) You might also wish to consider plink, as it sounds most similar to what you are looking for. plink is an application in the putty suite.

http://the.earth.li/~sgtatham/putty/0.58/htmldoc/Chapter7.html#plink

(Vissale Neang) Maybe you can try OpenSSH for windows, which can be obtained from:

http://sshwindows.sourceforge.net/

It doesn't need the full Cygwin package.

(Antoine Mechelynck) For individual Unix-like programs needed for work in a native-Windows environment, I recommend getting them from the GnuWin32 project on sourceforge if it has them:

http://gnuwin32.sourceforge.net/

Unlike Cygwin, which sets up a Unix-like virtual machine on top of Windows, GnuWin32 is a rewrite of Unix utilities with Windows system calls, and its programs works quite well in the cmd.exe "Dos box".

(dave) Download WinSCP and use that to connect to the server. In Preferences > Editors, set gvim as your editor:

- Click "Add..."
- Set External Editor (adjust path as needed, include the quotes and !.! at the end):
  "c:\Program Files\Vim\vim70\gvim.exe" !.!
- Check that the filetype in the box below is {asterisk}.{asterisk} (all files), or whatever types you want (cec: change {asterisk} to * ; I had to

write it that way because otherwise the helptags
system thinks it's a tag)
- Make sure it's at the top of the listbox (click it,
then click "Up" if it's not)
If using the Norton Commander style, you just have to hit <F4>
to edit a file in a local copy of gvim.

(Vit Gottwald) How to generate public/private key and save
public key it on server:
http://www.chiark.greenend.org.uk/~sgtatham/putty/0.60/htmldoc/Chapter8.html#pubkey-getti
(8.3 Getting ready for public key authentication)

How to use a private key with 'pscp':

http://www.chiark.greenend.org.uk/~sgtatham/putty/0.60/htmldoc/Chapter5.html
(5.2.4 Using public key authentication with PSCP)

(Ben Schmidt) I find the ssh included with cwRsync is
brilliant, and install cwRsync or cwRsyncServer on most
Windows systems I come across these days. I guess COPSSH,
packed by the same person, is probably even better for use as
just ssh on Windows, and probably includes sftp, etc. which I
suspect the cwRsync doesn't, though it might

(cec) To make proper use of these suggestions above, you will
need to modify the following user-settable variables in your
.vimrc:

g:netrw_ssh_cmd g:netrw_list_cmd g:netrw_mkdir_cmd
g:netrw_rm_cmd g:netrw_rmdir_cmd g:netrw_rmf_cmd

The first one (g:netrw_ssh_cmd) is the most important; most
of the others will use the string in g:netrw_ssh_cmd by
default.

netrw-p9 netrw-ml_get
P9. I'm browsing, changing directory, and bang! ml_get errors
appear and I have to kill vim. Any way around this?

Normally netrw attempts to avoid writing swapfiles for
its temporary directory buffers. However, on some systems
this attempt appears to be causing ml_get errors to
appear. Please try setting g:netrw_use_noswf to 0
in your <.vimrc>:
let g:netrw_use_noswf= 0

netrw-p10
P10. I'm being pestered with "[something] is a directory" and
"Press ENTER or type command to continue" prompts...

The "[something] is a directory" prompt is issued by Vim,
not by netrw, and there appears to be no way to work around
it. Coupled with the default cmdheight of 1, this message
causes the "Press ENTER..." prompt. So: read hit-enter ;

I also suggest that you set your 'cmdheight' to 2 (or more) in your <.vimrc> file.

netrw-p11

P11. I want to have two windows; a thin one on the left and my editing window on the right. How may I accomplish this?

You probably want netrw running as in a side window. If so, you will likely find that ":[N]Lexplore" does what you want. The optional "[N]" allows you to select the quantity of columns you wish the :Lexplore r window to start with (see g:netrw_winsize for how this parameter works).

Previous solution:

* Put the following line in your <.vimrc>:
  let g:netrw_altv = 1
* Edit the current directory: :e .
* Select some file, press v
* Resize the windows as you wish (see CTRL-W_< and CTRL-W_>). If you're using gvim, you can drag the separating bar with your mouse.
* When you want a new file, use ctrl-w h to go back to the netrw browser, select a file, then press P (see CTRL-W_h and netrw-P). If you're using gvim, you can press <leftmouse> in the browser window and then press the <middlemouse> to select the file.

netrw-p12

P12. My directory isn't sorting correctly, or unwanted letters are appearing in the listed filenames, or things aren't lining up properly in the wide listing, ...

This may be due to an encoding problem. I myself usually use utf-8, but really only use ascii (ie. bytes from 32-126). Multibyte encodings use two (or more) bytes per character. You may need to change g:netrw_sepchr and/or g:netrw_xstrlen .

netrw-p13

P13. I'm a Windows + putty + ssh user, and when I attempt to browse, the directories are missing trailing "/"s so netrw treats them as file transfers instead of as attempts to browse subdirectories. How may I fix this?

(mikeyao) If you want to use vim via ssh and putty under Windows, try combining the use of pscp/psftp with plink. pscp/psftp will be used to connect and plink will be used to execute commands on the server, for example: list files and directory using 'ls'.

These are the settings I use to do this:

```
" list files, it's the key setting, if you haven't set,
" you will get a blank buffer
```

```
let g:netrw_list_cmd = "plink HOSTNAME ls -Fa"
" if you haven't add putty directory in system path, you should
" specify scp/sftp command.  For examples:
"let g:netrw_sftp_cmd = "d:\\dev\\putty\\PSFTP.exe"
"let g:netrw_scp_cmd = "d:\\dev\\putty\\PSCP.exe"
```

netrw-p14

P14. I would like to speed up writes using Nwrite and scp/ssh style connections. How? (Thomer M. Gil)

Try using ssh's ControlMaster and ControlPath (see the ssh_config man page) to share multiple ssh connections over a single network connection. That cuts out the cryptographic handshake on each file write, sometimes speeding it up by an order of magnitude. (see http://thomer.com/howtos/netrw_ssh.html) (included by permission)

Add the following to your ~/.ssh/config:

```
# you change "*" to the hostname you care about
Host *
  ControlMaster auto
  ControlPath /tmp/%r@%h:%p
```

Then create an ssh connection to the host and leave it running:

```
ssh -N host.domain.com
```

Now remotely open a file with Vim's Netrw and enjoy the zippiness:

```
vim scp://host.domain.com//home/user/.bashrc
```

netrw-p15

P15. How may I use a double-click instead of netrw's usual single click to open a file or directory? (Ben Fritz)

First, disable netrw's mapping with

```
let g:netrw_mousemaps= 0
```

and then create a netrw buffer only mapping in $HOME/.vim/after/ftplugin/netrw.vim:

```
nmap <buffer> <2-leftmouse> <CR>
```

Note that setting g:netrw_mousemaps to zero will turn off all netrw's mouse mappings, not just the <leftmouse> one. (see g:netrw_mousemaps)

netrw-p16

P16. When editing remote files (ex. :e ftp://hostname/path/file), under Windows I get an E303 message complaining that its unable to open a swap file.

(romainl) It looks like you are starting Vim from a protected directory. Start netrw from your $HOME or other writable directory.

netrw-p17

P17. Netrw is closing buffers on its own.
     What steps will reproduce the problem?
        1. :Explore, navigate directories, open a file
        2. :Explore, open another file
        3. Buffer opened in step 1 will be closed. o
    What is the expected output? What do you see instead?
        I expect both buffers to exist, but only the last one does.

   (Lance) Problem is caused by "set autochdir" in .vimrc.
   (drchip) I am able to duplicate this problem with 'acd' set.
            It appears that the buffers are not exactly closed;
            a ":ls!" will show them (although ":ls" does not).

netrw-P18

P18. How to locally edit a file that's only available via
     another server accessible via ssh?
     See http://stackoverflow.com/questions/12469645/
     "Using Vim to Remotely Edit A File on ServerB Only
      Accessible From ServerA"

netrw-P19

P19. How do I get numbering on in directory listings?
        With g:netrw_bufsettings , you can control netrw's buffer
        settings; try putting
          let g:netrw_bufsettings="noma nomod nu nobl nowrap ro nornu"
       in your .vimrc. If you'd like to have relative numbering
        instead, try
          let g:netrw_bufsettings="noma nomod nonu nobl nowrap ro rnu"

netrw-P20

P20. How may I have gvim start up showing a directory listing?
        Try putting the following code snippet into your .vimrc:
            augroup VimStartup
              au!
              au VimEnter * if expand("%") == "" && argc() == 0 &&
              \ (v:servername =~ 'GVIM\d*' || v:servername == "")
              \ | e . | endif
            augroup END
       You may use Lexplore instead of "e" if you're so inclined.
        This snippet assumes that you have client-server enabled
        (ie. a "huge" vim version).

netrw-P21

P21. I've made a directory (or file) with an accented character, but
        netrw isn't letting me enter that directory/read that file:

        Its likely that the shell or o/s is using a different encoding
        than you have vim (netrw) using. A patch to vim supporting
        "systemencoding" may address this issue in the future; for
        now, just have netrw use the proper encoding. For example:

                au FileType netrw set enc=latin1

netrw-P22

P22. I get an error message when I try to copy or move a file:

error (netrw) tried using g:netrw_localcopycmd<cp>; it doesn't work!

What's wrong?

Netrw uses several system level commands to do things (see

g:netrw_localcopycmd , g:netrw_localmovecmd ,
g:netrw_localrmdir , g:netrw_mkdir_cmd).

You may need to adjust the default commands for one or more of these commands by setting them properly in your .vimrc. Another source of difficulty is that these commands use vim's local directory, which may not be the same as the browsing directory shown by netrw (see g:netrw_keepdir).

==========

11. Debugging Netrw Itself netrw-debug {{{1

Step 1: check that the problem you've encountered hasn't already been resolved by obtaining a copy of the latest (often developmental) netrw at:

http://www.drchip.org/astronaut/vim/index.html#NETRW

The <netrw.vim> script is typically installed on systems as something like:

/usr/local/share/vim/vim7x/plugin/netrwPlugin.vim
/usr/local/share/vim/vim7x/autoload/netrw.vim
(see output of :echo &rtp)

which is loaded automatically at startup (assuming :set nocp). If you installed a new netrw, then it will be located at

$HOME/.vim/plugin/netrwPlugin.vim
$HOME/.vim/autoload/netrw.vim

Step 2: assuming that you've installed the latest version of netrw, check that your problem is really due to netrw. Create a file called netrw.vimrc with the following contents:

```
set nocp
so $HOME/.vim/plugin/netrwPlugin.vim
```

Then run netrw as follows:

```
vim -u netrw.vimrc --noplugins -i NONE [some path here]
```

Perform whatever netrw commands you need to, and check that the problem is still present. This procedure sidesteps any issues due to personal .vimrc settings, .viminfo file, and other plugins. If the problem does not appear,

then you need to determine which setting in your .vimrc is causing the
conflict with netrw or which plugin(s) is/are involved.

Step 3: If the problem still is present, then get a debugging trace from
netrw:

1. Get the <Decho.vim> script, available as:

   http://www.drchip.org/astronaut/vim/index.html#DECHO
   or
   http://vim.sourceforge.net/scripts/script.php?script_id=120

   Decho.vim is provided as a "vimball"; see vimball-intro .

2. Edit the <netrw.vim> file by typing:

   ```
   vim netrw.vim
   :DechoOn
   :wq
   ```

   To restore to normal non-debugging behavior, re-edit <netrw.vim>
   and type

   ```
   vim netrw.vim
   :DechoOff
   :wq
   ```

   This command, provided by <Decho.vim>, will comment out all
   Decho-debugging statements (Dfunc(), Dret(), Decho(), Dredir()).

3. Then bring up vim and attempt to evoke the problem by doing a
   transfer or doing some browsing. A set of messages should appear
   concerning the steps that <netrw.vim> took in attempting to
   read/write your file over the network in a separate tab or
   server vim window.

   To save the file, use

   ```
   :tabnext
   :set bt=
   :w! DBG
   ```

   Furthermore, it'd be helpful if you would type
   ```
   :Dsep <command>
   ```
   where <command> is the command you're about to type next,
   thereby making it easier to associate which part of the
   debugging trace is due to which command.

   Please send that information to <netrw.vim>'s maintainer along
   with the o/s you're using and the vim version that you're using
   (see :version)
   ```
   NdrOchip at ScampbellPfamily.AbizM - NOSPAM
   ```

==

v162: Sep 19, 2016 * (haya14busa) pointed out two syntax errors with a patch; these are now fixed.
Oct 26, 2016 * I started using mate-terminal and found that x and gx (netrw-x and netrw-gx) were no longer working. Fixed (using atril when $DESKTOP_SESSION is "mate").
Nov 04, 2016 * (Martin Vuille) pointed out that @+ was being restored with keepregstar rather than keepregplus.
Nov 09, 2016 * Broke apart the command from the options, mostly for Windows. Introduced new netrw settings: g:netrw_localcopycmdopt g:netrw_localcopydircmdopt g:netrw_localmkdiropt g:netrw_localmovecmdopt g:netrw_localrmdiropt
Nov 21, 2016 * (mattn) provided a patch for preview; swapped winwidth() with winheight()
Nov 22, 2016 * (glacambre) reported that files containing spaces weren't being obtained properly via scp. Fix: apparently using single quotes such as with 'file name' wasn't enough; the spaces inside the quotes also had to be escaped (ie. 'file\ name').
* Also fixed obtain (netrw-O) to be able to obtain files with spaces in their names
Dec 20, 2016 * (xc1427) Reported that using "I" (netrw-I) when atop "Hiding" in the banner also caused the active-banner hiding control to occur
Jan 03, 2017 * (Enno Nagel) reported that attempting to apply netrw to a directory that was without read permission caused a syntax error.
Jan 13, 2017 * (Ingo Karkat) provided a patch which makes using netrw#Call() better. Now returns value of internal routines return, for example.
Jan 13, 2017 * (Ingo Karkat) changed netrw#FileUrlRead to use :edit instead of :read . I also changed the routine name to netrw#FileUrlEdit.
Jan 16, 2017 * (Sayem) reported a problem where :Lexplore could generate a new listing buffer and window instead of toggling the netrw display. Unfortunately, the directions for eliciting the problem weren't complete, so I may or may not have fixed that issue.
Feb 06, 2017 * Implemented cb and cB. Changed "c" to "cd". (see netrw-cb , netrw-cB , and netrw-cd)
Mar 21, 2017 * previously, netrw would specify (safe) settings even when the setting was already safe for netrw. Netrw now attempts to leave such already-netrw-safe settings alone. (affects s:NetrwOptionRestore() and s:NetrwSafeOptions(); also introduced s:NetrwRestoreSetting())
Jun 26, 2017 * (Christian Brabandt) provided a patch to

allow curl to follow redirects (ie. -L option)
Jun 26, 2017 * (Callum Howard) reported a problem with :Lexpore not removing the Lexplore window after a change-directory
Aug 30, 2017 * (Ingo Karkat) one cannot switch to the previously edited file (e.g. with CTRL-^) after editing a file:// URL. Patch to have a "keepalt" included.
Oct 17, 2017 * (Adam Faryna) reported that gn (netrw-gn) did not work on directories in the current tree
v157: Apr 20, 2016 * (Nicola) had set up a "nmap <expr> ..." with a function that returned a 0 while silently invoking a shell command. The shell command activated a ShellCmdPost event which in turn called s:LocalBrowseRefresh(). That looks over all netrw buffers for changes needing refreshes. However, inside a :map-<expr> , tab and window changes are disallowed. Fixed. (affects netrw's s:LocalBrowseRefresh())
* g:netrw_localrmdir not used any more, but the relevant patch that causes delete() to take over was #1107 (not #1109).
* expand() is now used on g:netrw_home ; consequently, g:netrw_home may now use environment variables
* s:NetrwLeftmouse and s:NetrwCLeftmouse will return without doing anything if invoked when inside a non-netrw window
Jun 15, 2016 * gx now calls netrw#GX() which returns the word under the cursor. The new wrinkle: if one is in a netrw buffer, then netrw's s:NetrwGetWord().
Jun 22, 2016 * Netrw was executing all its associated Filetype commands silently; I'm going to try doing that "noisily" and see if folks have a problem with that.
Aug 12, 2016 * Changed order of tool selection for handling http://... viewing. (Nikolay Aleksandrovich Pavlov)
Aug 21, 2016 * Included hiding/showing/all for tree listings
* Fixed refresh (^L) for tree listings
v156: Feb 18, 2016 * Changed =~ to =~# where appropriate
Feb 23, 2016 * s:ComposePath(base,subdir) now uses fnameescape() on the base portion
Mar 01, 2016 * (gt_macki) reported where :Explore would make file unlisted. Fixed (tst943)
Apr 04, 2016 * (reported by John Little) netrw normally suppresses browser messages, but sometimes those "messages" are what is wanted. See g:netrw_suppress_gx_mesg
Apr 06, 2016 * (reported by Carlos Pita) deleting a remote

```
                      file was giving an error message.  Fixed.
        Apr 08, 2016    * (Charles Cooper) had a problem with an
                          undefined b:netrw_curdir.  He also provided
                          a fix.
        Apr 20, 2016    * Changed s:NetrwGetBuffer(); now uses
                          dictionaries.  Also fixed the "No Name"
                          buffer problem.
v155:   Oct 29, 2015    * (Timur Fayzrakhmanov) reported that netrw's
                          mapping of ctrl-l was not allowing refresh of
                          other windows when it was done in a netrw
                          window.
        Nov 05, 2015    * Improved s:TreeSqueezeDir() to use search()
                          instead of a loop
                        * NetrwBrowse() will return line to
                          w:netrw_bannercnt if cursor ended up in
                          banner
        Nov 16, 2015    * Added a <Plug>NetrwTreeSqueeze ( netrw-s-cr )
        Nov 17, 2015    * Commented out imaps -- perhaps someone can
                          tell me how they're useful and should be
                          retained?
        Nov 20, 2015    * Added  netrw-ma  and  netrw-mA  support
        Nov 20, 2015    * gx ( netrw-gx ) on a URL downloaded the
                          file in addition to simply bringing up the
                          URL in a browser.  Fixed.
        Nov 23, 2015    * Added  g:netrw_sizestyle  support
        Nov 27, 2015    * Inserted a lot of <c-u>s into various netrw
                          maps.
        Jan 05, 2016    *  netrw-qL  implemented to mark files based
                          upon  location-list s; similar to  netrw-qF .
        Jan 19, 2016    * using - call delete(directoryname,"d") -
                          instead of using g:netrw_localrmdir if
                          v7.4 + patch#1107 is available
        Jan 28, 2016    * changed to using  winsaveview()  and
                           winrestview()
        Jan 28, 2016    * s:NetrwTreePath() now does a save and
                          restore of view
        Feb 08, 2016    * Fixed a tree-listing problem with remote
                          directories
v154:   Feb 26, 2015    * (Yuri Kanivetsky) reported a situation where
                          a file was not treated properly as a file
                          due to g:netrw_keepdir == 1
        Mar 25, 2015    * (requested by Ben Friz) one may now sort by
                          extension
        Mar 28, 2015    * (requested by Matt Brooks) netrw has a lot
                          of buffer-local mappings; however, some
                          plugins (such as vim-surround) set up
                          conflicting mappings that cause vim to wait.
                          The "<nowait>" modifier has been included
                          with most of netrw's mappings to avoid that
                          delay.
        Jun 26, 2015    *  netrw-gn  mapping implemted
                        * :Ntree NotADir resulted in having
                          the tree listing expand in the error messages
                          window.  Fixed.
```

```
                Jun 29, 2015    * Attempting to delete a file remotely caused
                                  an error with "keepsol" mentioned; fixed.
                Jul 08, 2015    * Several changes to keep the  :jumps  table
                                  correct when working with
                                   g:netrw_fastbrowse  set to 2
                                * wide listing with accented characters fixed
                                  (using %-S instead of %-s with a  printf()
                Jul 13, 2015    * (Daniel Hahler) CheckIfKde() could be true
                                  but kfmclient not installed.  Changed order
                                  in netrw#BrowseX(): checks if kde and
                                  kfmclient, then will use xdg-open on a unix
                                  system (if xdg-open is executable)
                Aug 11, 2015    * (McDonnell) tree listing mode wouldn't
                                  select a file in a open subdirectory.
                                * (McDonnell) when multiple subdirectories
                                  were concurrently open in tree listing
                                  mode, a ctrl-L wouldn't refresh properly.
                                * The netrw:target menu showed duplicate
                                  entries
                Oct 13, 2015    * (mattn) provided an exception to handle
                                  windows with shellslash set but no shell
                Oct 23, 2015    * if g:netrw_usetab and <c-tab> now used
                                  to control whether NetrwShrink is used
                                  (see  netrw-c-tab )
v153:           May 13, 2014    * added another  g:netrw_ffkeep  usage {{{2
                May 14, 2014    * changed s:PerformListing() so that it
                                  always sets ft=netrw for netrw buffers
                                  (ie. even when syntax highlighting is
                                  off, not available, etc)
                May 16, 2014    * introduced the  netrw-ctrl-r  functionality
                May 17, 2014    * introduced the  netrw-:NetrwMB  functionality
                                * mb and mB ( netrw-mb ,  netrw-mB ) will
                                  add/remove marked files from bookmark list
                May 20, 2014    * (Enno Nagel) reported that :Lex <dirname>
                                  wasn't working.  Fixed.
                May 26, 2014    * restored test to prevent leftmouse window
                                  resizing from causing refresh.
                                  (see s:NetrwLeftmouse())
                                * fixed problem where a refresh caused cursor
                                  to go just under the banner instead of
                                  staying put
                May 28, 2014    * (László Bimba) provided a patch for opening
                                  the  :Lexplore  window 100% high, optionally
                                  on the right, and will work with remote
                                  files.
                May 29, 2014    * implemented :NetrwC  (see  netrw-:NetrwC )
                Jun 01, 2014    * Removed some "silent"s from commands used
                                  to implemented scp://... and pscp://...
                                  directory listing.  Permits request for
                                  password to appear.
                Jun 05, 2014    * (Enno Nagel) reported that user maps "/"
                                  caused problems with "b" and "w", which
                                  are mapped (for wide listings only) to
                                  skip over files rather than just words.
```

```
            Jun 10, 2014    *  g:netrw_gx  introduced to allow users to
                              override default "<cfile>" with the gx
                              ( netrw-gx ) map
            Jun 11, 2014    * gx ( netrw-gx ), with  'autowrite'  set,
                              will write modified files.  s:NetrwBrowseX()
                              will now save, turn off, and restore the
                               'autowrite'  setting.
            Jun 13, 2014    * added visual map for gx use
            Jun 15, 2014    * (Enno Nagel) reported that with having hls
                              set and wide listing style in use, that the
                              b and w maps caused unwanted highlighting.
            Jul 05, 2014    *  netrw-mv  and  netrw-mX  commands included
            Jul 09, 2014    *  g:netrw_keepj  included, allowing optional
                              keepj
            Jul 09, 2014    * fixing bugs due to previous update
            Jul 21, 2014    * (Bruno Sutic) provided an updated
                              netrw_gitignore.vim
            Jul 30, 2014    * (Yavuz Yetim) reported that editing two
                              remote files of the same name caused the
                              second instance to have a "temporary"
                              name.  Fixed: now they use the same buffer.
            Sep 18, 2014    * (Yasuhiro Matsumoto) provided a patch which
                              allows scp and windows local paths to work.
            Oct 07, 2014    * gx (see  netrw-gx ) when atop a directory,
                              will now do  gf  instead
            Nov 06, 2014    * For cygwin: cygstart will be available for
                              netrw#BrowseX() to use if its executable.
            Nov 07, 2014    * Began support for file://... urls.  Will use
                               g:netrw_file_cmd  (typically elinks or links)
            Dec 02, 2014    * began work on having mc ( netrw-mc ) copy
                              directories.  Works for linux machines,
                              cygwin+vim, but not for windows+gvim.
            Dec 02, 2014    * in tree mode, netrw was not opening
                              directories via symbolic links.
            Dec 02, 2014    * added resolved link information to
                              thin and tree modes
            Dec 30, 2014    * (issue#231)  :ls  was not showing
                              remote-file buffers reliably.  Fixed.
v152:       Apr 08, 2014    * uses the  'noswapfile'  option (requires {{{2
                              vim 7.4 with patch 213)
                            * (Enno Nagel) turn  'rnu'  off in netrw
                              buffers.
                            * (Quinn Strahl) suggested that netrw
                              allow regular window splitting to occur,
                              thereby allowing  'equalalways'  to take
                              effect.
                            * (qingtian zhao) normally, netrw will
                              save and restore the  'fileformat' ;
                              however, sometimes that isn't wanted
            Apr 14, 2014    * whenever netrw marks a buffer as ro,
                              it will also mark it as nomod.
            Apr 16, 2014    * sftp protocol now supported by
                              netrw#Obtain(); this means that one
                              may use "mc" to copy a remote file
```

```
                      to a local file using sftp, and that
                      the  netrw-O  command can obtain remote
                      files via sftp.
                    * added [count]C support (see  netrw-C )
          Apr 18, 2014  * when  g:netrw_chgwin  is one more than
                      the last window, then vertically split
                      the last window and use it as the
                      chgwin window.
          May 09, 2014  * SavePosn was "saving filename under cursor"
                      from a non-netrw window when using :Rex.
v151:     Jan 22, 2014  * extended :Rexplore to return to buffer {{{2
                      prior to Explore or editing a directory
                    * (Ken Takata) netrw gave error when
                      clipboard was disabled.  Sol'n: Placed
                      several if has("clipboard") tests in.
                    * Fixed ftp://X@Y@Z// problem; X@Y now
                      part of user id, and only Z is part of
                      hostname.
                    * (A Loumiotis) reported that completion
                      using a directory name containing spaces
                      did not work.  Fixed with a retry in
                      netrw#Explore() which removes the
                      backslashes vim inserted.
          Feb 26, 2014  * :Rexplore now records the current file
                       using w:netrw_rexfile when returning via
                       :Rexplore
          Mar 08, 2014  * (David Kotchan) provided some patches
                      allowing netrw to work properly with
                      windows shares.
                    * Multiple one-liner help messages available
                      by pressing <cr> while atop the "Quick
                      Help" line
                    * worked on ShellCmdPost, FocusGained event
                      handling.
                    *  :Lexplore  path: will be used to update
                      a left-side netrw browsing directory.
          Mar 12, 2014  *  netrw-s-cr : use <s-cr>  to close
                      tree directory implemented
          Mar 13, 2014  * (Tony Mechylynck) reported that using
                      the browser with ftp on a directory,
                      and selecting a gzipped txt file, that
                      an E19 occurred (which was issued by
                      gzip.vim).  Fixed.
          Mar 14, 2014  * Implemented :MF and :MT (see  netrw-:MF
                      and  netrw-:MT , respectively)
          Mar 17, 2014  *  :Ntree  [dir] wasn't working properly; fixed
          Mar 18, 2014  * Changed all uses of set to setl
          Mar 18, 2014  * Commented the netrw_btkeep line in
                      s:NetrwOptionSave(); the effect is that
                      netrw buffers will remain as  'bt' =nofile.
                      This should prevent swapfiles being created
                      for netrw buffers.
          Mar 20, 2014  * Changed all uses of lcd to use s:NetrwLcd()
                      instead.  Consistent error handling results
```

```
                    and it also handles Window's shares
                  * Fixed  netrw-d  command when applied with ftp
                  * https: support included for netrw#NetRead()
v150:   Jul 12, 2013    * removed a "keepalt" to allow ":e #" to {{{2
                    return to the netrw directory listing
        Jul 13, 2013    * (Jonas Diemer) suggested changing
                    a <cWORD> to <cfile>.
        Jul 21, 2013    * (Yuri Kanivetsky) reported that netrw's
                    use of mkdir did not produce directories
                    following the user's umask.
        Aug 27, 2013    * introduced  g:netrw_altfile  option
        Sep 05, 2013    * s:Strlen() now uses  strdisplaywidth()
                    when available, by default
        Sep 12, 2013    * (Selyano Baldo) reported that netrw wasn't
                    opening some directories properly from the
                    command line.
        Nov 09, 2013    *  :Lexplore  introduced
                  * (Ondrej Platek) reported an issue with
                    netrw's trees (P15).  Fixed.
                  * (Jorge Solis) reported that "t" in
                    tree mode caused netrw to forget its
                    line position.
        Dec 05, 2013    * Added <s-leftmouse> file marking
                    (see  netrw-mf )
        Dec 05, 2013    * (Yasuhiro Matsumoto) Explore should use
                    strlen() instead s:Strlen() when handling
                    multibyte chars with strpart()
                    (ie. strpart() is byte oriented, not
                    display-width oriented).
        Dec 09, 2013    * (Ken Takata) Provided a patch; File sizes
                    and a portion of timestamps were wrongly
                    highlighted with the directory color when
                    setting `:let g:netrw_liststyle=1` on Windows.
                  * (Paul Domaskis) noted that sometimes
                    cursorline was activating in non-netrw
                    windows.  All but one setting of cursorline
                    was done via setl; there was one that was
                    overlooked.  Fixed.
        Dec 24, 2013    * (esquifit) asked that netrw allow the
                    /cygdrive prefix be a user-alterable
                    parameter.
        Jan 02, 2014    * Fixed a problem with netrw-based ballon
                    evaluation (ie. netrw#NetrwBaloonHelp()
                    not having been loaded error messages)
        Jan 03, 2014    * Fixed a problem with tree listings
                  * New command installed:  :Ntree
        Jan 06, 2014    * (Ivan Brennan) reported a problem with
                     netrw-P .  Fixed.
        Jan 06, 2014    * Fixed a problem with  netrw-P  when the
                    modified file was to be abandoned.
        Jan 15, 2014    * (Matteo Cavalleri) reported that when the
                    banner is suppressed and tree listing is
                    used, a blank line was left at the top of
                    the display.  Fixed.
```

```
                Jan 20, 2014    * (Gideon Go) reported that, in tree listing
                                  style, with a previous window open, that
                                  the wrong directory was being used to open
                                  a file.  Fixed. (P21)
        v149:   Apr 18, 2013    * in wide listing format, now have maps for {{{2
                                  w and b to move to next/previous file
                Apr 26, 2013    * one may now copy files in the same
                                  directory; netrw will issue requests for
                                  what names the files should be copied under
                Apr 29, 2013    * Trying Benzinger's problem again.  Seems
                                  that commenting out the BufEnter and
                                  installing VimEnter (only) works.  Weird
                                  problem!  (tree listing, vim -O Dir1 Dir2)
                May 01, 2013    * :Explore ftp://... wasn't working.  Fixed.
                May 02, 2013    * introduced  g:netrw_bannerbackslash  as
                                  requested by Paul Domaskis.
                Jul 03, 2013    * Explore now avoids splitting when a buffer
                                  will be hidden.
        v148:   Apr 16, 2013    * changed Netrw's Style menu to allow direct {{{2
                                  choice of listing style, hiding style, and
                                  sorting style

pi_paren.txt For Vim version 8.1. Last change: 2013 May 08

VIM REFERENCE MANUAL by Bram Moolenaar

Highlighting matching parens matchparen

The functionality mentioned here is a standard-plugin .
This plugin is only available if 'compatible' is not set.

You can avoid loading this plugin by setting the "loaded_matchparen" variable:
```
:let loaded_matchparen = 1
```

The plugin installs CursorMoved, CursorMovedI and WinEnter autocommands to redefine the match highlighting.

:NoMatchParen :DoMatchParen
To disable the plugin after it was loaded use this command:

```
:NoMatchParen
```

And to enable it again:

```
:DoMatchParen
```

The highlighting used is MatchParen. You can specify different colors with the ":highlight" command. Example:

```
:hi MatchParen ctermbg=blue guibg=lightblue
```

The characters to be matched come from the 'matchpairs' option. You can change the value to highlight different matches. Note that not everything is possible. For example, you can't highlight single or double quotes, because the start and end are equal.

The syntax highlighting attributes are used. When the cursor currently is not in a string or comment syntax item, then matches inside string and comment syntax items are ignored. Any syntax items with "string" or "comment" somewhere in their name are considered string or comment items.

The search is limited to avoid a delay when moving the cursor. The limits are:
- What is visible in the window.
- 100 lines above or below the cursor to avoid a long delay when there are closed folds.
- 'synmaxcol' times 2 bytes before or after the cursor to avoid a delay in a long line with syntax highlighting.
- A timeout of 300 msec (60 msec in Insert mode). This can be changed with the g:matchparen_timeout and g:matchparen_insert_timeout variables and their buffer-local equivalents b:matchparen_timeout and b:matchparen_insert_timeout.

If you would like the % command to work better, the matchit plugin can be

used, see matchit-install . This plugin also helps to skip matches in comments. This is unrelated to the matchparen highlighting, they use a different mechanism.

                    +====================+
                    | Tar File Interface |
                    +====================+
```

Author: Charles E. Campbell <NdrOchip@ScampbellPfamily.AbizM>
 (remove NOSPAM from Campbell's email first)

==
1. Contents tar tar-contents

==
2. Usage tar-usage tar-manual

When one edits a *.tar file, this plugin will handle displaying a
contents page. Select a file to edit by moving the cursor atop
the desired file, then hit the <return> key. After editing, one may
also write to the file. Currently, one may not make a new file in
tar archives via the plugin.

