Command-line completion.                                cmdline-completion
        While entering a command-line (on the bottom line of the screen)
        <Tab> can be typed to complete
           what         example
        - command       :e<Tab>
        - tag           :ta scr<Tab>
        - option        :set sc<Tab>
        - option value  :set hf=<Tab>
        - file name     :e ve<Tab>
        - etc.

        If there are multiple matches, CTRL-N (next) and CTRL-P (previous)
        will walk through the matches.  <Tab> works like CTRL-N, but wraps
        around to the first match.

        The 'wildchar' option can be set to the character for command-line
        completion, <Tab> is the default.  CTRL-D can be typed after an
        (incomplete) wildcard; all matches will be listed.  CTRL-A will insert
        all matches.  CTRL-L will insert the longest common part of the
        matches.

Insert-mode completion.                                 ins-completion
        In Insert mode the CTRL-N and CTRL-P keys can be used to complete a
        word that appears elsewhere.     i_CTRL-N
        With CTRL-X another mode is entered, through which completion can be
        done for:
         i_CTRL-X_CTRL-F        file names
         i_CTRL-X_CTRL-K        words from 'dictionary' files
         i_CTRL-X_CTRL-T        words from 'thesaurus' files
         i_CTRL-X_CTRL-I        words from included files
         i_CTRL-X_CTRL-L        whole lines
         i_CTRL-X_CTRL-]        words from the tags file
         i_CTRL-X_CTRL-D        definitions or macros
         i_CTRL-X_CTRL-O        Omni completion: clever completion
```

specifically for a file type
etc.

Long line support. 'wrap' 'linebreak'
If the 'wrap' option is off, long lines will not wrap and only part of them will be shown. When the cursor is moved to a part that is not shown, the screen will scroll horizontally. The minimum number of columns to scroll can be set with the 'sidescroll' option. The zh and zl commands can be used to scroll sideways.
Alternatively, long lines are broken in between words when the 'linebreak' option is set. This allows editing a single-line paragraph conveniently (e.g. when the text is later read into a DTP program). Move the cursor up/down with the gk and gj commands.

Text formatting. formatting
The 'textwidth' option can be used to automatically limit the line length. This supplements the 'wrapmargin' option of Vi, which was not very useful. The gq operator can be used to format a piece of text (for example, gqap formats the current paragraph). Commands for text alignment: :center , :left and :right .

Extended search patterns. pattern
There are many extra items to match various text items. Examples:
A "\n" can be used in a search pattern to match a line break.
"x\{2,4}" matches "x" 2 to 4 times.
"\s" matches a white space character.

Directory, remote and archive browsing. netrw
Vim can browse the file system. Simply edit a directory. Move around in the list with the usual commands and press <Enter> to go to the directory or file under the cursor.
This also works for remote files over ftp, http, ssh, etc.
Zip and tar archives can also be browsed. tar zip

Edit-compile-edit speedup. quickfix
The :make command can be used to run the compilation and jump to the first error. A file with compiler error messages is interpreted. Vim jumps to the first error.

Each line in the error file is scanned for the name of a file, line number and error message. The 'errorformat' option can be set to a list of scanf-like strings to handle output from many compilers.

The :cn command can be used to jump to the next error.
:cl lists all the error messages. Other commands are available.
The 'makeef' option has the name of the file with error messages.
The 'makeprg' option contains the name of the program to be executed with the :make command.
The 'shellpipe' option contains the string to be used to put the output of the compiler into the errorfile.

Finding matches in files. :vimgrep
Vim can search for a pattern in multiple files. This uses the advanced Vim regexp pattern, works on all systems and also works to

search in compressed files.

Improved indenting for programs. 'cindent'
When the 'cindent' option is on the indent of each line is automatically adjusted. C syntax is mostly recognized. The indent for various styles can be set with 'cinoptions'. The keys to trigger indenting can be set with 'cinkeys'.

Comments can be automatically formatted. The 'comments' option can be set to the characters that start and end a comment. This works best for C code, but also works for e-mail (">" at start of the line) and other types of text. The = operator can be used to re-indent lines.

For many other languages an indent plugin is present to support automatic indenting. 30.3

Searching for words in included files. include-search
The [i command can be used to search for a match of the word under the cursor in the current and included files. The 'include' option can be set to a pattern that describes a command to include a file (the default is for C programs).
The [I command lists all matches, the [_CTRL-I command jumps to a match.
The [d , [D and [_CTRL-D commands do the same, but only for lines where the pattern given with the 'define' option matches.

Automatic commands. autocommand
Commands can be automatically executed when reading a file, writing a file, jumping to another buffer, etc., depending on the file name. This is useful to set options and mappings for C programs, documentation, plain text, e-mail, etc. This also makes it possible to edit compressed files.

Scripts and Expressions. expression
Commands have been added to form up a powerful script language.
:if Conditional execution, which can be used for example to set options depending on the value of $TERM.
:while Repeat a number of commands.
:for Loop over a list.
:echo Print the result of an expression.
:let Assign a value to an internal variable, option, etc. Variable types are Number, String, List and Dictionary.
:execute Execute a command formed by an expression.
:try Catch exceptions.
etc., etc. See eval .
Debugging and profiling are supported. debug-scripts profile
If this is not enough, an interface is provided to Python , Ruby , Tcl , Lua , Perl and MzScheme .

Viminfo. viminfo-file
The command-line history, marks and registers can be stored in a file that is read on startup. This can be used to repeat a search command or command-line command after exiting and restarting Vim. It is also

possible to jump right back to where the last edit stopped with '0 .
The 'viminfo' option can be set to select which items to store in the
.viminfo file. This is off by default.

Printing. printing
The :hardcopy command sends text to the printer. This can include
syntax highlighting.

Mouse support. mouse-using
The mouse is supported in the GUI version, in an xterm for Unix, for
BSDs with sysmouse, for Linux with gpm, for MS-DOS, and Win32. It
can be used to position the cursor, select the visual area, paste a
register, etc.

Usage of key names. <> key-notation
Special keys now all have a name like <Up>, <End>, etc.
This name can be used in mappings, to make it easy to edit them.

Editing binary files. edit-binary
Vim can edit binary files. You can change a few characters in an
executable file, without corrupting it. Vim doesn't remove NUL
characters (they are represented as <NL> internally).
-b command-line argument to start editing a binary file
'binary' Option set by -b . Prevents adding an <EOL> for the
last line in the file.

Multi-language support. multi-lang
Files in double-byte or multi-byte encodings can be edited. There is
UTF-8 support to be able to edit various languages at the same time,
without switching fonts. UTF-8
Messages and menus are available in different languages.

Move cursor beyond lines.
When the 'virtualedit' option is set the cursor can move all over the
screen, also where there is no text. This is useful to edit tables
and figures easily.

==
5. Other vim features other-features

A random collection of nice extra features.

When Vim is started with "-s scriptfile", the characters read from
"scriptfile" are treated as if you typed them. If end of file is reached
before the editor exits, further characters are read from the console.

The "-w" option can be used to record all typed characters in a script file.
This file can then be used to redo the editing, possibly on another file or
after changing some commands in the script file.

The "-o" option opens a window for each argument. "-o4" opens four windows.

Vi requires several termcap entries to be able to work full-screen. Vim only

requires the "cm" entry (cursor motion).

In command mode:

When the 'showcmd' option is set, the command characters are shown in the last
line of the screen. They are removed when the command is finished.

If the 'ruler' option is set, the current cursor position is shown in the
last line of the screen.

"U" still works after having moved off the last changed line and after "u".

Characters with the 8th bit set are displayed. The characters between '~' and
0xa0 are displayed as "~?", "~@", "~A", etc., unless they are included in the
'isprint' option.

"][" goes to the next ending of a C function ('}' in column 1).
"[]" goes to the previous ending of a C function ('}' in column 1).

"]f", "[f" and "gf" start editing the file whose name is under the cursor.
CTRL-W f splits the window and starts editing the file whose name is under
the cursor.

"*" searches forward for the identifier under the cursor, "#" backward.
"K" runs the program defined by the 'keywordprg' option, with the identifier
under the cursor as argument.

"%" can be preceded with a count. The cursor jumps to the line that
percentage down in the file. The normal "%" function to jump to the matching
brace skips braces inside quotes.

With the CTRL-] command, the cursor may be in the middle of the identifier.

The used tags are remembered. Commands that can be used with the tag stack
are CTRL-T, ":pop" and ":tag". ":tags" lists the tag stack.

The 'tags' option can be set to a list of tag file names. Thus multiple
tag files can be used. For file names that start with "./", the "./" is
replaced with the path of the current file. This makes it possible to use a
tags file in the same directory as the file being edited.

Previously used file names are remembered in the alternate file name list.
CTRL-^ accepts a count, which is an index in this list.
":files" command shows the list of alternate file names.
"#<N>" is replaced with the <N>th alternate file name in the list.
"#<" is replaced with the current file name without extension.

Search patterns have more features. The <NL> character is seen as part of the
search pattern and the substitute string of ":s". Vi sees it as the end of
the command.

Searches can put the cursor on the end of a match and may include a character
offset.

Count added to "~", ":next", ":Next", "n" and "N".

The command ":next!" with 'autowrite' set does not write the file. In vi the file was written, but this is considered to be a bug, because one does not expect it and the file is not written with ":rewind!".

In Vi when entering a <CR> in replace mode deletes a character only when 'ai' is set (but does not show it until you hit <Esc>). Vim always deletes a character (and shows it immediately).

Added :wnext command. Same as ":write" followed by ":next".

The ":w!" command always writes, also when the file is write protected. In Vi you would have to do ":!chmod +w %:S" and ":set noro".

When 'tildeop' has been set, "~" is an operator (must be followed by a movement command).

With the "J" (join) command you can reset the 'joinspaces' option to have only one space after a period (Vi inserts two spaces).

"cw" can be used to change white space formed by several characters (Vi is confusing: "cw" only changes one space, while "dw" deletes all white space).

"o" and "O" accept a count for repeating the insert (Vi clears a part of display).

Flags after Ex commands not supported (no plans to include it).

On non-UNIX systems ":cd" command shows current directory instead of going to the home directory (there isn't one). ":pwd" prints the current directory on all systems.

After a ":cd" command the file names (in the argument list, opened files) still point to the same files. In Vi ":cd" is not allowed in a changed file; otherwise the meaning of file names change.

":source!" command reads Vi commands from a file.

":mkexrc" command writes current modified options and mappings to a ".exrc" file. ":mkvimrc" writes to a ".vimrc" file.

No check for "tail recursion" with mappings. This allows things like ":map! foo ^]foo".

When a mapping starts with number, vi loses the count typed before it (e.g. when using the mapping ":map g 4G" the command "7g" goes to line 4). This is considered a vi bug. Vim concatenates the counts (in the example it becomes "74G"), as most people would expect.

The :put! command inserts the contents of a register above the current line.

The "p" and "P" commands of vi cannot be repeated with "." when the putted

text is less than a line. In Vim they can always be repeated.

":noremap" command can be used to enter a mapping that will not be remapped.
This is useful to exchange the meaning of two keys. ":cmap", ":cunmap" and
":cnoremap" can be used for mapping in command-line editing only. ":imap",
":iunmap" and ":inoremap" can be used for mapping in insert mode only.
Similar commands exist for abbreviations: ":noreabbrev", ":iabbrev"
":cabbrev", ":iunabbrev", ":cunabbrev", ":inoreabbrev", ":cnoreabbrev".

In Vi the command ":map foo bar" would remove a previous mapping
":map bug foo". This is considered a bug, so it is not included in Vim.
":unmap! foo" does remove ":map! bug foo", because unmapping would be very
difficult otherwise (this is vi compatible).

The ':' register contains the last command-line.
The '%' register contains the current file name.
The '.' register contains the last inserted text.

":dis" command shows the contents of the yank registers.

CTRL-O/CTRL-I can be used to jump to older/newer positions. These are the
same positions as used with the '' command, but may be in another file. The
":jumps" command lists the older positions.

If the 'shiftround' option is set, an indent is rounded to a multiple of
'shiftwidth' with ">" and "<" commands.

The 'scrolljump' option can be set to the minimum number of lines to scroll
when the cursor gets off the screen. Use this when scrolling is slow.

The 'scrolloff' option can be set to the minimum number of lines to keep
above and below the cursor. This gives some context to where you are
editing. When set to a large number the cursor line is always in the middle
of the window.

Uppercase marks can be used to jump between files. The ":marks" command lists
all currently set marks. The commands "']" and "`]" jump to the end of the
previous operator or end of the text inserted with the put command. "'[" and
"`[" do jump to the start.

The 'shelltype' option can be set to reflect the type of shell used on the
Amiga.

The 'highlight' option can be set for the highlight mode to be used for
several commands.

The CTRL-A (add) and CTRL-X (subtract) commands are new. The count to the
command (default 1) is added to/subtracted from the number at or after the
cursor. That number may be decimal, octal (starts with a '0') or hexadecimal
(starts with '0x'). Very useful in macros.

With the :set command the prefix "inv" can be used to invert boolean options.

In both Vi and Vim you can create a line break with the ":substitute" command

by using a CTRL-M. For Vi this means you cannot insert a real CTRL-M in the text. With Vim you can put a real CTRL-M in the text by preceding it with a CTRL-V.

In Insert mode:

If the 'revins' option is set, insert happens backwards. This is for typing Hebrew. When inserting normal characters the cursor will not be shifted and the text moves rightwards. Backspace, CTRL-W and CTRL-U will also work in the opposite direction. CTRL-B toggles the 'revins' option. In replace mode 'revins' has no effect. Only when enabled at compile time.

The backspace key can be used just like CTRL-D to remove auto-indents.

You can backspace, CTRL-U and CTRL-W over line breaks if the 'backspace' (bs) option includes "eol". You can backspace over the start of insert if the 'backspace' option includes "start".

When the 'paste' option is set, a few options are reset and mapping in insert mode and abbreviation are disabled. This allows for pasting text in windowing systems without unexpected results. When the 'paste' option is reset, the old option values are restored.

CTRL-T/CTRL-D always insert/delete an indent in the current line, no matter what column the cursor is in.

CTRL-@ (insert previously inserted text) works always (Vi: only when typed as first character).

CTRL-A works like CTRL-@ but does not leave insert mode.

CTRL-R {0-9a-z..} can be used to insert the contents of a register.

When the 'smartindent' option is set, C programs will be better auto-indented. With 'cindent' even more.

CTRL-Y and CTRL-E can be used to copy a character from above/below the current cursor position.

After CTRL-V you can enter a three digit decimal number. This byte value is inserted in the text as a single character. Useful for international characters that are not on your keyboard.

When the 'expandtab' (et) option is set, a <Tab> is expanded to the appropriate number of spaces.

The window always reflects the contents of the buffer (Vi does not do this when changing text and in some other cases).

If Vim is compiled with DIGRAPHS defined, digraphs are supported. A set of normal digraphs is included. They are shown with the ":digraph" command. More can be added with ":digraph {char1}{char2} {number}". A digraph is entered with "CTRL-K {char1} {char2}" or "{char1} BS {char2}" (only when

'digraph' option is set).

When repeating an insert, e.g. "10atest <Esc>" vi would only handle wrapmargin for the first insert. Vim does it for all.

A count to the "i" or "a" command is used for all the text. Vi uses the count only for one line. "3iabc<NL>def<Esc>" would insert "abcabcabc<NL>def" in Vi but "abc<NL>defabc<NL>defabc<NL>def" in Vim.

In Command-line mode:

<Esc> terminates the command-line without executing it. In vi the command line would be executed, which is not what most people expect (hitting <Esc> should always get you back to command mode). To avoid problems with some obscure macros, an <Esc> in a macro will execute the command. If you want a typed <Esc> to execute the command like vi does you can fix this with
	":cmap ^V<Esc> ^V<CR>"

General:

The 'ttimeout' option is like 'timeout', but only works for cursor and function keys, not for ordinary mapped characters. The 'timeoutlen' option gives the number of milliseconds that is waited for. If the 'esckeys' option is not set, cursor and function keys that start with <Esc> are not recognized in insert mode.

There is an option for each terminal string. Can be used when termcap is not supported or to change individual strings.

The 'fileformat' option can be set to select the <EOL>: "dos" <CR><NL>, "unix" <NL> or "mac" <CR>.
When the 'fileformats' option is not empty, Vim tries to detect the type of <EOL> automatically. The 'fileformat' option is set accordingly.

On systems that have no job control (older Unix systems and non-Unix systems) the CTRL-Z, ":stop" or ":suspend" command starts a new shell.

If Vim is started on the Amiga without an interactive window for output, a window is opened (and :sh still works). You can give a device to use for editing with the -d argument, e.g. "-d con:20/20/600/150".

The 'columns' and 'lines' options are used to set or get the width and height of the display.

Option settings are read from the first and last few lines of the file. Option 'modelines' determines how many lines are tried (default is 5). Note that this is different from the Vi versions that can execute any Ex command in a modeline (a major security problem). trojan-horse

If the 'insertmode' option is set (e.g. in .exrc), Vim starts in insert mode. And it comes back there, when pressing <Esc>.

Undo information is kept in memory. Available memory limits the number and

size of change that can be undone. This may be a problem with MS-DOS, is hardly a problem on the Amiga and almost never with Unix and Win32.

If the 'backup' or 'writebackup' option is set: Before a file is overwritten, a backup file (.bak) is made. If the "backup" option is set it is left behind.

Vim creates a file ending in ".swp" to store parts of the file that have been changed or that do not fit in memory. This file can be used to recover from an aborted editing session with "vim -r file". Using the swap file can be switched off by setting the 'updatecount' option to 0 or starting Vim with the "-n" option. Use the 'directory' option for placing the .swp file somewhere else.

Vim is able to work correctly on filesystems with 8.3 file names, also when using messydos or crossdos filesystems on the Amiga, or any 8.3 mounted filesystem under Unix. See 'shortname' .

Error messages are shown at least one second (Vi overwrites error messages).

If Vim gives the hit-enter prompt, you can hit any key. Characters other than <CR>, <NL> and <Space> are interpreted as the (start of) a command. (Vi only accepts a command starting with ':').

The contents of the numbered and unnamed registers is remembered when changing files.

The "No lines in buffer" message is a normal message instead of an error message, since that may cause a mapping to be aborted.

The AUX: device of the Amiga is supported.

==
6. Command-line arguments cmdline-arguments

Different versions of Vi have different command-line arguments. This can be confusing. To help you, this section gives an overview of the differences.

Five variants of Vi will be considered here:

Elvis	Elvis version 2.1b
Nvi	Nvi version 1.79
Posix	Posix 1003.2
Vi	Vi version 3.7 (for Sun 4.1.x)
Vile	Vile version 7.4 (incomplete)
Vim	Vim version 5.2

Only Vim is able to accept options in between and after the file names.

+{command}	Elvis, Nvi, Posix, Vi, Vim: Same as "-c {command}".
-	Nvi, Posix, Vi: Run Ex in batch mode. Vim: Read file from stdin (use -s for batch mode).
--	Vim: End of options, only file names are following.

```
--cmd {command} Vim: execute {command} before sourcing vimrc files.

--echo-wid      Vim: GTK+ echoes the Window ID on stdout

--help          Vim: show help message and exit.

--literal       Vim: take file names literally, don't expand wildcards.

--nofork        Vim: same as  -f

--noplugin[s]   Vim: Skip loading plugins.

--remote        Vim: edit the files in another Vim server

--remote-expr {expr}    Vim: evaluate {expr} in another Vim server

--remote-send {keys}    Vim: send {keys} to a Vim server and exit

--remote-silent {file}  Vim: edit the files in another Vim server if possible

--remote-wait   Vim: edit the files in another Vim server and wait for it

--remote-wait-silent    Vim: like --remote-wait, no complaints if not possible

--role {role}   Vim: GTK+ 2: set role of main window

--serverlist    Vim: Output a list of Vim servers and exit

--servername {name}     Vim: Specify Vim server name

--socketid {id}         Vim: GTK window socket to run Vim in

--windowid {id}         Vim: Win32 window ID to run Vim in

--version       Vim: show version message and exit.

-?              Vile: print usage summary and exit.

-a              Elvis: Load all specified file names into a window (use -o for
                Vim).

-A              Vim: Start in Arabic mode (when compiled with Arabic).

-b {blksize}    Elvis: Use {blksize} blocksize for the session file.
-b              Vim: set 'binary' mode.

-C              Vim: Compatible mode.

-c {command}    Elvis, Nvi, Posix, Vim: run {command} as an Ex command after
                loading the edit buffer.
                Vim: allow up to 10 "-c" arguments

-d {device}     Vim: Use {device} for I/O (Amiga only). {only when compiled
```

```
                without the  +diff  feature}
-d              Vim: start with 'diff' set.  vimdiff

-dev {device}   Vim: Use {device} for I/O (Amiga only).

-D              Vim: debug mode.

-e              Elvis, Nvi, Vim: Start in Ex mode, as if the executable is
                called "ex".

-E              Vim: Start in improved Ex mode  gQ , like "exim".

-f              Vim: Run GUI in foreground (Amiga: don't open new window).
-f {session}    Elvis: Use {session} as the session file.