  :Vimuntar
VIMUNTAR

:Vimuntar [vimhome]

     This command copies, if necessary, the tarball to the .vim or vimfiles
     directory using the first writable directory in the 'runtimepath'
     when no [vimhome] is specified. Otherwise, the [vimhome] argument
     allows the user to specify that directory, instead.

     The copy is done using the command in g:tar_copycmd , which is
             cp   for cygwin, unix, macunix
             copy for windows (32, 95, 64, 16)
    The extraction is done with the command specified with
      g:tar_extractcmd , which by default is
             "tar -xf"

  :TarDiff
DIFFERENCING SUPPORT

:TarDiff [filename]

This command will attempt to show the differences between the tarball version of a file and the associated file on the system. In order to find that file on the system, the script uses the path associated with the file mentioned in the tarball. If the current directory is not correct for that path, :TarDiff will fail to find the associated file.

If the [filename] is given, that that filename (and path) will be used to specify the associated file.

PREVENTING LOADING

If for some reason you do not wish to use vim to examine tar'd files, you may put the following two variables into your <.vimrc> to prevent the tar plugin from loading:

```
let g:loaded_tarPlugin= 1
let g:loaded_tar      = 1
```

3. Options tar-options

These options are variables that one may change, typically in one's <.vimrc> file.

Variable	Default Value	Explanation
g:tar_browseoptions	"Ptf"	used to get a list of contents
g:tar_readoptions	"OPxf"	used to extract a file from a tarball
g:tar_cmd	"tar"	the name of the tar program
g:tar_nomax	0	if true, file window will not be maximized

g:tar_secure	undef	if exists:
		"--"s will be used to prevent unwanted option expansion in tar commands. Please be sure that your tar command accepts "--"; Posix compliant tar utilities do accept them.
		if not exists:
		The tar plugin will reject any tar files or member files that begin with "-"
		Not all tar's support the "--" which is why it isn't default.

g:tar_writeoptions	"uf"	used to update/replace a file

4. History tar-history

v28 Jun 23, 2011 * a few more decompression options (tbz tb2 txz)

```
   v27 May 31, 2011 * moved cygwin detection before g:tar_copycmd handling
                    * inserted additional  :keepj  modifiers
                    * changed silent  to  sil!  ( :silent )
   v26 Aug 09, 2010 * uses buffer-local instead of window variables to hold
                      tarfile name
                    * inserted keepj before 0d to protect jump list
   v25 Jun 19, 2010 * (Jan Steffens) added support for xz compression
   v24 Apr 07, 2009 * :Untarvim command implemented
       Sep 28, 2009 * Added lzma support
   v22 Aug 08, 2008 * security fixes
   v16 Jun 06, 2008 * tarfile:: used instead of tarfile: when editing files
                      inside tarballs.  Fixes a problem with tarballs called
                      things like c:\abc.tar. (tnx to Bill McCarthy)
   v14 May 09, 2008 * arno caught a security bug
       May 28, 2008 * various security improvements.  Now requires patch 299
                      which provides the fnameescape() function
       May 30, 2008 * allows one to view *.gz and *.bz2 files that are in
                     *.tar files.
   v12 Sep 07, 2007 * &shq now used if not the empty string for g:tar_shq
   v10 May 02, 2006 * now using "redraw then echo" to show messages, instead
                      of "echo and prompt user"
   v9 May 02, 2006 * improved detection of masquerading as tar file
   v8 May 02, 2006 * allows editing of files that merely masquerade as tar
                     files
   v7 Mar 22, 2006 * work on making tar plugin work across network
      Mar 27, 2006 * g:tar_cmd now available for users to change the name
                     of the tar program to be used.  By default, of course,
                     it's "tar".
   v6 Dec 21, 2005 * writing to files not in directories caused problems -
                     fixed (pointed out by Christian Robinson)
   v5 Nov 22, 2005 * report option workaround installed
   v3 Sep 16, 2005 * handles writing files in an archive back to the
                     archive
      Oct 18, 2005 * <amatch> used instead of <afile> in autocmds
      Oct 18, 2005 * handles writing to compressed archives
      Nov 03, 2005 * handles writing tarfiles across a network using
                     netrw#NetWrite()
   v2              * converted to use Vim7's new autoload feature by
                     Bram Moolenaar
   v1 (original)   * Michael Toren (see http://michael.toren.net/code/)

pi_vimball.txt For Vim version 8.1. Last change: 2016 Apr 11

Vimball Archiver

Author: Charles E. Campbell <NdrOchip@ScampbellPfamily.AbizM>
(remove NOSPAM from Campbell's email first)

1. Contents vba vimball vimball-contents

2. Vimball Introduction vimball-intro

Vimball is intended to make life simpler for users of plugins. All
a user needs to do with a vimball is:

```
vim someplugin.vba
:so %
:q
```

and the plugin and all its components will be installed into their
appropriate directories. Note that one doesn't need to be in any
particular directory when one does this. Plus, any help for the
plugin will also be automatically installed.

If a user has decided to use the AsNeeded plugin, vimball is smart
enough to put scripts nominally intended for .vim/plugin/ into
.vim/AsNeeded/ instead.

Removing a plugin that was installed with vimball is really easy:

```
vim
:RmVimball someplugin
```

This operation is not at all easy for zips and tarballs, for example.

Vimball examines the user's 'runtimepath' to determine where to put

the scripts. The first directory mentioned on the runtimepath is usually used if possible. Use

```
:echo &rtp
```

to see that directory.

==

3. Vimball Manual vimball-manual

MAKING A VIMBALL :MkVimball

```
:[range]MkVimball[!] filename [path]
```

The range is composed of lines holding paths to files to be included in your new vimball, omitting the portion of the paths that is normally specified by the runtimepath ('rtp'). As an example:

```
plugin/something.vim
doc/something.txt
```

using

```
:[range]MkVimball filename
```

on this range of lines will create a file called "filename.vba" which can be used by Vimball.vim to re-create these files. If the "filename.vba" file already exists, then MkVimball will issue a warning and not create the file. Note that these paths are relative to your .vim (vimfiles) directory, and the files should be in that directory. The vimball plugin normally uses the first 'runtimepath' directory that exists as a prefix; don't use absolute paths, unless the user has specified such a path.

If you use the exclamation point (!), then MkVimball will create the "filename.vba" file, overwriting it if it already exists. This behavior resembles that for :w .

If you wish to force slashes into the filename, that can also be done by using the exclamation mark (ie. :MkVimball! path/filename).

The tip at http://vim.wikia.com/wiki/Using_VimBall_with_%27Make%27 has a good idea on how to automate the production of vimballs using make.

MAKING DIRECTORIES VIA VIMBALLS g:vimball_mkdir

First, the mkdir() command is tried (not all systems support it).

If it doesn't exist, then if g:vimball_mkdir doesn't exist, it is set as follows:

```
|g:netrw_localmkdir|, if it exists
"mkdir"            , if it is executable
"makedir"          , if it is executable
Otherwise          , it is undefined.
```

One may explicitly specify the directory making command using g:vimball_mkdir. This command is used to make directories that are needed as indicated by the vimball.

CONTROLLING THE VIMBALL EXTRACTION DIRECTORY g:vimball_home

You may override the use of the 'runtimepath' by specifying a variable, g:vimball_home.

vimball-extract

```
vim filename.vba
```

Simply editing a Vimball will cause Vimball.vim to tell the user to source the file to extract its contents.

Extraction will only proceed if the first line of a putative vimball file holds the "Vimball Archiver by Charles E. Campbell" line.

LISTING FILES IN A VIMBALL :VimballList

```
:VimballList
```

This command will tell Vimball to list the files in the archive, along with their lengths in lines.

MANUALLY INVOKING VIMBALL EXTRACTION :UseVimball

```
:UseVimball [path]
```

This command is contained within the vimball itself; it invokes the vimball#Vimball() routine which is responsible for unpacking the vimball. One may choose to execute it by hand instead of sourcing the vimball; one may also choose to specify a path for the installation, thereby overriding the automatic choice of the first existing directory on the 'runtimepath' .

REMOVING A VIMBALL :RmVimball

```
:RmVimball vimballfile [path]
```

This command removes all files generated by the specified vimball (but not any directories it may have made). One may choose a path for de-installation, too (see 'runtimepath'); otherwise, the default is the first existing directory on the 'runtimepath' .
To implement this, a file (.VimballRecord) is made in that directory containing a record of what files need to be removed for all vimballs used thus far.

PREVENTING LOADING

If for some reason you don't want to be able to extract plugins using vimballs: you may prevent the loading of vimball.vim by putting the following two variables in your <.vimrc>:

```
let g:loaded_vimballPlugin= 1
let g:loaded_vimball      = 1
```

WINDOWS vimball-windows

Many vimball files are compressed with gzip. Windows, unfortunately, does not come provided with a tool to decompress gzip'ped files. Fortunately, there are a number of tools available for Windows users to un-gzip files:

Item	Tool/Suite	Free	Website
7zip	tool	y	http://www.7-zip.org/
Winzip	tool	n	http://www.winzip.com/downwz.htm
unxutils	suite	y	http://unxutils.sourceforge.net/
cygwin	suite	y	http://www.cygwin.com/
GnuWin32	suite	y	http://gnuwin32.sourceforge.net/
MinGW	suite	y	http://www.mingw.org/

==========

4. Vimball History vimball-history {{{1

```
        37 : Jul 18, 2014 * (by request of T. Miedema) added augroup around
                            the autocmds in vimballPlugin.vim
             Jul 06, 2015 * there are two uses of tabc; changed to tabc!
        34 : Sep 22, 2011 * "UseVimball path" now supports a non-full path by
                            prepending the current directory to it.
        33 : Apr 02, 2011 * Gave priority to *.vmb over *.vba
                          * Changed silent! to sil! (shorter)
                          * Safed  'swf'  setting (during vimball extraction,
                            its now turned off)
        32 : May 19, 2010 * (Christian Brabrandt) :so someplugin.vba and
                            :so someplugin.vba.gz (and the other supported
                            compression types) now works
                          * (Jan Steffens) added support for xz compression
                          * fenc extraction was erroneously picking up the
                            end of the line number when no file encoding
                            was present.  Fixed.
                          * By request, beginning the switchover from the vba
                            extension to vmb.  Currently both are supported;
                            MkVimball, however, now will create *.vmb files.
             Feb 11, 2011 * motoyakurotsu reported an error with vimball's
                            handling of zero-length files
             Feb 18, 2016 * Changed =~ to =~# where appropriate
        30 : Dec 08, 2008 * fnameescape() inserted to protect error
                            messaging using corrupted filenames from
                            causing problems
                          * RmVimball supports filenames that would
                            otherwise be considered to have "magic"
                            characters (ie. Abc[1].vba)
             Feb 18, 2009 * s:Escape(), g:vimball_shq, and g:netrw_shq
                            removed (shellescape() used directly)
             Oct 05, 2009 * (Nikolai Weibull) suggested that MkVimball
                            be allowed to use slashes in the filename.
        26 : May 27, 2008 * g:vimball_mkdir usage installed.  Makes the
```

```
                  $HOME/.vim (or $HOME\vimfiles) directory if
                  necessary.
     May 30, 2008 * (tnx to Bill McCarthy) found and fixed a bug:
                  vimball wasn't updating plugins to AsNeeded/
                  when it should
25 : Mar 24, 2008 * changed vimball#Vimball() to recognize doc/*.??x
                  files as help files, too.
     Apr 18, 2008 * RmVimball command is now protected by saving and
                  restoring settings -- in particular, acd was
                  causing problems as reported by Zhang Shuhan
24 : Nov 15, 2007 * g:vimball_path_escape used by s:Path() to
                  prevent certain characters from causing trouble
                  (defunct:  fnameescape()  and  shellescape()
                  now used instead)
22 : Mar 21, 2007 * uses setlocal instead of set during BufEnter
21 : Nov 27, 2006 * (tnx to Bill McCarthy) vimball had a header
                  handling problem and it now changes \s to /s
20 : Nov 20, 2006 * substitute() calls have all had the 'e' flag
                  removed.
18 : Aug 01, 2006 * vimballs now use folding to easily display their
                  contents.
                  * if a user has AsNeeded/somefile, then vimball
                  will extract plugin/somefile to the AsNeeded/
                  directory
17 : Jun 28, 2006 * changes all \s to /s internally for Windows
16 : Jun 15, 2006 * A. Mechelynck's idea to allow users to specify
                  installation root paths implemented for
                  UseVimball, MkVimball, and RmVimball.
                  * RmVimball implemented
15 : Jun 13, 2006 * bugfix
14 : May 26, 2006 * bugfixes
13 : May 01, 2006 * exists("&acd") used to determine if the acd
                  option exists
12 : May 01, 2006 * bugfix - the  'acd'  option is not always defined
11 : Apr 27, 2006 * VimballList would create missing subdirectories that
                  the vimball specified were needed.  Fixed.
10 : Apr 27, 2006 * moved all setting saving/restoration to a pair of
                  functions.  Included some more settings in them
                  which frequently cause trouble.
9  : Apr 26, 2006 * various changes to support Windows' predilection
                  for backslashes and spaces in file and directory
                  names.
7  : Apr 25, 2006 * bypasses foldenable
                  * uses more exe and less norm! (:yank :put etc)
                  * does better at insuring a "Press ENTER" prompt
                  appears to keep its messages visible
4  : Mar 31, 2006 * BufReadPost seems to fire twice; BufReadEnter
                  only fires once, so the "Source this file..."
                  message is now issued only once.
3  : Mar 20, 2006 * removed query, now requires sourcing to be
                  extracted (:so %).  Message to that effect
                  included.
                  * :VimballList  now shows files that would be
                  extracted.
```

```
        2  : Mar 20, 2006 * query, :UseVimball included
        1  : Mar 20, 2006 * initial release

```

Author: Charles E. Campbell <NdrOchip@ScampbellPfamily.AbizM>
          (remove NOSPAM from Campbell's email first)

==
1. Contents   zip zip-contents

==
2. Usage   zip-usage zip-manual

   When one edits a *.zip file, this plugin will handle displaying a
   contents page. Select a file to edit by moving the cursor atop
   the desired file, then hit the <return> key. After editing, one may
   also write to the file. Currently, one may not make a new file in
   zip archives via the plugin.

                                                                  zip-x
   x : may extract a listed file when the cursor is atop it

   OPTIONS

                                                        g:zip_nomax

   If this variable exists and is true, the file window will not be
   automatically maximized when opened.

                                                        g:zip_shq
   Different operating systems may use one or more shells to execute
   commands. Zip will try to guess the correct quoting mechanism to
   allow spaces and whatnot in filenames; however, if it is incorrectly
   guessing the quote to use for your setup, you may use
        g:zip_shq
  which by default is a single quote under Unix (') and a double quote
   under Windows ("). If you'd rather have no quotes, simply set
   g:zip_shq to the empty string (let g:zip_shq= "") in your <.vimrc>.

g:zip_unzipcmd

Use this option to specify the program which does the duty of "unzip". It's used during browsing. By default:

```
let g:zip_unzipcmd= "unzip"
```

g:zip_zipcmd

Use this option to specify the program which does the duty of "zip". It's used during the writing (updating) of a file already in a zip file; by default:

```
let g:zip_zipcmd= "zip"
```

g:zip_extractcmd

This option specifies the program (and any options needed) used to extract a file from a zip archive. By default,

```
let g:zip_extractcmd= g:zip_unzipcmd
```

PREVENTING LOADING

If for some reason you do not wish to use vim to examine zipped files, you may put the following two variables into your <.vimrc> to prevent the zip plugin from loading:

```
let g:loaded_zipPlugin= 1
let g:loaded_zip      = 1
```

==========

3. Additional Extensions zip-extension

Apparently there are a number of archivers which generate zip files that don't use the .zip extension (.jar, .xpi, etc). To handle such files, place a line in your <.vimrc> file:

```
au BufReadCmd *.jar,*.xpi call zip#Browse(expand("<amatch>"))
```

One can simply extend this line to accommodate additional extensions that should be treated as zip files.

Alternatively, one may change g:zipPlugin_ext in one's .vimrc. Currently (11/30/15) it holds:

```
let g:zipPlugin_ext= '*.zip,*.jar,*.xpi,*.ja,*.war,*.ear,*.celzip,
\ *.oxt,*.kmz,*.wsz,*.xap,*.docx,*.docm,*.dotx,*.dotm,*.potx,*.potm,
\ *.ppsx,*.ppsm,*.pptx,*.pptm,*.ppam,*.sldx,*.thmx,*.xlam,*.xlsx,*.xlsm,
\ *.xlsb,*.xltx,*.xltm,*.xlam,*.crtx,*.vdw,*.glox,*.gcsx,*.gqsx,*.epub'
```

==========

4. History zip-history {{{1

v28 Oct 08, 2014 * changed the sanity checks for executables to reflect
the command actually to be attempted in zip#Read()
and zip#Write()
* added the extraction of a file capability
Nov 30, 2015 * added *.epub to the g:zipPlugin_ext list

```
    Sep 13, 2016 * added *.apk to the  g:zipPlugin_ext  list and
                   sorted the suffices.
v27 Jul 02, 2013 * sanity check: zipfile must have "PK" as its first
                   two bytes.
                 * modified to allow zipfile: entries in quickfix lists
v26 Nov 15, 2012 * (Jason Spiro) provided a lot of new extensions that
                   are synonyms for .zip
v25 Jun 27, 2011 * using keepj with unzip -Z
                   (consistent with the -p variant)
                 * (Ben Staniford) now uses
                     has("win32unix") && executable("cygpath")
                   before converting to cygwin-style paths
v24 Jun 21, 2010 * (Cédric Bosdonnat) unzip seems to need its filenames
                   fnameescape'd as well as shellquote'd
                 * (Motoya Kurotsu) inserted keepj before 0d to protect
                   jump list
v17 May 09, 2008 * arno caught a security bug
v15 Sep 07, 2007 * &shq now used if not the empty string for g:zip_shq
v14 May 07, 2007 * using b:zipfile instead of w:zipfile to avoid problem
                   when editing alternate file to bring up a zipfile
v10 May 02, 2006 * now using "redraw then echo" to show messages, instead
                   of "echo and prompt user"
                 * g:zip_shq provided to allow for quoting control for the
                   command being passed via :r! ... commands.
v8 Apr 10, 2006 * Bram Moolenaar reported that he received an error message
                  due to "Pattern not found: ^.*\%0c"; this was caused by
                  stridx finding a Name... at the beginning of the line;
                  zip.vim tried 4,$s/^.*\%0c//, but that doesn't work.
                  Fixed.
v7 Mar 22, 2006 * escaped some characters that can cause filename handling
                  problems.
v6 Dec 21, 2005 * writing to files not in directories caused problems -
                  fixed (pointed out by Christian Robinson)
v5 Nov 22, 2005 * report option workaround installed
v3 Oct 18, 2005 * <amatch> used instead of <afile> in autocmds
v2 Sep 16, 2005 * silenced some commands (avoiding hit-enter prompt)
                * began testing under Windows; works thus far
                * filetype detection fixed
   Nov 03, 2005 * handles writing zipfiles across a network using
                  netrw#NetWrite()
v1 Sep 15, 2005 * Initial release, had browsing, reading, and writing

VIM REFERENCE MANUAL by Bram Moolenaar

SPONSOR VIM DEVELOPMENT sponsor

Fixing bugs and adding new features takes a lot of time and effort. To show your appreciation for the work and motivate Bram and others to continue working on Vim please send a donation.

Since Bram is back to a paid job the money will now be used to help children in Uganda. See uganda . But at the same time donations increase Bram's motivation to keep working on Vim!

For the most recent information about sponsoring look on the Vim web site:

http://www.vim.org/sponsor/

More explanations can be found in the sponsor-faq .

REGISTERED VIM USER register

You can become a registered Vim user by sending at least 10 euro. This works similar to sponsoring Vim, see sponsor above. Registration was made possible for the situation where your boss or bookkeeper may be willing to register software, but does not like the terms "sponsoring" and "donation".

More explanations can be found in the register-faq .

VOTE FOR FEATURES vote-for-features

To give registered Vim users and sponsors an advantage over lurkers they can vote for the items Bram should work on. How does this voting work?

1. You send at least 10 euro. See below for ways to transfer money send-money .

2. You will be e-mailed a registration key. Enter this key on your account page on the Vim website. You can easily create an account if you don't have one yet.

3. You can enter your votes on the voting page. There is a link to that page on your account page after entering a registration key. Your votes will be counted for two years.

4. The voting results appear on the results page, which is visible for everybody: http://www.vim.org/sponsor/vote_results.php

Additionally, once you have sent 100 euro or more in total, your name appears

in the "Vim hall of honour": http://www.vim.org/sponsor/hall_of_honour.php
But only if you enable this on your account page.

HOW TO SEND MONEY send-money

Credit card Through PayPal, see the PayPal site for information:
  https://www.paypal.com/en_US/mrb/pal=XAC62PML3GF8Q
  The e-mail address for sending sponsorship money is:
  donate@vim.org
  The e-mail address for Vim registration is:
  register@vim.org
  Using Euro is preferred, other currencies are also accepted.
  In Euro countries a bank transfer is preferred, this has lower
  costs.

Other methods See iccf-donations .
  Include "Vim sponsor" or "Vim registration" in the comment of
  your money transfer. Send me an e-mail that mentions the
  amount you transferred if you want to vote for features and
  show others you are a registered Vim user or sponsor.

Cash Small amounts can be sent with ordinary mail. Put something
  around the money, so that it's not noticeable from the
  outside. Mention your e-mail address if you want to vote for
  features and show others you are a registered Vim user or
  sponsor.

You can use this permanent address:
  Bram Moolenaar
  Finsterruetihof 1
  8134 Adliswil
  Switzerland

QUESTIONS AND ANSWERS sponsor-faq register-faq

Why should I give money?

If you do not show your appreciation for Vim then Bram will be less motivated
to fix bugs and add new features. He will do something else instead.

How much money should I send?

That is up to you. The more you give, the more children will be helped.
An indication for individuals that use Vim at home: 10 Euro per year. For
professional use: 30 Euro per year per person. Send at least 10 euro to be
able to vote for features.

What do I get in return?

Each registered Vim user and sponsor who donates at least 10 euro will be able to vote for new features. These votes will give priority to the work on Vim. The votes are valid for two years. The more money you send the more your votes count votes-counted .

If you send 100 Euro or more in total you will be mentioned on the "Vim hall of honour" page on the Vim web site. But only if you enable this on your account page. You can also select whether the amount will be visible.

How do I become a Vim sponsor or registered Vim user?

Send money, as explained above send-money and include your e-mail address. When the money has been received you will receive a unique registration key. This key can be used on the Vim website to activate voting on your Vim account. You will then get an extra page where you can vote for features and choose whether others will be able to see that you donated. There is a link to this page on your "My Account" page.

What is the difference between sponsoring and registering?

It has a different name. Use the term "registration" if your boss doesn't like "sponsoring" or "donation". The benefits are the same.

How can I send money?

See send-money . Check the web site for the most recent information: http://www.vim.org/sponsor/

Why don't you use the SourceForge donation system?

SourceForge takes 5% of the donations for themselves. If you want to support SourceForge you can send money to them directly.

I cannot afford to send money, may I still use Vim?

Yes.

I did not register Vim, can I use all available features?

Yes.

I noticed a bug, do I need to register before I can report it?

No, suggestions for improving Vim can always be given. For improvements use the developer maillist , for reporting bugs see bugs .

How are my votes counted? votes-counted

You may vote when you send 10 euro or more. You can enter up to ten votes.
You can select the same item several times to give it more points. You can
also enter three counter votes, these count as negative points.

When you send 30 euro or more the points are doubled. Above 100 euro they
count four times, above 300 euro they count six times, above 1000 euro ten
times.

Can I change my votes?

You can change your votes any time you like, up to two years after you
sent money. The points will be counted right away.

Can I add an item to vote on?

Not directly. You can suggest items to vote on to Bram. He will consider
fitting your item into the list.

How about Charityware?

Currently the Vim donations go to uganda anyway. Thus it doesn't matter if
you sponsor Vim or ICCF. Except that Vim sponsoring will allow you to vote
for features.

I donated $$$, now please add feature XYZ!

There is no direct relation between your donation and the work Bram does.
Otherwise you would be paying for work and we would have to pay tax over the
donation. If you want to hire Bram for specific work, contact him directly,
don't use the donation system.

Are the donations tax deductible?

That depends on your country. The donations to help the children in Uganda
are tax deductible in Holland, Germany, Canada and in the USA. See the ICCF
website http://iccf-holland.org/donate.html. You must send an e-mail to Bram
to let him know that the donation is done because of the use of Vim.

Can you send me a bill?

No, because there is no relation between the money you send and the work that
is done. But a receipt is possible.

VIM FAQ by: Christian Brabandt <cb@256bit.org>

Frequently Asked Questions vim-faq Vim-FAQ

This Vim FAQ is created from the questions and answers posted to the vim@vim.org user mailing list and the comp.editors newsgroup. There are several ways to solve a problem in Vim. This FAQ gives one of those several possibilities. You can explore the other ways using the information and links given in this FAQ. The credit for the answers in this FAQ goes to Peppe, Benji, Charles Campbell and numerous others. An online version of this FAQ is available at http://vimhelp.appspot.com/vim_faq.txt.html

faq-1

SECTION 1 - GENERAL INFORMATION

faq-1.1

1.1. What is Vim?

Vim stands for Vi IMproved. It used to be Vi IMitation, but there are so
many improvements that a name change was appropriate. Vim is a text editor
which includes almost all the commands from the Unix program "Vi" and a lot
of new ones. All commands can be given with the keyboard. This has the
advantage that you can keep your fingers on the keyboard and your eyes on
the screen. For those who want it, there is mouse support and a GUI version
with scrollbars and menus.

Vim is an editor, not a word processor. A word processor is used mainly
to do layout of text. This means positioning it, changing the way it
appears on output. More often than not, the final document is meant to
be printed or typeset or what have you, in order to present it in a
pleasing manner to others. Examples of word processors are Microsoft
Word, FrameMaker, and OpenOffice Writer.

An editor is simply for entering text. Any typesetting or laying out of the
document is secondary. With an editor, one's main concern is entering text,
not making the text look good. Examples of editors other than Vim and Vi
are Emacs, TextMate, Ultraedit and gedit. And Notepad.

For more information read

     intro

faq-1.2

1.2. Who wrote Vim?

Most of Vim is based on Stevie and was written by Bram Moolenaar, with contributions from t
people to mention here.

For more information, read:

     author
     credits

faq-1.3

1.3. Is Vim compatible with Vi?

Yes. Vim is very much compatible with Vi. You can use the "-C"
command-line flag to start Vim in Vi compatible mode:

    $ vim -C

You can also use:

```
$ vim -u NONE
```

You can also set the 'compatible' option to enable Vi compatibility:

```
:set compatible
```

If you want to make sure, to start Vim in a 'nocompatible' mode to
original Vi, supply the -N command line argument:

```
$ vim -N
```

For more information, read

```
-C
-N
'compatible'
compatible-default
```

faq-1.4

1.4. What are some of the improvements of Vim over Vi?

A short summary of the improvements of Vim over vi is listed below. The list shows that Vim is a thoroughly modern and feature-packed editor. Standard features of modern editors are implemented, and there is an equal emphasis on general power-user features and features for programmers.

Features to modernise Vi:

Multi-level undo

Allows you to set the number of times you can undo your changes in a file buffer. You can also redo an undone change.
Also starting with version 7.3 Vim can permanently store your undo information, so that you can undo your changes which you have done in a previous editing session.

Tabs, Multiple windows and buffers

Each file can be displayed in its own window. You can move easily from one window to another. Each file opened during a Vim session also has an associated buffer and you can easily jump from one to the other. Also like any modern GUI, Vim supports opening several files in tabs. You can do batch processing for tabs, buffers, windows and the argumentlist.

Flexible insert mode

Vim allows you to use the arrow keys while in insert mode to move around in the file. No more hitting <Esc>, moving around, then hitting `i' or `a'.

Macros

Vim has a facility which allows you to record a sequence of typed characters and repeat them any number of times.

Visual mode

You can highlight sections of text and execute operations on this section of text only.

Block operators

Allow selection and highlighting of rectangular blocks of text in order do execute specific operations on them.

Online help system

You can easily find help on any aspect of using Vim. Help is displayed in its own window.

Command-line editing and history

History allows you to use the arrow keys to repeat or search for a command that has already been typed. Allows you to match the beginning of a command with the beginning of another similar command in the history buffer. You can also edit a command to correct typos or change a few values.

Command line completion.

Using the <Tab> key, you can complete commands, options, filenames, etc. as needed.

Horizontal scrolling.

Long lines can be scrolled horizontally (with or without the GUI).

Unicode and internationalization improvements.

Vim is able to edit files in unicode encoding and uses internally an utf-8 encoding. Additionally Vim can display text right to left oriented.

Advanced user features:

Text formatting

With two keystrokes, you can format large sections of text, without the use of external programs.

Completion in Insert mode

Vim provides several different possibilities to complete your text. For example Vim can complete words while you are typing, by matching the current word with other similar words in the file.

Jump tags

   Just like in an internet browser, you can jump back to previous parts
   of the text you were editing, and then forward again. Your brain is
   thus free to edit instead of navigate.

Automatic commands

   Commands automatically executed when reading or writing a file,
   jumping to another buffer, etc.

Viminfo

   Allows storing of the command line history, marks and registers in a
   file to be read on startup. Therefore, you can recall old search
   patterns, macros, etc., in a new Vim session.

Mouse support

   The mouse is supported in an xterm and for MS-DOS. It can be used to
   position the cursor, select the visual area, paste a register, etc.

Graphical User Interface (GUI)

   There are several different graphical user interfaces available.
   Also, it's very easy to add your own menus. Of course, console vim is
   still supported, and very widely used.

Scripting language

   Vim has a powerful scripting language so new commands can be created.
   You can also use Perl, Python, TCL, Lua and Ruby to achieve the same thing!

Plugins

   Extra functionality implemented via vim commands (regular commands or
   the scripting language) that is automatically loaded on startup.
   Examples: file explorer, network editing, enhanced autocompletion,
   syntax checks.
   More are being developed and shared on VimOnline all the time.

Syntax highlighting for many programming languages

   Syntax highlighting (including concealing items) for hundreds of
   programming languages is supported. Support for others can be
   added.

Extended regular expressions

   Vim supports extended regular expressions which are similar in
   functionality to that of Perl regular expressions.

Integrated Spell checking

Spell checking has been integrated into Vim

Diff mode

Vim can highlight the differences between two, three or four files. Identical lines will be folded away and hidden.

Encryption using the blowfish algorithm

Vim allows to encrypt your files using the symmetric block cipher blowfish as well as the swap file.

Extensive customizable

Vim can be tuned and customized to work like you want by setting options. You can define your own commands, macros and even plugins to extend its capabilities

Packages

Packages have been added to keep the installation of the growing number of plugins manageable. This is a convenient way to get one or more plugins, drop them in a directory and keep them updated. Vim will load them automatically, or only when desired.