-F              Vim: Start in Farsi mode (when compiled with Farsi).
                Nvi: Fast start, don't read the entire file when editing
                starts.

-G {gui}        Elvis: Use the {gui} as user interface.

-g              Vim: Start GUI.
-g N            Vile: start editing at line N

-h              Vim: Give help message.
                Vile: edit the help file

-H              Vim: start Hebrew mode (when compiled with it).

-i              Elvis: Start each window in Insert mode.
-i {viminfo}    Vim: Use {viminfo} for viminfo file.

-L              Vim: Same as "-r" (also in some versions of Vi).

-l              Nvi, Vi, Vim: Set 'lisp' and 'showmatch' options.

-m              Vim: Modifications not allowed to be written, resets 'write'
                option.

-M              Vim: Modifications not allowed, resets 'modifiable' and the
                'write' option.

-N              Vim: No-compatible mode.

-n              Vim: No swap file used.

-nb[args]       Vim: open a NetBeans interface connection

-O[N]           Vim: Like -o, but use vertically split windows.

-o[N]           Vim: Open [N] windows, or one for each file.

-p[N]           Vim: Open [N] tab pages, or one for each file.
```

```
-P {parent-title} Win32 Vim: open Vim inside a parent application window

-q {name}        Vim: Use {name} for quickfix error file.
-q{name}         Vim: Idem.

-R               Elvis, Nvi, Posix, Vile, Vim: Set the 'readonly' option.

-r               Elvis, Nvi, Posix, Vi, Vim: Recovery mode.

-S               Nvi: Set 'secure' option.
-S {script}      Vim: source script after starting up.

-s               Nvi, Posix, Vim: Same as "-" (silent mode), when in Ex mode.
                 Elvis: Sets the 'safer' option.
-s {scriptin}    Vim: Read from script file {scriptin}; only when not in Ex
                 mode.
-s {pattern}     Vile: search for {pattern}

-t {tag}         Elvis, Nvi, Posix, Vi, Vim: Edit the file containing {tag}.
-t{tag}          Vim: Idem.

-T {term}        Vim: Set terminal name to {term}.

-u {vimrc}       Vim: Read initializations from {vimrc} file.

-U {gvimrc}      Vim: Read GUI initializations from {gvimrc} file.

-v               Nvi, Posix, Vi, Vim: Begin in Normal mode (visual mode, in Vi
                 terms).
                 Vile: View mode, no changes possible.

-V               Elvis, Vim: Verbose mode.
-V{nr}           Vim: Verbose mode with specified level.

-w {size}        Elvis, Posix, Nvi, Vi, Vim: Set value of 'window' to {size}.
-w{size}         Nvi, Vi: Same as "-w {size}".
-w {name}        Vim: Write to script file {name} (must start with non-digit).

-W {name}        Vim: Append to script file {name}.

-x               Vi, Vim: Ask for encryption key.  See  encryption .

-X               Vim: Don't connect to the X server.

-y               Vim: Start in easy mode, like  evim .

-Z               Vim: restricted mode

@{cmdfile}       Vile: use {cmdfile} as startup file.

==============================================================================
7. POSIX compliance                                    posix   posix-compliance

In 2005 the POSIX test suite was run to check the compatibility of Vim.  Most
```

of the test was executed properly. There are the few things where Vim
is not POSIX compliant, even when run in Vi compatibility mode.
                                                        $VIM_POSIX
Set the $VIM_POSIX environment variable to have 'cpoptions' include the POSIX
flags when Vim starts up. This makes Vim run as POSIX as it can. That's
a bit different from being Vi compatible.

This is where Vim does not behave as POSIX specifies and why:

                                                        posix-screen-size
        The $COLUMNS and $LINES environment variables are ignored by Vim if
        the size can be obtained from the terminal in a more reliable way.
        Add the '|' flag to 'cpoptions' to have $COLUMNS and $LINES overrule
        sizes obtained in another way.

        The "{" and "}" commands don't stop at a "{" in the original Vi, but
        POSIX specifies it does. Add the '{' flag to 'cpoptions' if you want
        it the POSIX way.

        The "D", "o" and "O" commands accept a count. Also when repeated.
        Add the '#' flag to 'cpoptions' if you want to ignore the count.

        The ":cd" command fails if the current buffer is modified when the '.'
        flag is present in 'cpoptions'.

        There is no ATTENTION message, the "A" flag is added to 'shortmess'.

These are remarks about running the POSIX test suite:
- vi test 33 sometimes fails for unknown reasons
- vi test 250 fails; behavior will be changed in a new revision
    http://www.opengroup.org/austin/mailarchives/ag-review/msg01710.html
    (link no longer works, perhaps it's now:
    https://www.opengroup.org/sophocles/show_mail.tpl?CALLER=show_archive.tpl&source=L&list
- vi test 310 fails; exit code non-zero when any error occurred?
- ex test 24 fails because test is wrong. Changed between SUSv2 and SUSv3.
- ex tests 47, 48, 49, 72, 73 fail because .exrc file isn't read in silent
  mode and $EXINIT isn't used.
- ex tests 76, 78 fail because echo is used instead of printf. (fixed)
    Also: problem with \s not changed to space.
- ex test 355 fails because 'window' isn't used for "30z".
- ex test 368 fails because shell command isn't echoed in silent mode.
- ex test 394 fails because "=" command output isn't visible in silent mode.
- ex test 411 fails because test file is wrong, contains stray ':'.
- ex test 475 and 476 fail because reprint output isn't visible in silent mode.
- ex test 480 and 481 fail because the tags file has spaces instead of a tab.
- ex test 502 fails because .exrc isn't read in silent mode.
- ex test 509 fails because .exrc isn't read in silent mode. and exit code is
  1 instead of 2.
- ex test 534 fails because .exrc isn't read in silent mode.

 vim:tw=78:ts=8:ft=help:norl:

version4.txt For Vim version 8.1. Last change: 2006 Apr 24

VIM REFERENCE MANUAL by Bram Moolenaar

This document lists the incompatible differences between Vim 3.0 and Vim 4.0.
Although 4.0 is mentioned here, this is also for version 4.1, 4.2, etc..

This file is important for everybody upgrading from Vim 3.0. Read it
carefully to avoid unexpected problems.

'backup' option default changed backup-changed

The default value for 'backup' used to be on. This resulted in a backup file
being made when the original file was overwritten.

Now the default for 'backup' is off. As soon as the writing of the file has
successfully finished, the backup file is deleted. If you want to keep the
backup file, set 'backup' on in your vimrc. The reason for this change is
that many people complained that leaving a backup file behind is not
Vi-compatible. 'backup'

Extension for backup file changed backup-extension

The extension for the backup file used to be ".bak". Since other programs
also use this extension and some users make copies with this extension, it was
changed to the less obvious "~". Another advantage is that this takes less
space, which is useful when working on a system with short file names. For
example, on MS-DOS the backup files for "longfile.c" and "longfile.h" would
both become "longfile.bak"; now they will be "longfile.c~" and "longfile.h~".

If you prefer to use ".bak", you can set the 'backupext' option:

```
        :set bex=.bak
```

Structure of swap file changed   swapfile-changed

The contents of the swap file were extended with several parameters. Vim
stores the user name and other information about the edited file to make
recovery more easy and to be able to know where the swap file comes from. The
first part of the swap file can now be understood on a machine with a
different byte order or sizeof(int). When you try to recover a file on such a
machine, you will get an error message that this is not possible.

Because of this change, swap files cannot be exchanged between 3.0 and 4.0.
If you have a swap file from a crashed session with 3.0, use Vim 3.0 to
recover the file---don't use 4.0.   swap-file

"-w scriptout" argument changed   scriptout-changed

"vim -w scriptout" used to append to the scriptout file. Since this was
illogical, it now creates a new file. An existing file is not overwritten
(to avoid destroying an existing file for those who rely on the appending).
[This was removed again later]   -w

Backspace and Delete keys   backspace-delete

In 3.0 both the delete key and the backspace key worked as a backspace in
insert mode; they deleted the character to the left of the cursor. In 4.0 the
delete key has a new function: it deletes the character under the cursor, just
like it does on the command-line. If the cursor is after the end of the line
and 'bs' is set, two lines are joined.   <Del>   i_<Del>

In 3.0 the backspace key was always defined as CTRL-H and delete as CTRL-?.
In 4.0 the code for the backspace and delete key is obtained from termcap or
termlib, and adjusted for the "stty erase" value on Unix. This helps people
who define the erase character according to the keyboard they are working on.
                                                          <BS>   i_<BS>

If you prefer backspace and delete in Insert mode to have the old behavior,
put this line in your vimrc:

```
        inoremap ^? ^H
```

And you may also want to add these, to fix the values for <BS> and <Del>:

```
        set t_kb=^H
        set t_kD=^?
```

(Enter ^H with CTRL-V CTRL-H and ^? with CTRL-V CTRL-? or <Del>.)

If the value for t_kb is correct, but the t_kD value is not, use the ":fixdel" command. It will set t_kD according to the value of t_kb. This is useful if you are using several different terminals. :fixdel

When ^H is not recognized as <BS> or <Del>, it is used like a backspace.

Escape for | changed escape-bar

When the 'b' flag is present in 'cpoptions', the backslash cannot be used to escape '|' in mapping and abbreviate commands, only CTRL-V can. This is Vi-compatible. If you work in Vi-compatible mode and had used "\|" to include a bar in a mapping, this needs to be replaced by "^V|". See :bar .

Key codes changed key-codes-changed

The internal representation of key codes has changed dramatically. In 3.0 a one-byte code was used to represent a key. This caused problems with different characters sets that also used these codes. In 4.0 a three-byte code is used that cannot be confused with a character. key-notation

If you have used the single-byte key codes in your vimrc for mappings, you will have to replace them with the 4.0 codes. Instead of using the three-byte code directly, you should use the symbolic representation for this in <>. See the table below. The table also lists the old name, as it was used in the 3.0 documentation.

The key names in <> can be used in mappings directly. This makes it possible to copy/paste examples or type them literally. The <> notation has been introduced for this <> . The 'B' and '<' flags must not be present in 'cpoptions' to enable this to work 'cpoptions' .

old name	new name	old code		old MS-DOS code

	(not used)	0x9f	159	0xcf	207

Terminal options changed termcap-changed

The names of the terminal options have been changed to match the termcap names of these options. All terminal options now have the name t_xx, where xx is the termcap name. Normally these options are not used, unless you have a termcap entry that is wrong or incomplete, or you have set the highlight options to a different value. terminal-options

Note that for some keys there is no termcap name. Use the <> type of name instead, which is a good idea anyway.

Note that "t_ti" has become "t_mr" (invert/reverse output) and "t_ts" has become "t_ti" (init terminal mode). Be careful when you use "t_ti"!

old name	new name	meaning	
t_cdl	t_DL	delete number of lines	t_cdl
t_ci	t_vi	cursor invisible	t_ci
t_cil	t_AL	insert number of lines	t_cil

t_cm		t_cm	move cursor	
t_cri		t_RI	cursor number of chars right	t_cri
t_cv		t_ve	cursor visible	t_cv
t_cvv		t_vs	cursor very visible	t_cvv
t_dl		t_dl	delete line	
t_cs		t_cs	scroll region	
t_ed		t_cl	clear display	t_ed
t_el		t_ce	clear line	t_el
t_il		t_al	insert line	t_il
		t_da	display may be retained above the screen	
		t_db	display may be retained below the screen	
t_ke		t_ke	put terminal out of keypad transmit mode	
t_ks		t_ks	put terminal in keypad transmit mode	
t_ms		t_ms	save to move cursor in highlight mode	
t_se		t_se	normal mode (undo t_so)	
t_so		t_so	shift out (standout) mode	
t_ti		t_mr	reverse highlight	
t_tb		t_md	bold mode	t_tb
t_tp		t_me	highlight end	t_tp
t_sr		t_sr	scroll reverse	
t_te		t_te	out of termcap mode	
t_ts		t_ti	into termcap mode	t_ts_old
t_vb		t_vb	visual bell	
t_csc		t_CS	cursor is relative to scroll region	t_csc

t_ku	t_ku	<Up>	arrow up	
t_kd	t_kd	<Down>	arrow down	
t_kr	t_kr	<Right>	arrow right	
t_kl	t_kl	<Left>	arrow left	
t_sku		<S-Up>	shifted arrow up	t_sku
t_skd		<S-Down>	shifted arrow down	t_skd
t_skr	t_%i	<S-Right>	shifted arrow right	t_skr
t_skl	t_#4	<S-Left>	shifted arrow left	t_skl
t_f1	t_k1	<F1>	function key 1	t_f1
t_f2	t_k2	<F2>	function key 2	t_f2
t_f3	t_k3	<F3>	function key 3	t_f3

t_sf7		<S-F7>	shifted function key 7	t_sf7
t_sf8		<S-F8>	shifted function key 8	t_sf8
t_sf9		<S-F9>	shifted function key 9	t_sf9
t_sf10		<S-F10>	shifted function key 10	t_sf10
t_help	t_%1	<Help>	help key	t_help

t_undo t_&8   <Undo>   undo key   t_undo

'errorformat' option changed   errorformat-changed

'errorformat' can now contain several formats, separated by commas. The first
format that matches is used. The default values have been adjusted to catch
the most common formats.   errorformat

If you have a format that contains a comma, it needs to be preceded with a
backslash. Type two backslashes, because the ":set" command will eat one.

'graphic' option gone   graphic-option-gone

The 'graphic' option was used to make the characters between <~> and 0xa0
display directly on the screen. Now the 'isprint' option takes care of this
with many more possibilities. The default setting is the same; you only need
to look into this if you previously set the 'graphic' option in your vimrc.
                                                                'isprint'

'yankendofline' option gone   ye-option-gone

The 'yankendofline' option has been removed. Instead you can just use
        :map Y y$

'icon' and 'title' default value changed   icon-changed

The 'title' option is now only set by default if the original title can be
restored. Avoids "Thanks for flying Vim" titles. If you want them anyway,
put ":set title" in your vimrc.   'title'

The default for 'icon' now depends on the possibility of restoring the
original value, just like 'title'. If you don't like your icon titles to be
changed, add this line to your vimrc: 'icon'
        :set noicon

'highlight' option changed   highlight-changed

The 'i' flag now means italic highlighting, instead of invert. The 'r' flag
is used for reverse highlighting, which is what 'i' used to be. Normally you
won't see the difference, because italic mode is not supported on most
terminals and reverse mode is used as a fallback.   'highlight'

When an occasion is not present in 'highlight', use the mode from the default
value for 'highlight', instead of reverse mode.

'tildeop' and 'weirdinvert' short names changed short-name-changed
---

Renamed 'to' (abbreviation for 'tildeop') to 'top'. 'tildeop'
Renamed 'wi' (abbreviation for 'weirdinvert') to 'wiv'. 'weirdinvert'

This was done because Vi uses 'wi' as the short name for 'window' and 'to' as
the short name for 'timeout'. This means that if you try setting these
options, you won't get an error message, but the effect will be different.

Use of "v", "V" and "CTRL-V" in Visual mode use-visual-cmds

In Visual mode, "v", "V", and "CTRL-V" used to end Visual mode. Now this
happens only if the Visual mode was in the corresponding type. Otherwise the
type of Visual mode is changed. Now only ESC can be used in all circumstances
to end Visual mode without doing anything. v_V

CTRL-B in Insert mode removed toggle-revins

CTRL-B in Insert mode used to toggle the 'revins' option. If you don't know
this and accidentally hit CTRL-B, it is very difficult to find out how to undo
it. Since hardly anybody uses this feature, it is disabled by default. If
you want to use it, define RIGHTLEFT in feature.h before compiling. 'revins'

 vim:tw=78:ts=8:ft=help:norl:

version5.txt For Vim version 8.1. Last change: 2016 Feb 27

VIM REFERENCE MANUAL by Bram Moolenaar

Welcome to Vim Version 5.0!

This document lists the differences between Vim 4.x and Vim 5.0.
Although 5.0 is mentioned here, this is also for version 5.1, 5.2, etc.
See vi_diff.txt for an overview of differences between Vi and Vim 5.0.
See version4.txt for differences between Vim 3.0 and Vim 4.0.

Fixed   fixed-5.1

VERSION 5.2   version-5.2
Long lines editable   long-lines
File browser added   file-browser-5.2
Dialogs added   dialogs-added
Popup menu added   popup-menu-added
Select mode added   new-Select-mode
Session files added   new-session-files
User defined functions and commands   new-user-defined
New interfaces   interfaces-5.2
New ports   ports-5.2
Multi-byte support   new-multi-byte
New functions   new-functions-5.2
New options   new-options-5.2

Fixed   fixed-5.8

==
                                INCOMPATIBLE   incompatible-5

Default value for 'compatible' changed   cp-default

Vim version 5.0 tries to be more Vi compatible. This helps people who use Vim
as a drop-in replacement for Vi, but causes some things to be incompatible
with version 4.x.

In version 4.x the default value for the 'compatible' option was off. Now the
default is on. The first thing you will notice is that the "u" command undoes
itself. Other side effects will be that mappings may work differently or not
work at all.

Since a lot of people switching from Vim 4.x to 5.0 will find this annoying,
the 'compatible' option is switched off if Vim finds a vimrc file. This is a
bit of magic to make sure that 90% of the Vim users will not be bitten by
this change.

What does this mean?
- If you prefer to run in 'compatible' mode and don't have a vimrc file, you
  don't have to do anything.
- If you prefer to run in 'nocompatible' mode and do have a vimrc file, you
  don't have to do anything.
- If you prefer to run in 'compatible' mode and do have a vimrc file, you
  should put this line first in your vimrc file:
        :set compatible
- If you prefer to run in 'nocompatible' mode and don't have a vimrc file,
  you can do one of the following:
    - Create an empty vimrc file (e.g.: "~/.vimrc" for Unix).
    - Put this command in your .exrc file or $EXINIT:
                :set nocompatible
   - Start Vim with the "-N" argument.

If you are new to Vi and Vim, using 'nocompatible' is strongly recommended,
because Vi has a lot of unexpected side effects, which are avoided by this
setting. See 'compatible'.

If you like some things from 'compatible' and some not, you can tune the
compatibility with 'cpoptions'.

When you invoke Vim as "ex" or "gex", Vim always starts in compatible mode.

Text formatting command "Q" changed Q-command-changed

The "Q" command formerly formatted lines to the width the 'textwidth' option specifies. The command for this is now "gq" (see gq for more info). The reason for this change is that "Q" is the standard Vi command to enter "Ex" mode, and Vim now does in fact have an "Ex" mode (see Q for more info).

If you still want to use "Q" for formatting, use this mapping:
```
:noremap Q gq
```
And if you also want to use the functionality of "Q":
```
:noremap gQ Q
```

Command-line arguments changed cmdline-changed

Command-line file-arguments and option-arguments can now be mixed. You can give options after the file names. Example:
```
vim main.c -g
```

This is not possible when editing a file that starts with a '-'. Use the "--" argument then --- :
```
vim -g -- -main.c
```

"-v" now means to start Ex in Vi mode, use "-R" for read-only mode.
old: "vim -v file" -v
new: "vim -R file" -R

"-e" now means to start Vi in Ex mode, use "-q" for quickfix.
old: "vim -e errorfile" -e
new: "vim -q errorfile" -q

"-s" in Ex mode now means to run in silent (batch) mode. -s-ex

"-x" reserved for crypt, use "-f" to avoid starting a new CLI (Amiga).
old: "vim -x file" -x
new: "vim -f file" -f

Vim allows up to ten "+cmd" and "-c cmd" arguments. Previously Vim executed only the last one.

"-n" now overrides any setting for 'updatecount' in a vimrc file, but not in a gvimrc file.

Autocommands are kept autocmds-kept

Before version 5.0, autocommands with the same event, file name pattern, and command could appear only once. This was fine for simple autocommands (like setting option values), but for more complicated autocommands, where the same

command might appear twice, this restriction caused problems. Therefore
Vim stores all autocommands and keeps them in the order that they are defined.

The most obvious side effect of this change is that when you source a vimrc
file twice, the autocommands in it will be defined twice. To avoid this, do
one of these:

- Remove any autocommands that might already be defined before defining
  them. Example:
```
:au! * *.ext
:au BufEnter *.ext ...
```

- Put the autocommands inside an ":if" command. Example:
```
if !exists("did_ext_autocmds")
  let did_ext_autocmds = 1
  autocmd BufEnter *.ext ...
endif
```

- Put your autocommands in a different autocommand group so you can remove
  them before defining them :augroup :
```
augroup uncompress
  au!
  au BufReadPost *.gz ...
augroup END
```

Use of 'hidden' changed   hidden-changed

In version 4.x, only some commands used the 'hidden' option. Now all commands
uses it whenever a buffer disappears from a window.

Previously you could do ":buf xxx" in a changed buffer and that buffer would
then become hidden. Now you must set the 'hidden' option for this to work.

The new behavior is simpler: whether Vim hides buffers no longer depends on
the specific command that you use.
- with 'hidden' not set, you never get hidden buffers. Exceptions are the
  ":hide" and ":close!" commands and, in rare cases, where you would otherwise
  lose changes to the buffer.
- With 'hidden' set, you almost never unload a buffer. Exceptions are the
  ":bunload" or ":bdel" commands.

":buffer" now supports a "!": abandon changes in current buffer. So do
":bnext", ":brewind", etc.

Text object commands changed   text-objects-changed

Text object commands have new names. This allows more text objects and makes
characters available for other Visual mode commands. Since no more single
characters were available, text objects names now require two characters.
The first one is always 'i' or 'a'.

OLD	NEW		
a	aw	a word	v_aw
A	aW	a WORD	v_aW
s	as	a sentence	v_as
p	ap	a paragraph	v_ap
S	ab	a () block	v_ab
P	aB	a {} block	v_aB

There is another set of text objects that starts with "i", for "inner". These select the same objects, but exclude white space.

X-Windows Resources removed x-resources

Vim no longer supports the following X resources:
- boldColor
- italicColor
- underlineColor
- cursorColor

Vim now uses highlight groups to set colors. This avoids the confusion of using a bold Font, which would imply a certain color. See :highlight and gui-resources .

Use of $VIM $VIM-use

Vim now uses the VIM environment variable to find all Vim system files. This includes the global vimrc, gvimrc, and menu.vim files and all on-line help and syntax files. See $VIM . Starting with version 5.4, $VIMRUNTIME can also be used.
For Unix, Vim sets a default value for $VIM when doing "make install".
When $VIM is not set, its default value is the directory from 'helpfile', excluding "/doc/help.txt".

Use of $HOME for MS-DOS and Win32 $HOME-use

The MS-DOS and Win32 versions of Vim now first check $HOME when searching for a vimrc or exrc file and for reading/storing the viminfo file. Previously Vim used $VIM for these systems, but this causes trouble on a system with several users. Now Vim uses $VIM only when $HOME is not set or the file is not found in $HOME. See _vimrc .

Tags file format changed tags-file-changed

Only tabs are allowed to separate fields in a tags file. This allows for spaces in a file name and is still Vi compatible. In previous versions of Vim, any white space was allowed to separate the fields. If you have a file

which doesn't use a single tab between fields, edit the tags file and execute this command:

```
:%s/\(\S*\)\s\+\(\S*\)\s\+\(.*\)/\1\t\2\t\3/
```

Options changed options-changed

The default value of 'errorfile' has changed from "errors.vim" to "errors.err". The reason is that only Vim scripts should have the ".vim" extensions.

The ":make" command no longer uses the 'errorfile' option. This prevents the output of the ":make" command from overwriting a manually saved error file. ":make" uses the 'makeef' option instead. This also allows for generating a unique name, to prevent concurrently running ":make" commands from overwriting each other's files.

With 'insertmode' set, a few more things change:
- <Esc> in Normal mode goes to Insert mode.
- <Esc> in Insert mode doesn't leave Insert mode.
- When doing ":set im", go to Insert mode immediately.

Vim considers a buffer to be changed when the 'fileformat' (formerly the 'textmode' option) is different from the buffer's initial format.

CTRL-B in Insert mode gone i_CTRL-B-gone

When Vim was compiled with the +rightleft feature, you could use CTRL-B to toggle the 'revins' option. Unfortunately, some people hit the 'B' key accidentally when trying to type CTRL-V or CTRL-N and then didn't know how to undo this. Since toggling the 'revins' option can easily be done with the mapping below, this use of the CTRL-B key is disabled. You can still use the CTRL-_ key for this i_CTRL-_ .

```
:imap <C-B> <C-O>:set revins!<CR>
```

==========

NEW FEATURES *new-5*

Syntax highlighting new-highlighting

Vim now has a very flexible way to highlighting just about any type of file. See syntax . Summary:

```
:syntax on
```

Colors and attributes can be set for the syntax highlighting, and also for other highlighted items with the ':' flag in the 'highlight' option. All highlighted items are assigned a highlight group which specifies their highlighting. See :highlight . The default colors have been improved.

You can use the "Normal" group to set the default fore/background colors for a color terminal. For the GUI, you can use this group to specify the font, too.

The "2html.vim" script can be used to convert any file that has syntax
highlighting to HTML. The colors will be exactly the same as how you see them
in Vim. With a HTML viewer you can also print the file with colors.

Built-in script language   new-script

A few extra commands and an expression evaluator enable you to write simple
but powerful scripts. Commands include ":if" and ":while". Expressions can
manipulate numbers and strings. You can use the '=' register to insert
directly the result of an expression. See expression .

Perl and Python support   new-perl-python

Vim can call Perl commands with ":perldo", ":perl", etc. See perl .
Patches made by Sven Verdoolaege and Matt Gerassimoff.

Vim can call Python commands with ":python" and ":pyfile". See python .

Both of these are only available when enabled at compile time.

Win32 GUI version   added-win32-GUI

The GUI has been ported to MS Windows 95 and NT. All the features of the X11
GUI are available to Windows users now.   gui-w32
This also fixes problems with running the Win32 console version under Windows
95, where console support has always been bad.
There is also a version that supports OLE automation interface.   if_ole.txt
Vim can be integrated with Microsoft Developer Studio using the VisVim DLL.
It is possible to produce a DLL version of gvim with Borland C++ (Aaron).

VMS version   added-VMS

Vim can now also be used on VMS systems. Port done by Henk Elbers.
This has not been tested much, but it should work.
Sorry, no documentation!

BeOS version   added-BeOS

Vim can be used on BeOS systems (including the BeBox). (Olaf Seibert)
See os_beos.txt .

Macintosh GUI version   added-Mac

Vim can now be used on the Macintosh. (Dany St-Amant)
It has not been tested much yet, be careful!
See os_mac.txt .

More Vi compatible more-compatible

There is now a real Ex mode. Started with the "Q" command, or by calling the
executable "ex" or "gex". Ex-mode

Always allow multi-level undo, also in Vi compatible mode. When the 'u' flag
in 'cpoptions' is included, CTRL-R is used for repeating the undo or redo
(like "." in Nvi).

Read input from stdin read-stdin

When using the "-" command-line argument, Vim reads its text input from stdin.
This can be used for putting Vim at the end of a pipe:
```
   grep "^a.*" *.c | vim -
```
See -- .

Regular expression patterns added-regexp

Added specifying a range for the number of matches of an atom: "\{a,b}". /\{
Added the "shortest match" regexp "\{-}" (Webb).
Added "\s", matches a white character. Can replace "[\t]". /\s
Added "\S", matches a non-white character. Can replace "[^ \t]". /\S

Overloaded tags tag-overloaded

When using a language like C++, there can be several tags for the same
tagname. Commands have been added to be able to jump to any of these
overloaded tags:
```
 :tselect       List matching tags, and jump to one of them.
 :stselect      Idem, and split window.
 g_CTRL-]       Do ":tselect" with the word under the cursor.