Programming performance features:

Edit-compile-edit speedup

You can compile within Vim and automatically jump to the location of errors in the source code.

Indenting for many programming languages

C, C++, Java, Perl, XML and many other languages can be automatically indented by vim while you type. Support for others can be added.

Searching for words in include files

Vim allows you to search for a match of the word under the cursor in the current and included files.

Advanced text objects

Instantly select, delete, copy, indent, format, change case, or ... to all the text between (and), or { and }, or < and >, or [and]. Or a word, sentence, or paragraph. Very powerful.

Folding

Certain parts of the text can be "folded" away. The best example is the body of a function. You can get an overview of the code, and then open the fold of the function whose detail you need to see.

ctags and cscope integration

    Using these two powerful programs, you can jump to a definition of a
    function from a calling instance of it, and use other tricks to
    navigate source code.

Integration of several programming languages

    If you find the internal scripting language not powerful enough, you
    can extend Vim using Lua, Ruby, Tcl, Perl and Python 2 and 3.

Asynchronous I/O support

    Vim uses jobs and channels to talk to other programs
    asynchronously. This allows to have e.g. a compiler run in the
    background and open the quickfix list as soon as it is finished to
    fix warnings and errors.

Timers

    Timers are asynchronous and can fire once or repeatedly to invoke a
    function to do any work.

For more information, read

    vi-differences

faq-1.5

1.5. Is Vim free?

Vim is Charityware. There are no restrictions on using or copying Vim, but
the author encourages you to make a donation to charity. A document
explaining how to do so is included in the distribution.

For more information, read

    copyright

==

faq-2

SECTION 2 - RESOURCES

faq-2.1

2.1. Where can I learn more about Vim?

You can post your Vim questions to the vim@vim.org mailing list. You can
post your Vim development related questions to the vim-dev@vim.org mailing
list. Vim does not have a newsgroup of its own. But the appropriate
newsgroup to post to is comp.editors.

"VimOnline" is a web page that serves as a de facto homepage for vim,
although the main purpose of it is to gather tips and scripts from
everywhere. Get involved! The URL is vim.sourceforge.net or vim.sf.net.

Finally, read the Vi FAQ:

    http://www.faqs.org/faqs/editor-faq/vi/part1/index.html

Finally, there are also some communities, where you can discuss features
or ask questions:

    http://vi.stackexchange.com
    http://vim.reddit.com

For more information, read

     mail-list
     internet

faq-2.2

2.2. Is there a mailing list available?

There are several:

    NAME   DESCRIPTION

    vim-announce   Announcements of new releases
    vim   General discussion
    vim-dev   Patches, bug reports, development discussions
    vim-mac   Macintosh discussion
    vim-fr   General discussion in French

Of these, only vim and vim-dev are of general interest. vim-announce is
read-only to most people, and its messages are sent to the other lists as
well. The remaining four are very low volume.

    To subscribe: send an email to <NAME>-subscribe@vim.org
    To unsubscribe: send an email to <NAME>-unsubscribe@vim.org
    To get help: send an email to <NAME>-help@vim.org

The available mailing lists are also mentioned here:

    http://www.vim.org/maillist.php

faq-2.3

2.3. Is there an archive available for the Vim mailing lists?

Yes. Visit http://www.yahoogroups.com/list/<name>, where name is one of:
vimannounce, vim, vimdev, vim-fr, vim-mac, vim-vms.

Alternatively, visit www.gmane.org to find out about GMANE, which allows
you to access the mailing lists as though they were newsgroups. This
offers some convenience to those who wish to browse the history or casually
observe the current threads.

faq-2.4

2.4. Where can I get the Vim user manual in HTML/PDF/PS format?

You can download the HTML/PDF/PS format of the Vim user manual from:

http://vimdoc.sourceforge.net/

Note, the user manual from that page is currently pretty outdated. It's best to either use the documentation that comes with vim or use the online version at http://vimhelp.appspot.com

You can find a pdf version of the full English help, including this faq (in letter, A4 and Ipad format) at:

http://www.nathangrigg.net/vimhelp/

This document is cross-referenced, so you can use the hyperlink functionality.

faq-2.5

2.5. I have a "xyz" (some) problem with Vim. How do I determine if it is a problem with my setup or with Vim? / Have I found a bug in Vim?

First, you need to find out, whether the error is in the actual runtime files or any plugin that is distributed with Vim or whether it is a simple side effect of any configuration option from your .vimrc or .gvimrc. So first, start vim like this:

```
vim -u NONE -U NONE -N -i NONE
```

This starts Vim in nocompatible mode (-N), without reading your viminfo file (-i NONE), without reading any configuration file (-u NONE for not reading .vimrc file and -U NONE for not reading a .gvimrc file) or even plugin.

In this invocation, try to reproduce your problem. If the error persists, the chance is good you've found a bug in Vim (see also Question 2.6. faq-2.6)

If the error does not occur when starting Vim this way, then the problem is either related to some plugin of yours or some setting in one of your local setup files. You need to find out, what triggers the error, you try starting Vim this way:

```
vim -u NONE -U NONE -N
```

If the error occurs, the problem is your .viminfo file. Simply delete the viminfo file then. If the error does not occur, try:

```
vim -u ~/.vimrc --noplugin -N -i NONE
```

This will simply use your .vimrc as configuration file, but not load any plugins. If the error occurs this time, the error is possibly caused by some configuration option inside your .vimrc file. Depending on the length of your vimrc file, it can be quite hard to trace the origin within that file.

The best way is to add :finish command in the middle of your .vimrc. Then restart again using the same command line. If the error still occurs, the bug must be caused because of a setting in the first half of

your .vimrc. If it doesn't happen, the problematic setting must be in the second half of your .vimrc. So move the :finish command to the middle of that half, of which you know that triggers the error and move your way along, until you find the problematic option. If your .vimrc is 350 lines long, you need at a maximum 9 tries to find the offending line (in practise, this can often be further reduced, since often lines depend on each other).

If the problem does not occur, when only loading your .vimrc file, the error must be caused by a plugin or another runtime file (indent autoload or syntax script). Check the output of the :scriptnames command to see what files have been loaded and for each one try to disable each one by one and see which one triggers the bug. Often files that are loaded by vim, have a simple configuration variable to disable them, but you need to check inside each file separately.

You can also use the -V command line argument to get more debug information to analyze the problem:

```
$ vim -V2logfile
```

You can increase the value passed to the -V argument to get more debug information. By also specifying a logfile name, this makes sure, the debug messages don't appear on the screen and won't disturb you when trying to reproduce the problem.

For more information, read

-u
-U
-N
-V
'verbose'
:verbose
:set-verbose

faq-2.6

2.6. Where can I report bugs?

First collect the required information using the following command:

```
:source $VIMRUNTIME/bugreport.vim
```

Now send the resulting text from the above command to the bugs@vim.org e-mail address. There is also a public bug tracker available at http://code.google.com/p/vim/issues/list. A copy of each message there will be forwarded to the Vim Development list.

The Vim Development mailing list (see Question 2.2 faq-2.2) is a good place to discuss general bugs. If the bug you find is with syntax highlighting, a runtime file, or some other "added feature" (i.e. not directly programmed into vim), attempt to inform the maintainer of that feature. His e-mail address will be mentioned at the top of the corresponding

runtime file.

For more information, read

	bug-reports

faq-2.7

2.7. Where can the FAQ be found?

The FAQ can be found at http://vimhelp.appspot.com/vim_faq.txt.html.
It will be auto-generated from the source that is managed in the github
repository http://www.github.com/chrisbra/vim_faq (Patches are welcome).

The repository also includes the faq in different formats, e.g. manpage,
pdf file, html file, plain text version and a version in vim help format.

A slightly older version (which doesn't seem to get updated anymore) can
still be found at VimOnline (vim.sf.net).

faq-2.8

2.8. What if I don't find an answer in this FAQ?

This FAQ covers mainly Vim-specific questions. You may find more
information suitable for most Vi clones by reading the Vi FAQ. It is posted
regularly on comp.editors. You can also find a copy at

	http://www.faqs.org/faqs/editor-faq/vi/part1/index.html

Also, since Vim has gathered so many features in the last few years,
successfully documenting the frequently asked questions here is a
near-impossible task. To make it possible, please email the maintainer if
you have a good question. A good question is one that you've tried to
answer yourself (remember, Vim has great documentation) but struggled.

faq-2.9

2.9. I have a patch for implementing a Vim feature. Where can I send this
	patch?

You can send your patches to the Vim developer mailing list
vim-dev@vim.org.

For more information, read

	vim-dev

faq-2.10

2.10. I have a Vim tip or developed a new Vim syntax/indent/filetype/
	compiler plugin or developed a new script or a colorscheme.
	Is there a public website where I can upload this?

Yes. You can use the Vim Online website to upload your plugins/scripts,
colorschemes, etc. The site is at http://vim.sourceforge.net
Nowadays people also seem to share their plugins/runtime files at
github.

Tips can also be shared in the Wiki which you can find at
http://vim.wikia.com

==
faq-3

SECTION 3 - AVAILABILITY

faq-3.1

3.1. What is the latest version of Vim?

The latest version of Vim is 7.4 released on 10th August 2013.

The release-history of different versions of Vim is below:

Version 8.0	12th September, 2016
Version 7.4	10th August, 2013
Version 7.3	15th August, 2010
Version 7.2	9th August, 2008
Version 7.1	12th May, 2007
Version 7.0	8th May, 2006
Version 6.4	15th October, 2005
Version 6.3	8th June 2004
Version 6.2	1st June 2003
Version 6.1	24th March 2002
Version 6.0	27th September, 2001
Version 5.8	31st May, 2001
Version 5.7	24th June, 2000
Version 5.6	16th January, 2000
Version 5.5	21st September, 1999
Version 5.4	26th July, 1999
Version 5.3	31st August, 1998
Version 5.2	24th August, 1998
Version 5.1	7th April, 1998
Version 5.0	19th February, 1998
Version 4.6	13th March,1997
Version 4.5	17th October, 1996
Version 4.2	5th July,1996
Version 4.0	21st May, 1996
Version 3.0	16th August, 1994
Version 2.0	21st December, 1993
Version 1.27	23rd April, 1993
Version 1.17	21st April, 1992

For more information, read

new-5
new-6
new-7
new-8
changed-7.1
changed-7.2
changed-7.3
changed-7.4

faq-3.2

3.2. Where can I find the latest version of Vim?

You can download the sources for the latest version of Vim from the
Github repository. The URL for this site is
https://github.com/vim/vim

A mirror is available at bitbucket:
https://bitbucket.org/vim-mirror/vim

Some users keep updated repositories for distributing latest binary
versions of Vim. You can find those repositories here:

http://vim.wikia.com/wiki/Where_to_download_Vim
faq-3.3
3.3. What platforms does it run on?

All Unix platforms.
All Windows platforms.
Amiga, Atari, BeOS, DOS, Macintosh, MachTen, OS/2, RiscOS, VMS, IBM z/OS.

faq-3.4
3.4. Where can I download the latest version of the Vim runtime files?

You can download the latest version of the Vim runtime files (syntax files,
filetype plugins, compiler files, color schemes, documentation, indentation
files and keymaps) from the Vim ftp site from the
ftp://ftp.vim.org/pub/vim/runtime directory.

Alternatively, the runtime files can be downloaded from the git
repository that holds Vim source code at:
https://github.com/vim/vim/tree/master/runtime

==
faq-4
SECTION 4 - HELP

faq-4.1
4.1. How do I use the help files?

Help can be found for all functions of Vim. In order to use it, use the
":help" command. This will bring you to the main help page. On that first
page, you will find explanations on how to move around. Basically, you move
around in the help pages the same way you would in a read-only document.
You can jump to specific subjects by using tags. This can be done in two
ways:

   * Use the "<Ctrl-]>" command while standing on the name of a command
     or option. This only works when the tag is a keyword.
     "<Ctrl-LeftMouse>" and "g<LeftMouse>" work just like "<Ctrl-]>".

   * use the ":tag <subject>" command. This works with all characters.

Use "<Ctrl-T>" to jump back to previous positions in the help files. Use
":q" to close the help window.

If you want to jump to a specific subject on the help pages, use ":help {subject}". If you don't know what to look for, try ":help index" to get a list of all available subjects. Use the standard search keys to locate the information you want. You can abbreviate the ":help" command as ":h".

For searching the help, see the next Question 4.2. faq-4.2

For more information, read

online-help

faq-4.2

4.2. How do I search for a keyword in the Vim help files?

a) You can press the CTRL-D key after typing the help keyword to get a list of all the help keywords containing the supplied pattern. You can also use the meta characters like *, \+, etc to specify the help search pattern:

```
:help init<C-D>
:help str*()<C-D>
:help '*indent<C-D>
```

b) You can press the Tab key after typing a partial help keyword to expand to the matching keyword. You can continue to press the Tab key to see other keyword matches.

c) From the help window, you can use the ":tag" command to search for keywords. For example,

```
:tselect /window
```

This command will list all the help keywords containing the text "window". You can select one from the list and jump to it.

d) You can use the ":helpgrep" command to search for the given text in all the help files. The quickfix window will be opened with all the matching lines.

For more information, read

help-summary
c_CTRL-D
c_<Tab>
:tselect
:help
:helpgrep

faq-4.3

4.3. I am getting an error message E123, what did I do wrong?

You can get more information about the error and the error message using:

E123

For more information, read

error-messages

faq-4.4

4.4. Where can I read about the various modes in Vim?

You can get information about the different modes in Vim by reading

vim-modes

faq-4.5

4.5. How do I generate the Vim help tags file after adding a new Vim help file?

You can use the ":helptags" command to regenerate the Vim help tag file from within Vim. For example:

```
:cd $VIMRUNTIME/doc
:helptags .
```

To update all "doc" directories in your 'runtimepath', you can use

```
:helptags ALL
```

For more information, read

:helptags
add-local-help

faq-4.6

4.6. Can I use compressed versions of the help files?

Yes. You can compress the help files and still be able to view them with Vim. This makes accessing the help files a bit slower and requires the "gzip" utility. Follow these steps to compress and use the Vim help files:

- Compress all the help files using "gzip doc/*.txt".

- Edit the "doc/tags" file and change the ".txt" to ".txt.gz" using
```
:%s=\(\t.*\.txt\)\t=\1.gz\t=
```

- Add the following line to your vimrc:
```
set helpfile={dirname}/help.txt.gz
```

Where {dirname} is the directory where the help files are. The gzip.vim plugin supplied with the standard Vim distribution will take care of decompressing the files. You must make sure that $VIMRUNTIME is set to where the other Vim files are, when they are not in the same location as the compressed "doc" directory.

Note, that the :helpgrep command does not work with compressed help pages.

For more information, read

	gzip-helpfile
	'helpfile'
	gzip
	$VIMRUNTIME

==
faq-5

SECTION 5 - EDITING A FILE

faq-5.1

5.1. How do I load a file in Vim for editing?

There are several ways to load a file for editing. The simplest is to
use the ":e" (:edit) command:

    :e <filename>

You can also use the ":n" (:next) command to load files into Vim:

    :n <filename(s)>

You can also use the ":args" command to load files into Vim:

    :args <filename(s)>

For more information, read

	usr_07.txt
	edit-files
	:edit
	:next_f
	:args_f

faq-5.2

5.2. How do I save the current file in another name (save as) and edit a
     new file?

You can use the ":saveas" command to save the current file in another name:

    :saveas <newfilename>

Alternatively, you can also use the following commands:

    :w <newfilename>
    :edit #

You can also use the ":file" command, followed by ":w" command:

    :file <newfilename>
    :w

For more information, read

```
07.7
:saveas
:file_f
:w
```

faq-5.3

5.3. How do I change the current directory to the directory of the current file?

You can use the following command to change the current directory to the directory of the current file:

```
:cd %:p:h
```

To automatically change the current directory to the directory of the current file, simply set the option 'autochdir'.

```
:set autochdir
```

For more information, read

```
:cd
:lcd
filename-modifiers
autocommand
'acd'
getcwd()
```

faq-5.4

5.4. How do I write a file without the line feed (EOL) at the end of the file?

You can turn off the 'eol' option and turn on the 'binary' option to write a file without the EOL at the end of the file:

```
:set binary
:set noeol
:w
```

Alternatively, you can use:

```
:set noeol
:w ++bin
```

If you rather only like Vim not to write missing EOLs, you can reset the 'fixeol' option. This needs a Vim newer 7.4.785, so you should wrap this in an if condition in your .vimrc like this:

```
if exists('+fixeol')
    set nofixeol
endif
```

This has the advantage of avoiding the many side effects that the
'binary' option has.

For more information, read

	'endofline'
	'fixeol'
	'binary'
	23.4

faq-5.5

5.5. How do I configure Vim to open a file at the last edited location?

Vim stores the cursor position of the last edited location for each buffer
in the '"' register. You can use the following autocmd in your .vimrc or
.gvimrc file to open a file at the last edited location:

```
au BufReadPost * if line("'\"") > 0 && line("'\"") <= line("$") |
                    \ exe "normal! g`\"" | endif
```

Alternatively, you can simply source the vimrc_example.vim file, which is
distributed with Vim.

For more information, read

	'quote
	last-position-jump
	vimrc_example.vim

faq-5.6

5.6. When editing a file in Vim, which is being changed by an external
	application, Vim opens a warning window (like the confirm dialog) each
	time a change is detected. How do I disable this warning?

You can set the Vim 'autoread' option to automatically read the file again
when it is changed outside of Vim:

```
:set autoread
```

You can also use the following autocommand:

```
autocmd FileChangedShell *
      \ echohl WarningMsg |
      \ echo "File has been changed outside of vim." |
      \ echohl None
```

For more information, read

	'autoread'
	FileChangedShell
	timestamp
	:checktime

faq-5.7

5.7. How do I edit a file whose name is under the cursor?

You can use the gf command to edit a file whose name is under the cursor.
You can use the CTRL-W f command to edit the file in a new window and
finally you can use CTRL-W gf top open a new tab page that contains the
file name under the cursor.

For more information, read

	gf
	CTRL-W_f
	CTRL-W_gf
	'isfname'
	'path'
	'suffixesadd'
	'includeexpr'

faq-5.8

5.8. How do I reload/re-edit the current file?

You can use the ":edit" command, without specifying a file name, to reload
the current file. If you have made modifications to the file, you can use
":edit!" to force the reload of the current file (you will lose your
modifications, but depending on your 'undoreload' settings, those
changes might be saved into the undo history).

For more information, read

	:edit
	:edit!
	'confirm'
	'undoreload'

faq-5.9

5.9. How do I autosave a file periodically?

Vim doesn't support auto-saving a file periodically.

For more information, read

	'updatetime'
	CursorHold
	swap-file

faq-5.10

5.10. How do I open a file in read-only mode?

You can open a file in read-only mode using the ":view" command:

    :view <filename>

This command sets the 'readonly' option for the opened buffer. You can also
use the "-R" command-line option to open a file in read-only mode:

```
    $ vim -R <filename>
```

You can also use the symbolic link executable "view" to open a file in
read-only mode from the command-line:

```
    $ view <filename>
```

For more information, read

```
     07.6
     'readonly'
     'modifiable'
     :view
     :sview
     view
     -R
     -M
```

faq-5.11

5.11. How do I open a file for editing without saving the modifications to
      the current file?

You can open a file for editing without saving the modifications to the
current file and without losing the changes using one of the following
methods:

```
    :split <new_filename>
    :new <new_filename>
```

You can also set the 'hidden' option and edit a new file:

```
    :set hidden
    :e <new_filename>
```

If you want to discard the changes made to the current file and load
another file for editing, then you can use the following command:

```
    :e! <new_filename>
```

For more information, read

```
     :edit!_f
     'hidden'
     :split
     :new
```

faq-5.12

5.12. How do I reduce the loading time for very large files in Vim?

You can use the following settings to reduce the loading time for
very large files in Vim:

```
    :set lazyredraw
    :set noswapfile
```

```
    :set undolevels=-1
    :set eventignore=all
    :set nohidden
    :set syntax=off
```

Note that the above settings will disable many Vim features including the
following: Swap files support for crash recovery, undo support, syntax
highlighting, filetype detection and other autocommand based features.

There is also the LargeFile plugin available at
http://www.vim.org/scripts/script.php?script_id=1506
which automatically sets these options, when working with large files
(it is configurable, what is considered to be a large file, by default,
it is 100MB).

==
faq-6

SECTION 6 - EDITING MULTIPLE FILES

faq-6.1

6.1. How do I open multiple files at once from within Vim?

Make a difference between args, buffers, tabs and windows. They are all
different things in VIM.

args is a list of arguments. Buffers are place to edit text, almost
always attached to a file but not necessarily. Window is a place for a
buffer and tab is set of windows, better name would be 'layout'.

There are several ways to open multiple files at once from within Vim. You
can use the ":next" command to specify a group of files:

```
    :next f1.txt f2.txt
    :next *.c
```

You can use the :args command to specify a group of files as arguments:

```
    :args f1.txt f2.txt
    :args *.c
```

After loading the files, you can use the ":next" and ":prev" command to
switch between the files.

To execute command for all files in argument-list use ":argdo"

For more information, read

```
     07.2
     :next
     :args_f
     argument-list
```

faq-6.2

6.2. How do I switch between multiple files/buffers in Vim?

To list all buffers use ":ls", to list buffers without file attached to (also known as unlisted buffers, ex. scratch buffer and help-window) use ":ls!"

There are several ways to switch between multiple files. You can use the ":buffer" command to switch between multiple files. You can also shorten command as ":b" and use only part of the filename. For example,

```
:buffer file1
:buffer file2
:b e2
```

You can also use <TAB> after ":b" for autocompletion. Try also ":b" followed by <CTRL-d> to see all available buffers. This works also for ":e".

You can also use the CTRL-^ key to switch between buffers. By specifying a count before pressing the key, you can edit the buffer with that number. Without the count, you can edit the alternate buffer by pressing CTRL-^

You can also use the ":e #" command to edit a particular buffer:

```
:e #5
```

To close a buffer use ":bd" -command.

To execute command for all files in buffer-list use ":bufdo"

For more information, read

```
edit-files
:buffer
CTRL-^
alternate-file
22.4
07.3
```

faq-6.3

6.3. How do I open several files in Vim, with each file in a separate window/tab?

You can use the -o and -O Vim command line arguments to open multiple files in separate horizontally or vertically split Vim windows. For example:

```
$ vim -o3 f1.txt f2.txt f3.txt
```

The above command will open the files f1.txt, f2.txt and f3.txt in three separate horizontally split Vim windows.

```
$ vim -O3 f1.txt f2.txt f3.txt
```

The above command will open the files f1.txt, f2.txt and f3.txt in three separate vertically split Vim windows.

```
$ vim -p f1.txt f2.txt f3.txt
```

The above command will open the files f1.txt, f2.txt and f3.txt in three separate tab windows. The option 'tabpagemax' defines, how many tabpages can be opened at the same time, by default it is set to 10.

For more information, read

-o
-O
-p
startup-options
'tabpagemax'

faq-6.4

6.4. How do I configure Vim to autoload several files at once similar to "work-sets" or "projects"?

You can use the ":mksession" and the ":mkview" commands to autoload several files in Vim.

The ":mksession" command creates a Vim script that restores the current editing session. You can use the ":source" command to source the file produced by the mksession command.

The ":mkview" command creates a Vim script that restores the contents of the current window. You can use the ":loadview" command to load the view for the current file.

For more information, read

21.4
21.5
views-sessions
'sessionoptions'
:mksession
:source
v:this_session
:mkview
:loadview
'viewdir'
buffers

faq-6.5

6.5. Is it possible to open multiple top level windows in a single instance of Vim similar to Nedit or Emacs?

No. It is currently not possible to open multiple top-level windows in a single instance of Vim. This feature is in the todo list.

faq-6.6

6.6. How do I browse/explore directories from within Vim?

You can use the netrw.vim plugin, supplied with the standard Vim
installation, to browse/explore directories from within Vim. You can start
the file explorer using one of the following commands:

```
:e <directory>
:Explore
:Sexplore
:Vexplore
:Texplore
```

From the file explorer, you can browse through directories, rename, delete
and edit files.

For more information, read

```
netrw.vim
22.1
```

faq-6.7

6.7. How do I edit files over a network using ftp/scp/rcp/http?

You can use the netrw.vim plugin, supplied with the standard Vim package,
to edit files over a network using ftp/scp/rcp/http. Using this plugin, Vim
will transparently load and save the files over ftp/scp/rcp/http. For
example, to edit a file over ftp, you can use the following command:

```
$ vim ftp://machine/path
```

For more information, read:

```
netrw.vim
```

==========

faq-7

SECTION 7 - BACKUP

faq-7.1

7.1. When I edit and save files, Vim creates a file with the same name as
the original file and a "~" character at the end. How do I stop Vim
from creating this file? (or) How do I disable the Vim backup file
feature?

You have set the 'backup' option, so Vim creates a backup file when saving
the original file. You can stop Vim from creating the backup file, by
clearing the option:

```
:set nobackup
```

Note that, by default this option is turned off. You have explicitly
enabled the 'backup' option in one of the initialization files. You may
also have to turn off the 'writebackup' option:

```
:set nowritebackup
```

For more information, read

```
07.4
backup-table
'backup'
'writebackup'
'backupskip'
'backupdir'
'backupext'
'backupcopy'
backup
```

faq-7.2

7.2. When I edit and save files, Vim creates a file with the same name as the original file and a "un~" extension at the end. How do I stop Vim from creating this file (or) How do I disable the Vim undofile feature?

Vim 7.3 contains as new feature persistent undo, that is, undo information won't be lost when quitting Vim and be stored in a file that ends with .un You have set the 'undofile' option, so Vim creates an undo file when saving the original file. You can stop Vim from creating the backup file, by clearing the option:

```
:set noundofile
```

Note that, by default this option is turned off. You have explicitly enabled the 'undofile' option in one of the initialization files. If you want your undofiles to be stored only in a particular directory, you can point the 'undodir' option to a directory that will contain all your aggregated undofiles.

For more information, read

```
'undodir'
'undofile'
undo-persistence
```

faq-7.3

7.3. How do I configure Vim to store all the backup files in a particular directory?

You can configure Vim to store all the backup files in a particular directory using the 'backupdir' option. For example, to store all the backup files in the ~/backup directory, you can use the following command:

```
:set backupdir=~/backup
```

For more information, read

```
07.4
'backupdir'
backup
```

faq-7.4

7.4. When I save a file with Vim, the file permissions are changed. How do I configure Vim to save a file without changing the file

permissions?

This may happen, if the 'backupcopy' option is set to 'no' or 'auto'. Note that the default value for this option is set in such a way that this will correctly work in most of the cases. If the default doesn't work for you, try setting the 'backupcopy' option to 'yes' to keep the file permission when saving a file:

```
:set backupcopy=yes
```

This applies, only if you have configured Vim to make a backup whenever overwriting a file. By default, Vim will not backup files.

For more information, read

```
'backupcopy'
backup
'backup'
'writebackup'
```

==

faq-8

SECTION 8 - BUFFERS

faq-8.1

8.1. I have made some modifications to a buffer. How do I edit another buffer without saving the modified buffer and also without losing the modifications?

You can set the 'hidden' option to edit a file without losing modifications to the current file:

```
:set hidden
```

By setting the 'hidden' option, you can also save the modification history (undo-history) for the buffer. Otherwise, as you switch between files, the undo-history will be lost (unless you use persistent undofiles).

For more information, read

```
'hidden'
hidden-quit
:hide
```

faq-8.2

8.2. How do I configure Vim to auto-save a modified buffer when switching to another buffer?

You can set the 'autowrite' option to auto-save a modified buffer when switching to another buffer:

```
:set autowrite
```

For more information, read

'autowrite'
'autowriteall'
'hidden'

faq-8.3

8.3. How do I replace the buffer in the current window with a blank buffer?

You can use the ":enew" command to load an empty buffer in place of the buffer in the current window.

For more information, read

:enew

faq-8.4

8.4. Is there a keyboard shortcut to load a buffer by the buffer number?

You can use the CTRL-^ command to load a buffer by specifying the buffer number. For example, to load buffer number 5, you have to use the 5 CTRL-^ command.

For more information, read

CTRL-^

faq-8.5

8.5. How do I open all the current buffers in separate windows?

You can use the ":ball" or ":sball" commands to open all the buffers in the buffer list:

```
:ball
```

If you want all buffers to be opened in new tabs, simply prefix the :tab command:

```
:tab :sball
```

For more information, read

:ball

faq-8.6

8.6. How do I close (delete) a buffer without exiting Vim?

You can use any of ":bdelete", ":bwipeout" or ":bunload" commands to delete a buffer without exiting Vim. For example:

```
:bdelete file1
```

For more information, read

:bdelete

:bwipeout
:bunload

faq-8.7
8.7. When I use the command ":%bd" to delete all the buffers, not all the buffers are deleted. Why?

In the ":%bd" command, the '%' range will be replaced with the starting and ending line numbers in the current buffer. Instead of using '%' as the range, you should specify numbers for the range. For example, to delete all the buffers, you can use the command ":1,9999bd".

For more information, read

:bd

(This behaviour has been fixed with patch 7.4.530)

faq-8.8
8.8. How do I display the buffer number of the current buffer/file?

You can use 2<CTRL-G> command to display the buffer number for the current file/buffer. Note the use of count before the CTRL-G command. If the count is greater than 1, then Vim will display the buffer number.

You can also use the following command to display the current buffer number:

```
:echo bufnr("%")
```

You can also include the "%n" field to the 'statusline' option to display the current buffer number on the statusline.

For more information read,

CTRL-G
bufnr()
:echo
'statusline'

faq-8.9
8.9. How do I delete a buffer without closing the window in which the buffer is displayed?

You can use the following command to open the next buffer and delete the current buffer.

```
:bnext | bdelete #
```

For more information read,

:bnext
:bdelete
:buffers

faq-8.10

8.10. How do I map the tab key to cycle through and open all the buffers?

You can use the following two map commands, to map the CTRL-Tab key to open the next buffer and the CTRL-SHIFT-Tab key to open the previous buffer:

```
:nnoremap <C-Tab> :bnext<CR>
:nnoremap <S-C-Tab> :bprevious<CR>
```

Note, this might not work in the terminal version of Vim.

For more information read,

```
:bnext
:bprevious
```

==========

faq-9

SECTION 9 - WINDOWS

faq-9.1

9.1. What is the difference between a Vim window and a buffer?

A Vim buffer is a file loaded into memory for editing. The original file remains unchanged until you write the buffer to the file. A Vim window is a viewport onto a buffer. You can use multiple windows on one buffer or several windows on different buffers.

For more information, read

```
usr_08.txt
22.4
windows-intro
Q_wi
```

faq-9.2

9.2. How do I increase the width of a Vim window?

You can increase the width of a Vim window using one of the following commands:

```
:vert resize +N
:vert resize -N
:vert resize N
```

You can also use CTRL-W < or CTRL-W > or CTRL-W | commands.

For more information, read

```
:vertical-resize
CTRL-W_>
CTRL-W_<
window-resize
```

faq-9.3

9.3. How do I zoom into or out of a window?

You can zoom into a window (close all the windows except the current window) using the "CTRL-W o" command or the ":only" ex command.

You can use the "CTRL-W _" command or the ":resize" ex command to increase the current window height to the highest possible without closing other windows.

You can use the "CTRL-W |" command or the ":vertical resize" ex command to increase the current window width to the highest possible without closing other windows.

You can use the "CTRL-W =" command to make the height and width of all the windows equal.

You can also set the following options to get better results with the above commands:

Method 1:
Set the 'winminheight' option to 0:

```
:set winminheight=0
```

By default, this option is set to 1.
This option controls the minimum height of an inactive window (when it is not the current window). When the 'winminheight' option is set to 0, only the status line will be displayed for inactive windows.

Method 2:
Set the 'noequalalways' option and set the 'winheight' option to a large value (like 99999):

```
:set noequalalways
:set winheight=99999
```

Now, the active window will always open to its maximum size, while the other windows will stay present, but shrunken to just a status line.

With any of the above mentioned methods, you cannot restore the window layout after zooming into a window. If you want to restore the Vim window layout after zooming into a window, you can use the ZoomWin plugin. You can download this plugin from the Vim online website at:

http://vim.sourceforge.net/scripts/script.php?script_id=508

For more information, read

```
CTRL-W_o
window-resize
'winminheight'
'equalalways'
```

'winheight'
08.3

faq-9.4

9.4. How do I execute an ex command on all the open buffers or open windows or all the files in the argument list?

You can use the ":bufdo" command to execute an ex command on all the open buffers. You can use the ":windo" command to execute an ex command on all the open windows. You can use the ":argdo" command to execute an ex command on all the files specified in the argument list. And finally you can use the ":tabdo" command to execute an ex command in all open tab pages.

For more information, read

:windo
:bufdo
:argdo
:tabdo
26.3

==

faq-10

SECTION 10 - MOTION

faq-10.1

10.1. How do I jump to the beginning (first line) or end (last line) of a file?

You can use 'G' command to jump to the last line in the file and the 'gg' command to jump to the first line in the file.

For more information, read

G
gg

faq-10.2

10.2. In insert mode, when I press the <Esc> key to go to command mode, the cursor moves one character to the left (except when the cursor is on the first character of the line). Is it possible to change this behavior to keep the cursor at the same column?

No. It is not possible to change this behavior. The cursor is always positioned on a valid character (unless you have virtual-edit mode enabled). So, if you are appending text to the end of a line, when you return to command mode the cursor must drop back onto the last character you typed. For consistency sake, the cursor drops back everywhere, even if you are in the middle of a line.

You can use the CTRL-O or CTRL-\ CTRL-O command in insert mode to execute a single ex command and return back to insert mode without moving the cursor column.

For more information, read

	'virtualedit'
	i_CTRL-O
	i_CTRL-_CTRL-O

faq-10.3

10.3. How do I configure Vim to maintain the horizontal cursor position when scrolling with the <Page Up>, <Page Down>, etc keys?

You can reset the 'startofline' option to keep the cursor at the same horizontal location when scrolling text:

```
:set nostartofline
```

For more information, read

	'startofline'

faq-10.4

10.4. Some lines in a file are more than the screen width and they are all wrapped. When I use the j, k keys to move from one line to the next, the cursor is moved to the next line in the file instead of the next line on the screen. How do I move from one screen line to the next?

You can use the gj and gk commands to move from one screen line to the next/previous screen line. The j and k commands move the cursor from one file line to the next file line. You can also avoid the line wrapping by resetting the 'wrap' option:

```
:set nowrap
```

For more information, read

	gj
	gk
	'wrap'

You can use the following mappings:

```
:map <Up> gk
:imap <Up> <C-o>gk
:map <Down> gj
:imap <Down> <C-o>gj
:noremap j gj
:noremap k gk
```

faq-10.5

10.5. What is the definition of a sentence, paragraph and section in Vim?

A sentence is defined as ending at a '.', '!' or '?' followed by either the end of a line, or by a space (or two) or tab. Which characters and the number of spaces needed to constitute a sentence ending is determined by the 'joinspaces' and 'cpoptions' options.

A paragraph begins after each empty line, and also at each of a set of paragraph macros, specified by the pairs of characters in the 'paragraphs' option.

A section begins after a form-feed (<C-L>) in the first column and at each of a set of section macros, specified by the pairs of characters in the 'sections' option.

For more information, read

    sentence
    'joinspaces'
    'cpoptions'
    paragraph
    section
    word

faq-10.6

10.6. How do I jump to beginning or end of a sentence, paragraph or a section?

You can use the following motion commands to jump to the beginning or end of a sentence or a paragraph or a section:

motion	position	where
(	beginning	current sentence
)	end	current sentence
{	beginning	current paragraph
}	end	current paragraph
[]	end	previous section
[[	beginning	current section
][	end	current section
]]	beginning	next section

Each of these motions can be preceded by a number which will extend the jump forward (or backward).

For more information, read

    object-motions

faq-10.7

10.7. I have lines in a file that extends beyond the right extent of the screen. How do I move the Vim view to the right to see the text off the screen?

You can use one of the following commands to horizontally scroll the screen to the left or right:

    zl - scroll to the left
    zh - scroll to the right
    zL - scroll half a screenwidth to the left
    zH - scroll half a screenwidth to the right

    zs - scroll to position the cursor at the start of the screen
    ze - scroll to position the cursor at the end of the screen

You can use the g0 command to move the cursor to the first character of the screen line and the g$ command to move the cursor to the last character of the screen line without scrolling the screen.

For more information, read

     scroll-horizontal

faq-10.8

10.8. How do I scroll two or more buffers simultaneously?

You can set the "scrollbind" option for each of the buffers to scroll them simultaneously.

For more information, read

     'scrollbind'
     scroll-binding
     'scrollopt'
     'cursorbind'

faq-10.9

10.9. When I use my arrow keys, Vim changes modes, inserts weird characters in my document but doesn't move the cursor properly. What's going on?

There are a couple of things that could be going on: either you are using Vim over a slow connection or Vim doesn't understand the key sequence that your keyboard is generating.

If you are working over a slow connection (such as a 2400 bps modem), you can try to set the 'timeout' or 'ttimeout' option. These options, combined with the 'timeoutlen' and 'ttimeoutlen' options, may fix the problem.

The preceding procedure will not work correctly if your terminal sends key codes that Vim does not understand. In this situation, your best option is to map your key sequence to a matching cursor movement command and save these mappings in a file. You can then ":source" the file whenever you work from that terminal.

For more information, read

     'timeout'
     'ttimeout'
     'timeoutlen'
     'ttimeoutlen'
     :map
     vt100-cursor-keys

faq-10.10

10.10. How do I configure Vim to move the cursor to the end of the previous line, when the left arrow key is pressed and the cursor is currently

at the beginning of a line?

You can add the '<' flag to the 'whichwrap' option to configure Vim to move the cursor to the end of the previous line, when the left arrow key is pressed and the cursor is currently at the beginning of a line:

```
:set whichwrap+=<
```

Similarly, to move the cursor the beginning of the next line, when the right arrow key is pressed and the cursor is currently at the end of a line, add the '>' flag to the 'whichwrap' option:

```
:set whichwrap+=>
```

The above will work only in normal and visual modes. To use this in insert and replace modes, add the '[' and ']' flags respectively.

For more information, read

```
'whichwrap'
05.7
```

faq-10.11

10.11. How do I configure Vim to stay only in insert mode (modeless editing)?

You can set the 'insertmode' option to configure Vim to stay only in insert mode:

```
:set insertmode
```

By setting this option, you can use Vim as a modeless editor. If you press the <Esc> key, Vim will not go to the normal mode. To execute a single normal mode command, you can press CTRL-O followed by the normal mode command. To execute more than one normal command, you can use CTRL-L followed by the commands. To return to insert mode, press the <Esc> key. To disable this option, reset the 'insertmode' option:

```
:set noinsertmode
```

You can also start vim using the "evim" command or you can use "vim -y" to use Vim as a modeless editor.

You can also start Vim in insert mode using the ":startinsert" ex command.

For more information, read

```
'insertmode'
:startinsert
:stopinsert
i_CTRL-O
i_CTRL-L
evim
evim-keys
```

faq-10.12

10.12. How do I display some context lines when scrolling text?

You can set the 'scrolloff' option to display a minimal number of screen lines (context) above and below the cursor.

```
:set scrolloff=10
```

For more information, read

```
'scrolloff'
'sidescrolloff'
```

faq-10.13

10.13. How do I go back to previous cursor locations?

You can go back to the cursor location before the latest jump using the '' or `` command. You can use the CTRL-O command to go back to older cursor positions and the CTRL-I command to go to the newer cursor positions in the jump list.

For more information, read

```
03.10
mark-motions
jump-motions
```

==========

faq-11

SECTION 11 - SEARCHING TEXT

faq-11.1

11.1. After I searched for a text with a pattern, all the matched text stays highlighted. How do I turn off the highlighting temporarily/permanently?

The 'hlsearch' option controls whether all the matches for the last searched pattern are highlighted or not. By default, this option is not enabled. If this option is set in a system-wide vimrc file, then you can turn off the search highlighting by using the following command:

```
:set nohlsearch
```

To temporarily turn off the search highlighting, use

```
:nohlsearch
```

You can also clear the search highlighting, by searching for a pattern that is not in the current file (for example, search for the pattern 'asdf').

You can use this mapping, to clear the search highlighting when redrawing the window pressing <CTRL-L>

```
:nnoremap <silent> <C-L> <C-L>:nohls<CR>
```

For more information, read

```
'hlsearch'
:nohlsearch
```

faq-11.2

11.2. How do I enter a carriage return character in a search pattern?

You can either use '\r' or <CTRL-V><CTRL-M> to enter a carriage return character in a pattern. In Vim scripts, it is better to use '\r' for the carriage return character.

For more information, read

```
sub-replace-special
```

faq-11.3

11.3. How do I search for the character ^M?

You can enter the ^M character in a search command by first pressing the CTRL-V key and then pressing the CTRL-M key.

```
/^V^M
```

You can also use the "\r" character. In Vim scripts, "\r" is preferred.

For more information, read

```
c_CTRL-V
using_CTRL-V
/\r
```

faq-11.4

11.4. How can I search/replace characters that display as '~R', '~S', etc.?

You can use the 'ga' command to display the ASCII value/code for the special character. For example, let us say the ASCII value is 142. Then you can use the following command to search for the special character:

```
/^V142
```

where, ^V is entered by pressing CTRL-V.

For more information, read

```
ga
using_CTRL_V
24.8
```

faq-11.5

11.5. How do I highlight all the non-printable characters in a file?

You can use the following commands and search pattern to highlight all the non-printable characters in a file:

```
:set hlsearch
/\(\p\|$\)\@!.
```

For more information, read

```
/\p
/bar
/$
/\(
/\@!
'hlsearch'
```

faq-11.6

11.6. How do I search for whole words in a file?

You can search for whole words in a file using the \< and \> atoms. For example:

```
/\<myword\>
```

The \< atom matches the beginning of the word and the \> atom matches the end of the word.

For more information, read

```
/\<
/\>
```

faq-11.7

11.7. How do I search for the current word under the cursor?

You can press the * key to search forward for the current word under the cursor. To search backward, you can press the # key. Note that only whole keywords will be searched using these commands.

For more information, read

```
star
#
gstar
g#
03.8
search-commands
```

faq-11.8

11.8. How do I search for a word without regard to the case (uppercase or lowercase)?

To always ignore case while searching for a pattern, set the 'ignorecase' option:

```
:set ignorecase
```

To ignore case only when searching a particular pattern, use the special \c directive:

```
/\c<pattern>
```

For more information, read

```
'ignorecase'
/ignorecase
/\c
```

faq-11.9

11.9. How do I search for words that occur twice consecutively?

You can use one of the following search commands to locate words that occur twice consecutively:

```
/\(\<\w\+\)\_s\+\1\>
/\(\<\k\+\)\_s\+\1\>
```

The main difference is the use of '\w' and '\k', where the latter is based on the 'iskeyword' option which may include accented and other language specific characters.

For more information, read

```
/\1
/\(
/\)
/\<
/\>
/\w
/\k
/\+
/\_x
'iskeyword'
```

faq-11.10

11.10. How do I count the number of times a particular word occurs in a buffer?

You can use the following set of commands to count the number of times a particular word occurs in a buffer:

```
:let cnt=0
:g/\<your_word\>/let cnt=cnt+1
:echo cnt
```

This only counts the number of lines where the word occurs. You can also use the following command:

```
:%s/\<word\>/&/gn
```

To count the number of alphabetic words in a file, you can use

```
:%s/\a\+/&/gn
```

To count the number of words made up of non-space characters, you can use

```
:%s/\S\+/&/gn
```

For more information, read

```
count-items
word-count
v_g_CTRL-G
12.5
:s_flags
```

faq-11.11

11.11. How do I place the cursor at the end of the matched word when searching for a pattern?

You can use the 'e' offset to the search command to place the cursor at the end of the matched word. For example

```
/mypattern/e
```

For more information about search offsets, read

```
search-offset
/
```

faq-11.12

11.12. How do I search for an empty line?

You can search for an empty line using:

```
/^$
```

or

```
/^\s*$
```

The latter also matches lines, that consist only of white space, while the former only matches true empty lines. For more information, read

```
/^
/$
/\s
/star
search-commands
```

faq-11.13

11.13. How do I search for a line containing only a single character?

You can search for a line containing only a single character using:

```
/^\s*\a\s*$
```

For more information, read

```
/^
/\a
/\s
/star
/$
```

faq-11.14

11.14. How do I search and replace a string in multiple files?

You can use the 'argdo', 'bufdo', 'windo' or 'tabdo' commands to execute an ex command on multiple files. For example:

```
:argdo %s/foo/bar/g|upd
```

For more information, read

```
:argdo
:bufdo
:windo
:tabdo
```

faq-11.15

11.15. I am using the ":s" substitute command in a mapping. When a search for a pattern fails, the map terminates. I would like the map to continue processing the next command, even if the substitute command fails. How do I do this?

You can use the 'e' flag to the substitute command to continue processing other commands in a map, when a pattern is not found.

For more information, read

```
:s_flags
```

faq-11.16

11.16. How do I search for the n-th occurrence of a character in a line?

To search for the n-th occurrence of a character in a line, you can prefix the 'f' command with a number. For example, to search for the 5th occurrence of the character @ in a line, you can use the command 5f@. This assumes the cursor is at the beginning of the line - and that this first character is not the one your are looking for.

For more information, read

```
f
F
```

t
T
;
,

faq-11.17

11.17. How do I replace a tab (or any other character) with a hard return (newline) character?

You can replace a tab (or any other character) with a hard return (newline) character using the following command:

```
:s/\t/\r/
```

Note that in the above command, if you use \n instead of \r, then the tab characters will not be replaced by a new-line character.

For more information, read

sub-replace-special
NL-used-for-Nul
CR-used-for-NL

faq-11.18

11.18. How do I search for a character by its ASCII value?

You can search for a character by its ASCII value by pressing CTRL-V followed by the decimal or hexadecimal or octal value of that character in the search "/" command. To determine the ASCII value of a character you can use the ":ascii" or the "ga" command.

For example, to search for the ASCII character with value 188 (??), you can use one of the following search commands:

```
/<CTRL-V>188
/<CTRL-V>o274
/<CTRL-V>xBC
/<CTRL-V>u00bc
```

You can also search for the character with the decimal/octal/hex number using a collation [] like this:

```
/[\d188]
/[\o274]
/[\xbc]
/[\u00bc]
```

Alternatively, you can use the special atom \%d \%o \%x \%u:

```
/\%d188
/\%o274
/\%xbc
/\%u00bc
```

Or you use digraphs to enter the character. For example enter:

```
/CTRL-K14
```

to search for the above character.

For more information, read

```
i_CTRL-V_digit
:ascii
ga
/\]
/\%d
digraphs
```

faq-11.19

11.19. How do I search for long lines?

You can search for long lines or lines containing more than a specific number of characters using the Vim regular-expressions in the search command. For example, to search for all the lines containing more than 80 characters, you can use one of the following commands:

```
/^.\{80}.\+$
/^.*\%>80c.*$
/^.*\%>80v.*$
```

For more information, read

```
/\{
/\%c
/\%v
```

faq-11.20

11.20. How do I display all the lines in the current buffer that contain a specified pattern?

You can use the following command to display all the lines in the current buffer that contain a specified pattern:

```
:g/<pattern>/p
```

For example, the following command will display all the lines in the current buffer that contain "vim":

```
:g/vim/p
```

Since :p is the default command to be executed for the ex command :g, you can also use:

```
:g/vim
```

If you also want the corresponding line numbers, then you can use the following command:

```
    :g/<pattern>/#
```

For more information, read

```
     :global
     :print
     :number
```

faq-11.21

11.21. How do I search for a text string that spans multiple lines?

You can search for a text string that spans multiple lines using the _x regular expression atom. For example, to search for the text string "Hello World", you can use the following search command:

```
    /Hello\_sWorld
```

This will match the word "Hello" followed by a newline character and then the word "World" at the beginning of the next line. This will also match the word "Hello" immediately followed by a space character and then the word "World". When searching for the "Hello World" string, to include the space characters at the end and beginning of the line, you can use the following search command:

```
    /Hello\_s\+World
```

For more information, read

```
     27.8
     pattern-atoms
     /\_
     pattern-searches
```

faq-11.22

11.22. How do I search for a pattern within the specified range of lines in a buffer?

You can search for a pattern within a range of lines using the \%>l and \%<l regular expression atoms.

For example, to search for the word 'white' between the lines 10 and 30 in a buffer, you can use the following command:

```
    /white\%>9l\%<31l
```

For more information, read

```
     /\%l
```

faq-11.23

11.23. How do I clear the last searched pattern?

The last searched pattern is stored in the "/" register. You can clear

this register using the following command:

```
:let @/=""
```

To clear the last search pattern whenever a buffer is unloaded, you can use the following command:

```
:autocmd BufUnload * let @/ = ""
```

For more information, read

```
@/
:let-@
autocmd-searchpat
last-pattern
```

faq-11.24

11.24. Why does this pattern 'a.\{-}p\@!' not match?

"\{-}" doesn't just mean "as few as possible", it means "as few as possible to make the whole pattern succeed". If it didn't match the 'p', the whole pattern would fail (because of the "p\@!") so it does match the "p". It is a longer match, but it is the shortest match that makes the whole pattern succeed.

If you wanted "as few as possible regardless" you would use "\@>", which basically divides a pattern up so that the pieces either side behave independently. If the pattern were "a.\{-}\@>p\@!" then ".\{-}" would always match nothing because that's the smallest match that can succeed when there are not other restrictions. The whole pattern then would behave the same as "ap\@!", i.e. it would match any "a" not followed by a "p").

This means, it matches as few as possible 'a's without trying to keep going until Vim finds the longest match. This means, it will still match 'ap'.

faq-11.25

11.25. How can I use '/' within a pattern, without escaping it?

When using / to search for a pattern, you need to escape all '/' within the pattern, because they would otherwise terminate the pattern. So you can't directly search for /usr/share/doc/ but need to search for \/usr\/share\/doc\/

The easiest solution around that, would be to use '?' to start a backward search and afterwards use /<CR> to use the last search-pattern in forward direction.

If you have a Vim, that has the eval-feature built in (which needs at least a normal built or higher), you can also directly paste the pattern into the search register:

```
:let @/ = '/usr/share/doc/'
```

Then use 'n' to jump to the next occurrence.

See also the help at

```
@/
/<CR>
```

faq-11.26

11.26. How can I operate on a search match?

The 'gn' command makes it easy to operate on regions of text that match the current search pattern. By default, it will search forward for the last used search pattern and visually select the match. If the cursor is already on the match, it will be visually selected. If you used the 'gn' command after an operator (e.g. 'c' to change text), it will be applied on the match.

If Visual mode is active before using gn, the visual selection will be extended until the end of the next match.

The 'gN' commands works similar but searches backwards.

This allows to repeat simple operations on each match. For example, you might want to change each occurence of apples by peaches. So you search using '/apple' then you can use 'cgnpeach<esc>' to replace the current match by peach. Now you can use the dot '.' command to redo the replacement for the rest of the buffer.

See also the help at

```
gn
gN
```

==

faq-12

SECTION 12 - CHANGING TEXT

faq-12.1

12.1. How do I delete all the trailing white space characters (SPACE and TAB) at the end of all the lines in a file?

You can use the ":substitute" command on the entire file to search and remove all the trailing white space characters:

```
:%s/\s\+$//
```

For more information, read

```
:%
:s
/\s
/\+
/$
```

faq-12.2

12.2. How do I replace all the occurrences of multiple consecutive space characters to a single space?

You can use the following command to replace all the occurrences of multiple consecutive space characters to a single space:

```
:%s/ \{2,}/ /g
```

Alternatively use:

```
:%s/  \+/ /g
```

For more information, read

:%
:s
/\{
:s_flags

faq-12.3

12.3. How do I reduce a range of empty lines into one line only?

You can use the following command to reduce a range of empty lines into one line only:

```
:v/./,/./-1join
```

The explanation for this command is below:

```
:v/./          Execute the following command for all lines not
               containing a character (empty lines).
 .,            Use the current line as the start of the range of
               lines.
 /./           Use the line containing a character as the last line.
 -1            Adjust the range of lines to end with the line before
               the last line.
 j             Join the lines in the range.
```

Note that this will give an error message if the empty lines are at the end of the file. To correct this, you have to add a temporary line at the end of the file, execute the command and then remove the temporary line.

For more information, read

:v
:join
cmdline-ranges
collapse

faq-12.4

12.4. How do I delete all blank lines in a file? How do I remove all the lines containing only space characters?

To remove all blank lines, use the following command:

```
:g/^$/d
```

To remove all lines with only whitespace (spaces or tabs) in them, use the following command:

```
:g/^\s\+$/d
```

To remove all the lines with only whitespace, if anything, use the following command:

```
:g/^\s*$/d
```

faq-12.5

12.5. How do I copy/yank the current word?

You can use the "yiw" (yank inner word without whitespace) command or the "yaw" (yank a word with whitespace) command to copy/yank the current word.

For more information, read

```
04.6
04.8
iw
yank
text-objects
objects
```

faq-12.6

12.6. How do I yank text from one position to another position within a line, without yanking the entire line?

You can specify a motion command with the yank operator (y) to yank text from one position to another position within a line. For example, to yank from the current cursor position till the next letter x, use yfx or Fx or tx or Tx. To yank till the nth column, use n|. To yank till the next occurrence of a 'word', use /word. To do a yank till the nth column on another line, first mark the position using the 'ma' command, go to the start of the yank position, and then yank till the mark using y`a (note the direction of the quote)

For more information, read

```
yank
motion.txt
04.6
```

faq-12.7

12.7. When I yank some text into a register, how do I append the text to the current contents of the register?

When you specify the register for some operation, if you use the upper-case for the register name, then the new text will be appended to the existing

contents. For example, if you have some text in the register "a". If you want to append some new text to this, you have to use the "A" register name. If you use the lowercase register name, then the contents of the register will be overwritten with the new text.

For more information, read

```
quote
quote_alpha
10.1
```

faq-12.8

12.8. How do I yank a complete sentence that spans over more than one line?

To yank a complete sentence that spans over more than one line you have to use the yank operator followed by a motion command. For example:

```
y)
```

From inside the sentence you can use 'yi)' to yank the sentence.

For more information, read

```
yank
{motion}
object-motions
04.6
```

faq-12.9

12.9. How do I yank all the lines containing a pattern into a buffer?

You can use the ":global" command to yank all the lines containing the pattern into a register and then paste the contents of the register into the buffer:

```
:let @a=''
:g/mypattern/y A
```

The first command, clears the contents of the register "a". The second command copies all the lines containing "mypattern" into the register "a". Note that the capital letter "A" is used to append the matched lines. Now you can paste the contents of register "a" to a buffer using "ap command.

If you only want to collect all matches, you can use a different approach. For that run the ':s' command with the flags 'gn' so that it won't actually change the buffer ('n' flag) but select each match ('g' flag). Combining this with the '\=' part in the replacement part, you can copy each match to e.g. a list. Altogether this looks like this:

```
:let list=[]
:%s/pattern/\=add(list, submatch(0))/gn
```

Now all matches will be in the list and you can post process them as wanted.

For more information, read

```
:g
:y
:let-register
quote_alpha
put
registers
:registers
sub-replace-\=
```

faq-12.10

12.10. How do I delete all the lines in a file that do not contain a pattern?

You can use ":v" command to delete all the lines that do not contain a pattern:

```
:v/pattern/d
```

or

```
:g!/pattern/d
```

For more information, read

```
:v
:g
```

faq-12.11

12.11. How do I add a line before each line with "pattern" in it?

You can use the following command to add a line before each line with "pattern" in it:

```
:g/pattern/normal! Oi<line of text goes here>
```

Alternatively you can yank the line using the Y command and then insert the line using the following command:

```
:g/pattern/put!
```

For more information, read

```
:g
:put
insert
0
```

faq-12.12

12.12. Is there a way to operate on a line if the previous line contains a particular pattern?

You can use the ":global" command to operate on a line, if the previous line contains a particular pattern:

```
:g/<pattern>/+{cmd}
```

For more information, read

```
:g
:range
```

faq-12.13

12.13. How do I execute a command on all the lines containing a pattern?

You can use the ":global" (:g) command to execute a command on all the lines containing a pattern.

```
:g/my pattern/d
```

If you want to use a non-Ex command, then you can use the ":normal" command:

```
:g/my pattern/normal {command}
```

Unless you want the normal mode commands to be remapped, consider using a ":normal!" command instead (note the "!").

For more information, read

```
:global
:v
:normal
```

faq-12.14

12.14. Can I copy the character above the cursor to the current cursor position?

In Insert mode, you can copy the character above the cursor to the current cursor position by typing <Ctrl-Y>. The same can be done with the characters below the cursor by typing <Ctrl-E>.

For more information, read

```
i_CTRL-Y
i_CTRL-E
```

faq-12.15

12.15. How do I insert a blank line above/below the current line without entering insert mode?

You can use the ":put" ex command to insert blank lines. For example, try

```
:put =''
:put! =''
```

For more information, read

```
:put
```

faq-12.16

12.16. How do I insert the name of the current file into the current buffer?

There are several ways to insert the name of the current file into the current buffer. In insert mode, you can use the <C-R>% or the <C-R>=expand("%") command. In normal mode, you can use the ":put =@%" command.

For more information, read

```
i_CTRL-R
expand()
!!
```

faq-12.17

12.17. How do I insert the contents of a Vim register into the current buffer?

In insert mode, you can use the <C-R><register> command to insert the contents of <register>. For example, use <C-R>a to insert the contents of register "a" into the current buffer.

In normal mode, you can use the ":put <register>" command to insert the contents of <register>. For example, use the ":put d" command to insert the contents of register "d" into the current buffer.

For more information, read

```
i_CTRL-R
i_CTRL-R_CTRL-R
i_CTRL-R_CTRL-O
i_CTRL-R_CTRL-P
:put
```

faq-12.18

12.18. How do I move the cursor past the end of line and insert some characters at some columns after the end of the line?

You can set the "virtualedit" option to move the cursor past the end-of-line and insert characters in a column after the end-of-line. To start the virtual mode, use

```
:set virtualedit=all
```

For more information, read

```
'virtualedit'
```

faq-12.19

12.19. How to replace the word under the cursor (say: junk) with

"foojunkbar" in Vim?

There are several ways to do this. If the word is the first such word on the line, use the following command:

```
:exe "s/".expand("<cword>")."/foo&bar/"
```

To match specifically you could use a more complex substitution like this:

```
:exe 's/\<'.expand("<cword>").'\%>'.(col(".")-1).'c\>/foo&bar/'
```

You can also use the command: ciwfoo<C-R>"bar<Esc>

For more information, read

```
:substitute
expand()
col()
/\%c
```

faq-12.20

12.20. How do I replace a particular text in all the files in a directory?

You can use the "argdo" command to execute the substitute command on all the files specified as arguments:

```
:args *
:argdo %s/<your_text>/<replacement_text>/ge | update
```

For more information, read

```
:args_f
:argdo
:s_flags
```

faq-12.21

12.21. I have some numbers in a file. How do I increment or decrement the numbers in the file?

You can use the CTRL-A key to increment the number and the CTRL-X key to decrement the number. You can also specify the number to increment/decrement from the number by specifying a count to the key. This works for decimal, octal and hexadecimal numbers. You can change the base used by Vim for this operation by modifying the 'nrformats' option.

For more information, read

```
26.2
CTRL-A
CTRL-X
'nrformats'
```

faq-12.22

12.22. How do I reuse the last used search pattern in a ":substitute"

command?

To reuse the last used search pattern in a ":substitute" command, don't specify a new search pattern:

```
:s/pattern/newtext/
:s//sometext/
```

In the second ":s" command, as a search pattern is not specified, the pattern specified in the first ":s" command 'pattern' will be used.

If you want to change the search pattern but repeat the substitution pattern you can use the special right hand side, you can use the tilde character:

```
:s/newpattern/~/
```

For more information, read

```
:s
:&
:~
&
sub-replace-special
```

faq-12.23

12.23. How do I change the case of a string using the ":substitute" command?

You can use special characters in the replacement string for a ":substitute" command to change the case of the matched string. For example, to change the case of the string "MyString" to all uppercase, you can use the following command:

```
:%s/MyString/\U&/g
```

To change the case to lowercase, you can use the following command:

```
:%s/MyString/\L&/g
```

To change the case of the first character in all the words in the current line to uppercase, you can use the following command:

```
:s/\<\(.\)\(\k*\)\>/\u\1\L\2/g
```

For more information, read

```
sub-replace-special
:substitute
/\U
/\L
/\u
```

faq-12.24

12.24. How do I enter characters that are not present in the keyboard?

You can use digraphs to enter characters that are not present in the keyboard. You can use the ":digraphs" command to display all the currently defined digraphs. You can add a new digraph to the list using the ":digraphs" command.

For more information, read

    digraphs
    'digraph'
    24.9

faq-12.25

12.25. Is there a command to remove any or all digraphs?

No. The digraphs table is defined at compile time. You can only add new ones. Adding a command to remove digraphs is on the todo list.

faq-12.26

12.26. In insert mode, when I press the backspace key, it erases only the characters entered in this instance of insert mode. How do I erase previously entered characters in insert mode using the backspace key?

This is traditional vi behaviour. You can set the 'backspace' option to erase previously entered characters in insert mode:

```
:set backspace=indent,eol,start
```

For more information, read

    'backspace'
    i_backspacing

faq-12.27

12.27. I have a file which has lines longer than 72 characters terminated with "+" and wrapped to the next line. How can I quickly join the lines?

You can use the ":global" command to search and join the lines:

```
:g/+$/j
```

This will, however, only join every second line. A couple of more complex examples which will join all consecutive lines with a "+" at the end are:

```
:g/*$/,/\(^\|[^+]\)$/j
:g/+$/mark a | .,/\(^\|[^+]\)$/s/+$// | 'a,.j
```

For more information, read

    :g
    :j

:mark

faq-12.28

12.28. How do I paste characterwise yanked text into separate lines?

You can use the ":put" command to paste characterwise yanked text into new lines:

```
:put =@"
```

For more information, read

:put
quote_=

faq-12.29

12.29. How do I change the case (uppercase, lowercase) of a word or a character or a block of text?

You can use the "~" command to switch the case of a character.

You can change the case of the word under the cursor to uppercase using the "gUiw" or "viwU" command and to lowercase using the "guiw" or "viwu" command.

You can switch the case (upper case to lower case and vice versa) of the word under the cursor using the "viw~" or "g~iw" command.

You can use the "gUgU" command to change the current line to uppercase and the "gugu" command to change the current line to lowercase.

You can use the "g~g~" command to switch the case of the current line. You can use the "g~{motion}" or "{Visual}~" commands to switch the case of a block of text.

If you set 'tildeop' the "~" command behaves like an operator and expects a motion command to act on. If you have

```
:set tildeop
```

and you want to change the case from the current cursor position to the end of line, simply use "~$".

For more information, read

case
'tildeop'

faq-12.30

12.30. How do I enter ASCII characters that are not present in the keyboard?

You can enter ASCII characters that are not present in the keyboard by pressing CTRL-V and then the ASCII character number. You can also use

digraphs to enter special ASCII characters.

For more information, read

```
i_CTRL-V_digit
digraphs
45.5
```

faq-12.31

12.31. How do I replace non-printable characters in a file?

To replace a non-printable character, you have to first determine the ASCII value for the character. You can use the ":ascii" ex command or the "ga" normal-mode command to display the ASCII value of the character under the cursor.

You can enter the non-printable character by entering CTRL-V followed by the decimal number 1-255 (with no leading zero), or by x and a hex number 00-FF, or by an octal number 0-0377 (with leading zero), or by u and a hex number 0-FFFF, or by U and a hex number 0-7FFFFFFF

Another alternative is to use the ":digraphs" ex command to display the digraphs for all characters, together with their value in decimal and alpha. You can enter a non-printable character by entering CTRL-K followed by two alphanumeric characters (a digraph).