        After ":ta {tagname}" with multiple matches:
 :tnext         Go to next matching tag.
 :tprevious     Go to previous matching tag.
 :trewind       Go to first matching tag.
 :tlast         Go to last matching tag.
```

The ":tag" command now also accepts wildcards. When doing command-line
completion on tags, case-insensitive matching is also available (at the end).

New commands new-commands

:amenu	Define menus for all modes, inserting a CTRL-O for Insert mode, ESC for Visual and CTRL-C for Cmdline mode. "amenu" is used for the default menus and the Syntax menu.
:augroup	Set group to be used for following autocommands. Allows the grouping of autocommands to enable deletion of a specific group.
:crewind	Go to first error.
:clast	Go to last error.
:doautoall	Execute autocommands for all loaded buffers.
:echo	Echo its argument, which is an expression. Can be used to display messages which include variables.
:execute	Execute its argument, which is an expression. Can be used to built up an Ex command with anything.
:hide	Works like ":close".
:if	Conditional execution, for built-in script language.
:intro	Show introductory message. This is always executed when Vim is started without file arguments.
:let	Assign a value to an internal variable.
:omap	Map only in operator-pending mode. Makes it possible to map text-object commands.
:redir	Redirect output of messages to a file.
:update	Write when buffer has changed.
:while	While-loop for built-in script language.

Visual mode:

v_O	"O" in Visual block mode, moves the cursor to the other corner horizontally.
v_D	"D" in Visual block mode deletes till end of line.

Insert mode:

i_CTRL-]	Triggers abbreviation, without inserting any character.

New options added-options

'background'	Used for selecting highlight color defaults. Also used in
		"syntax.vim" for selecting the syntax colors. Often set
		automatically, depending on the terminal used.

'complete'	Specifies how Insert mode completion works.

'eventignore'	Makes it possible to ignore autocommands temporarily.

'fileformat'	Current file format. Replaces 'textmode'.
'fileformats'	Possible file formats. Replaces 'textauto'.
		New is that this also supports Macintosh format: A single <CR>
		separates lines.
		The default for 'fileformats' for MS-DOS, Win32 and OS/2 is
		"dos,unix", also when 'compatible' set. Unix type files
		didn't work anyway when 'fileformats' was empty.

'guicursor'	Set the cursor shape and blinking in various modes.
		Default is to adjust the cursor for Insert and Replace mode,
		and when an operator is pending. Blinking is default on.

'fkmap'		Farsi key mapping.

'hlsearch'	Highlight all matches with the last used search pattern.

'hkmapp'	Phonetic Hebrew mapping. (Ilya Dogolazky)

'iconstring'	Define the name of the icon, when not empty. (Version 5.2: the
		string is used literally, a newline can be used to make two
		lines.)

'lazyredraw'	Don't redraw the screen while executing macros, registers or
		other not typed commands.

'makeef'	Errorfile to be used for ":make". "##" is replaced with a
		unique number. Avoids that two Vim sessions overwrite each
		others errorfile. The Unix default is "/tmp/vim##.err"; for
		Amiga "t:vim##.Err, for others "vim##.err".

'matchtime'	1/10s of a second to show a matching paren, when 'showmatch'
		is set. Like Nvi.

'mousehide'	Hide mouse pointer in GUI when typing text.

'nrformats'	Defines what bases Vim will consider for numbers when using
		the CTRL-A and CTRL-X commands. Default: "hex,octal".

'shellxquote'	Add extra quotes around the whole shell command, including
		redirection.

'softtabstop'	Make typing behave like tabstop is set at this value, without
		changing the value of 'tabstop'. Makes it more easy to keep
		'ts' at 8, while still getting four spaces for a <Tab>.

'titlestring'	String for the window title, when not empty. (Version 5.2:

this string is used literally, a newline can be used to make
two lines.)

'verbose'	Level of verbosity. Makes it possible to show which .vimrc,
.exrc, .viminfo files etc. are used for initializing. Also
to show autocommands that are being executed. Can also be set
by using the "-V" command-line argument.

New command-line arguments	added-cmdline-args

-U	Set the gvimrc file to be used. Like "-u" for the vimrc.

-V	Set the 'verbose' option. E.g. "vim -V10".

-N	Start in non-compatible mode.

-C	Start in compatible mode.

-Z	Start in restricted mode, disallow shell commands. Can also
be done by calling the executable "rvim".

-h	Show usage information and exit.

Various additions	added-various

Added support for SNiFF+ connection (submitted by Toni Leherbauer). Vim can
be used as an editor for SNiFF. No documentation available...

For producing a bug report, the bugreport.vim script has been included.
Can be used with ":so $VIMRUNTIME/bugreport.vim", which creates the file
"bugreport.txt" in the current directory. bugs

Added range to ":normal" command. Now you can repeat the same command for
each line in the range. :normal-range

Included support for the Farsi language (Shiran). Only when enabled at
compile time. See farsi .

==========

IMPROVEMENTS	improvements-5

Performance:
- When 'showcmd' was set, mappings would execute much more slowly because the
  output would be flushed very often. Helps a lot when executing the "life"
  macros with 'showcmd' set.
- Included patches for binary searching in tags file (David O'Neill).
  Can be disabled by resetting the 'tagbsearch' option.
- Don't update the ruler when repeating insert (slowed it down a lot).
- For Unix, file name expansion is now done internally instead of starting a
  shell for it.

- Expand environment variables with expand_env(), instead of calling the
  shell. Makes ":so $VIMRUNTIME/syntax/syntax.vim" a LOT faster.
- Reduced output for cursor positioning: Use CR-LF for moving to first few
  columns in next few lines; Don't output CR twice when using termios.
- Optimized cursor positioning. Use CR, BS and NL when it's shorter than
  absolute cursor positioning.
- Disable redrawing while repeating insert "1000ii<Esc>".
- Made "d$" or "D" for long lines a lot faster (delete all characters at once,
  instead of one by one).
- Access option table by first letter, instead of searching from start.
- Made setting special highlighting attributes a lot faster by using
  highlight_attr[], instead of searching in the 'highlight' string.
- Don't show the mode when redrawing is disabled.
- When setting an option, only redraw the screen when required.
- Improved performance of Ex commands by using a lookup table for the first
  character.

Options:
'cinoptions'   Added 'g' flag, for C++ scope declarations.
'cpoptions'   Added 'E' flag: Disallow yanking, deleting, etc. empty text
                area. Default is to allow empty yanks. When 'E' is included,
                "y$" in an empty line now is handled as an error (Vi
                compatible).
                Added 'j' flag: Only add two spaces for a join after a '.',
                not after a '?' or '!'.
                Added 'A' flag: don't give ATTENTION message.
                Added 'L' flag: When not included, and 'list' is set,
                'textwidth' formatting works like 'list' is not set.
                Added 'W' flag: Let ":w!" behave like Vi: don't overwrite
                readonly files, or a file owned by someone else.
'highlight'   Added '@' flag, for '@' characters after the last line on the
                screen, and '$' at the end of the line when 'list' is set.
                Added 'i' flag: Set highlighting for 'incsearch'. Default
                uses "IncSearch" highlight group, which is linked to "Visual".
                Disallow 'h' flag in 'highlight' (wasn't used anymore since
                3.0).
'guifont'   Win32 GUI only: When set to "*" brings up a font requester.
'guipty'   Default on, because so many people need it.
'path'   Can contain wildcards, and "**" for searching a whole tree.
'shortmess'   Added 'I' flag to avoid the intro message.
'viminfo'   Added '%' flag: Store buffer list in viminfo file.

- Increased defaults for 'maxmem' and 'maxmemtot' for Unix and Win32. Most
  machines have much more RAM now that prices have dropped.
- Implemented ":set all&", set all options to their default value. :set

Swap file:
- Don't create a swap file for a readonly file. Then create one on the first
  change. Also create a swapfile when the amount of memory used is getting
  too high. swap-file
- Make swap file "hidden", if possible. On Unix this is done by prepending a
  dot to the swap file name. When long file names are used, the DJGPP and
  Win32 versions also prepend a dot, in case a file on a mounted Unix file
  system is edited. :swapname On MSDOS the hidden file attribute is NOT

  set, because this causes problems with share.exe.
- 'updatecount' always defaults to non-zero, also for Vi compatible mode.
  This means there is a swap file, which can be used for recovery.

Tags:
- Included ctags 2.0 (Darren Hiebert). The syntax for static tags changed
  from
        {tag}:{fname}   {fname} {command}
  to
        {tag}   {fname} {command};"   file:
  Which is both faster to parse, shorter and Vi compatible. The old format is
  also still accepted, unless disabled in src/feature.h (see OLD_STATIC_TAGS).
   tags-file-format
- Completion of tags now also includes static tags for other files, at the
  end.
- Included "shtags" from Stephen Riehm.
- When finding a matching tag, but the file doesn't exist, continue searching
  for another match. Helps when using the same tags file (with links) for
  different versions of source code.
- Give a tag with a global match in the current file a higher priority than a
  global match in another file.

Included xxd version V1.8 (Juergen Weigert).

Autocommands:
- VimLeave autocommands are executed after writing the viminfo file, instead
  of before.   VimLeave
- Allow changing autocommands while executing them. This allows for
  self-modifying autocommands. (idea from Goldberg)
- When using autocommands with two or more patterns, could not split
  ":if/:endif" over two lines. Now all matching autocommands are executed in
  one do_cmdline().
- Autocommands no longer change the command repeated with ".".
- Search patterns are restored after executing autocommands. This avoids
  that the 'hlsearch' highlighting is messed up by autocommands.
- When trying to execute an autocommand, also try matching the pattern with
  the short file name. Helps when short file name is different from full
  file name (expanded symbolic links). autocmd-patterns
- Made the output of ":autocmd" shorter and look better.
- Expand <sfile> in an ":autocmd" when it is defined.   <sfile>
- Added "nested" flag to ":autocmd", allows nesting.   autocmd-nested
- Added [group] argument to ":autocmd". Overrides the currently set group.
   autocmd-groups
- new events:
   BufUnload   before a buffer is unloaded
   BufDelete   before a buffer is deleted from the buffer list
   FileChangedShell   when a file's modification time has changed after
                        executing a shell command
   User   user-defined autocommand
- When 'modified' was set by a BufRead* autocommand, it was reset again
  afterwards. Now the ":set modified" is remembered.

GUI:
- Improved GUI scrollbar handling when redrawing is slower than the scrollbar

  events are generated.
- "vim -u NONE" now also stops loading the .gvimrc and other GUI inits. -u
  Use "-U" to use another gvimrc file. -U
- Handle CTRL-C for external command, also for systems where "setsid()" is
  supported.
- When starting the GUI, restrict the window size to the screen size.
- The default menus are read from $VIMRUNTIME/menu.vim. This allows for a
  customized default menu. menu.vim
- Improved the default menus. Added File/Print, a Window menu, Syntax menu,
  etc.
- Added priority to the ":menu" command. Now each menu can be put in a place
  where you want it, independent of the order in which the menus are defined.
   menu-priority

Give a warning in the intro screen when running the Win32 console version on
Windows 95 because there are problems using this version under Windows 95.
 win32-problems

Added 'e' flag for ":substitute" command: Don't complain when not finding a
match (Campbell). :s

When using search commands in a mapping, only the last one is kept in the
history. Avoids that the history is trashed by long mappings.

Ignore characters after "ex", "view" and "gvim" when checking startup mode.
Allows the use of "gvim5" et. al. gvim "gview" starts the GUI in readonly
mode. gview

When resizing windows, the cursor is kept in the same relative position, if
possible. (Webb)

":all" and ":ball" no longer close and then open a window for the same buffer.
Avoids losing options, jumplist, and other info.

"-f" command-line argument is now ignored if Vim was compiled without GUI.
 -f

In Visual block mode, the right mouse button picks up the nearest corner.

Changed default mappings for DOS et al. Removed the DOS-specific mappings,
only use the Windows ones. Added Shift-Insert, Ctrl-Insert, Ctrl-Del and
Shift-Del.

Changed the numbers in the output of ":jumps", so you can see where {count}
CTRL-O takes you. :jumps

Using "~" for $HOME now works for all systems. $HOME

Unix: Besides using CTRL-C, also use the INTR character from the tty settings.
Somebody has INTR set to DEL.

Allow a <LF> in a ":help" command argument to end the help command, so another
command can follow.

Doing "%" on a line that starts with "	#if" didn't jump to matching "#else".
Don't recognize "#if", "#else" etc. for '%' when 'cpo' contains the '%' flag.
 %

Insert mode expansion with "CTRL-N", "CTRL-P" and "CTRL-X" improved
 ins-completion :
- 'complete' option added.
- When 'nowrapscan' is set, and no match found, report the searched direction
  in the error message.
- Repeating CTRL-X commands adds following words/lines after the match.
- When adding-expansions, accept single character matches.
- Made repeated CTRL-X CTRL-N not break undo, and "." repeats the whole
  insertion. Also fixes not being able to backspace over a word that has been
  inserted with CTRL-N.

When copying characters in Insert mode from previous/next line, with CTRL-E or
CTRL-Y, 'textwidth' is no longer used.	i_CTRL-E

Commands that move in the arglist, like ":n" and ":rew", keep the old cursor
position of the file (this is mostly Vi compatible).

Vim now remembers the '< and '> marks for each buffer. This fixes a problem
that a line-delete in one buffer invalidated the '< and '> marks in another
buffer.	'<

For MSDOS, Unix and OS/2: When $VIM not set, use the path from the executable.
When using the executable path for $VIM, remove "src/" when present. Should
make Vim find the docs and syntax files when it is run directly after
compiling.	$VIM

When quitting Visual mode with <Esc>, the cursor is put at start of the Visual
area (like after executing an operator).

Win32 and Unix version: Removed 1100 character limit on external commands.

Added possibility to include a space in a ":edit +command" argument, by
putting a backslash before it.	+cmd

After recovery, BufReadPost autocommands are applied.	:recover

Added color support for "os2ansi", OS/2 console. (Slootman)

Allow "%:p:h" when % is empty.	:_%

Included "<sfile>": file name from the ":source" command.	<sfile>

Added "<Bslash>" special character. Helps for avoiding multiple backslashes
in mappings and menus.

In a help window, a double-click jumps to the tag under the cursor (like
CTRL-]).

<C-Left> and <C-Right> now work like <S-Left> and <S-Right>, move a word
forward/backward (Windows compatible). <C-Left>

Removed the requirement for a ":version" command in a .vimrc file. It wasn't
used for anything. You can use ":if" to handle differences between versions.
 :version

For MS-DOS, Win32 and OS/2: When comparing file names for autocommands, don't
make a difference between '/' and '\' for path separator.

New termcap options:
"mb": blink. Can only be used by assigning it to one of the other highlight
      options.   t_mb
"bc": backspace character.   t_bc
"nd": Used for moving the cursor right in the GUI, to avoid removing one line
      of pixels from the last bold character.   t_nd
"xs": highlighting not erased by overwriting, for hpterm. Combined with
      'weirdinvert'. Visual mode works on hpterm now.   t_xs

Unix: Set time of patch and backup file same as original file. (Hiebert).

Amiga: In QuickFix mode no longer opens another window. Shell commands can be
used now.

Added decmouse patches from David Binette. Can now use Dec and Netterm mouse.
But only when enabled at compile time.

Added '#' register: Alternate file name quote# . Display '#' register with
":dis" command. :display

Removed ':' from 'isfname' default for Unix. Check for "://" in a file name
anyway. Also check for ":\\", for MS-DOS.

Added count to "K"eyword command, when 'keywordprg' is "man", is inserted in
the man command. "2K" results in "!man 2 <cword>".   K

When using "gf" on a relative path name, remove "../" from the file name, like
it's done for file names in the tags file. gf

When finishing recording, don't make the recorded register the default put
register.

When using "!!", don't put ":5,5!" on the command-line, but ":.!". And some
other enhancements to replace the line number with "." or "$" when possible.

MSDOS et al.: Renamed $VIM/viminfo to $VIM/_viminfo. It's more consistent:
.vimrc/_vimrc and .viminfo/_viminfo

For systems where case doesn't matter in file names (MSDOS, Amiga), ignore
case while sorting file names. For buffer names too.

When reading from stdin doesn't work, read from stderr (helps for "foo | xargs
vim").

32 bit MS-DOS version: Replaced csdpmi3 by csdpmi4.

Changed <C-Left> and <C-Right> to skip a WORD instead of a word.

Warning for changed modified time when overwriting a file now also works on
other systems than Unix.

Unix: Changed the defaults for configure to be the same as the defaults for
Makefile: include GUI, Perl, and Python.

Some versions of Motif require "-lXpm". Added check for this in configure.

Don't add "-L/usr/lib" to the link line, causes problems on a few systems.

==
                            COMPILE TIME CHANGES   compile-changes-5

When compiling, allow a choice for minimal, normal or maximal features in an
easy way, by changing a single line in src/feature.h.
The DOS16 version has been compiled with minimal features to avoid running
out of memory too quickly.
The Win32, DJGPP, and OS/2 versions use maximal features, because they have
enough memory.
The Amiga version is available with normal and maximal features.

Added "make test" to Unix version Makefile. Allows for a quick check if most
"normal" commands work properly. Also tests a few specific commands.

Added setlocale() with codepage support for DJGPP version.

autoconf:
- Added autoconf check for -lXdmcp.
- Included check for -lXmu, no longer needed to edit the Makefile for this.
- Switched to autoconf 2.12.
- Added configure check for <poll.h>. Seems to be needed when including
  Perl on Linux?
- termlib is now checked before termcap.
- Added configure check for strncasecmp(), stricmp() and strnicmp(). Added
  vim_stricmp() for when there's no library function for stricmp().
- Use "datadir" in configure, instead of our own check for HELPDIR.

Removed "make proto" from Makefile.manx. Could not make it work without a lot
of #ifdefs.

Removed "proto/" from paths in proto.h. Needed for the Mac port.

Drastically changed Makefile.mint. Now it includes the Unix Makefile.

Added support for Dos16 in Makefile.b32 (renamed Makefile.b32 to Makefile.bor)

All source files are now edited with a tabstop of 8 instead of 4, which is
better when debugging and using other tools. 'softtabstop' is set to 4, to
make editing easier.

Unix: Added "link.sh" script, which removes a few unnecessary libraries from
the link command.

Don't use HPUX digraphs by default, but only when HPUX_DIGRAPHS is defined.
 digraphs-default

==
BUG FIXES bug-fixes-5

Note: Some of these fixes may only apply to test versions which were created after version 4.6, but before 5.0.

When doing ":bdel", try going to the next loaded buffer. Don't rewind to the start of the buffer list.

mch_isdir() for Unix returned TRUE for "" on some systems.

Win32: 'shell' set to "mksnt/sh.exe" breaks ":!" commands. Don't use backslashes in the temp file names.

On linux, with a FAT file system, could get spurious "file xxx changed since editing started" messages, because the time is rounded off to two seconds unexpectedly.

Crash in GUI, when selecting a word (double click) and then extend until an empty line.

For systems where isdigit() can't handle characters > 255, get_number() caused a crash when moving the mouse during the prompt for recovery.

In Insert mode, "CTRL-O P" left the cursor on the last inserted character. Now the cursor is left after the last putted character.

When quickfix found an error type other than 'e' or 'w', it was never printed.

A setting for 'errorfile' in a .vimrc overruled the "-q errorfile" argument.

Some systems create a file when generating a temp file name. Filtering would then create a backup file for this, which was never deleted. Now no backup file is made when filtering.

simplify_filename() could remove a ".." after a link, resulting in the wrong file name. Made simplify_filename also work for MSDOS. Don't use it for Amiga, since it doesn't have "../".

otherfile() was unreliable when using links. Could think that reading/writing was for a different file, when it was the same.

Pasting with mouse in Replace mode didn't replace anything.

Window height computed wrong when resizing a window with an autocommand (could cause a crash).

":s!foo!bar!" wasn't possible (Vi compatible).

do_bang() freed memory twice when called recursively, because of autocommands (test11). Thanks to Electric Fence!

"v$d" on an empty line didn't remove the "-- VISUAL --" mode message from the command-line, and inverted the cursor.

":mkexrc" didn't check for failure to open the file, causing a crash. (Felderhoff).

Win32 mch_write() wrote past fixed buffer, causing terminal keys no longer to be recognized. Both console and GUI version.

Athena GUI: Crash when removing a menu item. Now Vim doesn't crash, but the reversing of the menu item is still wrong.

Always reset 'list' option for the help window.

When 'scrolloff' is non-zero, a 'showmatch' could cause the shown match to be in the wrong line and the window to be scrolled (Acevedo).

After ":set all&", 'lines' and 'ttytype' were still non-default, because the defaults never got set. Now the defaults for 'lines' and 'columns' are set after detecting the window size. 'term' and 'ttytype' defaults are set when detecting the terminal type.

For (most) non-Unix systems, don't add file names with illegal characters when expanding. Fixes "cannot open swapfile" error when doing ":e *.burp", when there is no match.

In X11 GUI, drawing part of the cursor obscured the text. Now the text is drawn over the cursor, like when it fills the block. (Seibert)

when started with "-c cmd -q errfile", the cursor would be left in line 1. Now a ":cc" is done after executing "cmd".

":ilist" never ignored case, even when 'ignorecase' set.

"vim -r file" for a readonly file, then making a change, got ATTENTION message in insert mode, display mixed up until <Esc> typed. Also don't give ATTENTION message after recovering a file.

The abbreviation ":ab #i #include" could not be removed.

CTRL-L completion (longest common match) on command-line didn't work properly for case-insensitive systems (MS-DOS, Windows, etc.). (suggested by Richard Kilgore).

For terminals that can hide the cursor ("vi" termcap entry), resizing the window caused the cursor to disappear.

Using an invalid mark in an Ex address didn't abort the command.

When 'smarttab' set, would use 'shiftround' when inserting a TAB after a space. Now it always rounds to a tabstop.

Set '[and '] marks for ":copy", ":move", ":append", ":insert", ":substitute"
and ":change". (Acevedo).

"d$" in an empty line still caused an error, even when 'E' is not in
'cpoptions'.

Help files were stored in the viminfo buffer list without a path.

GUI: Displaying cursor was not synchronized with other displaying. Caused
several display errors. For example, when the last two lines in the file
start with spaces, "dd" on the last line copied text to the (then) last line.

Win32: Needed to type CTRL-SHIFT-- to get CTRL-_.

GUI: Moving the cursor forwards over bold text would remove one column of bold
pixels.

X11 GUI: When a bold character in the last column was scrolled up or down, one
column of pixels would not be copied.

Using <BS> to move the cursor left can sometimes erase a character. Now use
"le" termcap entry for this.

Keyword completion with regexp didn't work. e.g., for "b.*crat".

Fixed: With CTRL-O that jumps to another file, cursor could end up just after
the line.

Amiga: '$' was missing from character recognized as wildcards, causing $VIM
sometimes not to be expanded.

":change" didn't adjust marks for deleted lines.

":help [range]" didn't work. Also for [pattern], [count] and [quotex].

For 'cindent'ing, typing "class::method" doesn't align like a label when the
second ':' is typed.
When inserting a CR with 'cindent' set (and a bunch of other conditions) the
cursor went to a wrong location.
'cindent' was wrong for a line that ends in '}'.
'cindent' was wrong after "else {".

While editing the cmdline in the GUI, could not use the mouse to select text
from the command-line itself.

When deleting lines, marks in tag stack were only adjusted for the current
window, not for other windows on the same buffer.

Tag guessing could find a function "some_func" instead of the "func" we were
looking for.

Tags file name relative to the current file didn't work.

":g/pat2/s//pat2/g", causing the number of subs to be reported, used to cause a scroll up. Now you no longer have to hit <CR>.

X11 GUI: Selecting text could cause a crash.

32 bit DOS version: CTRL-C in external command killed Vim. When SHELL is set to "sh.exe", external commands didn't work. Removed using of command.com, no longer need to set 'shellquote'.

Fixed crash when using ":g/pat/i".

Fixed (potential) crash for X11 GUI, when using an X selection. Was giving a pointer on the stack to a callback function, now it's static.

Using "#" and "*" with an operator didn't work. E.g. "c#".

Command-line expansion didn't work properly after ":*". (Acevedo)

Setting 'weirdinvert' caused highlighting to be wrong in the GUI.

":e +4 #" didn't work, because the "4" was in unallocated memory (could cause a crash).

Cursor position was wrong for ":e #", after ":e #" failed, because of changes to the buffer.

When doing ":buf N", going to a buffer that was edited with ":view", the readonly flag was reset. Now make a difference between ":e file" and ":buf file": Only set/reset 'ro' for the first one.

Avoid hit-enter prompt when not able to write viminfo on exit.

When giving error messages in the terminal where the GUI was started, GUI escape codes would be written to the terminal. In an xterm this could be seen as a '$' after the message.

Mouse would not work directly after ":gui", because full_screen isn't set, which causes starttermcap() not to do its work.

'incsearch' did not scroll the window in the same way as the actual search. When 'nowrap' set, incsearch didn't show a match when it was off the side of the screen. Now it also shows the whole match, instead of just the cursor position (if possible).

":unmap", ":unab" and ":unmenu" did not accept a double quote, it was seen as the start of a comment. Now it's Vi compatible.

Using <Up><Left><Left><Up> in the command-line, when there is no previous cmdline in the history, inserted a NUL on the command-line.

"i<Esc>" when on a <Tab> in column 0 left the cursor in the wrong place.

GUI Motif: When adding a lot of menu items, the menu bar goes into two rows. Deleting menu items, reducing the number of rows, now also works.

With ":g/pat/s//foo/c", a match in the first line was scrolled off of the screen, so you could not see it.
When using ":s//c", with 'nowrap' set, a match could be off the side of the screen, so you could not see it.

When 'helpfile' was set to a fixed, non-absolute path in feature.h, Vim would crash. mch_Fullname can now handle file names in read-only memory. (Lottem)

When using CTRL-A or CTRL-@ in Insert mode, there could be strange effects when using CTRL-D next. Also, when repeating inserted text that included "0 CTRL-D" or "^ CTRL-D" this didn't work. (Acevedo)
Using CTRL-D after using CTRL-E or CTRL-Y in Insert mode that inserted a '0' or '^', removed the '0' or '^' and more indent.

The command "2".p" caused the last inserted text to be executed as commands. (Acevedo)

Repeating the insert of "CTRL-V 048" resulted in "^@" to be inserted.

Repeating Insert completion could fail if there are special characters in the text. (Acevedo)

":normal /string<CR>" caused the window to scroll. Now all ":normal" commands are executed without scrolling messages.

Redo of CTRL-E or CTRL-Y in Insert mode interpreted special characters as commands.

Line wrapping for 'tw' was done one character off for insert expansion inserts.

buffer_exists() function didn't work properly for buffer names with a symbolic link in them (e.g. when using buffer_exists(#)).

Removed the "MOTIF_COMMENT" construction from Makefile. It now works with FreeBSD make, and probably with NeXT make too.

Matching the 'define' and 'include' arguments now honor the settings for 'ignorecase'. (Acevedo)

When one file shown in two windows, Visual selection mixed up cursor position in current window and other window.

When doing ":e file" from a help file, the 'isk' option wasn't reset properly, because of a modeline in the help file.

When doing ":e!", a cursor in another window on the same buffer could become invalid, leading to "ml_get: invalid lnum" errors.

Matching buffer name for when expanded name has a different path from not expanded name (Brugnara).

Normal mappings didn't work after an operator. For example, with ":map Q gq",

"QQ" didn't work.

When ":make" resulted in zero errors, a "No Errors" error message was given
(which breaks mappings).

When ":sourcing" a file, line length was limited to 1024 characters. CTRL-V
before <EOL> was not handled Vi compatible. (Acevedo)

Unexpected exit for X11 GUI, caused by SAVE_YOURSELF event. (Heimann)

CTRL-X CTRL-I only found one match per line. (Acevedo)
When using an illegal CTRL-X key in Insert mode, the CTRL-X mode message
was stuck.

Finally managed to ignore the "Quit" menu entry of the Window manager! Now
Vim only exists when there are no changed buffers.

Trying to start the GUI when $DISPLAY is not set resulted in a crash.
When $DISPLAY is not set and gvim starts vim, title was restored to "Thanks
for flying Vim".
When $DISPLAY not set, starting "gvim" (dropping back to vim) and then
selecting text with the mouse caused a crash.

"J", with 'joinspaces' set, on a line ending in ". ", caused one space too
many to be added. (Acevedo)

In insert mode, a CTRL-R {regname} which didn't insert anything left the '"'
on the screen.

":z10" didn't work. (Clapp)

"Help "*" didn't work.

Renamed a lot of functions, to avoid clashes with POSIX name space.

When adding characters to a line, making it wrap, the following lines were
sometimes not shifted down (e.g. after a tag jump).

CTRL-E, with 'so' set and cursor on last line, now does not move cursor as
long as the last line is on the screen.

When there are two windows, doing "^W+^W-" in the bottom window could cause
the status line to be doubled (not redrawn correctly).

This command would hang: ":n `cat`". Now connect stdin of the external
command to /dev/null, when expanding.

Fixed lalloc(0,) error for ":echo %:e:r". (Acevedo)

The "+command" argument to ":split" didn't work when there was no file name.

When selecting text in the GUI, which is the output of a command-line command
or an external command, the inversion would sometimes remain.

GUI: "-mh 70" argument was broken. Now, when menuheight is specified, it is not changed anymore.

GUI: When using the scrollbar or mouse while executing an external command, this caused garbage characters.

Showmatch sometimes jumped to the wrong position. Was caused by a call to findmatch() when redrawing the display (when syntax highlighting is on).

Search pattern "\(a *\)\{3} did not work correctly, also matched "a a". Problem with brace_count not being decremented.

Wildcard expansion added too many non-matching file names.

When 'iskeyword' contains characters like '~', "*" and "#" didn't work properly. (Acevedo)

On Linux, on a FAT file system, modification time can change by one second. Avoid a "file has changed" warning for a one second difference.

When using the page-switching in an xterm, Vim would position the cursor on the last line of the window on exit. Also removed the cursor positioning for ":!" commands.

":g/pat/p" command (partly) overwrote the command. Now the output is on a separate line.

With 'ic' and 'scs' set, a search for "Keyword", ignore-case matches were highlighted too.

"^" on a line with only white space, put cursor beyond the end of the line.

When deleting characters before where insertion started ('bs' == 2), could not use abbreviations.

CTRL-E at end of file puts cursor below the file, in Visual mode, when 'so' is non-zero. CTRL-E didn't work when 'so' is big and the line below the window wraps. CTRL-E, when 'so' is non-zero, at end of the file, caused jumping up-down.

":retab" didn't work well when 'list' is set.

Amiga: When inserting characters at the last line on the screen, causing it to wrap, messed up the display. It appears that a '\n' on the last line doesn't always cause a scroll up.

In Insert mode "0<C-D><C-D>" deleted an extra character, because Vim thought that the "0" was still there. (Acevedo)

"z{count}l" ignored the count. Also for "zh" et. al. (Acevedo)

"S" when 'autoindent' is off didn't delete leading white space.

"/<Tab>" landed on the wrong character when 'incsearch' is set.

Asking a yes/no question could cause a hit-enter prompt.

When the file consists of one long line (>4100 characters), making changes caused various errors and a crash.

DJGPP version could not save long lines (>64000) for undo.

"yw" on the last char in the file didn't work. Also fixed "6x" at the end of the line. "6X" at the start of a line fails, but does not break a mapping. In general, a movement for an operator doesn't beep or flush a mapping, but when there is nothing to operate on it beeps (this is Vi compatible).

"m'" and "m`" now set the '' mark at the cursor position.

Unix: Resetting of signals for external program didn't work, because SIG_DFL and NULL are the same! For "!!yes|dd count=1|, the yes command kept on running.

Partly fixed: Unix GUI: Typeahead while executing an external command was lost. Now it's not lost while the command is producing output.

Typing <S-Tab> in Insert mode, when it isn't mapped, inserted "<S-Tab>". Now it works like a normal <Tab>, just like <C-Tab> and <M-Tab>.

Redrawing ruler didn't check for old value correctly (caused UMR warnings in Purify).

Negative array index in finish_viminfo_history().

":g/^/d|mo $" deleted all the lines. The ":move" command now removes the :global mark from the moved lines.

Using "vG" while the last line in the window is a "@" line, didn't update correctly. Just the "v" showed "~" lines.

"daw" on the last char of the file, when it's a space, moved the cursor beyond the end of the line.

When 'hlsearch' was set or reset, only the current buffer was redrawn, while this affects all windows.

CTRL-^, positioning the cursor somewhere from 1/2 to 1 1/2 screen down the file, put the cursor at the bottom of the window, instead of halfway.

When scrolling up for ":append" command, not all windows were updated correctly.

When 'hlsearch' is set, and an auto-indent is highlighted, pressing <Esc> didn't remove the highlighting, although the indent was deleted.

When 'ru' set and 'nosc', using "$j" showed a wrong ruler.

Under Xfree 3.2, Shift-Tab didn't work (wrong keysym is used).

Mapping <S-Tab> didn't work. Changed the key translations to use the shortest key code possible. This makes the termcode translations and mappings more consistent. Now all modifiers work in all combinations, not only with <Tab>, but also with <Space>, <CR>, etc.

For Unix, restore three more signals. And Vim catches SIGINT now, so CTRL-C in Ex mode doesn't make Vim exit.

""a5Y" yanked 25 lines instead of 5.

"vrxxx<Esc>" in an empty line could not be undone.

A CTRL-C that breaks ":make" caused the errorfile not to be read (annoying when you want to handle what ":make" produced so far).

":0;/pat" didn't find "pat" in line 1.

Search for "/test/s+1" at first char of file gave bottom-top message, or didn't work at all with 'nowrapscan'.

Bug in viminfo history. Could cause a crash on exit.

":print" didn't put cursor on first non-blank in line.

":0r !cat </dev/null" left cursor in line zero, with very strange effects.

With 'showcmd' set and 'timeoutlen' set to a few seconds, trick to position the cursor leftwards didn't work.

AIX stty settings were restored to cs5 instead of cs8 (Winn).

File name completion didn't work for "zsh" versions that put spaces between file names, instead of NULs.

Changed "XawChain*" to "XtChain*", should work for more systems.

Included quite a few fixes for rightleft mode (Lottem).

Didn't ask to hit-enter when GUI is started and error messages are printed.

When trying to edit a file in a non-existent directory, ended up with editing "No file".

"gqap" to format a paragraph did too much redrawing.

When 'hlsearch' set, only the current window was updated for a new search pattern.

Sometimes error messages on startup didn't cause a hit-enter prompt, because of autocommands containing an empty line.

Was possible to select part of the window in the border, below the command line.

'< and '> marks were not at the correct position after linewise Visual
selection.

When translating a help argument to "CTRL-x", prepend or append a '_', when
applicable.

Blockwise visual mode wasn't correct when moving vertically over a special
character (displayed as two screen characters).

Renamed "struct option" to "struct vimoption" to avoid name clash with GNU
getopt().

":abclear" didn't work (but ":iabclear" and ":cabclear" did work).

When 'nowrap' used, screen wasn't always updated correctly.

"vim -c split file" displayed extra lines.

After starting the GUI, searched the termcap for a "gui" term.

When 'hls' used, search for "^$" caused a hang.
When 'hls' was set, an error in the last regexp caused trouble.

Unix: Only output an extra <EOL> on exit when outputted something in the
alternate screen, or when there is a message that needs to be cleared.

"/a\{" did strange things, depending on previous search.

"c}" only redrew one line (with -u NONE).

For mappings, CTRL-META-A was shown as <M-^A> instead of <MC-A>, while :map
only accepts <MC-A>. Now <M-C-A> is shown.

Unix: When using full path name in a tags file, which contains a link, and
'hidden' set and jumping to a tag in the current file, would get bogus
ATTENTION message. Solved by always expanding file names, even when starting
with '/'.

'hlsearch' highlighting of special characters (e.g., a TAB) didn't highlight
the whole thing.

"r<CR>" didn't work correctly on the last char of a line.

Sometimes a window resize or other signal caused an endless loop, involving
set_winsize().

"vim -r" didn't work, it would just hang (using tgetent() while 'term' is
empty).

"gk" while 'nowrap' set moved two lines up.

When windows are split, a message that causes a scroll-up messed up one of the
windows, which required a CTRL-L to be typed.

Possible endless loop when using shell command in the GUI.

Menus defined in the .vimrc were removed when GUI started.

Crash when pasting with the mouse in insert mode.

Crash with ":unmenu *" in .gvimrc for Athena.

"5>>" shifted 5 lines 5 times, instead of 1 time.

CTRL-C when getting a prompt in ":global" didn't interrupt.

When 'so' is non-zero, and moving the scrollbar completely to the bottom,
there was a lot of flashing.

GUI: Scrollbar ident must be long for DEC Alpha.

Some functions called vim_regcomp() without setting reg_magic, which could
lead to unpredictable magicness.

Crash when clicking around the status line, could get a selection with a
backwards range.

When deleting more than one line characterwise, the last character wasn't
deleted.

GUI: Status line could be overwritten when moving the scrollbar quickly (or
when 'wd' is non-zero).

An ESC at the end of a ":normal" command caused a wait for a terminal code to
finish. Now, a terminal code is not recognized when its start comes from a
mapping or ":normal" command.

Included patches from Robert Webb for GUI. Layout of the windows is now done
inside Vim, instead of letting the layout manager do this. Makes Vim work
with Lesstif!

UMR warning in set_expand_context().

Memory leak: b_winlnum list was never freed.

Removed TIOCLSET/TIOCLGET code from os_unix.c. Was changing some of the
terminal settings, and looked like it wasn't doing anything good. (suggested
by Juergen Weigert).

Ruler overwrote "is a directory" message. When starting up, and 'cmdheight'
set to > 1, first message could still be in the last line.

Removed prototype for putenv() from proto.h, it's already in osdef2.h.in.

In replace mode, when moving the cursor and then backspacing, wrong characters
were inserted.

Win32 GUI was checking for a CTRL-C too often, making it slow.

Removed mappings for MS-DOS that were already covered by commands.

When visually selecting all lines in a file, cursor at last line, then "J".
Gave ml_get errors. Was a problem with scrolling down during redrawing.

When doing a linewise operator, and then an operator with a mouse click, it
was also linewise, instead of characterwise.

When 'list' is set, the column of the ruler was wrong.

Spurious error message for "/\(b\+\)*".

When visually selected many lines, message from ":w file" disappeared when
redrawing the screen.

":set <M-b>=^[b", then insert "^[b", waited for another character. And then
inserted "<M-b>" instead of the real <M-b> character. Was trying to insert
K_SPECIAL x NUL.

CTRL-W] didn't use count to set window height.

GUI: "-font" command-line argument didn't override 'guifont' setting from
.gvimrc. (Acevedo)

GUI: clipboard wasn't used for "*y". And some more Win32/X11 differences
fixed for the clipboard (Webb).

Jumping from one help file to another help file, with 'compatible' set,
removed the 'help' flag from the buffer.

File-writable bit could be reset when using ":w!" for a readonly file.

There was a wait for CTRL-O n in Insert mode, because the search pattern was
shown.
Reduced wait, to allow reading a message, from 10 to 3 seconds. It seemed
nothing was happening.

":recover" found same swap file twice.

GUI: "*yy only worked the second time (when pasting to an xterm)."

DJGPP version (dos32): The system flags were cleared.

Dos32 version: Underscores were sometimes replaced with y-umlaut (Levin).

Version 4.1 of ncurses can't handle tputs("", ..). Avoid calling tputs() with
an empty string.

<S-Tab> in the command-line worked like CTRL-P when no completion started yet.
Now it does completion, last match first.

Unix: Could get annoying "can't write viminfo" message after doing "su". Now

the viminfo file is overwritten, and the user set back to the original one.

":set term=builtin_gui" started the GUI in a wrong way. Now it's not
allowed anymore. But "vim -T gui" does start the GUI correctly now.

GUI: Triple click after a line only put last char in selection, when it is a
single character word.

When the window is bigger than the screen, the scrolling up of messages was
wrong (e.g. ":vers", ":hi"). Also when the bottom part of the window was
obscured by another window.

When using a wrong option only an error message is printed, to avoid that the
usage information makes it scroll off the screen.

When exiting because of not being able to read from stdin, didn't preserve the
swap files properly.

Visual selecting all chars in more than one line, then hit "x" didn't leave an
empty line. For one line it did leave an empty line.

Message for which autocommand is executing messed up file write message (for
FileWritePost event).

"vim -h" included "-U" even when GUI is not available, and "-l" when lisp is
not available.

Crash for ":he <C-A>" (command-line longer than screen).

":s/this/that/gc", type "y" two times, then undo, did reset the modified
option, even though the file is still modified.

Empty lines in a tags file caused a ":tag" to be aborted.

When hitting 'q' at the more prompt for ":menu", still scrolled a few lines.

In an xterm that uses the bold trick a single row of characters could remain
after an erased bold character. Now erase one extra char after the bold char,
like for the GUI.

":pop!" didn't work.

When the reading a buffer was interrupted, ":w" should not be able to
overwrite the file, ":w!" is required.

":cf%" caused a crash.

":gui longfilename", when forking is enabled, could leave part of the
longfilename at the shell prompt.

==
VERSION 5.1   version-5.1

Improvements made between version 5.0 and 5.1.

This was mostly a bug-fix release, not many new features.

Changed changed-5.1

The expand() function now separates file names with <NL> instead of a space.
This avoids problems for file names with embedded spaces. To get the old
result, use substitute(expand(foo), "\n", " ", "g").

For Insert-expanding dictionaries allow a backslash to be used for
wildchars. Allows expanding "ze\kra", when 'isk' includes a backslash.

New icon for the Win32 GUI.

":tag", ":tselect" etc. only use the argument as a regexp when it starts
with '/'. Avoids that ":tag xx~" gives an error message: "No previous sub.
regexp". Also, when the :tag argument contained wildcard characters, it was
not Vi compatible.
When using '/', the argument is taken literally too, with a higher priority,
so it's found before wildcard matches.
Only when the '/' is used are matches with different case found, even though
'ignorecase' isn't set.
Changed "g^]" to only do ":tselect" when there is more than on matching tag.

Changed some of the default colors, because they were not very readable on a
dark background.

A character offset to a search pattern can move the cursor to the next or
previous line. Also fixes that "/pattern/e+2" got stuck on "pattern" at the
end of a line.

Double-clicks in the status line do no longer start Visual mode. Dragging a
status line no longer stops Visual mode.

Perl interface: Buffers() and Windows() now use more logical arguments, like
they are used in the rest of Vim (Moore).

Init '" mark to the first character of the first line. Makes it possible to
use '" in an autocommand without getting an error message.

Added added-5.1

"shell_error" internal variable: result of last shell command.

":echohl" command: Set highlighting for ":echo".

'S' flag in 'highlight' and StatusLineNC highlight group: highlighting for
status line of not-current window. Default is to use bold for current
window.

Added buffer_name() and buffer_number() functions (Aaron).
Added flags argument "g" to substitute() function (Aaron).
Added winheight() function.

Win32: When an external command starts with "start ", no console is opened
for it (Aaron).

Win32 console: Use termcap codes for bold/reverse based on the current
console attributes.

Configure check for "strip". (Napier)

CTRL-R CTRL-R x in Insert mode: Insert the contents of a register literally,
instead of as typed.

Made a few "No match" error messages more informative by adding the pattern
that didn't match.

"make install" now also copies the macro files.

tools/tcltags, a shell script to generate a tags file from a TCL file.

"--with-tlib" setting for configure. Easy way to use termlib: "./configure
--with-tlib=termlib".

'u' flag in 'cino' for setting the indent for contained () parts.

When Win32 OLE version can't load the registered type library, ask the user
if he wants to register Vim now. (Erhardt)
Win32 with OLE: When registered automatically, exit Vim.
Included VisVim 1.1b, with a few enhancements and the new icon (Heiko
Erhardt).

Added patch from Vince Negri for Win32s support. Needs to be compiled with
VC 4.1!

Perl interface: Added $curbuf. Rationalized Buffers() and Windows().
(Moore) Added "group" argument to Msg().

Included Perl files in DOS source archive. Changed Makefile.bor and
Makefile.w32 to support building a Win32 version with Perl included.

Included new Makefile.w32 from Ken Scott. Now it's able to make all Win32
versions, including OLE, Perl and Python.

Added CTRL-W g] and CTRL-W g ^]: split window and do g] or g^].

Added "g]" to always do ":tselect" for the ident under the cursor.
Added ":tjump" and ":stjump" commands.
Improved listing of ":tselect" when tag names are a bit long.

Included patches for the Macintosh version. Also for Python interface.
(St-Amant)

":buf foo" now also restores cursor column, when the buffer was used before.

Adjusted the Makefile for different final destinations for the syntax files
and scripts (for Debian Linux).

Amiga: $VIM can be used everywhere. When $VIM is not defined, "VIM:" is
used. This fixes that "VIM:" had to be assigned for the help files, and
$VIM set for the syntax files. Now either of these work.

Some xterms send vt100 compatible function keys F1-F4. Since it's not
possible to detect this, recognize both type of keys and translate them to
<F1> - <F4>.

Added "VimEnter" autocommand. Executed after loading all the startup stuff.

BeOS version now also runs on Intel CPUs (Seibert).

Fixed   fixed-5.1

":ts" changed position in the tag stack when cancelled with <CR>.
":ts" changed the cursor position for CTRL-T when cancelled with <CR>.
":tn" would always jump to the second match.   Was using the wrong entry in
the tag stack.
Doing "tag foo", then ":tselect", overwrote the original cursor position in
the tag stack.

"make install" changed the vim.1 manpage in a wrong way, causing "doc/doc"
to appear for the documentation files.

When compiled with MAX_FEAT, xterm mouse handling failed. Was caused by DEC
mouse handling interfering.

Was leaking memory when using selection in X11.

CTRL-D halfway a command-line left some characters behind the first line(s)
of the listing.

When expanding directories for ":set path=", put two extra backslashes
before a space in a directory name.

When 'lisp' set, first line of a function would be indented. Now its indent
is set to zero. And use the indent of the first previous line that is at
the same () level. Added test33.

"so<Esc>u" in an empty file didn't work.

DOS: "seek error in swap file write" errors, when using DOS 6.2 share.exe,
because the swap file was made hidden. It's no longer hidden.

":global" command would sometimes not execute on a matching line. Happened
when a data block is full in ml_replace().

For AIX use a tgetent buffer of 2048 bytes, instead of 1024.

Win32 gvim now only sets the console size for external commands to 25x80
on Windows 95, not on NT.

Win32 console: Dead key could cause a crash, because of a missing "WINAPI"
(Deshpande).

The right mouse button started Visual mode, even when 'mouse' is empty, and
in the command-line, a left click moved the cursor when 'mouse' is empty.
In Visual mode, 'n' in 'mouse' would be used instead of 'v'.

A blinking cursor or focus change cleared a non-Visual selection.

CTRL-Home and CTRL-End didn't work for MS-DOS versions.

Could include NUL in 'iskeyword', causing a crash when doing insert mode
completion.

Use _dos_commit() to flush the swap file to disk for MSDOS 16 bit version.

In mappings, CTRL-H was replaced by the backspace key code. This caused
problems when it was used as text, e.g. ":map _U :%s/.^H//g<CR>".

":set t_Co=0" was not handled like a normal term. Now it's translated into
":set t_Co=", which works.

For ":syntax keyword" the "transparent" option did work, although not
mentioned in the help. But synID() returned wrong name.

"gqG" in a file with one-word-per-line (e.g. a dictionary) was very slow and
not interruptible.

"gq" operator inserted screen lines in the wrong situation. Now screen
lines are inserted or deleted when this speeds up displaying.

cindent was wrong when an "if" contained "((".

'r' flag in 'viminfo' was not used for '%'. Could get files in the buffer
list from removable media.

Win32 GUI with OLE: if_ole_vc.mak could not be converted into a project.
Hand-edited to fix this...

With 'nosol' set, doing "$kdw" below an empty line positioned the cursor at
the end of the line.

Dos32 version changed "\dir\file" into "/dir/file", to work around a DJGPP
bug. That bug appears to have been fixed, therefore this translation has
been removed.

"/^*" didn't work (find '*' in first column).

"<afile>" was not always set for autocommands. E.g., for ":au BufEnter *

let &tags = expand("<afile>:p:h") . "/tags".

In an xterm, the window may be a child of the outer xterm window. Use the parent window when getting the title and icon names. (Smith)

When starting with "gvim -bg black -fg white", the value of 'background' is only set after reading the .gvimrc file. This causes a ":syntax on" to use the wrong colors. Now allow using ":gui" to open the GUI window and set the colors. Previously ":gui" in a gvimrc crashed Vim.

tempname() returned the same name all the time, unless the file was actually created. Now there are at least 26 different names.

File name used for <afile> was sometimes full path, sometimes file name relative to current directory.

When 'background' was set after the GUI window was opened, it could change colors that were set by the user in the .gvimrc file. Now it only changes colors that have not been set by the user.

Ignore special characters after a CSI in the GUI version. These could be interpreted as special characters in a wrong way. (St-Amant)

Memory leak in farsi code, when using search or ":s" command.
Farsi string reversing for a mapping was only done for new mappings. Now it also works for replacing a mapping.

Crash in Win32 when using a file name longer than _MAX_PATH. (Aaron)

When BufDelete autocommands were executed, some things for the buffer were already deleted (esp. Perl stuff).

Perl interface: Buffer specific items were deleted too soon; fixes "screen no longer exists" messages. (Moore)

The Perl functions didn't set the 'modified' flag.

link.sh did not return an error on exit, which may cause Vim to start installing, even though there is no executable to install. (Riehm)

Vi incompatibility: In Vi "." redoes the "y" command. Added the 'y' flag to 'cpoptions'. Only for 'compatible' mode.

":echohl" defined a new group, when the argument was not an existing group.

"syn on" and ":syn off" could move the cursor, if there is a hidden buffer that is shorter that the current cursor position.

The " mark was not set when doing ":b file".

When a "nextgroup" is used with "skipwhite" in syntax highlighting, space at the end of the line made the nextgroup also be found in the next line.

":he g<CTRL-D>", then ":" and backspace to the start didn't redraw.

X11 GUI: "gvim -rv" reversed the colors twice on Sun. Now Vim checks if the
result is really reverse video (background darker than foreground).

"cat link.sh | vim -" didn't set syntax highlighting.

Win32: Expanding "file.sw?" matched ".file.swp". This is an error of
FindnextFile() that we need to work around. (Kilgore)

"gqgq" gave an "Invalid lnum" error on the last line.
Formatting with "gq" didn't format the first line after a change of comment
leader.

There was no check for out-of-memory in win_alloc().

"vim -h" didn't mention "-register" and "-unregister" for the OLE version.

Could not increase 'cmdheight' when the last window is only one line. Now
other windows are also made smaller, when necessary.

Added a few {} to avoid "suggest braces around" warnings from gcc 2.8.x.
Changed return type of main() from void to int. (Nam)

Using '~' twice in a substitute pattern caused a crash.

"syn on" and ":syn off" could scroll the window, if there is a hidden buffer
that is shorter that the current cursor position.

":if 0 | if 1 | endif | endif" didn't work. Same for ":while" and "elseif".

With two windows on modified files, with 'autowrite' set, cursor in second
window, ":qa" gave a warning for the file in the first window, but then
auto-wrote the file in the second window. (Webb)

Win32 GUI scrollbar could only handle 32767 lines. Also makes the
intellimouse wheel use the configurable number of scrolls. (Robinson)

When using 'patchmode', and the backup file is on another partition, the file
copying messed up the write-file message.

GUI X11: Alt-Backspace and Alt-Delete didn't work.

"`0" could put the cursor after the last character in the line, causing
trouble for other commands, like "i".

When completing tags in insert mode with ^X^], some matches were skipped,
because the compare with other tags was wrong. E.g., when "mnuFileSave" was
already there, "mnuFile" would be skipped. (Negri)

When scrolling up/down, a syntax item with "keepend" didn't work properly.
Now the flags are also stored for the syntax state at the start of each line.

When 'ic' was changed while 'hlsearch' is on, there was no redraw to show the
effect.

Win32 GUI: Don't display "No write since last chance" in a message box, but in the Vim window.

==
VERSION 5.2 version-5.2

Improvements made between version 5.1 and 5.2.

Long lines editable long-lines

A single long line that doesn't fit in the window doesn't show a line of @@@ anymore. Redrawing starts at a character further on in the line, such that the text around the cursor can be seen. This makes it possible to edit these long lines when wrapping is on.

File browser added file-browser-5.2

The Win32, Athena and Motif GUI bring up a file requester if the user asks to ":browse" for the ":e", ":w", ":r", ":so", ":redirect" and ":mkexrc/vimrc/vsess" commands. ":browse e /foo/bar" opens the requester in the /foo/bar directory, so you can have nice mapping rhs's like ":browse so $vim/macros". If no initial dir specified for ":browse e", can be compiled to either begin in the current directory, or that of the current buffer. (Negri and Kahn)
Added the 'browsedir' option, with value "current", "last" or "buffer". Tells whether a browse dialog starts in last used dir, dir of current buffer, or current dir. ":browse w" is unaffected.
The default menus have been changed to use the ":browse" command.

Dialogs added dialogs-added

Added the ":confirm" command. Works on ":e", ":q", ":w", ":cl". Win32, Athena and Motif GUI uses a window-dialog. All other platforms can use prompt in command-line. ":confirm qa" offers a choice to save all modified files.

confirm() function: allows user access to the confirm engine.

Added 'v' flag to 'guioptions'. When included, a vertical button layout is always used for the Win32 GUI dialog. Otherwise, a horizontal layout is preferred.

Win32 GUI: ":promptfind" and ":promptrepl" pop up a dialog to find/replace. To be used from a menu entry. (Negri)

Popup menu added popup-menu-added

When the 'mousemodel' option is set to "popup", the right mouse button displays the top level menu headed with "PopUp" as pop-up context menu. The "PopUp" menu is not displayed in the normal menu bar. This currently only works for Win32 and Athena GUI.

Select mode added new-Select-mode

A new mode has been added: "Select mode". It is like Visual mode, but typing a printable character replaces the selection.
- CTRL-G can be used to toggle between Visual mode and Select mode.
- CTRL-O can be used to switch from Select mode to Visual mode for one command.
- Added 'selectmode' option: tells when to start Select mode instead of Visual mode.
- Added 'mousemodel' option: Change use of mouse buttons.
- Added 'keymodel' option: tells to use shifted special keys to start a Visual or Select mode selection.
- Added ":behave". Can be used to quickly set 'selectmode', 'mousemodel' and 'keymodel' for MS-Windows and xterm behavior.
- The xterm-like selection is now called modeless selection.
- Visual mode mappings and menus are used in Select mode. They automatically switch to Visual mode first. Afterwards, reselect the area, unless it was deleted. The "gV" command can be used in a mapping to skip the reselection.
- Added the "gh", "gH" and "g^H" commands: start Select (highlight) mode.
- Backspace in Select mode deletes the selected area.

"mswin.vim" script. Sets behavior mostly like MS-Windows.

Session files added new-session-files

":mks[ession]" acts like "mkvimrc", but also writes the full filenames of the currently loaded buffers and current directory, so that :so'ing the file re-loads those files and cd's to that directory. Also stores and restores windows. File names are made relative to session file.
The 'sessionoptions' option sets behavior of ":mksession". (Negri)

User defined functions and commands new-user-defined

Added user defined functions. Defined with ":function" until ":endfunction". Called with "Func()". Allows the use of a variable number of arguments. Included support for local variables "l:name". Return a value with ":return". See :function .
Call a function with ":call". When using a range, the function is called for each line in the range. :call
"macros/justify.vim" is an example of using user defined functions.
User functions do not change the last used search pattern or the command to be redone with ".".

'maxfuncdepth' option. Restricts the depth of function calls. Avoids trouble
(crash because of out-of-memory) when a function uses endless recursion.

User definable Ex commands: ":command", ":delcommand" and ":comclear".
(Moore) See user-commands .

New interfaces interfaces-5.2

Tcl interface. (Wilken) See tcl .
Uses the ":tcl", ":tcldo" and "tclfile" commands.

Cscope support. (Kahn) (Sekera) See cscope .
Uses the ":cscope" and ":cstag" commands. Uses the options 'cscopeprg',
'cscopetag', 'cscopetagorder' and 'cscopeverbose'.

New ports ports-5.2

Amiga GUI port. (Nielsen) Not tested much yet!

RISC OS version. (Thomas Leonard) See riscos .
This version can run either with a GUI or in text mode, depending upon where
it is invoked.
Deleted the "os_archie" files, they were not working anyway.

Multi-byte support new-multi-byte

MultiByte support for Win32 GUI. (Baek)
The 'fileencoding' option decides how the text in the file is encoded.
":ascii" works for multi-byte characters. Multi-byte characters work on
Windows 95, even when using the US version. (Aaron)
Needs to be enabled in feature.h.
This has not been tested much yet!

New functions new-functions-5.2

browse()	puts up a file requester when available. (Negri)
escape()	escapes characters in a string with a backslash.
fnamemodify()	modifies a file name.
input()	asks the user to enter a line. (Aaron) There is a separate history for lines typed for the input() function.
argc()	
argv()	can be used to access the argument list.
winbufnr()	buffer number of a window. (Aaron)
winnr()	window number. (Aaron)
matchstr()	Return matched string.
setline()	Set a line to a string value.

New options   new-options-5.2

'allowrevins'   Enable the CTRL-_ command in Insert and Command-line mode.
'browsedir'   Tells in which directory a browse dialog starts.
'confirm'   when set, :q :w and :e commands always act as if ":confirm"
                 is used. (Negri)
'cscopeprg'
'cscopetag'
'cscopetagorder'
'cscopeverbose' Set the cscope behavior.
'filetype'   RISC-OS specific type of file.
'grepformat'
'grepprg'   For the :grep command.
'keymodel'   Tells to use shifted special keys to start a Visual or Select
                 mode selection.
'listchars'   Set character to show in 'list' mode for end-of-line, tabs and
                 trailing spaces. (partly by Smith) Also sets character to
                 display if a line doesn't fit when 'nowrap' is set.
'matchpairs'   Allows matching '<' with '>', and other single character
                 pairs.
'mousefocus'   Window focus follows mouse (partly by Terhaar). Changing the
                 focus with a keyboard command moves the pointer to that
                 window. Also move the pointer when changing the window layout
                 (split window, change window height, etc.).
'mousemodel'   Change use of mouse buttons.
'selection'   When set to "inclusive" or "exclusive", the cursor can go one
                 character past the end of the line in Visual or Select mode.
                 When set to "old" the old behavior is used. When
                 "inclusive", the character under the cursor is included in the
                 operation. When using "exclusive", the new "ve" entry of
                 'guicursor' is used. The default is a vertical bar.
'selectmode'   Tells when to start Select mode instead of Visual mode.
'sessionoptions' Sets behavior of ":mksession". (Negri)
'showfulltag'   When completing a tag in Insert mode, show the tag search
                 pattern (tidied up) as a choice as well (if there is one).
'swapfile'   Whether to use a swap file for a buffer.
'syntax'   When it is set, the syntax by that name is loaded. Allows for
                 setting a specific syntax from a modeline.
'ttymouse'   Allows using xterm mouse codes for terminals which name
                 doesn't start with "xterm".
'wildignore'   List of patterns for files that should not be completed at
                 all.
'wildmode'   Can be used to set the type of expansion for 'wildchar'.
                 Replaces the CTRL-T command for command line completion.
                 Don't beep when listing all matches.
'winaltkeys'   Win32 and Motif GUI. When "yes", ALT keys are handled
                 entirely by the window system. When "no", ALT keys are never
                 used by the window system. When "menu" it depends on whether
                 a key is a menu shortcut.
'winminheight'   Minimal height for each window. Default is 1. Set to 0 if
                 you want zero-line windows. Scrollbar is removed for

zero-height windows. (Negri)

New Ex commands new-ex-commands-5.2

:badd	Add file name to buffer list without side effects. (Negri)
:behave	Quickly set MS-Windows or xterm behavior.
:browse	Use file selection dialog.
:call	Call a function, optionally with a range.
:cnewer	
:colder	To access a stack of quickfix error lists.
:comclear	Clear all user-defined commands.
:command	Define a user command.
:continue	Go back to ":while".
:confirm	Ask confirmation if something unexpected happens.
:cscope	Execute cscope command.
:cstag	Use cscope to jump to a tag.
:delcommand	Delete a user-defined command.
:delfunction	Delete a user-defined function.
:endfunction	End of user-defined function.
:function	Define a user function.
:grep	Works similar to ":make". (Negri)
:mksession	Create a session file.
:nohlsearch	Stop 'hlsearch' highlighting for a moment.
:Print	This is Vi compatible. Does the same as ":print".
:promptfind	Search dialog (Win32 GUI).
:promptrepl	Search/replace dialog (Win32 GUI).
:return	Return from a user-defined function.
:simalt	Win32 GUI: Simulate alt-key pressed. (Negri)
:smagic	Like ":substitute", but always use 'magic'.
:snomagic	Like ":substitute", but always use 'nomagic'.
:tcl	Execute TCL command.
:tcldo	Execute TCL command for a range of lines.
:tclfile	Execute a TCL script file.
:tearoff	Tear-off a menu (Win32 GUI).
:tmenu	
:tunmenu	Win32 GUI: menu tooltips. (Negri)
:star :*	Execute a register.

Changed changed-5.2

Renamed functions:

```
buffer_exists()    -> bufexists()
buffer_name()      -> bufname()
buffer_number()    -> bufnr()
file_readable()    -> filereadable()
highlight_exists() -> hlexists()
highlightID()      -> hlID()
last_buffer_nr()   -> bufnr("$")
```

The old ones are still there, for backwards compatibility.

The CTRL-_ command in Insert and Command-line mode is only available when the new 'allowrevins' option is set. Avoids that people who want to type SHIFT-_ accidentally enter reverse Insert mode, and don't know how to get out.

When a file name path in ":tselect" listing is too long, remove a part in the middle and put "..." there.

Win32 GUI: Made font selector appear inside Vim window, not just any odd place. (Negri)

":bn" skips help buffers, unless currently in a help buffer. (Negri)

When there is a status line and only one window, don't show '^' in the status line of the current window.

":*" used to be used for "'<,'>", the Visual area. But in Vi it's used as an alternative for ":@". When 'cpoptions' includes '*' this is Vi compatible.

When 'insertmode' is set, using CTRL-O to execute a mapping will work like 'insertmode' was not set. This allows "normal" mappings to be used even when 'insertmode' is set.

When 'mouse' was set already (e.g., in the .vimrc file), don't automatically set 'mouse' when the GUI starts.

Removed the 'N', 'I' and 'A' flags from the 'mouse' option.

Renamed "toggle option" to "boolean option". Some people thought that ":set xyz" would toggle 'xyz' on/off each time.

The internal variable "shell_error" contains the error code from the shell, instead of just 0 or 1.

When inserting or replacing, typing CTRL-V CTRL-<CR> used to insert "<C-CR>". That is not very useful. Now the CTRL key is ignored and a <CR> is inserted. Same for all other "normal" keys with modifiers. Mapping these modified key combinations is still possible.
In Insert mode, <C-CR> and <S-Space> can be inserted by using CTRL-K and then the special character.

Moved "quotes" file to doc/quotes.txt, and "todo" file to doc/todo.txt. They are now installed like other documentation files.

winheight() function returns -1 for a non-existing window. It used to be zero, but that is a valid height now.

The default for 'selection' is "inclusive", which makes a difference when using "$" or the mouse to move the cursor in Visual mode.

":q!" does not exit when there are changed buffers which are hidden. Use ":qa!" to exit anyway.

Disabled the Perl/Python/Tcl interfaces by default. Not many people use them

and they make the executable a lot bigger. The internal scripting language is
now powerful enough for most tasks.

The strings from the 'titlestring' and 'iconstring' options are used
untranslated for the Window title and icon. This allows for including a <CR>.
Previously a <CR> would be shown as "^M" (two characters).

When a mapping is started in Visual or Select mode which was started from
Insert mode (the mode shows "(insert) Visual"), don't return to Insert mode
until the mapping has ended. Makes it possible to use a mapping in Visual
mode that also works when the Visual mode was started from Select mode.

Menus in $VIMRUNTIME/menu.vim no longer overrule existing menus. This helps
when defining menus in the .vimrc file, or when sourcing mswin.vim.

Unix: Use /var/tmp for .swp files, if it exists. Files there survive a
reboot (at least on Linux).

Added   added-5.2

--with-motif-lib configure argument. Allows for using a static Motif library.

Support for mapping numeric keypad +,-,*,/ keys. (Negri)
When not mapped, they produce the normal character.

Win32 GUI: When directory dropped on gVim, cd there and edit new buffer.
(Negri)

Win32 GUI: Made CTRL-Break work as interrupt, so that CTRL-C can be
used for mappings.

In the output of ":map", highlight the "*" to make clear it's not part of the
rhs. (Roemer)

When showing the Visual area, the cursor is not switched off, so that it can
be located. The Visual area is now highlighted with a grey background in the
GUI. This makes the cursor visible when it's also reversed.

Win32: When started with single full pathname (e.g. via double-clicked file),
cd to that file's directory. (Negri)

Win32 GUI: Tear-off menus, with ":tearoff <menu-name>" command. (Negri)
't' option to 'guioptions': Add tearoff menu items for Win32 GUI and Motif.
It's included by default.
Win32 GUI: tearoff menu with submenus is indicated with a ">>". (Negri)

Added ^Kaa and ^KAA digraphs.
Added "euro" symbol to digraph.c. (Corry)

Support for Motif menu shortcut keys, using '&' like MS-Windows (Ollis).
Other GUIs ignore '&' in a menu name.

DJGPP: Faster screen updating (John Lange).

Clustering of syntax groups ":syntax cluster" (Bigham).
Including syntax files: ":syntax include" (Bigham).

Keep column when switching buffers, when 'nosol' is set (Radics).

Number function for Perl interface.

Support for Intellimouse in Athena GUI. (Jensen)

":sleep" also accepts an argument in milliseconds, when "m" is used.

Added 'p' flag in 'guioptions': Install callbacks for enter/leave window
events. Makes cursor blinking work for Terhaar, breaks it for me.

"--help" and "--version" command-line arguments.

Non-text in ":list" output is highlighted with NonText.

Added text objects: "i(" and "i)" as synonym for "ib". "i{" and "i}" as
synonym for "iB". New: "i<" and "i>", to select <thing>. All this also for
"a" objects.

'O' flag in 'shortmess': message for reading a file overwrites any previous
message. (Negri)

Win32 GUI: 'T' flag in 'guioptions': switch toolbar on/off.
Included a list with self-made toolbar bitmaps. (Negri)

Added menu priority for sub-menus. Implemented for Win32 and Motif GUI.
Display menu priority with ":menu" command.
Default and Syntax menus now include priority for items. Allows inserting
menu items in between the default ones.

When the 'number' option is on, highlight line numbers with the LineNr group.

"Ignore" highlight group: Text highlighted with this is made blank. It is
used to hide special characters in the help text.

Included Exuberant Ctags version 2.3, with C++ support, Java support and
recurse into directories. (Hiebert)

When a tags file is not sorted, and this is detected (in a simplistic way), an
error message is given.

":unlet" accepts a "!", to ignore non-existing variables, and accepts more
than one argument. (Roemer)
Completion of variable names for ":unlet". (Roemer)

When there is an error in a function which is called by another function, show
the call stack in the error message.

New file name modifiers:

":.": reduce file name to be relative to current dir.
":~": reduce file name to be relative to home dir.
":s?pat?sub?": substitute "pat" with "sub" once.
":gs?pat?sub?": substitute "pat" with "sub" globally.

New configure arguments: --enable-min-features and --enable-max-features.
Easy way to switch to minimum or maximum features.

New compile-time feature: modify_fname. For file name modifiers, e.g,
"%:p:h". Can be disabled to save some code (16 bit DOS).

When using whole-line completion in Insert mode, and 'cindent' is set, indent
the line properly.

MSDOS and Win32 console: 'guicursor' sets cursor thickness. (Negri)

Included new set of Farsi fonts. (Shiran)

Accelerator text now also works in Motif. All menus can be defined with & for
mnemonic and TAB for accelerator text. They are ignored on systems that don't
support them.
When removing or replacing a menu, compare the menu name only up to the <Tab>
before the mnemonic.

'i' and 'I' flags after ":substitute": ignore case or not.

"make install" complains if the runtime files are missing.

Unix: When finding an existing swap file that can't be opened, mention the
owner of the file in the ATTENTION message.

The 'i', 't' and 'k' options in 'complete' now also print the place where they
are looking for matches. (Acevedo)

"gJ" command: Join lines without inserting a space.

Setting 'keywordprg' to "man -s" is handled specifically. The "-s" is removed
when no count given, the count is added otherwise. Configure checks if "man
-s 2 read" works, and sets the default for 'keywordprg' accordingly.

If you do a ":bd" and there is only one window open, Vim tries to move to a
buffer of the same type (i.e. non-help to non-help, help to help), for
consistent behavior to :bnext/:bprev. (Negri)

Allow "<Nop>" to be used as the rhs of a mapping. ":map xx <Nop>", maps "xx"
to nothing at all.

In a ":menu" command, "<Tab>" can be used instead of a real tab, in the menu
path. This makes it more easy to type, no backslash needed.

POSIX compatible character classes for regexp patterns: [:alnum:], [:alpha:],
[:blank:], [:cntrl:], [:digit:], [:graph:], [:lower:], [:print:], [:punct:],
[:space:], [:upper:] and [:xdigit:]. (Briscoe)