For more information, read

```
:ascii
i_CTRL-V
i_CTRL-V_digit
:digraphs
```

faq-12.32

12.32. How do I remove duplicate lines from a buffer?

You can use the following user-defined command to remove all the duplicate lines from a buffer:

```
:command -range=% Uniq <line1>,<line2>g/^\%<<line2>l\(.*\)\n\1$/d
```

Add the above command to your .vimrc file and invoke ":Uniq" to remove all the duplicate lines.

faq-12.33

12.33. How do I prefix all the lines in a file with the corresponding line numbers?

You can prefix the lines in a file with the corresponding line number in several ways. Some of them are listed below:

```
:%s/^/\=line('.'). ' '
:%s/^/\=printf('%5d ', line('.'))/
:%s/^/\=strpart(line('.').'     ', 0, 5)
```

```
:%s/^/\=strpart('    ', strlen(line('.'))).line('.').'. '
```

The last two commands will pad the line numbers with space characters. The last command will right align the numbers and the command before that will left align the numbers.

If you don't want to number consecutive lines but rather non-consecutive regions, you can also use this idiom:

```
:let i = 1
:g/TODO/s/^/\=printf('%2d.',i)|let i+=1
```

This first initializes the variable i with 1. In the next line, a :g command is used to perform a substitute command only on lines, that match 'TODO'. After the substitute command has taken place, the variable i will be incremented by 1.

For more information, read

sub-replace-special
line()
expr6
strpart()
printf()
:execute
:global

faq-12.34

12.34. How do I exchange (swap) two characters or words or lines?

You can exchange two characters with the "xp" command sequence. The 'x' will delete the character under the cursor and 'p' will paste the just deleted character after the character under the cursor. This will result in exchanging the two characters.

You can exchange two words with the "deep" command sequence (start with the cursor in the blank space before the first word).

You can exchange two lines with the "ddp" command sequence. The 'dd' will delete the current line and 'p' will paste the just deleted line after the current line. This will result in exchanging the two lines.

All of the above operations will change the " unnamed register.

You can use the ":m +" ex command to exchange two lines without changing the unnamed register.

For more information, read

x
p
dd
d
e
linewise-register

quotequote
:move

faq-12.35

12.35. How do I change the characters used as word delimiters?

Vim uses the characters specified by the 'iskeyword' option as word
delimiters. The default setting for this option is "@,48-57,_,192-255".

For example, to add ':' as a word delimiter, you can use

```
:set iskeyword+=:
```

To remove '_' as a word delimiter, you can use

```
:set iskeyword-=_
```

For more information, read

'iskeyword'
word

==

faq-13

SECTION 13 - COMPLETION IN INSERT MODE

faq-13.1

13.1. How do I complete words or lines in insert mode?

In insert mode, you can complete words using the CTRL-P and CTRL-N keys.
The CTRL-N command searches forward for the next matching keyword.
The CTRL-P command searches backwards for the next matching keyword.

In insert mode, you can use the CTRL-X CTRL-L command sequence to complete
lines that starts with the same characters as in the current line before
the cursor. To get the next matching line, press the CTRL-P or CTRL-N keys.
There are a lot of other keys/ways available to complete words in insert
mode.

Vim supports completion of the following items:

```
CTRL-X CTRL-L    whole lines
CTRL-X CTRL-N    keywords in the current file
CTRL-X CTRL-K    words from a dictionary
CTRL-X CTRL-T    words from a thesaurus
CTRL-X CTRL-I    current and included files
CTRL-X CTRL-]    tags
CTRL-X CTRL-F    file names
CTRL-X CTRL-D    macro definitions (also in included files)
CTRL-X CTRL-V    Vim command line
CTRL-X CTRL-U    User defined completion
CTRL-X CTRL-O    Omni completion
```

User defined completions and omni completions are often set by filetype

plugins.

For more information, read

	24.3
	ins-completion

faq-13.2

13.2. How do I complete file names in insert mode?

In insert mode, you can use the CTRL-X CTRL-F command sequence to complete filenames that start with the same characters as in the current line before the cursor.

For more information, read

	compl-filename

faq-13.3

13.3. I am using CTRL-P/CTRL-N to complete words in insert mode. How do I complete words that occur after the just completed word?

You can use CTRL-X CTRL-N and CTRL-X CTRL-P keys to complete words that are present after the just completed word.

For more information, read

	i_CTRL-X_CTRL-P
	i_CTRL-X_CTRL-N
	ins-completion

==

faq-14

SECTION 14 - TEXT FORMATTING

faq-14.1

14.1. How do I format a text paragraph so that a new line is inserted at the end of each wrapped line?

You can use the 'gq' command to format a paragraph. This will format the text according to the current 'textwidth' setting. An alternative would be to use the 'gw' command that formats like 'gq' but does not move the cursor.

Note that the gq operator can be used with a motion command to operate on a range of text. For example:

	gqgq - Format the current line
	gqap - Format current paragraph
	gwap - Format current paragraph (and don't move cursor)
	gq3j - Format the current and the next 3 lines

For more information, read

gq
gw
formatting
usr_25.txt
motion.txt

faq-14.2

14.2. How do I format long lines in a file so that each line contains less than 'n' characters?

You can set the 'textwidth' option to control the number of characters that can be present in a line. For example, to set the maximum width of a line to 70 characters, you can use the following command:

```
set textwidth=70
```

Now to break the long lines in a file to the length defined by the 'textwidth' option, you can use

```
:g/./normal gqq
```

For more information, read

'textwidth'
gq

faq-14.3

14.3. How do I join short lines to form a paragraph?

First, make sure the 'textwidth' option is set to a high value:

```
:set textwidth=99999
```

Next, join the short lines to form a paragraph using the command:

```
1GgqG
```

The above command will operate on the entire file. To do the formatting on all paragraphs in a specific range, use:

```
:'a,'bg/\S/normal gq}
```

For more information, read

gq
G
gqq

faq-14.4

14.4. How do I format bulleted and numbered lists?

You can configure Vim to format bulleted and numbered lists using the 'formatoptions' option. For example, you can format the list of the following format:

```
  - this is a test. this is a test. this is a test. this is a test.
  this is a test.

into this format:

  - this is a test. this is a test. this is a test. this is a test.
    this is a test.

You can use the 'n' flag in the 'formatoptions' to align the text.

    :set fo+=n

With this option, when formatting text, Vim will recognize numbered lists.
For this option to work, the 'autoindent' option also must be set.

For more information, read

     'formatoptions'
     fo-table
     format-comments
```

faq-14.5

14.5. How do I indent lines in insert mode?

In insert mode, you can press the CTRL-T key to insert one shiftwidth of indent at the start of the current line. In insert mode, you can use the CTRL-D key to delete on shiftwidth of indent at the start of the current line. You can also use the CTRL-O >> and CTRL-O << commands to indent the current line in insert mode.

For more information, read

```
     i_CTRL-T
     i_CTRL-D
     i_0_CTRL-D
     i_CTRL-O
     >>
     <<
```

faq-14.6

14.6. How do I format/indent an entire file?

You can format/indent an entire file using the gg=G command, where

```
    gg - Goto the beginning of the file
    =  - apply indentation
    G  - till end of file
```

For more information, read

```
     gg
     =
     G
```

'formatprg'
C-indenting

faq-14.7

14.7. How do I increase or decrease the indentation of the current line?

You can use the '>>' and '<<' commands to increase or decrease the indentation of the current line.

For more information, read

shift-left-right
>>
<<
'shiftwidth'

faq-14.8

14.8. How do I indent a block/group of lines?

You can visually select the group of lines and press the > or < key to indent/unindent the lines. You can also use the following ex-command to indent the lines

```
:10,20>
```

For more information, read

shift-left-right
v_>
v_<
:<
:>

faq-14.9

14.9. When I indent lines using the > or < key, the standard 8-tabstops are used instead of the current 'tabstop' setting. Why?

The number of spaces used when lines are indented using the ">" operator is controlled by the 'shiftwidth' option. The 'tabstop' setting is only used, when the 'shiftwidth' option is zero.

```
:set shiftwidth=4
```

For more information, read

'shiftwidth'
>>
'softtabstop'

faq-14.10

14.10. How do I turn off the automatic indentation of text?

By default, the automatic indentation of text is not turned on. Check the configuration files (.vimrc, .gvimrc) for settings related to indentation.

Make sure the ":filetype indent on" command is not present. If it is present, remove it. Also, depending on your preference, you may also want to check the value of the 'autoindent', 'smartindent', 'cindent' and 'indentexpr' options and turn them off as needed.

For more information, read

```
:filetype-indent-off
'autoindent'
'smartindent'
'cindent'
'indentexpr'
```

faq-14.11

14.11. How do I configure Vim to automatically set the 'textwidth' option to a particular value when I edit mails?

You can use the 'FileType' autocommand to set the 'textwidth' option:

```
autocmd FileType mail set tw=<your_value>
```

For more information, read

```
:autocmd
FileType
usr_43.txt
```

faq-14.12

14.12. Is there a way to make Vim auto-magically break lines?

Yes. Set the 'textwidth' option to the preferred length for a line. Then Vim will auto-magically break the newly entered lines. For example:

```
:set textwidth=75
```

For more information, read

```
'textwidth'
ins-textwidth
'formatoptions'
fo-table
formatting
```

faq-14.13

14.13. I am seeing a lot of ^M symbols in my file. I tried setting the 'fileformat' option to 'dos' and then 'unix' and then 'mac'. None of these helped. How can I hide these symbols?

When a file is loaded in Vim, the format of the file is determined as below:

- If all the lines end with a new line (<NL>), then the fileformat is 'unix'.
- If all the lines end with a carriage return (<CR>) followed by a new line

  (<NL>), then the fileformat is 'dos'.
- If all the lines end with carriage return (<CR>), then the fileformat is
  'mac'.

If the file has some lines ending with <CR> and some lines ending with <CR>
followed by a <NL>, then the fileformat is set to 'unix'.

You can change the format of the current file, by saving it explicitly in
dos format:

```
:w ++ff=dos
```

To display the format of the current file, use

```
:set fileformat?
```

The above behavior is also controlled by the 'fileformats' option. You can
try the following commands:

```
:set fileformats+=unix
:e <your_file>
:set fileformat=unix
:w
```

To remove the carriage return (<CR>) character at the end of all the lines
in the current file, you can use the following command:

```
:%s/\r$//
```

To force Vim to use a particular file format, when editing a file, you can
use the following command:

```
:e ++ff=dos filename
```

For more information, read

```
'fileformats'
'fileformat'
file-formats
DOS-format-write
Unix-format-write
Mac-format-write
dos-file-formats
23.1
++ff
```

faq-14.14

14.14. When I paste some text into a Vim buffer from another application,
the alignment (indentation) of the new text is messed up. How do I
fix this?

When you paste text into a GUI Vim using the mouse, Vim is able to
detect that you are pasting text. So all the indentation related
settings (like autoindent, smartindent, cindent, etc.) are ignored and

the text is pasted literally.

When pasting text into a Vim running in a terminal (like xterm) using the mouse, Vim may not be able to detect that you are pasting text. This depends on several things: the capability of the terminal to pass the mouse events to Vim, Vim is compiled to handle mouse events and access the clipboard, the DISPLAY variable is set properly, the Vim 'mouse' option is set correctly.

If Vim is able to detect that you are pasting text using the mouse, then the pasted text will be inserted literally.

If Vim is not able to detect that you are pasting using the mouse, then it will see the pasted text as though you literally typed the text. After the first line from the pasted text is inserted, when Vim encounters the newline character, because of the indentation settings, the next line will start indented. The spaces at the beginning of the second line in the pasted text will be inserted leading to additional indentation. This will be repeated for subsequent lines. So the pasted text will be inserted with stair case indentation.

You can fix this problem in a terminal Vim in several ways:

1. Build Vim with the +mouse and +xterm_clipboard compile-time options. The normal or big or huge build of Vim includes these options. Set the 'mouse' option to either 'a' or include 'i'. When pasting text using the mouse, don't press the Shift key. This will work only if Vim can access the X display. For more information, read the following Vim help topics:

   ```
   +feature-list
   'mouse'
   <MiddleMouse>
   x11-selection
   xterm-clipboard
   ```

1.1 Some Linux distributions build their terminal vim packages without X support. This makes no sense and leaves many users with the impression that Vim in terminal mode doesn't support some operations such as properly pasting text with a mouse.

   If your distribution includes gvim, which it almost certainly does these days, the solutions to this include the following.

   a) Start Vim as

      ```
      gvim -v
      ```

   b) Put this alias in your shell's configuration file, e.g. ~/.bashrc:

      ```
      alias vim='gvim -v'
      ```

   c) Put the following command in a file named 'vim' and put that

file in your ~/bin directory:

```
gvim -v "$@"
```

d) Link the distribution's gvim to ~/bin/vim with the following command, which needs to be executed only once.

```
ln -s $(which gvim) ~/bin/vim
```

For c) and d), make sure that ~/bin precedes /usr/bin in your PATH.

2. Paste the text using the CTRL-R CTRL-O * command. This will paste the text literally without any automatic indentation. If you want to paste the text and then fix the indentation, then you can use CTRL-R CTRL-P *. These commands will work only if Vim can access the X display. For more information, read the following Vim help topics:

```
i_CTRL-R_CTRL-O
i_CTRL-R_CTRL-P
quotestar
```

3. Set the 'paste' option before pasting the text. This option will disable the effect of all the indentation related settings. Make sure to turn off this option using ':set nopaste' after pasting the text. Otherwise the Vim indentation feature will not work. Do not permanently set the 'paste' option in your .vimrc file. If you are going to repeat these steps often, then you can set the 'pastetoggle' option to a key. When you press the specified key, the 'paste' option will be toggled. You can press the key once before pasting the text and the press the key once after pasting the text. Note that when the 'paste' option is set, all the mappings and abbreviations are disabled. For more information, read the following Vim help topics:

```
'paste'
'pastetoggle'
```

You can also refer to the following topics in the user manual:

```
04.7
09.3
```

faq-14.15

14.15. When there is a very long wrapped line (wrap is "on") and a line doesn't fit entirely on the screen it is not displayed at all. There are blank lines beginning with '@' symbol instead of wrapped line. If I scroll the screen to fit the line the '@' symbols disappear and the line is displayed again. What Vim setting control this behavior?

You can set the 'display' option to 'lastline' to display as much as possible of the last line in a window instead of displaying the '@' symbols.

```
    :set display=lastline
```

For more information, read

```
     'display'
```

faq-14.16

14.16. How do I convert all the tab characters in a file to space characters?

You can use the ":retab" command to update all the tab characters in the current file with the current setting of 'expandtab' and 'tabstop'. For example, to convert all the tabs to white spaces, use

```
    :set expandtab
    :retab
```

For more information, read

```
     :retab
     'expandtab'
     'tabstop'
     25.3
```

faq-14.17

14.17. What Vim options can I use to edit text that will later go to a word processor?

You can set the following options to edit text that will later go into a word processor:

```
    :set wrap
    :set linebreak
    :set textwidth=0
    :set showbreak=>>>
```

You can use the 'gk' and 'gj' commands to move one screen line up and down. For more information, read

```
     'wrap'
     'linebreak'
     'textwidth'
     'showbreak'
     gk
     gj
```

faq-14.18

14.18. How do I join lines without adding or removing any space characters?

By default, when you join lines using the "J" or ":join" command, Vim will replace the line break, leading white space and trailing white space with a single space character. If there are space characters at the end of a line or a line starts with the ')' character, then Vim will not add a space character.

To join lines without adding or removing any space characters, you can use
the gJ or ":join!" commands.

For more information, read

	gJ
	:join
	J
	10.5
	'joinspaces'
	'cpoptions'
	'formatoptions'

==
faq-15

SECTION 15 - VISUAL MODE

faq-15.1

15.1. How do I do rectangular block copying?

You can do rectangular block copying in Vim using the blockwise visual
mode. To start blockwise visual mode use the CTRL-V key. Move the cursor
using any of the motion commands and then use the y operator to yank to
visually selected text.

If CTRL-V does not work as expected, it may have been remapped to CTRL-Q by
the mswin.vim script which is often sourced by a vimrc on Windows machines
to mimic some common short cuts from other programs.

For more information, read

	04.4
	blockwise-visual
	visual-mode
	Q_vi

faq-15.2

15.2. How do I delete or change a column of text in a file?

You can use the Vim block-wise visual mode to select the column of text and
apply an operator (delete, change, copy, etc) on it.

For more information, read

	visual-block
	visual-operators

faq-15.3

15.3. How do I apply an ex-command on a set of visually selected lines?

When you select a range of lines in visual mode, the < register is set to
the start of the visual region and the > register is set to the end of the
visual region. You can use these registers to specify the range for an ex

command. After visually selecting the lines, press ":" to go to the command mode. Vim will automatically insert the visual range '<,'>. You can run any ex-command on the visual range.

For more information, read

```
v_:
'<
'>
```

faq-15.4

15.4. How do I execute an ex command on a column of text selected in Visual block mode?

All the ex commands operate on whole lines only. If you try to execute an ex command on a column of text selected in visual block mode, Vim will operate on all the selected lines (instead of the selected columns). You can use the vis.vim or NrrwRgn plugin script from http://vim.sourceforge.net scripts archive to do this.

For more information, read

```
cmdline-ranges
10.3
cmdline-lines
```

faq-15.5

15.5. How do I select the entire file in visual mode?

You can select the entire file in visual mode using ggVG.

```
gg - go to the beginning of the file.
V  - Start linewise visual mode
G  - goto the end of the file.
```

For more information, read

```
gg
linewise-visual
G
```

faq-15.6

15.6. When I visually select a set of lines and press the > key to indent the selected lines, the visual mode ends. How can I reselect the region for further operation? (or) How do I re-select the last selected visual area again?

You can use the 'gv' command to reselect the last selected visual area. You can also use the marks '< and '> to jump to the beginning or the end of the last selected visual area.

For more information, read

```
gv
```

'<
'>

faq-15.7
15.7. How do I jump to the beginning/end of a visually selected region?

You can use the 'o' command to jump to the beginning/end of a visually selected region.

For more information, read

v_o

faq-15.8
15.8. When I select text with mouse and then press : to enter an ex command, the selected text is replaced with the : character. How do I execute an ex command on a text selected using the mouse similar to the text selected using the visual mode?

This will happen if you have configured Vim to use select mode instead of Visual mode by setting the 'selectmode' option. Check the value of this option:

```
:set selectmode?
```

This mode is known as selectmode and is similar to the visual mode. This option is also automatically set when you use the "behave mswin" command. Select mode looks like visual mode, but it is similar to the selection mode in MS-Windows.

For more information, read

Select-mode
'selectmode'
09.4
:behave

faq-15.9
15.9. When I select a block of text using the mouse, Vim goes into selection mode instead of Visual mode. Why?

The 'selectmode' option controls whether Select mode will be started when selecting a block of text using the mouse. To start Visual mode when selecting text using mouse, remove the 'mouse' value from the 'selectmode' option:

```
:set selectmode-=mouse
```

Note that by default, the 'selectmode' option will be set to empty, so that always visual mode is used.

For more information, read

'selectmode'

Select-mode
:behave

faq-15.10

15.10. How do I visually select the last copy/pasted text?

You can use the '[and '] marks to visually select the last copy/pasted text. The '[mark is set to the beginning of the last changed/yanked text and the '] mark is set to the end of the last changed/yanked text. To visually select this block of text use the command '[v']

For more information, read

'[
']
`a
v

==

faq-16

SECTION 16 - COMMAND-LINE MODE

faq-16.1

16.1. How do I use the name of the current file in the command mode or an ex command line?

In the command line, the '%' character represents the name of the current file. In some commands, you have to use expand("%") to get the filename:

```
:!perl %
```

Another example is to load the latex generated pdf file from the file you are currently editing:

```
:!xpdf %<.pdf
```

For more information, read

:_%
cmdline-special
expand()

faq-16.2

16.2. How do I edit the text in the Vim command-line effectively?

You can use the command-line window for editing Vim command-line text. To open the Vim command-line window use the "q:" command in normal mode. In command-line mode, use the CTRL-F key. In this window, the command line history will be displayed. You can use normal Vim keys/commands to edit any previous/new command line. To execute a command line, press the enter/return key.

In a similar vain, the search history can be edited with "q/" and "q?" commands.

For more information, read

```
cmdline-window
```

faq-16.3

16.3. How do I switch from Vi mode to Ex mode?

You can use the Q command to switch from Vi mode to Ex mode. To switch from Ex mode back to the Vi mode, use the :vi command.

For more information, read

```
Q
gQ
Ex-mode
:vi
```

faq-16.4

16.4. How do I copy the output from an ex-command into a buffer?

To copy the output from an ex-command into a buffer, you have to first get the command output into a register. You can use the ":redir" command to get the output into a register. For example,

```
:redir @a
:g/HelloWord/p
:redir END
```

Now the register 'a' will contain the output from the ex command "g/HelloWord/p". Now you can paste the contents of the register 'a' into a buffer. You can also send or append the output of an ex-command into a file using the 'redir' command.

You can prefix the ":global" command with ":silent", to avoid having the lines printed to the screen.

To redirect the output from an ex-command to a file, you can use the following set of commands:

```
:redir > myfile
:g/HelloWord/p
:redir END
```

For more information, read

```
:redir
:silent
```

faq-16.5

16.5. When I press the tab key to complete the name of a file in the command mode, if there are more than one matching file names, then Vim completes the first matching file name and displays a list of all matching filenames. How do I configure Vim to only display the list

of all the matching filenames and not complete the first one?

You can modify the 'wildmode' option to configure the way Vim completes filenames in the command mode. In this case, you can set the 'wildmode' option to 'list':

```
:set wildmode=list
```

For more information, read

'wildmode'

faq-16.6

16.6. How do I copy text from a buffer to the command line and from the command line to a buffer?

To copy text from a buffer to the command line, after yanking the text from the buffer, use Ctrl-R 0 in the command line to paste the text. You can also yank the text to a specific register and use CTRL-R <register> to paste the text to the command line. You can use CTRL-R CTRL-W to paste the word under the cursor in the command line.

To copy text from the command line into a buffer, you can paste the contents of the : register using the ":p command. The most recently executed command line is stored in the : register.

Another approach for copying and pasting text to and from the command line is to open the command line window using q: from normal mode or CTRL-F from the command-line mode. In the command line window you can use all the Vim commands to edit the command line.

For more information, read

c_CTRL-R
quote_:
cmdline-window

faq-16.7

16.7. How do I put a command onto the command history without executing it?

To put a command onto the command history without executing it, press the <Esc> key to cancel the command.

An alternative solution, is to use the histadd() function like this:

```
:call histadd(':', 'echo strftime("%c")')
```

For more information, read

c_<Esc>
histadd()

faq-16.8

16.8. How do I increase the height of the command-line?

You can increase the height of the command-line by changing the 'cmdheight'
option:

```
:set cmdheight=2
```

For more information, read

```
'cmdheight'
hit-enter
05.7
```

==

faq-17

SECTION 17 - VIMINFO

faq-17.1

17.1. When I invoke Vim, I get error messages about illegal characters in
the viminfo file. What should I do to get rid of these messages?

You can remove the $HOME/.viminfo or the $HOME/_viminfo file to get rid of
these error messages.

For more information, read

```
viminfo-errors
viminfo-file-name
viminfo
21.3
```

faq-17.2

17.2. How do I disable the viminfo feature?

By default, the viminfo feature is disabled. If the viminfo feature is
enabled by a system-wide vimrc file, then you can disable the viminfo
feature by setting the 'viminfo' option to an empty string in your local
.vimrc file:

```
:set viminfo=""
```

For more information, read

```
'viminfo'
```

faq-17.3

17.3. How do I save and use Vim marks/commands across Vim sessions?

You can save and restore Vim marks across Vim sessions using the viminfo
file. To use the viminfo file, make sure the 'viminfo' option is not empty.
To save and restore Vim marks, the 'viminfo' option should not contain the
'f' flag or should have a value greater than zero for the 'f' option.

You can also use the viminfo file to synchronize the commandline history
across different sessions using :wviminfo and :rviminfo commands together

with the FocusGained and FocusLost autocommands:

```
augroup viminfo
    au!
    au FocusLost   * wviminfo
    au FocusGained * rviminfo
augroup end
```

Note, this will only work reliably, when Vim can detect the FocusLost and FocusGained autocommands correctly. This means it should work with GVim but might depend on your terminal for konsole vim.

For more information, read

```
21.3
viminfo
'viminfo'
:wviminfo
:rviminfo
FocusLost
FocusGained
```

==========

faq-18

SECTION 18 - REMOTE EDITING

faq-18.1

18.1. How do I open a file with existing instance of gvim? What happened to the Vim 5.x OpenWithVim.exe and SendToVim.exe files?

Starting with Vim6, the OLE version of OpenWithVim.exe and SendToVim.exe Vim utilities are replaced by the new client-server feature. To open the file j.txt with an existing instance of Gvim (MyVim), use:

```
$ gvim --servername MyVim --remote-silent j.txt
```

To list the server names of all the currently running Vim instances, use

```
$ vim --serverlist
```

To get more information about client-server feature, read

```
client-server
```

faq-18.2

18.2. How do I send a command to a Vim server to write all buffers to disk?

You can use the Vim remote server functionality to do this:

```
$ gvim --servername myVIM --remote-send "<C-\><C-N>:wall<CR>"
```

For more information, read

```
client-server
```

```
     CTRL-\_CTRL-N
     :wall
```

faq-18.3

18.3. Where can I get the documentation about the Vim remote server functionality?

You can get more information about the Vim remote server functionality by reading

```
     client-server
```

==

faq-19

SECTION 19 - OPTIONS

faq-19.1

19.1. How do I configure Vim in a simple way?

You can use the ":options" command to open the Vim option window:

```
    :options
```

This window can be used for viewing and setting all the options.

For more information, read

```
     :options
```

faq-19.2

19.2. How do I toggle the value of an option?

You can prefix the option with "inv" to toggle the value of the option:

```
    :set invignorecase
    :set invhlsearch
```

You can also suffix the option with "!" to toggle the value:

```
    :set ignorecase!
    :set hlsearch!
```

For more information, read

```
     set-option
```

faq-19.3

19.3. How do I set an option that affects only the current buffer/window?

Some of the Vim options can have a local or global value. A local value applies only to a specific buffer or window. A global value applies to all the buffers or windows.

When a Vim option is modified using the ":set" command, both the global and

local values for the option are changed. You can use the ":setlocal"
command to modify only the local value for the option and the ":setglobal"
command to modify only the global value.

You can use the ":setlocal" command to set an option that will affect only
the current file/buffer:

```
:setlocal textwidth=70
```

Note that not all options can have a local value. You can use ":setlocal"
command to set an option locally to a buffer/window only if the option is
allowed to have a local value.

You can also use the following command to set an option locally:

```
:let &l:{option-name} = <value>
```

For more information, read

```
:setlocal
local-options
```

faq-19.4

19.4. How do I use space characters for a Vim option value?

To use space characters in a Vim option value, you have to escape the space
character. For example:

```
:set tags=tags\ /usr/tags
```

For more information, read

```
option-backslash
```

faq-19.5

19.5. Can I add (embed) Vim option settings to the contents of a file?

You can use modelines to add Vim option settings to the contents of a file.
For example, in a C file, you can add the following line to the top or the
bottom of the file:

```
/* vim:sw=4: */
```

This will set the 'shiftwidth' option to 4, when editing that C file.
For this to work, the 'modeline' option should be set. By default, the
'modeline' option is set. An alternative example is given in this document
in the first line.

The 'modelines' settings specifies the number of
lines that will be checked for the Vim set commands.

For more information, read

```
21.6
```

modeline
auto-setting
'modeline'
'modelines'

faq-19.6

19.6. How do I display the line numbers of all the lines in a file?

You can set the 'number' option to display the line numbers for all the lines.

```
:set number
```

For more information, read

```
'number'
```

faq-19.7

19.7. How do I change the width of the line numbers displayed using the "number" option?

You can set the minimum number of columns to be used for line numbering by setting the 'numberwidth' option:

```
:set numberwidth=3
```

This set's the width for the line number to 3 digits, which is enough, if your buffer contains less than 999 lines. However, if your current buffer contains more lines than 999, the 'numberwidth' will be adjusted accordingly, so that the maximum line number will fit on the screen.

faq-19.8

19.8. How do I display (view) all the invisible characters like space, tabs and newlines in a file?

You can set the 'list' option to see all the invisible characters in your file.

```
:set list
```

With this option set, you can view space characters, tabs, newlines, trailing space characters and wrapped lines.

To not display the invisible characters (which is the default), you have to reset the 'list' option:

```
:set nolist
(or)
:set list!
```

The ":set list!" command will toggle the current setting of the boolean 'list' option.

You can modify the 'listchars' option to configure how and which invisible

characters are displayed. For example, with the following command all the trailing space characters will be displayed with a '.' character.

```
:set listchars=trail:.
```

For more information, read

'listchars'
'list'

faq-19.9

19.9. How do I configure Vim to always display the current line and column number?

You can set the 'ruler' option to display current column and line number in the status line:

```
:set ruler
```

For more information, read

'ruler'

faq-19.10

19.10. How do I display the current Vim mode?

You can set the 'showmode' option to display the current Vim mode. In Insert, Replace and Visual modes, Vim will display the current mode on the last line.

```
:set showmode
```

For more information, read

'showmode'

faq-19.11

19.11. How do I configure Vim to show pending/partial commands on the status line?

You can set the 'showcmd' option to display pending/partial commands in the status line:

```
:set showcmd
```

For more information, read

'showcmd'

faq-19.12

19.12. How do I configure the Vim status line to display different settings/values?

You can set the 'statusline' option to display different values/settings in

the Vim status line.

For more information, read

```
'statusline'
'laststatus'
'rulerformat'
'ruler'
```

faq-19.13

19.13. How do I configure Vim to display status line always?

You can set the 'laststatus' option to 2 to display the status line always.

```
:set laststatus=2
```

For more information, read

```
'laststatus'
```

faq-19.14

19.14. How do I make a Vim setting persistent across different Vim invocations/instances/sessions?

To make a Vim option setting persistent across different Vim instances, add your setting to the .vimrc or .gvimrc file. You can also use the ":mkvimrc" command to generate a vimrc file for the current settings.

For more information, read

```
save-settings
vimrc
gvimrc
vimrc-intro
:mkvimrc
initialization
```

faq-19.15

19.15. Why do I hear a beep (why does my window flash) about 1 second after I hit the Escape key?

This is normal behavior. If your window flashes, then you've got the visual bell on. Otherwise, you should hear a beep.

Vim needs a timeout to tell the difference between a simple escape and, say, a cursor key sequence. When you press a key in normal mode (and even in insert mode) and that key is the beginning of a mapping, Vim waits a certain amount of time to see if the rest of the mapping sequence follows. If the mapping sequence is completed before a given timeout period, the mapping for that sequence of keys is applied. If you interrupt the mapping, the normal actions associated with the keys are executed.

For example, if you have a mapping defined as ":imap vvv Vim is great!!" and you type "vvv" quickly, the "Vim is great!!" will be inserted into your

text. But if you type "vv v" then that is what will put into your text. This is also true if you type "vvv" too slowly where "too slowly" is longer than the value for the timeout option. Setting the timeout option to a larger value can help alleviate problems that appear when using function keys over a slow line.

For more information, read

    'ttimeout'

faq-19.16

19.16. How do I make the 'c' and 's' commands display a '$' instead of deleting the characters I'm changing?

To make the 'c' and 's' commands display a '$' instead of deleting the characters, add the $ flag to the 'cpoptions' option:

```
:set cpoptions+=$
```

For more information, read

    'cpoptions'

faq-19.17

19.17. How do I remove more than one flag using a single ":set" command from a Vim option?

You can remove more than one flag from a Vim option using a single ":set" command, by specifying the flags in exactly the same order as they appear in the option. For example, if you use the following command to remove the 't' and 'n' flags from the 'formatoptions' option:

```
:set formatoptions-=tn
```

The 't' and 'n' flags will be removed from the 'formatoptions' option, only if the 'formatoptions' option contains these flags in this order: 'tn'. Otherwise, it will not remove the flags. To avoid this problem, you can remove the flags one by one:

```
:set formatoptions-=t formatoptions-=n
```

For more information, read

    :set-=

==

faq-20

SECTION 20 - MAPPING KEYS

faq-20.1

20.1. How do I know what a key is mapped to?

To see what a key is mapped to, use the following commands:

```
    :map <key>
    :map! <key>
```

You can also check the mappings in a particular mode using one of the ":cmap", ":nmap", ":vmap", ":imap", ":omap", etc commands.

To find out, where the key has been mapped, prefix the :verbose command:

```
    :verbose :map <key>
```

For more information, read

```
     map-listing
     map-overview
```

faq-20.2

20.2. How do I list all the user-defined key mappings?

You can list all the user-defined key mappings using:

```
    :map
```

For more information, read

```
     map-listing
```

faq-20.3

20.3. How do I unmap a previously mapped key?

You can unmap a previously mapped key using the ":unmap" command:

```
    :unmap <key>
    :unmap! <key>
```

For mode specific mappings, you can use one of the ":nunmap/:vunmap/:ounmap/:iunmap/:lunmap/:cunmap" commands.

The following command will fail to unmap a buffer-local mapped key:

```
    :unmap <key>
```

To unmap a buffer-local mapped key, you have to use the <buffer> keyword in the unmap command:

```
    :unmap <buffer> <key>
    :unmap! <buffer> <key>
```

For more information, read

```
     :unmap
     map-modes
     :map-local
     mapleader
```

faq-20.4

20.4. I am not able to create a mapping for the <xxx> key. What is wrong?

1) First make sure, the key is passed correctly to Vim. To determine if this is the case, put Vim in Insert mode and then hit Ctrl-V (or Ctrl-Q if your Ctrl-V is remapped to the paste operation (e.g. on Windows if you are using the mswin.vim script file) followed by your key.

   If nothing appears in the buffer (and assuming that you have 'showcmd' on, ^V remains displayed near the bottom right of the Vim screen), then Vim doesn't get your key correctly and there is nothing to be done, other than selecting a different key for your mapping or using GVim, which should recognise the key correctly.

2) Possibly, Vim gets your key, but sees it as no different than something else. Say you want to map Ctrl-Right, then in Insert mode hit Ctrl-K followed by Ctrl-Right. If Vim displays <C-Right> it has correctly seen the keystroke and you should be able to map it (by using <C-Right> as your {lhs}). If it displays <Right> it has seen the keystroke but as if you hadn't held Ctrl down: this means your temrinal passes Ctrl-Right as if it were just <Right>. Anything else means the key has been misidentified.

3) If the key is seen, but not as itself and not as some recognizable key, then there is probably an error in the terminal library for the current terminal (termcap or terminfo database). In that case

```
:set term?
```

   will tell you which termcap or terminfo Vim is using. You can try to tell vim, what termcode to use in that terminal, by adding the following to your vimrc:

```
if &term == <termname>
    set <C-Right>=<keycode>
endif
```

   where <termname> above should be replaced by the value of 'term' (with quotes around it) and <keycode> by what you get when hitting Ctrl-V followed by Ctrl-Right in Insert mode (with nothing around it). <C-Right> should be left as-is (9 characters). Don't forget that in a :set command, white space is not allowed between the equal sign and the value, and any space, double quote, vertical bar or backslash present as part of the value must be backslash-escaped.

   Now you should be able to see the keycode corresponding to the key and you can create a mapping for the key using the following command:

```
:map <C-Right>  <your_command_to_be_mapped>
```

For more information, read

```
map-keys-fails
```

```
:map-special-keys
key-codes
```

faq-20.5

20.5. Why does mapping the <C-...> key not work?

The only Ctrl-printable-key chords which Vim can reliably detect (because they are defined in the ASCII standard) are the following:

```
Ctrl-@                  0x00            NUL
Ctrl-A to Ctrl-Z        0x01 to 0x1A
Ctrl-a to Ctrl-z        0x01 to 0x1A
Ctrl-[                  0x1B            ESC
Ctrl-\                  0x1C
Ctrl-]                  0x1D
Ctrl-^                  0x1E
Ctrl-_                  0x1F
Ctrl-?                  0x7F            DEL
```

Most of these, however, already have a function in Vim (and some are aliases of other keys: Ctrl-H and Bsp, Ctrl-I and Tab, Ctrl-M and Enter, Ctrl-[and Esc, Ctrl-? and Del).

The "safest" keys to use in Vim for the {lhs} of a mapping are the F keys, with or without Shift: <F2> to <F12> and <S-F1> to <S-F12>. (Some OSes, including mine, intercept Ctrl-Fn and Alt-Fn, which never reach an application program such as vim or gvim).

You can try other combinations of Ctrl + any key, but they may either not work everywhere (e.g. the terminal might not pass that key to Vim, or they might have unintended side effects (e.g. mapping <C-I> means also to map <Tab>).

This is a known issue, that has been discussed and might be implemented in the future to enable Vim to distinguish between various keys even in console mode. (e.g. https://groups.google.com/d/msg/vim_dev/2bp9UdfZ63M/sajb9KM0pNYJ)

faq-20.6

20.6. How do I map the numeric keypad keys?

First make sure that the numeric keypad keys are passed to Vim. Next, you can use the following command to map the numeric keypad keys:

```
:map <kSomething>  <your_command>
```

where, <kSomething> can be kHome, kEnd, kPageUp, kPageDown, kPlus, kMinus, kDivide, kMultiply, kEnter, etc.

For more information, read

```
key-codes
terminal-options
```

faq-20.7

20.7. How do I create a mapping that works only in visual mode?

You can create mappings that work only in specific modes (normal, command, insert, visual, etc). To create a mapping that works only in the visual mode, use the ":vmap" command:

```
:vmap <F3> <your mapping here>
```

This mapping will work in visual and select mode. If you want the map to work only in visual mode (excluding select mode), use:

```
:xmap <F3> <your mapping here>
```

and to have the mapping only work in select mode (but not visual mode), use:

```
:smap <F3> <your mapping here>
```

For more information, read

```
:vmap
:xmap
:smap
map-modes
40.1
```

faq-20.8

20.8. How do I create a mapping that works only in normal and operator pending mode (but not in visual mode)?

Using ":map" creates a mapping that works in normal, visual+select mode and operator pending mode. You can use ":nmap" to have the mapping only work in normal mode and ":vmap" to have the mapping only be defined for visual and select mode or use ":omap" to have the mapping only defined in operator pending mode.

But if you want to have a mapping defined, that works in both operator pending mode and normal mode, but not in visual and select mode, you need to first define the mapping using ":map" and afterwards delete the mapping for visual and select mode:

```
:map <f3> <your mapping here>
:vunmap <f3>
```

faq-20.9

20.9. In a Vim script, how do I know which keys to use for my mappings, so that the mapped key will not collide with an already used key?

Vim uses most of the keys in the keyboard. You can use the <leader> prefix in maps to define keys which will not overlap with Vim keys. For example:

```
:map <leader>S <C-W>s
:map <leader>j <C-W>j
:map <leader>k <C-W>k
```

where by default <leader> gets substituted with a backslash (\), so the user would enter

```
\s
\j
\k
```

to invoke the above map commands. The user can change the mapleader variable to be whatever they wanted:

```
:let mapleader = ","
```

When writing a plugin or other script, more often than not, it is advisable to use :noremap instead of :map to avoid side effects from user defined mappings.

For more information, read

```
<Leader>
<LocalLeader>
write-plugin
```

faq-20.10

20.10. How do I map the escape key?

You can map the Escape key to some other key using the ":map" command. For example, the following command maps the escape key to CTRL-O.

```
:map <C-O> <Esc>
```

faq-20.11

20.11. How do I map a key to perform nothing?

You can map a key to <Nop> to perform nothing when the key is pressed. For example, with the following mappings, the <F7> key will do nothing when pressed.

```
:map <F7> <Nop>
:map! <F7> <Nop>
```

For more information, read

```
<Nop>
:map
:map!
map-modes
```

faq-20.12

20.12. I want to use the Tab key to indent a block of text and Shift-Tab key to unindent a block of text. How do I map the keys to do this? This behavior is similar to textpad, visual studio, etc.

Use the following mapping:

```
    :inoremap <S-Tab> <C-O><lt><lt>
    :nnoremap <Tab> >>
    :nnoremap <S-Tab> <lt><lt>
    :vnoremap <Tab> >
    :vnoremap <S-Tab> <lt>
```

Note, that the <S-Tab> mapping will work only if Vim receives the correct key sequence. This is mostly the case with GUI Vim.

For more information, read

```
     :inoremap
     :nnoremap
     :vnoremap
     <S-Tab>
     i_CTRL-O
     >>
     <<
     <lt>
```

faq-20.13

20.13. In my mappings the special characters like <CR> are not recognized. How can I configure Vim to recognize special characters?

Check the value of the 'cpoptions' option:

```
    :set cpoptions?
```

If this option contains the '<' flag, then special characters will not be recognized in mappings. Remove the '<' flag from 'cpoptions' option:

```
    :set cpo-=<
```

Also, check the value of the 'compatible' option:

```
    :set compatible?
```

The 'compatible' option must be reset:

```
    :set nocompatible
```

For more information, read

```
     'cpoptions'
     'compatible'
```

faq-20.14

20.14. How do I use the '|' to separate multiple commands in a map?

You can escape the '|' character using backslash (\) to use '|' in a map.

```
    :map _l :!ls \| more<CR>
```

You can also try the following command:

```
:map _l :!ls <bar> more<CR>
```

There are also other ways to do this.

For more information, read

map_bar

faq-20.15

20.15. If I have a mapping/abbreviation whose ending is the beginning of another mapping/abbreviation, how do I keep the first from expanding into the second one?

Instead of using the ":map lhs rhs" command, use the ":noremap lhs rhs" command. For abbreviations, use "noreabbrev lhs rhs". The "nore" prefix prevents the mapping or abbreviation from being expanded again.

For more information, read

:noremap
:noreabbrev

faq-20.16

20.16. Why does it take a second or more for Vim to process a key, sometimes when I press a key?

Make sure you have not defined a mapping for this key using the following command:

```
:map <key>
```

If a mapping is defined for this key and the mapped key contains more than one character, then Vim will wait for the next character to be pressed to determine whether it is the mapped key or not. For example, if you have mapped "ab", then if you press "a", Vim will wait for the next key to be pressed. If the next key is "b", Vim will execute the mapped sequence. Otherwise, Vim will proceed with the normal processing of "a" followed by the next key. If the 'timeout' option is set (which is the default), then Vim will timeout after waiting for the period specified with the 'timeoutlen' option (default is 1 second).

For more information, read

map-typing
'timeoutlen'
'ttimeoutlen'
'timeout'
'ttimeout'
vt100-cursor-keys
slow-fast-terminal

faq-20.17

20.17. How do I map a key to run an external command using a visually

selected text?

You can the ":vmap" command to map a key in the visual mode. In the mapped command sequence, you have to first yank the text. The yanked text is available in the '"' register. Now, you can use the contents of this register to run the external command. For example, to run the external command "perldoc" on a visually selected text, you can use the following mapping:

```
:vmap <F7> y:!exec "!perldoc '" . @" . "'"<CR>
```

If you want the mapping to work in the visual mode, but not with the highlighted text, you can use the following command:

```
:vmap <F7> :<C-U>!perldoc <cword><CR>
```

The above mapping will use the word under the cursor instead of the highlighted text. Note the use of the <C-U> before invoking the "perldoc" external command. The <C-U> is used to erase the range of text selected in the visual mode and displayed on the command line. If the visual range is not removed using <C-U>, then the output from the external command will replace the visually selected text.

For more information, read

```
:vmap
quote_quote
:let-register
c_CTRL-U
:!cmd
```

faq-20.18

20.18. How do I map the Ctrl-I key while still retaining the functionality of the <Tab> key?

The Ctrl-I key and the <Tab> key produce the same keycode, so Vim cannot distinguish between the Ctrl-I and the <Tab> key. When you map the Ctrl-I key, the <Tab> key is also mapped (and vice versa). The same restriction applies for the Ctrl-[key and the <Esc> key.

For more information, read

```
keycodes
```

faq-20.19

20.19. How do I define a map to accept a count?

Use the @= command to use an expression. For example,

```
nnoremap = @='3l'
```

Now you can specify a count to the '=' command.

```
complex-repeat
```

faq-20.20

20.20. How can I make my normal mode mapping work from within Insert Mode?

Mappings in normal mode can be executed after <Ctrl-O> from insert mode as well but if there are more commands included in the mapping {rhs}, only the first one will be executed in normal mode and the rest of {rhs} will be printed literally in insert mode. One of ways to workaround this problem is to make {rhs} be one command, via wrapping it to the function. For example:

```
function GetFontNameOfFirstChar()
normal! 0
echo getfontname()
endfunction

:nmap <F9> :call GetFontNameOfFirstChar()<CR>
```

A more technical and detailed solution to this problem follows and can be found at http://groups.google.com/group/vim_dev/msg/75f1f2dfc00908bb

Not every normal mode-mapping is automatically suitable for execution via <Ctrl-O> from within insert mode; you need to explicitly design your mappings for that purpose.

The <Ctrl-O> command allows execution of one normal mode command from within insert mode, then returns to insert mode. If a normal mode mapping concatenates multiple normal mode commands, this breaks down in temporary normal mode and literally inserts the second part of the command into the buffer instead. To support execution of normal mode mappings from within insert mode, these strategies can be used:

1) Instead of concatenating multiple normal mode commands, use one :normal mapping:

```
:nnoremap <silent> zC :<C-U>normal! zCVzC<CR>
```

2) Concatenate multiple Ex commands via <Bar> on the rhs:

```
:nnoremap zC :<C-U>call MyMap1()<Bar>call MyMap2()<CR>
```

3) Shadow normal mode mappings by insert mode mappings that re-enter normal mode, then invoke the normal mode mapping:

```
:nnoremap <silent> <SID>MyMap2 :<C-U>call MyMap2()<CR>
:inoremap <silent> <script> <SID>MyMap2 <C-\><C-O><SID>MyMap2
:nnoremap <silent> <script> zC <SID>MyMap1<SID>MyMap2
```

4) Normal mode mappings that consist of multiple Ex command lines (and where Ex commands cannot be concatenated via <Bar>) replace ':<C-U>' with <SID>NM; the <SID>NM mapping enters normal mode for one ex command line:

```
:nnoremap <silent> <SID>NM :<C-U>
:inoremap <silent> <SID>NM <C-\><C-O>:
:nnoremap <silent> <script> zC <SID>MyMap1<SID>NMcall MyMap2()<CR>
```

5) If none of the above is possible, at least force normal mode for
    subsequent commands via <CTRL-\><CTRL-N> to avoid accidental insertion
    of the remainder of the mapping.

    :nnoremap zC zC<C-\><C-N>VzCzz

For more information, read
     i_CTRL-O
     map_bar
     i_CTRL-_CTRL-O
     CTRL-_CTRL-N

==
                                                                      faq-21
SECTION 21 - ABBREVIATIONS

                                                                    faq-21.1
21.1. How do I auto correct misspelled words?

You can auto correct misspelled words using abbreviations. For example, the
following abbreviation can be used to correct "teh" with "the":

    :abbreviate teh the

Vim supports abbreviations in insert mode, replace mode and command-line
mode.

For more information, read

     24.7
     abbreviations
     Q_ab

                                                                    faq-21.2
21.2. How do I create multi-line abbreviations?

You can create multi-line abbreviations by embedding the "<CR>"
key code in the text:

    iabbrev #c --------------<CR>-- Date:<CR>--<CR>---------

With the above abbreviation, when you type #c, it will be expanded to
the following text:

-- Date:
--

For more information, read

     abbreviations

faq-21.3

21.3. When my abbreviations are expanded, an additional space character is added at the end of the expanded text. How do I avoid this character?

To avoid an additional space character at the end of the expanded text, you can expand the abbreviation by pressing the CTRL-] key. The abbreviation will be expanded without adding a space character at the end.

Another alternative is to use the following function and command:

```
function! Eatchar(pat)
    let c = nr2char(getchar())
    return (c =~ a:pat) ? '' : c
endfunction
command! -nargs=+ Iabbr execute "iabbr" <q-args> . "<C-R>=Eatchar('\\s')<CR>"
```

Now, define your abbreviations using the new "Iabbr" command instead of the builtin "iabbrev" command. With this command, after expanding the abbreviated text, the next typed space character will be discarded.

For more information, read

abbreviations

faq-21.4

21.4. How do I insert the current date/time stamp into the file?

You can use the strftime() function to insert the current data/time stamp in a file. For example, you can use the following abbreviation:

```
iabbrev dts <C-R>=strftime("%y/%m/%d %H:%M")<CR>
```

With this abbreviation, when you type dts in insert mode, it will be expanded to the date/time stamp.

Some other forms of the above abbreviation are listed below:

```
iabbrev mdyl <C-R>=strftime("%a %d %b %Y")<CR>
iabbrev mdys <C-R>=strftime("%y%m%d")<CR>
iabbrev mdyc <C-R>=strftime("%c")<CR>
iabbrev hml  <C-R>=strftime("%d/%m/%y %H:%M:%S")<CR>
iabbrev hms  <C-R>=strftime("%H:%M:%S")<CR>
```

For more information, read

strftime()
i_CTRL-R

faq-21.5

21.5. How do I prevent an abbreviation from expanding in insert mode?

You can prevent an abbreviation from expanding in insert mode by typing CTRL-V before the character after the abbreviated word.

For more information, read

    abbreviations

==
faq-22

SECTION 22 - RECORD AND PLAYBACK

faq-22.1

22.1. How do I repeat an editing operation (insertion, deletion, paste, etc)?

You can repeat the last editing operation using the '.' command. This will repeat the last simple change like a insert, delete, change, paste, etc.

For more information, read

    04.3
    single-repeat
    Q_re

faq-22.2

22.2. How I record and repeat a set of key sequences?

You can use the 'q' command in normal mode to record a set of key sequences and store it in a register. For example, in the normal mode you can press q followed by a register name {0-9a-bA-Z"} to start the recording. To end/stop the recording press q again. You can playback/repeat the recorded key sequences by pressing @ followed by the register name. e.g. @a.

Another approach is to start Vim with the "-w" command-line argument.

```
$ vim -w <file_name>
```

Vim will record all the characters typed in the session in the specified file "file_name". You can use the recorded file with the "-s" command line argument to play it back:

```
$ vim -s <file_name>
```

For more information, read

    10.1
    recording
    -w
    -s

faq-22.3

22.3. How do I edit/modify a recorded set of key sequences?

The recorded key sequences are stored in a register. You can paste the contents of the register into a Vim buffer, edit the pasted text and again yank the text into the register. You can also use the ":let" command to

modify the register. For example:

```
:let @a = "iHello World\<Esc>"
```

For more information, read

```
recording
10.1
:let-register
<>
'cpoptions'
```

faq-22.4

22.4. How do I write recorded key sequences to a file?

The recorded key sequences are stored in a register. You can paste the contents of the register into a Vim buffer. Now you can save the buffer into a file. You can also modify the pasted text and again yank into the register to modify the recorded key sequence. For example, if you record a set of key sequences using qa ..... q. The recorded key sequences are stored in the register 'a'. You can paste the contents of register 'a' using "ap.

For more information, read

```
recording
10.1
```

faq-22.5

22.5. I am using register 0 to record my key sequences (i.e. q0 .... q). In the recorded key sequences, I am yanking some text. After the first replay of the recorded key sequence, I am no longer able to play it back.

Register 0 contains the text from the last yank operation. In your recorded key sequence, when the yank is performed, register 0 is overwritten with the yanked text. So your recording stored in register 0 is lost. You have to use some other register.

For more information, read

```
registers
```

==

faq-23

SECTION 23 - AUTOCOMMANDS

faq-23.1

23.1. How do I execute a command when I try to modify a read-only file?

You can use the FileChangedRO autocommand event to execute a command when a read-only file is modified. For example, you can use this event to checkout a read-only file:

```
:autocmd FileChangedRO * call MyCheckoutFunction()
```

For more information, read

```
FileChangedRO
```

faq-23.2

23.2. How do I execute a command every time when entering a buffer?

You can use the BufEnter autocommand event to execute a command every time when entering a buffer. For example:

```
:autocmd BufEnter *.c set formatoptions=croqt
```

For more information, read

```
BufEnter
```

faq-23.3

23.3. How do I execute a command every time when entering a window?

You can use the WinEnter autocommand event to execute a command every time when entering a window. For example:

```
:autocmd WinEnter *.c call MyFunction()
```

For more information, read

```
WinEnter
```

faq-23.4

23.4. From an autocmd, how can I determine the name of the file or the buffer number for which the autocommand is executed?

You can use the special words <afile> or <abuf> in an autocmd to get the name of the file or the buffer number for which the autocommand is executed.

For more information, read

```
:<afile>
:<abuf>
:<amatch>
```

faq-23.5

23.5. How do I automatically save all the changed buffers whenever Vim loses focus?

You can define an autocommand for the FocusLost event which will save all the modified buffers whenever Vim loses focus:

```
:autocmd FocusLost * wall
```

For more information, read

FocusLost
:wall

faq-23.6

23.6. How do I execute/run a function when Vim exits to do some cleanup?

You can use VimLeave autocmd event to execute a function just before Vim exits. For example,

```
:autocmd VimLeave * call MyCleanupFunction()
```

For more information, read

VimLeave

==========

faq-24

SECTION 24 - SYNTAX HIGHLIGHT

faq-24.1

24.1. How do I turn off/on syntax highlighting?

By default, the Vim syntax highlighting is turned off. To enable the syntax highlighting, you can use one of the following commands:

```
:syntax enable
```

or

```
:syntax on
```

To disable the syntax highlighting, you can use the following command:

```
:syntax off
```

For more information, read

06.1
06.4
:syntax-enable
:syntax-on
:syn-clear

faq-24.2

24.2. How do I change the background and foreground colors used by Vim?

Vim uses the "Normal" highlight group for the background and foreground colors. To change the foreground/background colors, you have to modify the "Normal" highlight group. For example, to set the background color to blue and foreground color to white, you can use

```
:highlight Normal ctermbg=blue ctermfg=white guibg=blue guifg=white
```

If you are using the Motif or the Athena version of the GUI Vim, then you can modify the foreground and background resource names in the .Xdefaults files to change the colors:

```
Vim.foreground:     Black
Vim.backround:      Wheat
```

You can also use the "-foreground" and "-background" command-line arguments to specify the foreground and background colors. These arguments are supported only in the Motif or Athena versions:

```
$ gvim -foreground Black -background Wheat
```

For more information, read

```
:highlight
.Xdefaults
-gui
```

faq-24.3

24.3. How do I change the highlight colors to suit a dark/light background?

You can set the 'background' option to either 'dark' or 'light' to change the highlight colors to suit a dark/light background:

```
:set background=dark
```

For more information, read

```
'background'
06.2
```

faq-24.4

24.4. How do I change the color of the line numbers displayed when the ":set number" command is used?

The line numbers displayed use the LineNr highlighting group. To display the current colors used, use

```
:hi LineNr
```

To change the color modify the LineNr highlight group. For example:

```
:hi linenr guifg=red guibg=black
```

This will give red numbers on a black background in GVIM.

For more information, read

```
:highlight
```

faq-24.5

24.5. How do I change the background color used for a Visually selected block?

You can modify the 'Visual' highlight group to change the color used for a visually selected block:

```
:highlight Visual guibg=red
```

For more information, read

```
:highlight
hl-Visual
```

faq-24.6

24.6. How do I highlight the special characters (tabs, trailing spaces, end of line, etc) displayed by the 'list' option?

You can modify the "NonText" and "SpecialKey" highlight groups to highlight the special characters displayed by the 'list' option:

```
:highlight NonText guibg=red
:highlight SpecialKey guibg=green
```

The "NonText" highlighting group is used for "eol", "extends" and "precedes" settings in the "listchars" option. The "SpecialKey" highlighting group is used for the "tab" and "trail" settings.

For more information, read

```
'listchars'
hl-NonText
hl-SpecialKey
```

faq-24.7

24.7. How do I specify a colorscheme in my .vimrc/.gvimrc file, so that Vim uses the specified colorscheme every time?

You can specify the color scheme using the ":colorscheme" command in your .vimrc or .gvimrc file:

```
colorscheme evening
```

For more information, read

```
:colorscheme
```

faq-24.8

24.8. Vim syntax highlighting is broken. When I am editing a file, some parts of the file is not syntax highlighted or syntax highlighted incorrectly.

Vim doesn't read the whole file to parse the text for syntax highlighting. It starts parsing wherever you are viewing the file. That saves a lot of time, but sometimes the colors are wrong. A simple fix is refreshing the screen using the CTRL-L key. Or scroll back a bit and then forward again. You can also use the command:

```
    :syntax sync fromstart
```

Note that this might considerably slow down the screen refreshing.

For more information, read

```
     :syn-sync
     :syn-sync-first
```

faq-24.9

24.9. Is there a built-in function to syntax-highlight the corresponding matching bracket?

Yes. Vim includes the matchparen Plugin as standard plugin that is enabled by default. Whenever the cursor moves over an item defined with the 'matchpairs' option, Vim will highlight the corresponding bracket using the MatchParen highlighting group.

However, if the corresponding parenthesis is not visible in the current window, the cursor won't jump to it.

The matchit plugin provides a similar function, that lets the cursor jump to related items (e.g. "if", "else", "endif" items) and skips matches in comments. This uses the % command to jump to corresponding items. Though both plugins provide similar functions they are unrelated and work differently.

For more information, read

```
     matchparen
     'matchpairs'
     matchit-install
     matchit-intro
```

faq-24.10

24.10. How do I turn off the C comment syntax highlighting?

You can use the following command to turn off C comment syntax highlighting:

```
    :highlight clear comment
```

For more information, read

```
     ft-c-syntax
```

faq-24.11

24.11. How do I add my own syntax extensions to the standard syntax files supplied with Vim?

You should not modify the syntax files supplied with Vim to add your extensions. When you install the next version of Vim, you will lose your changes. Instead you should create a file under the ~/.vim/after/syntax

directory with the same name as the original syntax file and add your additions to this file.

For more information, read

```
mysyntaxfile-add
'runtimepath'
```

faq-24.12

24.12. How do I replace a standard syntax file that comes with the Vim distribution with my own syntax file?

You can replace a standard syntax file that comes with the Vim distribution by creating a file with the same name as the original syntax file and placing it in the vim runtime syntax (~/.vim/syntax) directory. For example, to replace the c.vim syntax file in a Unix system, place the new c.vim in the ~/.vim/syntax directory. In a MS-Windows system, place the new syntax file in the $HOME/vimfiles/syntax or $VIM/vimfiles/syntax directory.

For more information, read

```
mysyntaxfile-replace
44.11
mysyntaxfile
```

faq-24.13

24.13. How do I highlight all the characters after a particular column?

You can use the ":match" command to highlight all the characters after a particular column:

```
:match Todo '\%>75v.\+'
```

This will highlight all the characters after the 75th column.

You can also set the 'colorcolumn' option to highlight a particular column:

```
:set colorcolumn=+2
```

which highlights 2 columns after the current 'textwidth' setting (alternatively, you can use the exact column number).

For more information, read

```
:match
/\%v
/\+
/.
'colorcolumn'
```

faq-24.14

24.14. How do I convert a source file (.c, .h, etc) with the Vim syntax highlighting into a HTML file?

You can use the 2html.vim script to convert a source file into a HTML file
with the Vim syntax highlighting. Use the following command:

```
:TOhtml
```

For more information, read

```
convert-to-HTML
:TOhtml
```

faq-24.15

24.15. How do I list the definition of all the current highlight groups?

You can list the definition of all the current highlight groups using the
":highlight" (without any arguments) ex command.

For more information, read

```
:highlight
```

faq-24.16

24.16. How can I embed one syntax highlighting language into another one?

It is possible to include one syntax highlighting into another one,
however most of the currently deployed syntax highlighting scripts are
not prepared to be included into another syntax script.

You can however create your own custom script to define your own
regions, which will be highlighted with a different language.

See the wiki for a comprehensive solution:
http://vim.wikia.com/wiki/Different_syntax_highlighting_within_regions_of_a_file

For more information, read

```
|:syn-include|
|sh-awk|
```

==

faq-25

SECTION 25 - VIM SCRIPT WRITING

faq-25.1

25.1. How do I list the names of all the scripts sourced by Vim?

You can use the ":scriptnames" command to list the names of all the scripts
sourced by Vim:

```
:scriptnames
```

For more information, read

```
:scriptnames
```

faq-25.2

25.2. How do I debug Vim scripts?

Vim has built-in support for a primitive debugger to debug Vim plugins and scripts. Using this debugger you can set breakpoints and step through the plugin functions.

For more information, read

```
debug-scripts
-D
```

faq-25.3

25.3. How do I locate the script/plugin which sets a Vim option?

You can use the ":verbose" command to locate the plugin/script which last modified a Vim option. For example:

```
:verbose set textwidth?
```

For more information, read

```
:set-verbose
:verbose
```

faq-25.4

25.4. I am getting some error/informational messages from Vim (possibly when running a script), the messages are cleared immediately. How do I display the messages again?

You can use the ":messages" command to display the previous messages.

```
:messages
```

For more information, read

```
:messages
:echoerr
:echomsg
message-history
```

faq-25.5

25.5. How do I save and restore a plugin specific information across Vim invocations?

Vim will save and restore global variables that start with an uppercase letter and don't contain a lower case letter. For this to work, the 'viminfo' option must contain the '!' flag. Vim will store the variables in the viminfo file.

For more information, read

```
'viminfo'
```

viminfo-file
variables

faq-25.6

25.6. How do I start insert mode from a Vim function?

You can use the ":startinsert" command to start the insert mode from inside a Vim function.

For more information, read

:startinsert

faq-25.7

25.7. How do I change the cursor position from within a Vim function?

You can use the cursor() function to position the cursor.

```
call cursor(lnum, col)
```

Alternatively, use the setpos() function:

```
call setpos('.', [bufnum, lnum, col, off])
```

which set's the cursor in the buffer bufnum to line lnum, column col and offset for 'virtualedit'. You can use the getpos() function, to return a list with these values, that can then be fed back to the setpos() function.

If you want to save and restore the viewpoint on a window, use the winsaveview() and winrestview() function calls.

You can also use the following command to change the cursor position:

```
exe "normal! " . lnum . "G" . col . "|"
```

For more information, read

cursor()
bar
getpos()
setpos()
winsaveview()
winrestview()

faq-25.8

25.8. How do I check the value of an environment variable in the .vimrc file?

You can use prefix the environment variable name with the '$' character to use it from a Vim script/function. You can refer to the value of an environment variable using the $env_var syntax:

```
if $EDITOR == 'vi'
endif
```

For more information, read

```
expr-env
```

faq-25.9

25.9. How do I check whether an environment variable is set or not from a Vim function?

You can use the exists() function to check for the existence of an environment variable.

```
if exists("$MY_ENV_VAR")
endif
```

For more information, read

```
exists()
expr-env
```

faq-25.10

25.10. How do I call/use the Vim built-in functions?

You can use the ":call" command to invoke a Vim built-in function:

```
:call cursor(10,20)
```

You can use the ":echo" command to echo the value returned by a function:

```
:echo char2nr('a')
```

You can use the ":let" command to assign the value returned by a function to a variable:

```
:let a = getline('.')
```

To store the return value from a function into a Vim register, you can use the following command:

```
:let @a = system('ls')
```

The above command will store the return value from the 'ls' command into the register 'a'.

For more information, read

```
:call
:echo
:let
:let-register
user-functions
usr_41.txt
```

faq-25.11

25.11. I am using some normal mode commands in my Vim script. How do I avoid using the user-defined mappings for these normal mode commands and use the standard Vim functionality for these normal mode commands?

You can use the "normal!" command in your script to invoke a normal-mode command. This will use the standard functionality of the normal mode command and will not use the user-defined mapping.

For more information, read

```
:normal
```

faq-25.12

25.12. How do I get the current visually selected text into a Vim variable or register?

You can get the current visually selected text into a Vim variable by yanking the text into Vim register and then assigning the contents of the register into the variable:

```
:normal! gvy
:let myvar = @"
```

The above command copies the visually selected text into the variable "myvar".