```
regexp character classes (for fast syntax highlight matching):
        digits:     \d [0-9]            \D  not digit (Roemer)
        hex:        \x [0-9a-fA-F]      \X  not hex
        octal:      \o [0-7]            \O  not octal
        word:       \w [a-zA-Z0-9_]     \W  not word
        head:       \h [a-zA-Z_]        \H  not head
        alphabetic: \a [a-zA-Z]         \A  not alphabetic
        lowercase:  \l [a-z]            \L  not lowercase
        uppercase:  \u [A-Z]            \U  not uppercase

":set" now accepts "+=", |^=" and "-=": add or remove parts of a string
option, add or subtract a number from a number option.  A comma is
automagically inserted or deleted for options that are a comma separated list.

Filetype feature, for autocommands.  Uses a file type instead of a pattern to
match a file.  Currently only used for RISC OS.  (Leonard)

In a pattern for an autocommand, environment variables can be used.  They are
expanded when the autocommand is defined.

"BufFilePre" and "BufFilePost" autocommand evens: Before and after applying
the ":file" command to change the name of a buffer.
"VimLeavePre" autocommand event: before writing the .viminfo file.

For autocommands argument: <abuf> is buffer number, like <afile>.

Made syntax highlighting a bit faster when scrolling backwards, by keeping
more syncing context.

Win32 GUI: Made scrolling faster by avoiding a redraw when deleting or
inserting screen lines.

GUI: Made scrolling faster by not redrawing the scrollbar when the thumb moved
less than a pixel.

Included ":highlight" in bugreport.vim.

Created install.exe program, for simplistic installation on DOS and
MS-Windows.

New register: '_', the black hole.  When writing to it, nothing happens.  When
reading from it, it's always empty.  Can be used to avoid a delete or change
command to modify the registers, or reduce memory use for big changes.

CTRL-V xff enters character by hex number.  CTRL-V o123 enters character by
octal number. (Aaron)

Improved performance of syntax highlighting by skipping check for "keepend"
when there isn't any.

Moved the mode message ("-- INSERT --") to the last line of the screen.  When
'cmdheight' is more than one, messages will remain readable.