You can also use the command:

```
:normal! gv"*y
```

In the above command, gv reselects the last visually selected text and the rest of the command copies the selected text into the * (clipboard) register. Alternatively, you can set the 'a' flag in the 'guioptions' option to automatically copy a visually selected text into the * register. To do this as part of a visual map, you can use a command similar to the one shown below:

```
:vmap <F3> "*y:call ...
```

For more information, read

```
gv
:normal
:let-@
quotestar
clipboard
registers
```

faq-25.13

25.13. I have some text in a Vim variable 'myvar'. I would like to use this variable in a ":s" substitute command to replace a text 'mytext'. How do I do this?

You can use the 'execute' command to evaluate the variable:

```
:execute '%s/mytext/' . myvar . '/'
```

For more information, read

```
:execute
```

You can also use "\=" in the substitute command to evaluate the variable:

```
:%s/mytext/\=myvar/
```

For more information, read

```
sub-replace-special
```

faq-25.14

25.14. A Vim variable (bno) contains a buffer number. How do I use this variable to open the corresponding buffer?

The :buffer command will not accept a variable name. It accepts only a buffer number or buffer name. You have to use the ":execute" command to evaluate the variable into the corresponding value. For example:

```
:execute "buffer " . bno
```

For more information, read

```
:execute
```

faq-25.15

25.15. How do I store the value of a Vim option into a Vim variable?

You can prefix the option name with the '&' character and assign the option value to a Vim variable using the "let" command. For example, to store the value of the 'textwidth' option into the Vim variable "old_tw", you can use the following command:

```
:let old_tw = &tw
```

To explicitly save buffer local options, use the prefix "l:"

```
:let old_tw = &l:tw
```

If you want to explicitly select the global option, use the "g:" prefix to the option name.

To do the opposite, to set the 'textwidth' option with the value stored in the 'old_tw' variable, you can use the following command:

```
:let &tw = old_tw
```

For more information, read

expr-option
:let-option

faq-25.16

25.16. I have copied and inserted some text into a buffer from a Vim function. How do I indent the inserted text from the Vim function?

You can use the following command to format the just inserted text:

```
:normal '[=']
```

For more information, read

'[
']
=
:normal

faq-25.17

25.17. How do I get the character under the cursor from a Vim script?

You can use the getline() function and use string index [] to get the character:

```
:echo getline(".")[col(".") - 1]
```

In the above command, getline(".") returns the text in the current line. The indexing of the string starts at zero, and you can get a single character in a string by its index with the "string[index]" notation. The col(".") returns the column of the cursor position; the adjustment is to get the right character of the string. However, this does NOT work with multibyte characters as this command only returns the byte index.

Alternatively, you can use the following sequence of commands to get the character under the cursor:

```
normal! vy
let ch=@"
```

Note, that the above commands will change the '< and '> marks.

For more information, read

getline()
col()
expr-[]

faq-25.18

25.18. How do I get the name of the current file without the extension?

You can get the name of the current file without the extension using:

```
:echo expand("%:r")
```

With some commands, you can use the file name modifiers directly:

```
:cd %:p:h
:!gcc -o %:r.o %
:!xpdf %<.pdf
```

For more information, read

```
filename-modifiers
expand()
cmdline-special
fnamemodify()
```

faq-25.19

25.19. How do I get the basename of the current file?

You can use the :t filename modifier to get the basename of the current file:

```
:echo expand("%:t")
```

For more information, read

```
filename-modifiers
```

faq-25.20

25.20. How do I get the output from a Vim function into the current buffer?

You can insert the return value from a function using the following command in insert mode:

```
<C-R>=MyFunc()
```

Note, that this will only insert the return value of the function.

For more information, read

```
i_CTRL-R
i_CTRL-R_CTRL-R
i_CTRL-R_CTRL-O
expression
```

faq-25.21

25.21. How do I call external programs from a Vim function?

There are several ways to call external programs from a Vim function. You can use the builtin system() function to invoke external programs and get the result:

```
:let output = system("ls")
```

You can also use "!" ex-command to run an external command.

For more information, read

```
system()
:!
10.9
```

faq-25.22

25.22. How do I get the return status of a program executed using the ":!" command?

You can use the predefined Vim v:shell_error variable to get the return status of the last run shell command.

For more information, read

```
v:shell_error
```

faq-25.23

25.23. How do I determine whether the current buffer is modified or not?

You can check the value of the 'modified' option to determine whether the current buffer is modified:

```
:set modified?
```

From a Vim script, you can check the value of the 'modified' option:

```
if &modified
    echo "File is modified"
endif
```

For more information, read

```
'modified'
```

faq-25.24

25.24. I would like to use the carriage return character in a normal command from a Vim script. How do I specify the carriage return character?

You can use the ":execute" command to specify the special (control) character in a normal mode command:

```
:execute "normal \<CR>"
:execute "normal ixxx\<Esc>"
```

For more information, read

```
:execute
expr-quote
```

faq-25.25

25.25. How do I split long lines in a Vim script?

You can split long lines in a Vim script by inserting the backslash
character ("\") at the start of the next line. For example,

For more information, read

	line-continuation

faq-25.26

25.26. When I try to "execute" my function using the "execute 'echo
Myfunc()'" command, the cursor is moved to the top of the current
buffer. Why?

The ":execute" command runs the normal mode command specified by the
argument. In the case of the following command:

```
:execute "echo Myfunc()"
```

The call to "echo Myfunc()" will return 0. The ":execute" command will run
the normal mode command "0", which moves the cursor to the top of the file.
To call a Vim function, you should use the ":call" command instead of the
":execute" command:

```
:call Myfunc()
```

For more information, read

	:call
	:execute
	:echo
	user-functions
	41.5
	41.6

faq-25.27

25.27. How do I source/execute the contents of a register?

If you have yanked a set of Vim commands into a Vim register (for example
register 'a'), then you can source the contents of the register using one
of the following commands:

```
:@a
```
or
```
:exe @a
```

For more information, read

	:@

faq-25.28

25.28. After calling a Vim function or a mapping, when I press the 'u'
key to undo the last change, Vim undoes all the changes made by
the mapping/function. Why?

When you call a function or a mapping, all the operations performed by the

function/mapping are treated as one single operation. When you undo the last operation by pressing 'u', all the changes made by the function/mapping are reversed.

For more information, read

```
undo-redo
:map-undo
```

faq-25.29

25.29. How can I call a function defined with s: (script local function) from another script/plugin?

The s: prefix for a Vim function name is used to create a script local function. A script local function can be called only from within that script and cannot be called from other scripts. To define a function in a script/plugin, so that it can be called from other plugins/scripts, define the function without the s: prefix.

For more information, read

```
script-variable
script-local
:scriptnames
```

faq-25.30

25.30. Is it possible to un-source a sourced script? In other words, reverse all the commands executed by sourcing a script.

No. It is not possible to reverse or undo all the commands executed by sourcing a script.

For more information, read

```
:source
```

==

faq-26

SECTION 26 - PLUGINS

faq-26.1

26.1. How do I set different options for different types of files?

You can create filetype plugins to set different options for different types of files. You should first enable filetype plugins using the command:

```
:filetype plugin on
```

A filetype plugin is a vim script that is loaded whenever Vim opens or creates a file of that type. For example, to ensure that the 'textwidth' option is set to 80 when editing a C program (filetype 'c'), create one of the following files:

```
~/.vim/ftplugin/c.vim (Unix)
```

```
        %HOME%\vimfiles\ftplugin\c.vim (Windows)
```

with the following text in it:

```
        setlocal textwidth=80
```

You can also use autocommands to set specific options when editing specific type of files. For example, to set the 'textwidth' option to 75 for only *.txt files, you can use the following autocmd:

```
    autocmd BufRead *.txt setlocal textwidth=80
```

For more information, read

```
     filetype-plugin
     add-filetype-plugin
     :autocmd
     40.3
```

faq-26.2

26.2. I have downloaded a Vim plugin or a syntax file or a indent file, or a color scheme or a filetype plugin from the web. Where should I copy these files so that Vim will find them?

You can place the Vim runtime files (plugins, syntax files, indent files, color schemes, filetype plugins, etc) under one of the directories specified in the 'runtimepath' option. To determine the current value of the 'runtimepath' option, use the following command:

```
    :set runtimepath
```

For Unix systems, this is usually the "$HOME/.vim" directory. For MS-Windows systems, this is usually the $VIM\vimfiles or $HOME\vimfiles directory. Depending on the type of the runtime file, you have to place it under a specific directory under the above runtime directory. The names of the directories are listed below:

```
    colors/   - color scheme files
    compiler/ - compiler files
    doc/      - documentation
    ftplugin/ - filetype plugins
    indent/   - indent scripts
    keymap/   - key mapping files
    lang/     - menu translations
    plugin/   - plugin scripts
    syntax/   - syntax files
    tutor/    - files for vimtutor
```

For more information, read

```
     your-runtime-dir
     'runtimepath'
     :runtime
```

faq-26.3

26.3. How do I extend an existing filetype plugin?

You can extend an existing filetype plugin by creating a file in the after/ directory in any of the 'runtimepath' directories.

- for small changes to be done after (and in addition to) what is already done by the ftplugin installed with Vim, use an after-directory, as follows (replacing foobar by the 'filetype' of the concerned files):

    - For changes private to one user:
        - on Windows:
            $HOME/vimfiles/after/ftplugin/foobar.vim
        - on Unix-like OSes:
            $HOME/.vim/after/ftplugin/foobar.vim
    - For changes affecting all users on the system:
        $VIM/vimfiles/after/ftplugin/foobar.vim

- when replacing the whole filetype-plugin by a different version, or when installing a new ftplugin for some filetype not yet supported by Vim out of the box: use the same paths without the after/ in them. In that case you should place near the start of your plugin an "if... finish... endif... let" block like the one in the plugins distributed with Vim.

All the above paths are given in Vim terminology (which is similar to Unix terminology, but is understood even by Vim for Windows); they don't exist by default, so the first time you need them you will have to create them using mkdir (on any OS including DOS/Windows) or md (on DOS/Windows only). $VIM and, on DOS/Windows, $HOME, do not necessarily exist outside Vim. If $HOME has no value (or no valid value) inside Vim, you can use $VIM instead; but on any but possibly very old versions of Windows, $HOMEDRIVE and $HOMEPATH are defined by the system, and if $HOME is undefined at Vim startup, Vim will set it by expanding $HOMEDRIVE$HOMEPATH before sourcing your vimrc. To know which values Vim uses, you can type (in a running Vim):

```
:echo $VIM
:echo $HOME
```

If you placed the file in the after/ftplugin runtime directory, then Vim will first source the existing filetype plugin file and then will source the new file. If you placed the file in the $VIMRTUNTIME/ftplugin runtime directory, then Vim will first source the new file and then will source the existing filetype plugin file.

For more information, read

```
ftplugin-overrule
filetype-plugin
add-filetype-plugin
```

'runtimepath'

faq-26.4

26.4. How do I turn off loading the Vim plugins?

You can reset the 'loadplugins' option to turn off loading the plugins:

```
:set noloadplugins
```

You can also specify the "--noplugin" command line argument to stop loading the plugins:

```
$ vim --noplugin
```

For more information, read

'loadplugins'
--noplugin
load-plugins

faq-26.5

26.5. How do I turn on/off loading the filetype plugins?

By default, Vim will not load the filetype plugins. You can configure Vim to load filetype plugins using the command:

```
filetype plugin on
```

You can turn off loading the filetype plugins using:

```
filetype plugin off
```

For more information, read

:filetype-plugin-on
:filetype-plugin-off
:filetype

faq-26.6

26.6. How do I override settings made in a file type plugin in the global ftplugin directory for all the file types?

You can use an autocommand triggered on the FileType event:

```
au Filetype * set formatoptions=xyz
```

This should at least be after "filetype on" in your vimrc. Best is to put it in your "myfiletypefile" file, so that it's always last.

If you want to override a setting for a particular filetype, then create a file with the same name as the original filetype plugin in the ~/.vim/after/ftplugin directory For example, to override a setting in the c.vim filetype plugin, create a c.vim file in the ~/.vim/after/ftplugin directory and add your preferences in this file.

For more information, read

	ftplugin-overrule
	ftplugins
	myfiletypefile

faq-26.7

26.7. How do I disable the Vim directory browser plugin?

To disable the directory browsing Vim plugin, add the following line to your .vimrc file:

```
let g:loaded_netrw = 1
```

For more information, read

	netrw

faq-26.8

26.8. How do I set the filetype option for files with names matching a particular pattern or depending on the file extension?

You can set the 'filetype' option for files with names matching a particular pattern using an autocmd. For example, to set the 'filetype' option to 'c' for all files with extension '.x', you can use the following autocmd:

```
autocmd! BufRead,BufNewFile *.x     setfiletype c
```

A better alternative to the above approach is to create a filetype.vim file in the ~/.vim directory (or in one of the directories specified in the 'runtimepath' option) and add the following lines:

```
" my filetype file
if exists("did_load_filetypes")
    finish
endif
augroup filetypedetect
    au! BufRead,BufNewFile *.x       setfiletype c
augroup END
```

For more information, read

	new-filetype
	43.2
	:setfiletype

==

faq-27

SECTION 27 - EDITING PROGRAM FILES

faq-27.1

27.1. How do I enable automatic indentation for C/C++ files?

You can enable file-type based indentation using:

```
:filetype indent on
```

If you want to only enable automatic C indentation, then use:

```
:set cindent
```

For more information, read

```
'cindent'
C-indenting
filetype
```

faq-27.2

27.2. How do I configure the indentation used for C/C++ files?

You can configure the Vim C indentation by modifying the value of the 'cinoptions', 'cinkeys' and 'cinwords' options.

For more information, read

```
'cindent'
'cinoptions'
'cinkeys'
'cinwords'
C-indenting
cinoptions-values
'smartindent'
```

faq-27.3

27.3. How do I turn off the automatic indentation feature?

By default, the automatic indentation is not turned on. You must have configured Vim to do automatic indentation in either .vimrc or .gvimrc files. You can disable automatic indentation using either,

```
:filetype indent off
```

or

```
:set nocindent
```

Also, check the setting for the following options:

```
:set autoindent?
:set smartindent?
:set indentexpr?
```

For more information, read

```
'cindent'
:filetype-indent-off
```

'autoindent'
'smartindent'
'indentexpr'

faq-27.4

27.4. How do I change the number of space characters used for the automatic indentation?

You can modify the 'shiftwidth' option to change the number of space characters used for the automatic indentation:

```
:set shiftwidth=4
```

For more information, read

'shiftwidth'

faq-27.5

27.5. I am editing a C program using Vim. How do I display the definition of a macro or a variable?

You can use the "[d" command to display the definition of a macro, "[i" command to display the definition of a variable, "gd" to goto the local declaration of a variable and "gD" to go to the global Declaration.

For more information, read

[d
[i
gd
gD
include-search
29.4
29.5

faq-27.6

27.6. I am editing a C program using Vim. How do I jump to the beginning or end of a code block from within the block?

You can use '[{' command to jump to the beginning of the code block and ']} to jump to the end of the code block from inside the block.

For more information, read

[{
]}
various-motions

faq-27.7

27.7. When editing C++ files and when inserting new lines above or below a comment (//) line, Vim automatically inserts the C++ comment character (//) at the beginning of the line. How do I disable this?

This automatic insertion of the comment leader (//) when new lines

are added is controlled by three flags in the 'formatoptions'
option: 'c', 'r' and 'o'. 'c' enables auto-wrapping of comment
lines when typing extends beyond the right margin. 'r' enables the
automatic insertion of the comment leader when <Enter> is pressed
while editing a comment line. 'o' enables the automatic insertion
of the comment leader when a new line is opened above or below an
existing comment line by typing O or o in Normal mode.

You can stop Vim from automatically inserting the comment leader
when typing <Enter> within a comment or when opening a new line by
removing the 'r' and 'o' flags from 'formatoptions'.

```
:set formatoptions-=r
:set formatoptions-=o
```

The default filetype plugin for C and C++ files
($VIMRUNTIME/ftplugin/c.vim) adds the 'r' and 'o' flags to the
'formatoptions' option. If you want to override this for C++ files,
then you can add the above lines to the
~/.vim/after/ftplugin/cpp.vim file.

For more information, read

```
formatoptions
30.6
format-comments
filetype-plugins
ftplugin-overrule
```

faq-27.8

27.8. How do I add the comment character '#' to a set of lines at the beginning of each line?

First, select the first character in all the lines using visual block mode
(CTRL-V). Press 'I' to start inserting characters at the beginning of the
line. Enter the comment character and then stop the insert mode by pressing
<Esc>. Vim will automatically insert the entered characters at the
beginning of all the selected lines.

For more information, read

```
visual-block
blockwise-operators
v_b_I
```

faq-27.9

27.9. How do I edit a header file with the same name as the corresponding C source file?

You can use the following command to edit a header file with the same name
as the corresponding C source file:

```
:e %:t:r.h
```

You can use the following command to edit the file in a new split window:

```
:sp %:t:r.h
```

In the above commands, the percent sign expands to the name of the current file. The ":t" modifier extracts the tail (last component) of the filename. The ":r" modifier extracts the root of the filename. The .h is appended to the resulting name to get the header filename.

Another approach is to use the following command:

```
:sfind %:t:r.h
```

This command will search for the header file in the directories specified in the 'path' option.

For more information, read

```
cmdline-special
filename-modifiers
:sfind
'path'
```

faq-27.10

27.10. How do I automatically insert comment leaders while typing comments?

To automatically insert comment leaders while typing comments, add the 'r' and 'o' flags to the 'formatoptions' option.

```
:set formatoptions+=ro
```

You may also want to add the 'c' flag to auto-wrap comments using the 'textwidth' option setting and the 'q' flag to format comments with the "gq" command:

```
:set formatoptions=croq
```

For more information, read

```
30.6
format-comments
'comments'
fo-table
```

==

faq-28

SECTION 28 - QUICKFIX

faq-28.1

28.1. How do I build programs from Vim?

You can use the ":make" command to build programs from Vim. The ":make" command runs the program specified by the 'makeprg' option.

For more information, read

	30.1
	:make_makeprg
	'makeprg'
	'makeef'
	:make
	quickfix

faq-28.2

28.2. When I run the make command in Vim I get the errors listed as the compiler compiles the program. When it finishes this list disappears and I have to use the :clist command to see the error message again. Is there any other way to see these error messages?

You can use the ":copen" or ":cwindow" command to open the quickfix window that contains the compiler output. You can select different error lines from this window and jump to the corresponding line in the source code.

For more information, read

	:copen
	:cwindow
	quickfix

faq-28.3

28.3. How can I perform a command for each item in the quickfix/location list?

Starting from Vim 7.4.858 Vim provides the new commands :cfdo, :cdo, :lfdo and :ldo. They work by iterating over all items in the quickfix list and performing a command on each. The difference is, that the :lfdo and :ldo commands iterate over the location list entries, while the :cfdo and :cdo commands operate on the items in the quickfix list. Also, the :cfdo and :lfdo operate on all different files, while the :cdo and :ldo commands operate on each item in the quickfix/location list.

For example you could vimgrep all C files in the current directory for a search string "Foobar":

```
:vimgrep /Foobar/ *.c
```

and as this populates your quickfix list, you could simply replace all occurences by using:

```
:cdo :%s/Foobar/Foobaz | upd
```

For more information, read

	:cfdo
	:cdo

==

faq-29

SECTION 29 - FOLDING

faq-29.1

29.1. How do I extend the Vim folding support?

You can use the 'foldexpr' option to fold using a user specified function. For example, to fold subroutines of the following form into a single line:

```
sub foo {
  my $barf;
  $barf = 3;
  return $barf;
}
```

You can use the following commands:

```
set foldmethod=expr
set foldexpr=MyFoldExpr(v:lnum)
fun! MyFoldExpr(line)
    let str = getline(a:line)
    if str =~ '^sub\>'
        return '1'
    elseif str =~ '^}'
        return '<1'
    else
        return foldlevel(a:line - 1)
    endif
endfun
```

For more information, read

'foldexpr'
fold-expr

faq-29.2

29.2. When I enable folding by setting the 'foldmethod' option, all the folds are closed. How do I prevent this?

You can set the 'foldlevelstart' option to a particular value to close only folds above the specified value.

```
:set foldlevelstart=99
```

For more information, read

'foldlevelstart'
'foldlevel'
fold-foldlevel

faq-29.3

29.3. How do I control how many folds will be opened when I start editing a file?

You can modify the 'foldlevelstart' option to control the number of folds that will be opened when you start editing a file. To start editing with

all the folds closed:

```
:set foldlevelstart=0
```

To start editing with all the folds opened, you can use

```
:set foldlevelstart=999
```

For more information, read

'foldlevelstart'

faq-29.4

29.4. How do I open and close folds using the mouse?

You can click on the + and - characters displayed at the leftmost column to open and close fold. For this to work, you have to set the 'foldcolumn' to a value greater than zero:

```
:set foldcolumn=2
```

For more information, read

'foldcolumn'

faq-29.5

29.5. How do I change the text displayed for a closed fold?

You can use the 'foldtext' option to change the text displayed for a closed fold.

For more information, read

'foldtext'
fold-foldtext
'fillchars'

faq-29.6

29.6. How do I store and restore manually created folds across different Vim invocations?

You can use the ":mkview" command to store manually created folds. Later, you can use the ":loadview" command to restore the folds. For this to work, the 'viewoptions' must contain "folds".

For more information, read

28.4
:mkview
:loadview
'viewoptions'
'viewdir'
:mksession
'sessionoptions'

faq-29.7

29.7. I have enabled syntax based folding. Why is Vim so slow?

Syntax based folding is currently rather slow in Vim and will possibly slow down Vim considerably. There is an issue in the todo list to fix this, but the todo list is rather long and it may take a while until this will be fixed.

You can find the issue in the todo list, if you read

    todo.txt

followed by a search for "folding with 'foldmethod'"

A workaround is to temporarily set the foldmethod to manual while in insert mode. This is described in the wiki at:
http://vim.wikia.com/wiki/Keep_folds_closed_while_inserting_text

==========

faq-30

SECTION 30 - VIM WITH EXTERNAL APPLICATIONS

faq-30.1

30.1. Can I run a shell inside a Vim window?

Currently Vim doesn't have support for running shell and other external commands inside a Vim window.

For more information, read

    shell-window

The Neovim project however has added the ":terminal" command which opens a new shell prompt. To read more about Neovim, look at their webpage
http://neovim.io

Alternatively, you can try using the Unix "screen", "tmux" or "splitvt" utility.

Following is a post from the vim_use mailinglist (http://groups.google.com/group/vim_use/msg/22c97ebfd6a978eb)

Date: Mon, 24 May 2010
Subject: Re: Terminal into vim, best options???
From: Nico Raffo
To: vim_use

There are quite a few options out there, all with their strengths and weaknesses. Shell integration is at the top of the Vim wish list. I'm sure Bram would be more interested in including it if someone developed and maintained a kick-ass patch :-)

Here is a (quite biased) overview of what's currently available:

Conque Shell
URL: http://code.google.com/p/conque/
Author: Nico Raffo (me!)
Requirements: *nix, python-enabled vim
Type: Plugin

Conque is a Vim plugin, written with Vim script and python. It turns
your Vim buffer into a terminal emulator. In INSERT mode your buffer
behaves like a standard unix terminal. In NORMAL mode you can navigate/
search/page through the terminal output.

Pros:
 * Relatively easy to install
 * Near complete VT100 support (you can run emacs in a vim buffer)
 * Use of Vim features in terminal, including syntax highlighting,
   copy/paste, etc
 * Active development

Cons:
 * No Windows support (coming with Vim 7.3)
 * Can be slow, especially with programs which use a lot of terminal
   colors

Vimshell
URL: http://github.com/Shougo/vimshell + http://github.com/Shougo/vimproc
Author: Shougo M
Requirements: Works on both *nix and Windows. One small, independent
component may need to be compiled from C source.
Type: Plugin

Vimshell is a shell, written in the Vim scripting language, that runs
in a Vim buffer. The shell was written to take full advantage of all
of Vim's features, for example you can use Vim's omnicomplete
features, or any other normal mode Vim commands, to edit your command
line. Great potential, but missing a few features, particularly
regarding interactive programs.

Pros:
 * Relatively easy to install
 * Edit the command line with Vim, full use of Vim features in both
   normal and insert mode
 * Very fast, since there is no background process required
 * Windows support
 * Active development

Cons:
 * Very limited support of interactive programs such as bash, mysql or
   python.
 * Shell has incomplete functionality compared to bash, etc.
 * Documentation only available in Japanese.

screen.vim (Vim + screen/tmux)
URL: http://www.vim.org/scripts/script.php?script_id=2711
Author: Eric Van Dewoestine
Requirements: *nix
Type: Plugin

screen.vim is a Vim plugin which streamlines and enhances the
experience of running split screen terminal with Vim running in one of
the windows and a terminal running in the other. It uses the programs
screen or tmux to manage the split windows and to run the terminal
emulation. Both of these programs are very mature, and will give a
better terminal experience than any other option. However since the
terminal is running independently of Vim, you won't be able to use Vim
commands to interact with the terminal output.

Pros:
 * Easy to install
 * Great shell support
 * Active development

Cons:
 * No use of Vim commands to manage the shell window
 * Relatively little integration between Vim and the shell

Vim-Shell
URL: http://www.wana.at/vimshell/
Author: Thomas Wanda
Requirements: *nix, patch and recompile Vim from source
Type: Extension

Vim-Shell is a Vim extension which converts a buffer into a terminal
emulator. The shell window itself is very fast and functionality is
very strong. It is works great for running complex interactive
programs. However the Vim buffer where it runs is no longer editable
(you can't scroll up, or even move the cursor). The last official
release was for Vim 7.0, although time spent searching on Google will
turn up patches for Vim 7.1 and 7.2.

Pros:
 * Near complete VT100 support (you can run emacs in a vim buffer, and
   just about anything else)
 * Very fast. Compiled into the C source

Cons:
 * Relatively difficult to install
 * No use of Vim features to navigate terminal output
 * No Windows or Mac support.
 * No development activity since 2006

Vimsh
URL: http://www.vim.org/scripts/script.php?script_id=165
Author: Brian Sturk

Requirements: python-enabled vim
Type: Plugin

Vimsh is a Vim plugin which allows you to run interactive programs in
a vim buffer. It provides a nice option for Windows use, but
functionality is overall less mature than the other options.

Pros:
 * Relatively easy to install
 * Use Vim commands to edit commands and navigate terminal output
 * Support in both *nix and Windows (no interactive programs in
   Windows)

Cons:
 * Limited functionality
 * Inactive development

---

faq-30.2

30.2. How do I pass the word under the cursor to an external command?

You can use the special keyword <cword> to pass the word under the cursor
to an external command. For example:

```
:!dict <cword>
```

For more information, read

:<cword>

faq-30.3

30.3. How do I get the output of a shell command into a Vim buffer?

You can use the ":r !" command to get the output of a shell command into a
Vim buffer. For example, to insert the output of the "ls" shell command,
you can use the following command:

```
:r !ls
```

To insert the output of the shell command above the first line use the
following command:

```
:0r !ls
```

For more information, read

:r!

faq-30.4

30.4. How do I pipe the contents of the current buffer to an external command and replace the contents of the buffer with the output from the command?

You can use the :! command to pipe the contents of the current buffer to an external command and replace the contents of the buffer with the output from the command. For example, to sort the contents of the current buffer, using the Unix sort command, you can use the following command:

```
:%!sort
```

To sort only lines 10-20, you can use the following command

```
:10,20!sort
```

Also, if you want to pipe a buffer to an external command but not put the results back in the buffer, you can use

```
:w !sort
```

The above command will pipe the entire buffer to the sort command. Note, that the space between the 'w' and the '!' is critical. To pipe only a range of lines, you can use

```
:10,20w !sort
```

The above command will pipe the lines 10-20 to the sort command.

For more information, read

```
:range!
10.9
:w_c
```

faq-30.5

30.5. How do I sort a section of my file?

You use the ":sort" command like this:

```
:5,100sort
```

Using the ":sort" command provides many options, you can sort numerical on the first found decimal number using:

```
:%sort n
```

Or you can specify to sort on the text, starting at virtual column 8:

```
:%sort /.*\%8v/
```

Alternatively can pipe a section of the file to the Unix "sort" utility to sort the file. For example:

```
:5,100!sort
```

You can also use a visual block, and use the "!sort" command on the selected block.

See also:
	:sort
	filter

faq-30.6

30.6. How do I use Vim as a pager?

You can use Vim as a pager using the $VIMRUNTIME/macros/less.sh shell script, supplied as part of the standard Vim distribution. This shell script uses the $VIMRUNTIME/macros/less.vim Vim script to provide less like key bindings.

For more information, read

	less

faq-30.7

30.7. How do I view Unix man pages from inside Vim?

You can view Unix man pages, inside Vim, using the man.vim plugin supplied as part of the standard Vim distribution. To use this plugin, add the following line to your startup vimrc file:

```
runtime ftplugin/man.vim
```

You can also press the K key to run the program specified by the 'keywordprg' option with the keyword under the cursor. By default, 'keywordprg' is set to run man on the keyword under the cursor.

For more information, read

	ft-man-plugin
	K
	'keywordprg'

faq-30.8

30.8. How do I change the diff command used by the Vim diff support?

By default, the Vim diff support uses the 'diff' command. You can change this by changing the 'diffexpr' option.

For more information, read

	diff-diffexpr
	'diffexpr'

faq-30.9

30.9. How do I use the Vim diff mode without folding?

You can use the following command-line to start Vim with two filenames and use the diff mode without folding:

```
$ vim -o file1 file2 "+windo set diff scrollbind scrollopt+=hor nowrap"
```

If you like vertically split windows, then replace "-o" with "-O".

For more information, read

    vimdiff

==

faq-31

SECTION 31 - GUI VIM

faq-31.1

31.1. How do I create buffer specific menus?

Adding support for buffer specific menus is in the Vim TODO list. In the mean time, you can try Michael Geddes's plugin, buffermenu.vim:

    http://vim.sourceforge.net/scripts/script.php?script_id=246

faq-31.2

31.2. How do I change the font used by GUI Vim?

You can change the 'guifont' option to change the font used by GUI Vim. To display the current value of this option, you can use

    :set guifont?

You can add the displayed font name to the .vimrc file to use the font across Vim sessions. For example, add the following line to the .vimrc file to use Andale Mono font.

    set guifont=Andale_Mono:h10:cANSI

For Win32, GTK and Photon version of Vim, you can use the following command to bringup a dialog which will help you in changing the guifont:

    :set guifont=*

You can also use the -font Vim command line option to specify the font used for normal text.

For more information, read

    'guifont'
    'guifontset'
    'guifontwide'
    font-sizes
    -font
    -boldfont
    -italicfont
    -menufont
    -menufontset

faq-31.3

31.3. When starting GUI Vim, how do I specify the location of the GVIM

window?

You can use the "-geometry" command line argument to specify the location of the GUI Vim window. For example:

```
$ gvim -geometry 80x25+100+300
```

For more information, read

31.4
-geom

faq-31.4

31.4. How do I add a horizontal scrollbar in GVim?

You can enable the horizontal scrollbar by modifying the 'guioptions' option:

```
:set guioptions+=b
```

For more information, read

'guioptions'
gui-horiz-scroll

faq-31.5

31.5. How do I make the scrollbar appear in the left side by default?

You can add the 'l' flag to the 'guioptions' option to make the scrollbar appear in the left side.

```
:set guioptions+=l
:set guioptions-=r
```

For more information, read

'guioptions'
gui-scrollbars

faq-31.6

31.6. How do I remove the Vim menubar?

You can remove the Vim menubar by removing the 'm' flag from the 'guioptions' option:

```
:set guioptions-=m
```

For more information, read

'guioptions'

faq-31.7

31.7. I am using GUI Vim. When I press the ALT key and a letter, the menu starting with that letter is selected. I don't want this behavior as

I want to map the ALT-<key> combination. How do I do this?

You can use the 'winaltkeys' option to disable the use of the ALT key to select a menu item:

```
:set winaltkeys=no
```

For more information, read

```
'winaltkeys'
:simalt
```

faq-31.8

31.8. Is it possible to scroll the text by dragging the scrollbar so that the cursor stays in the original location?

The way Vim is designed, the cursor position has to be in a visible spot in normal, visual, select and insert mode. This cannot be changed without modifying Vim. When the scrollbar is used, the cursor will be moved so that it is always visible. Another approach to solving this problem is to use the Vim marks. You can mark the current cursor position using ma. Then scroll to a different part of the text and jump back to the old position using `a. You can also try the following suggestion from the Vim Online website:

```
http://vim.wikia.com/wiki/VimTip320
```

For more information, read

```
mark-motions
```

faq-31.9

31.9. How do I get gvim to start browsing files in a particular directory when using the ":browse" command?

You can set the 'browsedir' option to the default directory to use for the ":browse" command.

```
:set browsedir='<your_dir>'
```

For more information, read

```
'browsedir'
```

faq-31.10

31.10. For some questions, like when a file is changed outside of Vim, Vim displays a GUI dialog box. How do I replace this GUI dialog box with a console dialog box?

You can set the 'c' flag in the 'guioptions' option to configure Vim to use console dialogs instead of GUI dialogs:

```
:set guioptions+=c
```

For more information, read

	'guioptions'

faq-31.11

31.11. I am trying to use GUI Vim as the editor for my xxx application. When the xxx application launches GUI Vim to edit a file, the control immediately returns to the xxx application. How do I start GUI Vim, so that the control returns to the xxx application only after I quit Vim?

You have to start GUI Vim with the '-f' (foreground) command line option:

```
$ gvim -f
```

By default, GUI Vim will disconnect from the program that started Vim. With the '-f' option, GUI Vim will not disconnect from the program that started it.

For more information, read

	gui-fork
	-f

faq-31.12

31.12. Why does the "Select Font" dialog doesn't show all the fonts installed in my system?

Vim supports only fixed width (mono-spaced) fonts. Proportional fonts are not supported. In the "Select Font" dialog, only fixed width fonts will be displayed.

For more information, read

	font-sizes
	'guifont'

faq-31.13

31.13. How do I use the mouse in Vim command-line mode?

You can set the 'c' flag in the 'mouse' option to use mouse in the Vim command-line mode:

```
:set mouse+=c
```

For more information, read

	mouse-using
	gui-mouse
	09.2

faq-31.14

31.14. When I use the middle mouse button to scroll text, it pastes the last copied text. How do I disable this behavior?

You can map the middle mouse button to <Nop> to disable the middle mouse button:

```
:map  <MiddleMouse> <Nop>
:map! <MiddleMouse> <Nop>
```

For more information, read

gui-mouse-mapping
<Nop>

faq-31.15

31.15. How do I change the location and size of a GUI Vim window?

You can use the "winpos" command to change the Vim window position. To change the size of the window, you can modify the "lines" and "columns" options.

For example, the following commands will position the GUI Vim window at the X,Y co-ordinates 50,50 and set the number of lines to 50 and the number of columns to 80.

```
:winpos 50 50
:set lines=50
:set columns=80
```

The arguments to the 'winpos' command specify the pixel co-ordinates of the Vim window. The 'lines' and 'columns' options specify the number of lines and characters to use for the height and the width of the window respectively.

For more information, read

31.4
:winpos
'lines'
'columns'
GUIEnter

faq-31.16

31.16. When splitting the Vim window vertically, Vim changes the position.

This is a known problem. When you are splitting the Vim window, Vim will try to draw a scrollbar. Since this changes the gui window, Vim tries to resize its main window to keep the same position and this will cause Vim to move its position. This happens on Windows with a multi-window setup or a window that was "snapped" to a certain position.

A workaournd to this problem is, to remove gui scrollbars, e.g.

```
:set guioptions-=L
```

==========

faq-32

SECTION 32 - VIM ON UNIX

faq-32.1

32.1. I am running Vim in a xterm. When I press the CTRL-S key, Vim freezes. What should I do now?

Many terminal emulators and real terminal drivers use the CTRL-S key to stop the data from arriving so that you can stop a fast scrolling display to look at it (also allowed older terminals to slow down the computer so that it did not get buffer overflows). You can start the output again by pressing the CTRL-Q key.

When you press the CTRL-S key, the terminal driver will stop sending the output data. As a result of this, it will look like Vim is hung. If you press the CTRL-Q key, then everything will be back to normal.

You can turn off the terminal driver flow control using the 'stty' command:

```
$ stty -ixon -ixoff
```

or, you can change the keys used for the terminal flow control, using the following commands:

```
$ stty stop <char>
$ stty start <char>
```

faq-32.2

32.2. I am seeing weird screen update problems in Vim. What can I do to solve this screen/display update problems?

You have to use a proper terminal emulator like xterm with correct TERM settings (TERM=xterm) and a correct terminfo/termcap file.
For more information, read

'term'

faq-32.3

32.3. I am using the terminal/console version of Vim. In insertmode, When I press the backspace key, the character before the cursor is not erased. How do I configure Vim to do this?

You have to make sure that Vim gets the correct keycode for the backpspace key. You can try using the command:

```
:fixdel
```

Make sure the TERM environment variable is set to the correct terminal name. You can try using the 'stty' command:

```
$ stty erase ^H
```

where, you have to enter the ^H character by pressing the CTRL-V key and then the CTRL-H key. Also check the value of your 'backspace' setting.

For more information, read

```
:fixdel
Linux-backspace
NetBSD-backspace
'backspace'
```

faq-32.4

32.4. I am using Vim in a xterm. When I quit Vim, the screen contents are restored back to the original contents. How do I disable this?

The xterm has a capability called "alternate screen". If this capability is present, vim switches to that alternate screen upon startup and back on exit, thus restoring the original screen contents. To disable this feature, add the following line to your .vimrc file:

```
:set t_ti= t_te=
```

For more information, read

```
'restorescreen'
xterm-screens
```

faq-32.5

32.5. When I start Vim, it takes quite a few seconds to start. How do I minimize the startup time?

This may be related to Vim opening the X display for setting the xterm title and using the X clipboard. Make sure the DISPLAY variable is set to point to the correct host. Try using the command line:

```
$ vim -X
```

This will prevent Vim from opening the X display. With this command-line option, the X clipboard cannot be used and also Vim will not be able to change the xterm title.

You can also set the 'clipboard' option to

```
:set clipboard=exclude:.*
```

This has the same effect as using the -X command-line argument.

For more information, read

```
-X
'clipboard'
```

If the clipboard is not the cause of the slow startup, it might be a plugin that slows down Vim. In that case, you can use the --startuptime argument to debug this further. You can do:

```
$ vim --startuptime vim_startup.log
```

and the timing will be written to the file vim_startup.log. For even more advanced profiling, you can use the profiling feature, that is available in huge builds of Vim. To do so, call Vim like this:

```
$ vim --cmd 'profile start profile.log' \
  --cmd 'profile func *' \
  --cmd 'profile file *' \
  -c 'profdel func *' \
  -c 'profdel file *' \
  -c 'qa!'
```

After running this, you will have a file profile.log in your current directory. To further analyse this, open the file profile.log and run:

```
" Open profile.log file in vim first
:let timings=[]
:g/^SCRIPT/call add(timings, [getline('.')[len('SCRIPT  '):], matchstr(getline(line('.
:enew
:call setline('.', ['count total (s)   self (s)  script']+map(copy(timings), 'printf("%
```

For more information, read

```
--startuptime
profiling
```

faq-32.6

32.6. How can I make the cursor in gvim in unix stop blinking?

You can modify the 'guicursor' option, to stop the cursor from blinking. For example:

```
:set guicursor=a:blinkon0
```

For more information, read

```
'guicursor'
```

faq-32.7

32.7. How do I change the menu font on GTK Vim?

You can modify the ~/.gtkrc file to change the menu font on GTK Vim. For example:

```
style "default"
{ font ="smooth09" }
class "*" style "default"
```

The last line changes the font of all widgets.

For more information, read

```
gui-gtk
```

faq-32.8

32.8. How do I prevent <Ctrl-Z> from suspending Vim?

You can map <Ctrl-Z> to prevent the suspending. Here are some suggestions:

- Make <Ctrl-Z> do nothing:

```
:map <C-Z> <Nop>
```

- Make <Ctrl-Z> start a shell:

```
:map <C-Z> :shell<CR>
```

- Make <Ctrl-Z> give an error message:

```
:map <C-Z> :"suspending disabled<CR>
```

For the last example, the double quote is necessary in order to keep the message on the status line.

faq-32.9

32.9. When I kill the xterm running Vim, the Vim process continues to run and takes up a lot of CPU (99%) time. Why is this happening?

When Vim is built with support for Python interface, you will have this problem. This is a known problem with the python thread library and Vim. To solve this problem, use a Vim binary built without the Python interface.

For more information, read

```
+python
python
```

faq-32.10

32.10. How do I get the Vim syntax highlighting to work in a Unix terminal?

The easiest and simplest way to get Vim syntax highlighting is to use the GUI version of Vim (GVIM). To get syntax highlighting to work in the console/terminal version of Vim, you have to run a terminal emulator (like Xfree86 xterm or rxvt or dtterm) that supports color. Note that if a terminal emulator supports changing the background and foreground colors, that does not mean that it also supports ANSI escape sequences for changing the color. You can download the latest version of Xfree86 xterm from http://dickey.his.com/xterm/xterm.html. You can download the latest version of rxvt from http://www.rxvt.org. You have to install the terminfo/termcap file that supports colors for the terminal emulator. Also, set the TERM environment variable to the correct name of the term that supports colors.

You can use the colortest.vim script supplied with the Vim runtime package to test the color setup. To use this script, follow these steps:

```
:e $VIMRUNTIME/syntax/colortest.vim
:source %
```

For more information, read

06.2
terminal-colors
termcap-colors
startup-terminal
xterm-color
colortest.vim

==

faq-33

SECTION 33 - VIM ON MS-WINDOWS

faq-33.1

33.1. In MS-Windows, CTRL-V doesn't start the blockwise visual mode. What happened?

The mswin.vim script provides key mappings and options to make Vim behave like a MS-Windows application. One of the keys mapped is CTRL-V which is used for pasting text in MS-Windows applications. This will disable the use of CTRL-V to start the blockwise visual mode. The mswin.vim script maps CTRL-Q for staring the blockwise visual mode. So you can use CTRL-Q instead of CTRL-V.

For more information, read

CTRL-V
CTRL-V-alternative
CTRL-Q
10.5

faq-33.2

33.2. When I press the CTRL-Y key, it acts like the CTRL-R key. How do I configure Vim to treat CTRL-Y as CTRL-Y?

The mapping of the CTRL-Y key to the CTRL-R key is done by the mswin.vim script. The mswin.vim script maps CTRL-Y to make Vim behave like a standard MS-Windows application. This is explained in ":help CTRL-Y". You can either comment out the line in mswin.vim that maps the CTRL-Y key or you can remove the line in your .vimrc file that sources the mswin.vim script.

faq-33.3

33.3. How do I start GUI Vim in a maximized window always?

You can use the "simalt" command to maximize the Vim window. You can use the GUIEnter autocmd to maximize the Vim window on startup:

```
autocmd GUIEnter * simalt ~x
```

For more information, read

:simalt
GUIEnter
gui-win32-maximized

faq-33.4

33.4. After doing some editing operations, Vim freezes. The cursor becomes an empty rectangle. I am not able enter any characters. What is happening?

Most probably, you used the mouse wheel to scroll the text in Vim. There is a known problem in using intellimouse mouse wheel with Vim. To avoid this problem, disable Universal scrolling support for Vim.

For more information, read

    intellimouse-wheel-problems

faq-33.5

33.5. I am using Windows XP, the display speed of maximized GVim is very slow. What can I do to speed the display updates?

This may be due to the fact that you have enabled 'Smooth edges of screen fonts' in the display properties. Try turning off font smoothing or try changing the smoothing method to "Standard".

faq-33.6

33.6. What are the recommended settings for using Vim with cygwin?

You may want to set the following shell related Vim settings:

```
:set shellcmdflag=-c
:set shellquote=
:set shellslash          " Use the forward slash for expansion.
:set shellxquote=\"
:set shell=d:\cygwin\bin\bash.exe " Use the bash shell
:set shellpipe=2>&1| tee
:set shellredir=>%s 2>&1
```

faq-33.7

33.7. I am trying to use GNU diff with Vim diff mode. When I run the diff from command line, it works. When I try to use the diff with Vim it doesn't work. What should I do now?

There is a problem with using GNU diff with Vim. You can try using the GNU diff.exe built by Ron Aaron from the following link:

    http://www.mossbayeng.com/~ron/vim/builds.html

faq-33.8

33.8. Is it possible to use Vim as an external editor for MS-Windows Outlook email client?

You can use the "cubiclevim" COM Add-In to use Vim as an external editor for MS-Windows Outlook email client. Visit the following URL for more information:

    http://sourceforge.net/projects/cubiclevim

Note, that currently this works only with MS-Office 2000 and XP.

Also the plugin OutlookVim might be worth a look:

http://www.vim.org/scripts/script.php?script_id=3087

faq-33.9

33.9. I am using Vim to edit HTML files. How do I start internet explorer with the current file to preview the HTML file?

You can use the following command:

```
:!start c:\progra~1\intern~1\iexplore.exe file://%:p<CR>
```

faq-33.10

33.10. I would like to use Vim with Microsoft Visual Studio. How do I do this?

You have to download and use the OLE version of Vim (for example: gvim61ole.zip). This file also contains instructions on how to use Vim with Visual Studio.

For more information, read

```
MSVisualStudio
```

faq-33.11

33.11. Where do I place the _vimrc and _gvimrc files?

You can place the _vimrc and _gvimrc files under the directory pointed to by the VIM environment variable. If you are sharing this system with other users, then you can place the files in a directory and set the HOME environment variable to this directory.

For more information, read

```
$HOME-use
_vimrc
```

faq-33.12

33.12. Every time I save a file, Vim warns about the file being changed outside of Vim. Why?

If you get the following warning message, every time you save a file:

```
WARNING: The file has been changed since reading it!!!
Do you really want to write to it (y/n)?
```

then this problem could be related to a bug in MS-Windows on the day daylight saving time starts. Vim remembers the timestamp of the file after it was written. Just before the next write the timestamp is obtained again to check if the file was changed outside of Vim. This works correctly, except on the day daylight saving time starts.

This problem will go away the next day after the day the daylight saving

time starts.

For more information, read

	W11

==
faq-34

SECTION 34 - PRINTING

faq-34.1

34.1. How do I print a file along with line numbers for all the lines?

You can set the 'printoptions' option and use the ":hardcopy" command to
print your file:

```
:set printoptions=number:y
:hardcopy
```

For more information, read

	'printoptions'
	:hardcopy

faq-34.2

34.2. How do I print a file with the Vim syntax highlighting colors?

You can use the ":hardcopy" command to print a file with the Vim syntax
highlighting colors. You can also convert your file to a HTML file using
the 2html.vim script and print the HTML file.

For more information, read

	syntax-printing
	2html.vim
	:hardcopy
	printing

==
faq-35

SECTION 35 - BUILDING VIM FROM SOURCE

faq-35.1

35.1. How do I build Vim from the sources on a Unix system?

For a Unix system, follow these steps to build Vim from the sources:

- Download the source and run-time files archive (vim-##.tar.bz2) from the
  ftp://ftp.vim.org/pub/vim/unix directory.
- Extract the archive using the bzip2 and tar utilities using the command:

```
$ bunzip2 -c <filename> | tar -xf -
```

- Alternatively, download the source from the mercurial repository:

  http://code.google.com/p/vim/source/checkout
- Run the 'make' command to configure and build Vim with the default
  configuration.
- Run 'make install' command to install Vim in the default directory.

To enable/disable various Vim features, before running the 'make' command
you can run the 'configure' command with different flags to include/exclude
the various Vim features. To list all the available options for the
'configure' command, use:

    $ configure -help

For more information, read

     install

faq-35.2

35.2. How do I install Vim in my home directory or a directory other
      than the default installation directory in Unix?

To install Vim in a directory other than the default installation
directory, you have to specify the directory using the --prefix option
while running the configure script.

    $ ./configure --prefix=/users/xyz

You can enable/disable various Vim feature by supplying different arguments
to the configure script. For more information about all these options, run

    $ ./configure --help

For more information, read

     install-home
     install

faq-35.3

35.3. How do I build Vim from the sources on a MS-Windows system?

For a MS-Windows system, Vim can be built using either the Visual C++
compiler or the Borland C++ compiler or the Ming GCC compiler or the cygwin
gcc compiler. Follow these steps to build Vim from the sources for
MS-Windows:

    - Download the source (vim##src.zip), runtime (vim##rt.zip) and the
      extra (vim-##-extra.tar.gz) archives from the
      ftp://ftp.vim.org/pub/vim/pc directory.
    - Extract the archives into a directory (for example, c:\vimsrc)
    - Alternatively, download the source from the mercurial repository:
      http://code.google.com/p/vim/source/checkout
    - Depending on the installed compiler, you can use the corresponding
      makefile to build the Vim sources. For Visual C++ use the
      Make_mvc.mak makefile, for borland C++ use the Make_bc5.mak makefile,
      for ming GCC use the Make_ming.mak makefile, for cygwin gcc use the

Make_cyg.mak makefile.

Depending on whether you want to build the GUI version of Vim or the console version of Vim, you have to pass different arguments to the makefiles. After successfully building the sources, you can copy the vim.exe or gvim.exe file to the desired directory along with the files from the runtime archive.

For more information, read

install

faq-35.4

35.4. The Vim help, syntax, indent files are missing from my Vim installation. How do I install these files?

The Vim help, syntax, indent and other runtime files are part of the Vim runtime package. You need to download and install the Vim runtime package. For example, for MS-Windows, the name of the Vim 6.1 runtime package is vim61rt.zip.

For more information, read

install

faq-35.5

35.5. I have built Vim from the source and installed the Vim package using "make install". Do I need to keep the Vim source directory?

No. Once you have built and installed Vim in some directory other than the original source directory (for example, /usr/bin or /usr/local/bin), then you can remove the source directory.

faq-35.6

35.6. How do I determine the Vim features which are enabled at compile time?

You can use the ":version" command to determine the Vim features that are enabled at compile time. The features that are enabled will be prefixed with a "+". The features that are not enabled will be prefixed with a "-".

If you want to test for a feature in a script, you can use the has() function:

```
if has("menu")
    " Set up some menus
endif
```

For more information, read

:version
+feature-list
has()

faq-35.7

35.7. Can I build Vim without the GUI support?

Yes. You can build Vim by optionally enabling/disabling many of the features including GUI.

For more information, read

    install

faq-35.8

35.8. When building Vim on a Unix system, I am getting "undefined reference to term_set_winsize" error. How do I resolve this error?

You will get this error when the build process is not able to locate the termlib, termcap or ncurses library. You have to install the ncurses-dev package to resolve this error.

faq-35.9

35.9. Vim configure keeps complaining about the lack of gtk-config while trying to use GTK 2.03. This is correct, since in GTK 2 they moved to using the generic pkg-config. I can get pkg-config to list the various includes and libs for gtk, but for some reason the configure script still isn't picking this up.

Use the following shell script named gtk-config:

```
#!/bin/sh
pkg-config gtk+-2.0 $1 $2
```

faq-35.10

35.10. I did successfully download the sources and compiled Vim on Unix. But feature ... still does not work. What is wrong and how can I fix it?

You should first check, that you are actually running your self compiled Vim and not the system's provided version. So first check your $PATH setting.

Depending on your compile options, some features might not be included in your build of Vim. You can use the ":version" command to determine the Vim features that are enabled at compile time. The features that are enabled will be prefixed with a "+". The features that are not enabled will be prefixed with a "-".

The easiest way to include all features is to build the huge version. To do this, you have to specify the --with-features option while running the configure script:

```
$ ./configure --with-features=huge
```

Nevertheless, a feature could still be disabled at compile time, if the configure script can't find the required libraries for those features (e.g. for clipboard integration, your Vim needs to be linked against the X11

development libraries).

There are several ways to install the required libraries:

1) On a Debian based distribution, you can use the package manager "apt"
   to install all required dependencies. As superuser, run the command:

   $ apt-get build-dep vim-gtk

   This makes sure all required libraries needed to compile the vim-gtk
   package will be installed. (This requires, that your sources list
   contains deb-src entries. See your distribution manual on how to
   enable this, if the above command did not work.)

2) In openSUSE you can use the package manager "zypper" to install all
   required libraries. This requires, that there is a source version of
   the package installable from a configured repository (which by
   default is not the case). Use:

   $ zypper search -t srcpackage vim

   to find out, whether or not there exists a source version in the
   repository. If there is none, you'll need to add a source repository.
   For openSUSE 11.2 you could use, e.g.

   $ zypper ar
   http://download.opensuse.org/source/distribution/11.2/repo/oss/src-11.2

   (one line)

   Once you have a source version available in your repositories, use
   this command to install all needed requirements:

   $ zypper source-install --build-deps-only vim

3) On a Fedora/RedHat based system, you can use

   $ yum-builddep vim-enhanced

4) Run configure with your options and watch for missing libraries:

   $ ./configure --with-features=huge 2>&1 |tee logfile

   This will run configure and record the output into the file "logfile".
   You need to check the logfile for missing dependencies. Consider this
   output:

    checking --disable-gtktest argument... gtk test enabled
    checking for pkg-config... /usr/bin/pkg-config
    checking for GTK - version >= 2.2.0... no

    Here you can see, that the gtk libraries are missing and therefore
    no GTK gui version can't be build. So you need to install the GTK
    library in your system, with your package manager or by compiling it

yourself. Then run the configure script again and check, that it finds the library.

In theory, those provided dependencies by your distribution might still lack some libraries, that are needed for features, that simply are not enabled in your distribution and therefore those commands in 1-3 won't install it. At the very least, this provides a jumping point and you need to track down the required missing packages using method 4 from above. But usually, this works good enough for most people and you won't have to bother with the fourth method.

For more information, read

```
:version
+feature-list
```

==

faq-36

SECTION 36 - VARIOUS

faq-36.1

36.1. How do I edit binary files with Vim?

You can set the following options to edit binary files in Vim:

```
:set binary
:set display=uhex
```

You can also use the "-b" command-line option to edit a binary file:

```
$ vim -b <binary_file_name>
```

You can also use the xxd utility (part of the Vim distribution) to edit binary files.

For more information, read

```
23.4
edit-binary
hex-editing
-b
'binary'
'endofline'
'display'
```

faq-36.2

36.2. How do I disable the visual error flash and the error beep?

You can disable both the visual error flash and the error beep using the following command:

```
:set visualbell t_vb=
```

For more information, read

'visualbell'
'errorbells'
t_vb

faq-36.3

36.3. How do I display the ascii value of a character displayed in a buffer?

You can use the 'ga' command to display the ascii value of a displayed character.

For more information, read

ga
:ascii

faq-36.4

36.4. Can I use zero as a count for a Vim command?

You cannot use zero as a count for a Vim command, as "0" is a command on its own, moving to the first column of the line.

For more information, read

0
count

faq-36.5

36.5. How do I disable the Vim welcome screen?

You can disable the Vim welcome screen, by adding the 'I' flag to the 'shortmess' option:

```
:set shortmess+=I
```

For more information, read

:intro
'shortmess'

faq-36.6

36.6. How do I avoid the "hit enter to continue" prompt?

Vim will prompt you with the "hit enter to continue" prompt, if there are some messages on the screen for you to read and the screen is about to be redrawn. You can add the 'T' flag to the 'shortmess' option to truncate all messages. This will help in avoiding the hit-enter prompt:

```
:set shortmess+=T
```

You can also increase the command height by setting the 'cmdheight' option:

```
:set cmdheight=2
```

For more information, read

```
hit-enter
avoid-hit-enter
'shortmess'
'cmdheight'
```

faq-36.7

36.7. How do I invoke Vim from command line to run a group of commands on a group of files?

There are several ways to invoke Vim from command line to run a group of commands on a group of files. You can use a set of "-c" command line options to specify a group of commands:

```
$ vim -c "<ex_command_1>" -c "<ex_command_2>" *.txt
```

Each of the ex-command specified with the "-c" command line option is executed one by one sequentially. You can also use a single "-c" command line option and the "|" character to separate the ex commands:

```
$ vim -c "<ex_command_1> | <ex_command_2>" *.txt
```

In the above command, if an ex command fails, then all the remaining ex commands will not be executed.

For example, to replace "ABC" with "DEF" in a file from the command-line, you can use the following command:

```
$ vim -c "%s/ABC/DEF/ge | update" myfile.txt
```

To replace "ABC" with "DEF" in multiple files from the command-line, you can use the following command:

```
$ vim -c "argdo %s/ABC/DEF/ge | update" *.txt
```

You can store the group of commands into a file and use the "-s" command line option to run the commands on a set of files. For example, if the group of commands are stored in the file mycmds.txt, then you can use the following command:

```
$ vim -s mycmds.txt *.pl
```

For more information, read

```
-c
-s
```

faq-36.8

36.8. How do I use a normal mode command from insert mode without leaving the insert mode?

You can use a normal command from insert mode, without leaving the insert

mode, by first pressing the CTRL-O key and then follow that with a single
normal mode command.

To execute more than one normal mode command, press the CTRL-L key,
followed by any number of normal mode commands and then press <Esc> to get
back to the insert mode. (This only works, when the 'insertmode' option
is set).

For more information, read

     i_CTRL-O
     i_CTRL-L

faq-36.9

36.9. How do I start Vim in insert mode?

You can start Vim in insert mode using the ":startinsert" ex command.

    $ vim +startinsert myfile.txt

The above command will open the file "myfile.txt" and start insert mode
with the cursor in front of the first character on the first line. To open
the file and start appending after the last character on the last line,
you can use the following command:

    $ vim + +startinsert! myfile.txt

For more information, read

     :startinsert

faq-36.10

36.10. How do I use Copy and Paste with Vim?

You should first check the output of the ":version" command and make
sure that +xterm-clipboard is present.

When running Vim in an xterm, you can either let Vim control the mouse
or let xterm control the mouse. This is configured by the 'mouse' option.

If the 'mouse' option is not set (or set to the default value), then Vim will
not control the mouse. You cannot move the Vim text cursor using the
mouse. When you select some text using the mouse, xterm will copy
it to the X11 cut buffer. When you press both the mouse buttons,
xterm will paste the text from the cut buffer.

If the 'mouse' option is set to 'a' or some other value, then Vim controls
the mouse. The mode (normal or insert or visual, etc) in which Vim
controls the mouse is configured by the 'mouse' option. You can move
the Vim text cursor using the mouse. When you select some text,
the 'clipboard' option setting is used to determine whether to transfer
the selected text to the clipboard or not. The default setting is to
transfer the selected text to the clipboard. If you want to use the
xterm selection mechanism in this mode, then you can press the

<Shift> key. If you press <Shift> key when selecting text using the
mouse, then Vim doesn't control the mouse and xterm controls the
mouse.

In the GUI mode, Copy and Paste should just work, depending on the 'mouse'
setting. For more information, read

	'clipboard'
	x11-selection
	clipboard
	'go-a'
	'mouse'
	xterm-copy-paste
	09.3

faq-36.11

36.11. Why shouldn't I modify the files in the system runtime directory?

Just be careful about modifying files under $VIMRUNTIME, which usually
is /usr/share/vim/vimXX (Unix) or C:\Program Files\vim\vimXX
(Windows) and XX being the version for which it applies, e.g. 73 for Vim
7.3.

One should generally avoid modifying those files because they may be
replaced during an upgrade of your Vim installation and your changes
will be lost. Also, if you upgrade to a new major or minor revision of
Vim (e.g., from 7.3 to 7.4), the new version of Vim will use a different
$VIMRUNTIME directory and while your changes won't be lost, they will be
ignored.

Consequently, take a look at

	filetypes

for an explanation of several ways to modify Vim's response to
different filetypes and where to put those modifications so that
they will not be overwritten.

==

faq-37

SECTION 37 - UNICODE
Author: Tony Mechelynck <antoine.mechelynck AT belgacom.net>

faq-37.1

37.1. Is it possible to create Unicode files using Vim?

Yes. It may be more or less complicated depending on the keyboard and fonts
available to you, but it is always possible to encode any possible Unicode
codepoint (and some illegal ones) into a file. To create a Unicode file
using Vim, you should have compiled Vim with the "+multi_byte" compile-time
option. You can get more information about Unicode from the following
sites:

	http://www.unicode.org

http://www.cl.cam.ac.uk/~mgk25/unicode.html

For more information, read

multibyte
usr_45.txt

faq-37.2

37.2. Which Vim settings are particularly important for editing Unicode files?

The most important are the various "encoding" options, i.e., 'encoding', 'fileencoding', 'fileencodings' and 'termencoding'. The boolean option 'bomb' is also significant.

For more information, read

'encoding'
'fileencoding'
'fileencodings'
'termencoding'
'bomb'

faq-37.3

37.3. What is the 'encoding' option?

Basically, the 'encoding' option defines how Vim will represent your data internally. However, all Unicode encodings are represented internally as utf-8 and converted (if necessary) when reading and writing.

For more information, read

'encoding'

faq-37.4

37.4. How does Vim name the various Unicode encodings?

Utf-8 is called utf-8 or utf8; utf-16 is called ucs-2 or ucs2; utf-32 is called ucs-4 or ucs4. Also, you may specify endianness (except for utf-8 which does not vary for endianness) by appending le for little-endian or be for big-endian. If you create a file with an encoding of ucs-2 or ucs-4 without specifying endianness, Vim will use what is typical of your machine.

For more information, read

encoding-names
encoding-values
encoding-table

faq-37.5

37.5. How does Vim specify the presence or absence of a byte-order mark?

When reading a file, if the 'fileencodings' option includes "ucs-bom", Vim

will check for a byte-order mark. When writing a file, if the 'bomb' option is set, Vim will write a byte-order mark on files whose encoding warrants it.

For more information, read

    'fileencodings'
    'bomb'

faq-37.6

37.6. What is the 'fileencoding' option?

The 'fileencoding' option defines the particular encoding which Vim will use to write a file. If empty, then the value of the 'encoding' option is the default.

For more information, read

    'fileencoding'

faq-37.7

37.7. What is the 'fileencodings' option?

The 'fileencodings' option defines the heuristics used by Vim when opening an existing file. It is a comma separated list of encodings. A special name, "ucs-bom" is used to indicate that Vim should check for the presence of a byte-order mark; however, it will not be recognised if it comes after "utf-8". Normally, "ucs-bom" (if present) should be first in the list.

When Vim opens a file, it checks it against the encodings listed in 'fileencodings'. The first one that matches is used. If there is no match, then Vim sets 'fileencoding' to the null string, i.e., the value of 'encoding' will be used.

For more information, read

    'fileencodings'
    'encoding'

faq-37.8

37.8. What is the 'termencoding' option?

The 'termencoding' option defines how your keyboard encodes the data you type. If empty, Vim assumes that it has the same value as 'encoding'. Usually it should be set to something that matches your locale.

For more information, read

    'termencoding'
    locale

faq-37.9

37.9. What is the 'bomb' option?

When reading a file with "ucs-bom" present in the 'fileencodings' option, Vim will set the 'bomb' option on or off depending on the presence or absence of a byte-order mark at the start of the file. When writing, Vim will write a byte-order mark if the 'bomb' option is set. You may set or unset it manually do make Vim write, or not write, the b.o.m.

For more information, read

    'bomb'

faq-37.10

37.10. Where can I find an example of a typical use of all these options?

There is a "tip", with explains them in different words with an example, at

http://vim.wikia.com/wiki/VimTip246

faq-37.11

37.11. How can I insert Unicode characters into a file using Vim?

Several methods are available:

- Characters present on your keyboard can be typed in the usual way, even those which require a "dead-key" prefix, like (for instance) the circumflex on French keyboards.
- Characters for which a digraph is defined can be typed as two characters prefixed by <Ctrl-K>.
- If you have set the 'digraph' option, you can enter the characters for which a digraph is defined as <char1><BS><char2>.
- Any character can be entered by using a <Ctrl-V> prefix (or <Ctrl-Q> if <Ctrl-V> is remapped to paste from the clipboard).

For more information, read

    digraphs
    'digraph'
    i_CTRL-V_digit

faq-37.12

37.12. How can I know which digraphs are defined and for which characters?

First set the 'encoding' option properly (for instance, to utf-8), then use the :digraphs command to list the currently defined digraphs.

Alternatively, the help file contains the complete set of all digraphs. So you can easily search that list there.

For more information, read

    :digraphs
    'encoding'
    digraph-table