When listing matching files, they are also sorted on 'suffixes', such that
```

they are listed in the same order as CTRL-N retrieves them.

synIDattr() takes a third argument (optionally), which tells for which
terminal type to get the attributes for. This makes it possible to run
2html.vim outside of gvim (using color names instead of #RRGGBB).

Memory profiling, only for debugging. Prints at exit, and with "g^A" command.
(Kahn)

DOS: When using a file in the current drive, remove the drive name:
"A:\dir\file" -> "\dir\file". This helps when moving a session file on a
floppy from "A:\dir" to "B:\dir".

Increased number of remembered jumps from 30 to 50 per window.

Command to temporarily disable 'hls' highlighting until the next search:
":nohlsearch".

"gp" and "gP" commands: like "p" and "P", but leave the cursor just after the
inserted text. Used for the CTRL-V command in MS-Windows mode.

Fixed   fixed-5.2

Win32 GUI: Could draw text twice in one place, for fake-bold text. Removed
this, Windows will handle the bold text anyway. (Negri)

patch 5.1.1: Win32s GUI: pasting caused a crash (Negri)

patch 5.1.2: When entering another window, where characters before the cursor
have been deleted, could have a cursor beyond the end of the line.

patch 5.1.3: Win32s GUI: Didn't wait for external command to finish. (Negri)

patch 5.1.4: Makefile.w32 can now also be used to generate the OLE version
(Scott).

patch 5.1.5: Crashed when using syntax highlighting: cursor on a line that
doesn't fit in the window, and splitting that line in two.

patch 5.1.6: Visual highlighting bug: After ":set nowrap", go to end of line
(so that the window scrolls horizontally), ":set wrap". Following Visual
selection was wrong.

patch 5.1.7: When 'tagbsearch' off, and 'ignorecase' off, still could do
binary searching.

patch 5.1.8: Win32 GUI: dragging the scrollbar didn't update the ruler.

patch 5.1.9: Using ":gui" in .vimrc, caused xterm cursor to disappear.

patch 5.1.10: A CTRL-N in Insert mode could cause a crash, when a buffer
without a name exists.

patch 5.1.11: "make test" didn't work in the shadow directory. Also adjusted "make shadow" for the links in the ctags directory.

patch 5.1.12: "buf 123foo" used "123" as a count, instead as the start of a buffer name.

patch 5.1.13: When completing file names on the command-line, reallocating the command-line may go wrong.

patch 5.1.14: ":[nvci]unmenu" removed menu for all modes, when full menu patch specified.

Graceful handling of NULLs in drag-dropped file list. Handle passing NULL to Fullname_save(). (Negri)

Win32: ":!start" to invoke a program without opening a console, swapping screens, or waiting for completion in either console or gui version, e.g. you can type ":!start winfile". ALSO fixes "can't delete swapfile after spawning a shell" bug. (enhancement of Aaron patch) (Negri)

Win32 GUI: Fix CTRL-X default keymapping to be more Windows-like. (Negri)

Shorten filenames on startup. If in /foo/bar, entering "vim ../bar/bang.c" displays "bang.c" in status bar, not "/foo/bar/bang.c" (Negri)

Win32 GUI: No copy to Windows clipboard when it's not desired.

Win32s: Fix pasting from clipboard - made an assumption not valid under Win32s. (Negri)

Win32 GUI: Speed up calls to gui_mch_draw_string() and cursor drawing functions. (Negri)

Win32 GUI: Middle mouse button emulation now works in GUI! (Negri)

Could skip messages when combining commands in one line, e.g.:
":echo "hello" | write".

Perl interpreter was disabled before executing VimLeave autocommands. Could not use ":perl" in them. (Aaron)

Included patch for the Intellimouse (Aaron/Robinson).

Could not set 'ls' to one, when last window has only one line. (Mitterand)

Fixed a memory leak when removing menus.

After ":only" the ruler could overwrite a message.

Dos32: removed changing of __system_flags. It appears to work better when it's left at the default value.

p_aleph was an int instead of along, caused trouble on systems where

sizeof(int) != sizeof(long). (Schmidt)

Fixed enum problems for Ultrix. (Seibert)

Small redraw problem: "dd" on last line in file cleared wrong line.

Didn't interpret "cmd | endif" when "cmd" starts with a range. E.g. "if 0 |
.d | endif".

Command "+|" on the last line of the file caused ml_get errors.

Memory underrun in eval_vars(). (Aaron)

Don't rename files in a difficult way, except on Windows 95 (was also done on
Windows NT).

Win32 GUI: An external command that produces an error code put the error
message in a dialog box. had to close the window and close the dialog. Now
the error code is displayed in the console. (Negri)

"comctl32.lib" was missing from the GUI libraries in Makefile.w32. (Battle)

In Insert mode, when entering a window in Insert mode, allow the cursor to be
one char beyond the text.

Renamed machine dependent rename() to mch_rename(). Define mch_rename() to
rename() when it works properly.

Rename vim_chdir() to mch_chdir(), because it's machine dependent.

When using an arglist, and editing file 5 of 4, ":q" could cause "-1 more
files to edit" error.

In if_python.c, VimCommand() caused an assertion when a do_cmdline() failed.
Moved the Python_Release_Vim() to before the VimErrorCheck(). (Harkins)

Give an error message for an unknown argument after "--". E.g. for "vim
--xyz".

The FileChangedShell autocommand didn't set <afile> to the name of the changed
file.

When doing ":e file", causing the attention message, there sometimes was no
hit-enter prompt. Caused by empty line or "endif" at end of sourced file.

A large number of patches for the VMS version. (Hunsaker)

When CTRL-L completion (find longest match) results in a shorter string, no
completion is done (happens with ":help").

Crash in Win32 GUI version, when using an Ex "@" command, because
LinePointers[] was used while not initialized.

Win32 GUI: allow mapping of Alt-Space.

Output from "vim -h" was sent to stderr. Sending it to stdout is better, so one can use "vim -h | more".

In command-line mode, ":vi[!]" should reload the file, just like ":e[!]".
In Ex mode, ":vi" stops Ex mode, but doesn't reload the file. This is Vi compatible.

When using a ":set ls=1" in the .gvimrc file, would get a status line for a single window. (Robinson)

Didn't give an error message for ":set ai,xx". (Roemer)
Didn't give an error message for ":set ai?xx", ":set ai&xx", ":set ai!xx".

Non-Unix systems: That a file exists but is unreadable is recognized as "new file". Now check for existence when file can't be opened (like Unix).

Unix: osdef.sh didn't handle declarations where the function name is at the first column of the line.

DJGPP: Shortening of file names didn't work properly, because get_cwd() returned a path with backslashes. (Negri)

When using a 'comments' part where a space is required after the middle part, always insert a space when starting a new line. Helps for C comments, below a line with "/****".

Replacing path of home directory with "~/" could be wrong for file names with embedded spaces or commas.

A few fixes for the Sniff interface. (Leherbauer)

When asking to hit 'y' or 'n' (e.g. for ":3,1d"), using the mouse caused trouble. Same for ":s/x/y/c" prompt.

With 'nowrap' and 'list', a Tab halfway on the screen was displayed as blanks, instead of the characters specified with 'listchars'. Also for other characters that take more than one screen character.

When setting 'guifont' to an unknown font name, the previous font was lost and a default font would be used. (Steed)

DOS: Filenames in the root directory didn't get shortened properly. (Negri)

DJGPP: making a full path name out of a file name didn't work properly when there is no _fullpath() function. (Negri)

Win32 console: ":sh" caused a crash. (Negri)

Win32 console: Setting 'lines' and/or 'columns' in the _vimrc failed miserably (could hang Windows 95). (Negri)

Win32: The change-drive function was not correct, went to the wrong drive. (Tsindlekht)

GUI: When editing a command line in Ex mode, Tabs were sometimes not
backspaced properly, and unprintable characters were displayed directly.
non-GUI can still be wrong, because a system function is called for this.

":set" didn't stop after an error. For example ":set no ai" gave an error for
"no", but still set "ai". Now ":set" stops after the first error.

When running configure for ctags, $LDFLAGS wasn't passed to it, causing
trouble for IRIX.

"@%" and "@#" when file name not set gave an error message. Now they just
return an empty string. (Steed)

CTRL-X and CTRL-A didn't work correctly with negative hex and octal numbers.
(Steed)

":echo" always started with a blank.

Updating GUI cursor shape didn't always work (e.g., when blinking is off).

In silent Ex mode ("ex -s" or "ex <file") ":s///p" didn't print a line. Also
a few other commands that explicitly print a text line didn't work. Made this
Vi compatible.

Win32 version of _chdrive() didn't return correct value. (Tsindlekht)

When using 't' in 'complete' option, no longer give an error message for a
missing tags file.

Unix: tgoto() can return NULL, which was not handled correctly in configure.

When doing ":help" from a buffer where 'binary' is set, also edited the help
file in binary mode. Caused extra ^Ms for DOS systems.

Cursor position in a file was reset to 1 when closing a window.

":!ls" in Ex mode switched off echo.

When doing a double click in window A, while currently in window B, first
click would reset double click time, had to click three times to select a
word.

When using <F11> in mappings, ":mkexrc" produced an exrc file that can't be
used in Vi compatible mode. Added setting of 'cpo' to avoid this. Also, add
a CTRL-V in front of a '<', to avoid a normal string to be interpreted as a
special key name.

Gave confusing error message for ":set guifont=-*-lucida-*": first "font is
not fixed width", then "Unknown font".

Some options were still completely left out, instead of included as hidden
options.

While running the X11 GUI, ignore SIGHUP signals. Avoids a crash after executing an external command (in rare cases).

In os_unixx.h, signal() was defined to sigset(), while it already was.

Memory leak when executing autocommands (was reported as a memory leak in syntax highlighting).

Didn't print source of error sometimes, because pointers were the same, although names were different.

Avoid a number of UMR errors from Purify (third argument to open()).

A swap file could still be created just after setting 'updatecount' to zero, when there is an empty buffer and doing ":e file". (Kutschera)

Test 35 failed on 64 bit machines. (Schild)

With "p" and "P" commands, redrawing was slow.

Awk script for html documentation didn't work correctly with AIX awk.
Replaced "[,.);\]   ]" with "[] ,.);   ]". (Briscoe)
The makehtml.awk script had a small problem, causing extra lines to be inserted. (Briscoe)

"gqgq" could not be repeated. Repeating for "gugu" and "gUgU" worked in a wrong way. Also made "gqq" work to be consistent with "guu".

C indent was wrong after "case ':':".

":au BufReadPre *.c put": Line from put text was deleted, because the buffer was still assumed to be empty.

Text pasted with the Edit/Paste menu was subject to 'textwidth' and 'autoindent'. That was inconsistent with using the mouse to paste. Now "*p is used.

When using CTRL-W CTRL-] on a word that's not a tag, and then CTRL-] on a tag, window was split.

":ts" got stuck on a tags line that has two extra fields.

In Insert mode, with 'showmode' on, <C-O><C-G> message was directly overwritten by mode message, if preceded with search command warning message.

When putting the result of an expression with "=<expr>p, newlines were inserted like ^@ (NUL in the file). Now the string is split up in lines at the newline.

putenv() was declared with "const char *" in pty.c, but with "char *" in osdef2.h.in. Made the last one also "const char *".

":help {word}", where +{word} is a feature, jumped to the feature list instead of where the command was explained. E.g., ":help browse", ":help autocmd".

Using the "\<xx>" form in an expression only got one byte, even when using a
special character that uses several bytes (e.g., "\<F9>").
Changed "\<BS>" to produce CTRL-H instead of the special key code for the
backspace key. "\<Del>" produces 0x7f.

":mkvimrc" didn't write a command to set 'compatible' or 'nocompatible'.

The shell syntax didn't contain a "syn sync maxlines" setting. In a long file
without recognizable items, syncing took so long it looked like Vim hangs.
Added a maxlines setting, and made syncing interruptible.

The "gs" command didn't flush output before waiting.

Memory leaks for:
    ":if 0 | let a = b . c | endif"
    "let a = b[c]"
    ":so {file}" where {file} contains a ":while"

GUI: allocated fonts were never released. (Leonard)

Makefile.bor:
- Changed $(DEFINES) into a list of "-D" options, so that it can also be used
  for the resource compiler. (not tested!)
- "bcc.cfg" was used for all configurations. When building for another
  configuration, the settings for the previous one would be used. Moved
  "bcc.cfg" to the object directory. (Geddes)
- Included targets for vimrun, install, ctags and xxd. Changed the default to
  use the Borland DLL Runtime Library, makes Vim.exe a log smaller. (Aaron)

"2*" search for the word under the cursor with "2" prepended. (Leonard)

When deleting into a specific register, would still overwrite the non-Win32
GUI selection. Now ""x"*P works.

When deleting into the "" register, would write to the last used register.
Now ""x always writes to the unnamed register.

GUI Athena: A submenu with a '.' in it didn't work. E.g.,
":amenu Syntax.XY\.Z.foo lll".

When first doing ":tag foo" and then ":tnext" and/or ":tselect" the order of
matching tags could change, because the current file is different. Now the
existing matches are kept in the same order, newly found matches are added
after them, not matter what the current file is.

":ta" didn't find the second entry in a tags file, if the second entry was
longer than the first one.

When using ":set si tw=7" inserting "foo {^P}" made the "}" inserted at the
wrong position. can_si was still TRUE when the cursor is not in the indent of
the line.

Running an external command in Win32 version had the problem that Vim exits

when the X on the console is hit (and confirmed). Now use the "vimrun"
command to start the external command indirectly. (Negri)

Win32 GUI: When running an external filter, do it in a minimized DOS box.
(Negri)

":let" listed variables without translation into printable characters.

Win32 console: When resizing the window, switching back to the old size
(when exiting or executing an external command) sometimes failed. (Negri)
This appears to also fix a "non fixable" problem:
Win32 console in NT 4.0: When running Vim in a cmd window with a scrollbar,
the scrollbar disappeared and was not restored when Vim exits. This does work
under NT 3.51, it appears not to be a Vim problem.

When executing BufDelete and BufUnload autocommands for a buffer without a
name, the name of the current buffer was used for <afile>.

When jumping to a tag it reported "tag 1 of >2", while in fact there could be
only two matches. Changed to "tag 1 of 2 or more".

":tjump tag" did a linear search in the tags file, which can be slow.

Configure didn't find "LibXm.so.2.0", a Xm library with a version number.

Win32 GUI: When using a shifted key with ALT, the shift modifier would remain
set, even when it was already used by changing the used key. E.g., "<M-S-9>"
resulted in "<M-S-(>", but it should be "<M-(>". (Negri)

A call to ga_init() was often followed by setting growsize and itemsize.
Created ga_init2() for this, which looks better. (Aaron)

Function filereadable() could call fopen() with an empty string, which might
be illegal.

X Windows GUI: When executing an external command that outputs text, could
write one character beyond the end of a buffer, which caused a crash. (Kohan)

When using "*" or "#" on a string that includes '/' or '?' (when these are
included in 'isk'), they were not escaped. (Parmelan)

When adding a ToolBar menu in the Motif GUI, the submenu_id field was not
cleared, causing random problems.

When adding a menu, the check if this menu (or submenu) name already exists
didn't compare with the simplified version (no mnemonic or accelerator) of the
new menu. Could get two menus with the same name, e.g., "File" and "&File".

Breaking a line because of 'textwidth' at the last line in the window caused a
redraw of the whole window instead of a scroll. Speeds up normal typing with
'textwidth' a lot for slow terminals.

An invalid line number produced an "invalid range" error, even when it wasn't
to be executed (inside "if 0").

When the unnamed, first buffer is re-used, the "BufDelete" autocommand was
not called. It would stick in a buffer list menu.

When doing "%" on the NUL after the line, a "{" or "}" in the last character
of the line was not found.

The Insert mode menu was not used for the "s" command, the Operator-pending
menu was used instead.

With 'compatible' set, some syntax highlighting was not correct, because of
using "[\t]" for a search pattern. Now use the regexps for syntax
highlighting like the 'cpoptions' option is empty (as was documented already).

When using "map <M-Space> ms" or "map <Space> sss" the output of ":map" didn't
show any lhs for the mapping (if 'isprint' includes 160). Now always use
<Space> and <M-Space>, even when they are printable.

Adjusted the Syntax menu, so that the lowest entry fits on a small screen (for
Athena, where menus don't wrap).

When using CTRL-E or CTRL-Y in Insert mode for characters like 'o', 'x' and
digits, repeating the insert didn't work.

The file "tools/ccfilter.README.txt" could not be unpacked when using short
file names, because of the two dots. Renamed it to
"tools/ccfilter_README.txt".

For a dark 'background', using Blue for Directory and SpecialKey highlight
groups is not very readable. Use Cyan instead.

In the function uc_scan_attr() in ex_docmd.c there was a goto that jumped into
a block with a local variable. That's illegal for some compilers.

Win32 GUI: There was a row of pixels at the bottom of the window which was not
drawn. (Aaron)

Under DOS, editing "filename/" created a swap file of "filename/.swp". Should
be "filename/_swp".

Win32 GUI: pointer was hidden when executing an external command.

When 'so' is 999, "J" near the end of the file didn't redisplay correctly.

":0a" inserted after the first line, instead of before the first line.

Unix: Wildcard expansion didn't handle single quotes and {} patterns. Now
":file 'window.c'" removes the quotes and ":e 'main*.c'" works (literal '*').
":file {o}{n}{e}" now results in file name "one".

Memory leak when setting a string option back to its default value.

==
VERSION 5.3   version-5.3

Version 5.3 was a bug-fix version of 5.2. There are not many changes.
Improvements made between version 5.2 and 5.3:

Changed   changed-5.3

Renamed "IDE" menu to "Tools" menu.

Added   added-5.3

Win32 GUI: Give a warning when Vim is activated, and one of the files changed
since editing started. (Negri)

Fixed   fixed-5.3

5.2.1: Win32 GUI: space for external command was not properly allocated, could
cause a crash. (Aaron) This was the reason to bring out 5.3 quickly after
5.2.

5.2.2: Some commands didn't complain when used without an argument, although
they need one: ":badd", ":browse", ":call", ":confirm", ":behave",
":delfunction", ":delcommand" and ":tearoff".
":endfunction" outside of a function gave wrong error message: "Command not
implemented". Should be ":endfunction not inside a function".

5.2.3: Win32 GUI: When gvim was installed in "Program files", or another path
with a space in it, executing external commands with vimrun didn't work.

5.2.4: Pasting with the mouse in Insert mode left the cursor on the last
pasted character, instead of behind it.

5.2.5: In Insert mode, cursor after the end of the line, a shift-cursor-left
didn't include the last character in the selection.

5.2.6: When deleting text from Insert mode (with "<C-O>D" or the mouse), which
includes the last character in the line, the cursor could be left on the last
character in the line, instead of just after it.

5.2.7: Win32 GUI: scrollbar was one pixel too big.

5.2.8: Completion of "PopUp" menu showed the derivatives "PopUpc", "PopUPi",
etc. ":menu" also showed these.

5.2.9: When using two input() functions on a row, the prompt would not be
drawn in column 0.

5.2.10: A loop with input() could not be broken with CTRL-C.

5.2.11: ":call asdf" and ":call asdf(" didn't give an error message.

5.2.12: Recursively using ":normal" crashes Vim after a while. E.g.:
":map gq :normal gq<CR>"

5.2.13: Syntax highlighting used 'iskeyword' from wrong buffer. When using
":help", then "/\k*" in another window with 'hlsearch' set.

5.2.14: When using ":source" from a function, global variables would not be
available unless "g:" was used.

5.2.15: XPM files can have the extension ".pm", which is the same as for Perl
modules. Added "syntax/pmfile.vim" to handle this.

5.2.16: On Win32 and Amiga, "echo expand("%:p:h")" removed one dirname in an
empty buffer. mch_Fullname() didn't append a slash at the end of a directory
name.

Should include the character under the cursor in the Visual area when using
'selection' "exclusive". This wasn't done for "%", "e", "E", "t" and "f".

""p would always put register 0, instead of the unnamed (last used) register.
Reverse the change that ""x doesn't write in the unnamed (last used) register.
It would always write in register 0, which isn't very useful. Use "-x for the
paste mappings in Visual mode.

When there is one long line on the screen, and 'showcmd' is off, "0$" didn't
redraw the screen.

Win32 GUI: When using 'mousehide', the pointer would flicker when the cursor
shape is changed. (Negri)

When cancelling Visual mode, and the cursor moves to the start, the wanted
column wasn't set, "k" or "j" moved to the wrong column.

When using ":browse" or ":confirm", was checking for a comment and separating
bar, which can break some commands.

Included fixes for Macintosh. (Kielhorn)

==
VERSION 5.4   version-5.4

Version 5.4 adds new features, useful changes and a lot of bug fixes.

Runtime directory introduced   new-runtime-dir

The distributed runtime files are now in $VIMRUNTIME, the user files in $VIM.
You normally don't set $VIMRUNTIME but let Vim find it, by using
$VIM/vim{version}, or use $VIM when that doesn't exist. This allows for
separating the user files from the distributed files and makes it more easy to
upgrade to another version. It also makes it possible to keep two versions of
Vim around, each with their own runtime files.

In the Unix distribution the runtime files have been moved to the "runtime"
directory. This makes it possible to copy all the runtime files at once,
without the need to know what needs to be copied.

The archives for DOS, Windows, Amiga and OS/2 now have an extra top-level
"vim" directory. This is to make clear that user-modified files should be put
here. The directory that contains the executables doesn't have '-' or '.'
characters. This avoids strange extensions.

The $VIM and $VIMRUNTIME variables are set when they are first used. This
allows them to be used by Perl, for example.

The runtime files are also found in a directory called "$VIM/runtime". This
helps when running Vim after just unpacking the runtime archive. When using
an executable in the "src" directory, Vim checks if "vim54" or "runtime" can
be added after removing it. This make the runtime files be found just after
compiling.

A default for $VIMRUNTIME can be given in the Unix Makefile. This is useful
if $VIM doesn't point to above the runtime directory but to e.g., "/etc/".

Filetype introduced   new-filetype-5.4

Syntax files are now loaded with the new FileType autocommand. Old
"mysyntaxfile" files will no longer work. filetypes

The scripts for loading syntax highlighting have been changed to use the
new Syntax autocommand event.

This combination of Filetype and Syntax events allows tuning the syntax
highlighting a bit more, also when selected from the Syntax menu. The
FileType autocommand can also be used to set options and mappings specifically
for that type of file.

The "$VIMRUNTIME/filetype.vim" file is not loaded automatically. The
":filetype on" command has been added for this. ":syntax on" also loads it.

The 'filetype' option has been added. It is used to trigger the FileType
autocommand event, like the 'syntax' option does for the Syntax event.

":set syntax=OFF" and ":set syntax=ON" can be used (in a modeline) to switch
syntax highlighting on/off for the current file.

The Syntax menu commands have been moved to $VIMRUNTIME/menu.vim. The Syntax
menu is included both when ":filetype on" and when ":syntax manual" is used.

Renamed the old 'filetype' option to 'osfiletype'. It was only used for
RISCOS. 'filetype' is now used for the common file type.

Added the ":syntax manual" command. Allows manual selection of the syntax to
be used, e.g., from a modeline.

Vim script line continuation   new-line-continuation

When an Ex line starts with a backslash, it is concatenated to the previous
line. This avoids the need for long lines. line-continuation (Roemer)
Example:

```
        if   has("dialog_con") ||
           \ has("dialog_gui")
            :let result = confirm("Enter your choice",
                                  \ "&Yes\n&No\n&Maybe",
                                  \ 2)
        endif
```

Improved session files   improved-sessions

New words for 'sessionoptions':
- "help"   Restore the help window.
- "blank"   Restore empty windows.
- "winpos"   Restore the Vim window position. Uses the new ":winpos"
                command
- "buffers"   Restore hidden and unloaded buffers. Without it only the
                buffers in windows are restored.
- "slash"   Replace backward by forward slashes in file names.
- "globals"   Store global variables.
- "unix"   Use unix file format (<NL> instead of <CR><NL>)

The ":mksession" and 'sessionoptions' are now in the +mksession feature.

The top line of the window is also restored when using a session file.

":mksession" and ":mkvimrc" don't store 'fileformat', it should be detected
when loading a file.

(Most of this was done by Vince Negri and Robert Webb)

Autocommands improved   improved-autocmds-5.4

New events:
 FileType   When the file type has been detected.
 FocusGained   When Vim got input focus. (Negri)
 FocusLost   When Vim lost input focus. (Negri)
 BufCreate   Called just after a new buffer has been created or has been
                renamed. (Madsen)
 CursorHold   Triggered when no key has been typed for 'updatetime'. Can be
                used to do something with the word under the cursor. (Negri)
                Implemented CursorHold autocommand event for Unix. (Zellner)
                Also for Amiga and MS-DOS.
 GUIEnter   Can be used to do something with the GUI window after it has

```
                been created (e.g., a ":winpos 100 50").
 BufHidden      When a buffer becomes hidden.  Used to delete the
                option-window when it becomes hidden.
```

Also trigger BufDelete just before a buffer is going to be renamed. (Madsen)

The "<amatch>" pattern can be used like "<afile>" for autocommands, except that it is the matching value for the FileType and Syntax events.

When ":let @/ = <string>" is used in an autocommand, this last search pattern will be used after the autocommand finishes.

Made loading autocommands a bit faster. Avoid doing strlen() on each exiting pattern for each new pattern by remembering the length.

Encryption new-encryption

Files can be encrypted when writing and decrypted when reading. Added the 'key' option, "-x" command line argument and ":X" command. encryption (based on patch from Mohsin Ahmed)

When reading a file, there is an automatic detection whether it has been crypted. Vim will then prompt for the key.

Note that the encryption method is not compatible with Vi. The encryption is not unbreakable. This allows it to be exported from the US.

GTK GUI port new-GTK-GUI

New GUI port for GTK+. Includes a toolbar, menu tearoffs, etc. gui-gtk Added the :helpfind command. (Kahn and Dalecki)

Menu changes menu-changes-5.4

Menus can now also be used in the console. It is enabled by the new 'wildmenu' option. This shows matches for command-line completion like a menu. This works as a minimal file browser.

The new :emenu command can be used to execute a menu item.

Uses the last status line to list items, or inserts a line just above the command line. (Negri)

The 'wildcharx' option can be used to trigger 'wildmenu' completion from a mapping.

When compiled without menus, this can be detected with has("menu"). Also show this in the ":version" output. Allow compiling GUI versions without menu

support. Only include toolbar support when there is menu support.

Moved the "Window" menu all the way to the right (priority 70). Looks more
familiar for people working with MS-Windows, shouldn't matter for others.

Included "Buffers" menu. Works with existing autocommands and functions. It
can be disabled by setting the "no_buffers_menu" variable. (Aaron and Madsen)

Win32 supports separators in a menu: "-.*-". (Geddes)
Menu separators for Motif now work too.

Made Popup menu for Motif GUI work. (Madsen)

'M' flag in 'guioptions': Don't source the system menu.

All the menu code has been moved from gui.c to menu.c.

Viminfo improved   improved-viminfo

New flags for 'viminfo':
'!'   Store global variables in the viminfo file if they are in uppercase
        letters. (Negri)
'h'   Do ":nohlsearch" when loading a viminfo file.

Store search patterns in the viminfo file with their offset, magic, etc. Also
store the flag whether 'hlsearch' highlighting is on or off (which is not used
if the 'h' flag is in 'viminfo').

Give an error message when setting 'viminfo' without commas.

Various new commands   new-commands-5.4

Operator g? : rot13 encoding. (Negri)

 zH and zL commands: Horizontal scrolling by half a page.
 gm move cursor to middle of screen line. (Ideas by Campbell)

Operations on Visual blocks: v_b_I , v_b_A , v_b_c , v_b_C , v_b_r ,
 v_b_< and v_b_> . (Kelly)

New command: CTRL-\ CTRL-N, which does nothing in Normal mode, and goes to
Normal mode when in Insert or Command-line mode. Can be used by VisVim or
other OLE programs to make sure Vim is in Normal mode, without causing a beep.
 CTRL-_CTRL-N

":cscope kill" command to use the connection filename. :cscope (Kahn)

 :startinsert command: Start Insert mode next.

 :history command, to show all four types of histories. (Roemer)

[m , [M ,]m and]M commands, for jumping backward/forward to start/end of method in a (Java) class.

":@*" executes the * register. :@ (Acevedo)

go and :goto commands: Jump to byte offset in the file.

gR and gr command: Virtual Replace mode. Replace characters without changing the layout. (Webb)

":cd -" changes to the directory from before the previous ":cd" command. :cd- (Webb)

Tag preview commands :ptag . Shows the result of a ":tag" in a dedicated window. Can be used to see the context of the tag (e.g., function arguments). (Negri)
:pclose command, and CTRL-W CTRL-Z: Close preview window. (Moore)
'previewheight' option, height for the preview window.
Also :ppop , :ptnext , :ptprevious , :ptNext , :ptrewind , :ptlast .

:find and :sfind commands: Find a file in 'path', (split window) and edit it.

The :options command opens an option window that shows the current option values. Or use ":browse set" to open it. Options are grouped by function. Offers short help on each option. Hit <CR> to jump to more help. Edit the option value and hit <CR> on a "set" line to set a new value.

Various new options new-options-5.4

Scroll-binding: 'scrollbind' and 'scrollopt' options. Added :syncbind command. Makes windows scroll the same amount (horizontally and/or vertically). (Ralston)

'conskey' option for MS-DOS. Use direct console I/O. This should work with telnet (untested!).

'statusline' option: Configurable contents of the status line. Also allows showing the byte offset in the file. Highlighting with %1* to %9*, using the new highlight groups User1 to User9. (Madsen)

'rulerformat' option: Configurable contents of the ruler, like 'statusline'. (Madsen)

'write' option: When off, writing files is not allowed. Avoids overwriting a file even with ":w!". The -m command line option resets 'write'.

'clipboard' option: How the clipboard is used. Value "unnamed": Use unnamed register like "*. (Cortopassi) Value "autoselect": Like what 'a' in 'guioptions' does but works in the terminal.

'guifontset' option: Specify fonts for the +fontset feature, for the X11 GUI versions. Allows using normal fonts when vim is compiled with this feature. (Nam)

'guiheadroom' option: How much room to allow above/below the GUI window. Used for Motif, Athena and GTK.

Implemented 'tagstack' option: When off, pushing tags onto the stack is disabled (Vi compatible). Useful for mappings.

'shellslash' option. Only for systems that use a backslash as a file separator. This option will use a forward slash in file names when expanding it. Useful when 'shell' is sh or csh.

'pastetoggle' option: Key sequence that toggles 'paste'. Works around the problem that mappings don't work in Insert mode when 'paste' is set.

'display' option: When set to "lastline", the last line fills the window, instead of being replaced with "@" lines. Only the last three characters are replaced with "@@@", to indicate that the line has not finished yet.

'switchbuf' option: Allows re-using existing windows on a buffer that is being jumped to, or split the window to open a new buffer. (Roemer)

'titleold' option. Replaces the fixed string "Thanks for flying Vim", which is used to set the title when exiting. (Schild)

Vim scripts   new-script-5.4

The exists() function can also check for existence of a function. (Roemer)
An internal function is now found with a binary search, should be a bit faster. (Roemer)

New functions:
- getwinposx() and getwinposy() : get Vim window position. (Webb)
- histnr() , histadd() , histget() and histdel() : Make history available. (Roemer)
- maparg() : Returns rhs of a mapping. Based on a patch from Vikas.
- mapcheck() : Check if a map name matches with an existing one.
- visualmode() : Return type of last Visual mode. (Webb)
- libcall() : Call a function in a library. Currently only for Win32. (Negri)
- bufwinnr() : find window that contains the specified buffer. (Roemer)
- bufloaded() : Whether a buffer exists and is loaded.
- localtime() and getftime() : wall clock time and last modification time of a file (Webb)
- glob() : expand file name wildcards only.
- system() : get the raw output of an external command. (based on a patch from Aaron).
- strtrans() : Translate String into printable characters. Used for 2html.vim script.
- append() : easy way to append a line of text in a buffer.

Changed functions:
- Optional argument to strftime() to give the time in seconds. (Webb)
- expand() now also returns names for files that don't exist.

Allow numbers in the name of a user command. (Webb)

Use "v:" for internal Vim variables: "v:errmsg", "v:shell_error", etc. The ones from version 5.3 can be used without "v:" too, for backwards compatibility.

New variables:
"v:warningmsg" and "v:statusmsg" internal variables. Contain the last given warning and status message. v:warningmsg v:statusmsg (Madsen)
"v:count1" variable: like "v:count", but defaults to one when no count is used. v:count1

When compiling without expression evaluation, "if 1" can be used around the not supported commands to avoid it being executed. Works like in Vim 4.x. Some of the runtime scripts gave errors when used with a Vim that was compiled with minimal features. Now "if 1" is used around code that is not always supported.

When evaluating an expression with && and ||, skip the parts that will not influence the outcome. This makes it faster and avoids error messages. (Webb)
Also optimized the skipping of expressions inside an "if 0".

Avoid hit-enter prompt avoid-hit-enter

Added 'T' flag to 'shortmess': Truncate all messages that would cause the hit-enter prompt (unless that would happen anyway).
The 'O' flag in 'shortmess' now also applies to quickfix messages, e.g., from the ":cn" command.

The default for 'shortmess' is now "filnxtToO", to make most messages fit on the command line, and not cause the hit-enter prompt.

Previous messages can be viewed with the new :messages command.

Some messages are shown fully, even when 'shortmess' tells to shorten messages, because the user is expected to want to see them in full: CTRL-G and some quickfix commands.

Improved quickfix improved-quickfix

Parse change-directory lines for gmake: "make[1]: Entering directory 'name'".
Uses "%D" and "%X" in 'errorformat'.
Also parse "Making {target} in {dir}" messages from make. Helps when not using GNU make. (Schandl)

Use 'isfname' for "%f" in 'errorformat'.

Parsing of multi-line messages. errorformat-multi-line

Allow a range for the :clist command. (Roemer)

Support for "global" file names, for error formats that output the file name
once for several errors. (Roemer)

 :cnfile jumps to first error in next file.

"$*" in 'makeprg' is replaced by arguments to ":make". (Roemer)

Regular expressions   regexp-changes-5.4

In a regexp, a '$' before "\)" is also considered to be an end-of-line. /$
In patterns "^" after "\|" or "\(" is a start-of-line. /^ (Robinson)

In a regexp, in front of "\)" and "\|" both "$" and "\$" were considered
end-of-line. Now use "$" as end-of-line and "\$" for a literal dollar. Same
for '^' after "\(" and "\|". /\$ /\^

Some search patterns can be extremely slow, even though they are not really
illegal. For example: "\([^a-z]\+\)\+Q". Allow interrupting any regexp
search with CTRL-C.

Register "/: last search string (read-only). (Kohan) Changed to use last used
search pattern (like what 'hlsearch' uses). Can set the search pattern with
":let @/ = {expr}".

Added character classes to search patterns, to avoid the need for removing the
'l' flag from 'cpoptions': [:tab:] , [:return:] , [:backspace:] and
 [:escape:] .

By adding a '?' after a comparative operator in an expression, the comparison
is done by ignoring case. expr-==?

Other improvements made between version 5.3 and 5.4

Changed   changed-5.4

Unix: Use $TMPDIR for temporary files, if it is set and exists.

Removed "Empty buffer" message. It isn't useful and can cause a hit-enter
prompt. (Negri)

"ex -" now reads commands from stdin and works in silent mode. This is to be
compatible with the original "ex" command that is used for scripts.

Default range for ":tcldo" is the whole file.

Cancelling Visual mode with ESC moved the cursor. There appears to be no reason for this. Now leave the cursor where it is.

The ":grep" and ":make" commands see " as part of the arguments, instead of the start of a comment.

In expressions the "=~" and "!~" operators no longer are affected by 'ignorecase'.

Renamed vimrc_example to vimrc_example.vim and gvimrc_example to gvimrc_example.vim. Makes them being recognized as vim scripts.

"gd" no longer starts searching at the end of the previous function, but at the first blank line above the start of the current function. Avoids that using "gd" in the first function finds global a variable.

Default for 'complete' changed from ".,b" to ".,w,b,u,t,i". Many more matches will be found, at the cost of time (the search can be interrupted).

It is no longer possible to set 'shell*' options from a modeline. Previously only a warning message was given. This reduces security risks.

The ordering of the index of documentation files was changed to make it more easy to find a subject.

On MS-DOS and win32, when $VIM was not set, $HOME was used. This caused trouble if $HOME was set to e.g., "C:\" for some other tool, the runtime files would not be found. Now use $HOME only for _vimrc, _gvimrc, etc., not to find the runtime file.

When 'tags' is "./{fname}" and there is no file name for the current buffer, just use it. Previously it was skipped, causing "vim -t {tag}" not to find many tags.

When trying to select text in the 'scrolloff' area by mouse dragging, the resulting scrolling made this difficult. Now 'scrolloff' is temporarily set to 0 or 1 to avoid this. But still allow scrolling in the top line to extend to above the displayed text.

Default for 'comments' now includes "sl:/*,mb: *,ex:*/", to make javadoc comments work. Also helps for C comments that start with "/*******".

CTRL-X CTRL-] Insert mode tag expansion tried to expand to all tags when used after a non-ID character, which can take a very long time. Now limit this to 200 matches. Also used for command-line tag completion.

The OS/2 distribution has been split in two files. It was too big to fit on a floppy. The same runtime archive as for the PC is now used.

In the documentation, items like <a-z> have been replaced with {a-z} for non-optional arguments. This avoids confusion with key names: <C-Z> is a CTRL-Z, not a character between C and Z, that is {C-Z}.

Added   added-5.4

Color support for the iris-ansi builtin termcap entry. (Tubman)

Included VisVim version 1.3a. (Erhardt)

Win32 port for SNiFF+ interface. (Leherbauer)
Documentation file for sniff interface: if_sniff.txt. (Leherbauer)

Included the "SendToVim" and "OpenWithVim" programs in the OleVim directory.
To be used with the OLE version of gvim under MS-Windows. (Schaller)

Included Exuberant Ctags version 3.2.4 with Eiffel support. (Hiebert)

When a file that is being edited is deleted, give a warning (like when the
time stamp changed).

Included newer versions of the HTML-generating Awk and Perl scripts. (Colombo)

Linux console mouse support through "gpm". (Tsindlekht)

Security fix: Disallow changing 'secure' and 'exrc' from a modeline. When
'secure' is set, give a warning for changing options that contain a program
name.

Made the Perl interface work with Perl 5.005 and threads. (Verdoolaege)

When giving an error message for an ambiguous mapping, include the offending
mapping. (Roemer)

Command line editing:
- Command line completion of mappings. (Roemer)
- Command line completion for ":function", ":delfunction", ":let", ":call",
  ":if", etc. (Roemer)
- When using CTRL-D completion for user commands that have
  "-complete=tag_listfiles" also list the file names. (Madsen)
- Complete the arguments of the ":command" command. (Webb)
- CTRL-R . in command line inserts last inserted text. CTRL-F, CTRL-P, CTRL-W
  and CTRL-A after CTRL-R are used to insert an object from under the cursor.
  (Madsen)

Made the text in uganda.txt about copying Vim a bit more clear.

Updated the Vim tutor. Added the "vimtutor" command, which copies the tutor
and starts Vim on it. "make install" now also copies the tutor.

In the output of ":clist" the current entry is highlighted, with the 'i'
highlighting (same as used for 'incsearch').

For the ":clist" command, you can scroll backwards with "b" (one screenful),
"u" (half a screenful) and "k" (one line).

Multi-byte support:
- X-input method for multi-byte characters. And various fixes for multi-byte
  support. (Nam)
- Hangul input method feature: hangul . (Nam)
- Cleaned up configuration of multi-byte support, XIM, fontset and Hangul
  input. Each is now configurable separately.
- Changed check for GTK_KEYBOARD to HANGUL_KEYBOARD_TYPE. (Nam)
- Added doc/hangulin.txt: Documentation for the Hangul input code. (Nam)
- XIM support for GTK+. (Nam)
- First attempt to include support for SJIS encoding. (Nagano)
- When a double-byte character doesn't fit at the end of the line, put a "~"
  there and print it on the next line.
- Optimize output of multi-byte text. (Park)
- Win32 IME: preedit style is like over-the-spot. (Nagano)
- Win32 IME: IME mode change now done with ImmSetOpenStatus. (Nagano)
- GUI Athena: file selection dialog can display multi-byte characters.
  (Nagano)
- Selection reply for XA_TEXT as XA_STRING. (Nagano)

"runtime/macros/diffwin.vim". Mappings to make a diff window. (Campbell)

Added ".obj" to the 'suffixes' option.

Reduced size of syntax/synload.vim by using the ":SynAu" user command.
Automated numbering of Syntax menu entries in menu.vim.
In the Syntax menu, insert separators between syntax names that start with
a different letter. (Geddes)

Xterm:
- Clipboard support when using the mouse in an xterm. (Madsen)
- When using the xterm mouse, track dragging of the mouse. Use xterm escape
  sequences when possible. It is more precise than other methods, but
  requires a fairly recent xterm version. It is enabled with "xterm2" in
  'ttymouse'. (Madsen)
- Check xterm patch level, to set the value of 'ttymouse'. Has only been
  added to xterm recently (patch level > 95). Uses the new 't_RV' termcap
  option. Set 'ttymouse' to "xterm2" when a correct response is recognized.
  Will make xterm mouse dragging work better.
- Support for shifted function keys on xterm. Changed codes for shifted
  cursor keys to what the xterm actually produces. Added codes for shifted
  <End> and <Home>.
- Added 't_WP' to set the window position in pixels and 't_WS' to set the
  window size in characters. Xterm can now move (used for ":winpos") and
  resize (use for ":set lines=" and ":set columns=").

X11:
- When in Visual mode but not owning the selection, display the Visual area
  with the VisualNOS group to show this. (Madsen)
- Support for requesting the type of clipboard support. Used for AIX and
  dtterm. (Wittig)
- Support compound_text selection (even when compiled without multi-byte).

Swap file:
- New variation for naming swap files: Replace path separators into %, place

  all swap files in one directory. Used when a name in 'dir' ends in two path
  separators. (Madsen)
- When a swap file is found, show whether it contains modifications or not in
  the informative message. (Madsen)
- When dialogs are supported, use a dialog to ask the user what to do when a
  swapfile already exists.

"popup_setpos" in 'mousemodel' option. Allows for moving the cursor when
using the right mouse button.

When a buffer is deleted, the selection for which buffer to display instead
now uses the most recent entry from the jump list. (Madsen)

When using CTRL-O/CTRL-I, skip deleted buffers.

A percentage is shown in the ruler, when there is room.

Used autoconf 1.13 to generate configure.

Included get_lisp_indent() from Dirk van Deun. Does better Lisp indenting
when 'p' flag in 'cpoptions' is not included.

Made the 2html.vim script quite a bit faster. (based on ideas from Geddes)

Unix:
- Included the name of the user that compiled Vim and the system name it was
  compiled on in the version message.
- "make install" now also installs the "tools" directory. Makes them
  available for everybody.
- "make check" now does the same as "make test". "make test" checks for
  Visual block mode shift, insert, replace and change.
- Speed up comparing a file name with existing buffers by storing the
  device/inode number with the buffer.
- Added configure arguments "--disable-gtk", "--disable-motif" and
  "--disable-athena", to be able to disable a specific GUI (when it doesn't
  work).
- Renamed the configure arguments for disabling the check for specific GUIs.
  Should be clearer now. (Kahn)
- On a Digital Unix system ("OSF1") check for the curses library before
  termlib and termcap. (Schild)
- "make uninstall_runtime" will only delete the version-specific files. Can
  be used to delete the runtime files of a previous version.

Macintosh: (St-Amant)
- Dragging the scrollbar, like it's done for the Win32 GUI. Moved common code
  from gui_w32.c to gui.c
- Added dialogs and file browsing.
- Resource fork preserved, warning when it will be lost.
- Copy original file attributes to newly written file.
- Set title/notitle bug solved.
- Filename completion improved.
- Grow box limit resize to a char by char size.
- Use of rgb.txt for more colors (but give back bad color).
- Apple menu works (beside the about...).

- Internal border now vim compliant.
- Removing a menu doesn't crash anymore.
- Weak-linking of Python 1.5.1 (only on PPC). Python is supported when the
  library is available.
- If an error is encountered when sourcing the users .vimrc, the alert box now
  shows right away with the OK button defaulted. There's no more "Delete"-key
  sign at the start of each line
- Better management of environment variables. Now $VIM is calculated only
  once, not regenerated every time it is used.
- No more CPU hog when in background.
- In a sourced Vim script the Mac file format can be recognized, just like DOS
  file format is.

When both "unix" and "mac" are present in 'fileformats', prefer "mac" format
when there are more CR than NL characters.
When using "mac" fileformat, use CR instead of a NL, because NL is used for
NUL. Will preserve all characters in a file. (Madsen)

The DOS install.exe now contains checks for an existing installation. It
avoids setting $VIM and $PATH again.
The install program for Dos/Windows can now install Vim in the popup menu, by
adding two registry keys.

Port to EGCS/mingw32. New Makefile.ming. (Aaron)

DOS 16 bit: Don't include cursor shape stuff. Save some bytes.

TCL support to Makefile.w32. (Duperval)

OS/2: Use argv[0] to find runtime files.

When using "gf" to go to a buffer that has already been used, jump to the
line where the cursor last was.

Colored the output of ":tselect" a bit more. Different highlighting between
tag name and file name. Highlight field name ("struct:") separately from
argument.

Backtick expansion for non-Unix systems. Based on a patch from Aaron.
Allows the use of things like ":n `grep -l test *.c`" and
"echo expand('`ls m*`')".

Check for the 'complete' option when it is set. (Acevedo)
'd' flag in 'complete' searches for defined names or macros.
While searching for Insert mode completions in include files and tags files,
check for typeahead, so that you can use matches early. (Webb)
The '.' flag in 'complete' now scans the current buffer completely, ignoring
'nowrapscan'. (Webb)

Added '~' flag to 'whichwrap'. (Acevedo)

When ending the Visual mode (e.g., with ESC) don't grab ownership of the
selection.

In a color terminal, "fg" and "bg" can be used as color names. They stand for
the "Normal" colors.

A few cscope cleanups. (Kahn)

Included changed vimspell.sh from Schemenauer.

Concatenation of strings in an expression with "." is a bit faster. (Roemer)

The ":redir" command can now redirect to a register: ":redir @r". (Roemer)

Made the output of ":marks" and ":jumps" look similar. When the mark is in
the current file, show the text at the mark. Also for ":tags".

When configure finds ftello() and fseeko(), they are used in tag.c (for when
you have extremely big tags files).

Configure check for "-FOlimit,2000" argument for the compiler. (Borsenkow)

GUI:
- When using ":gui" in a non-GUI Vim, give a clear error message.
- "gvim -v" doesn't start the GUI (if console support is present).
- When in Ex mode, use non-Visual selection for the whole screen.
- When starting with "gvim -f" and using ":gui" in the .gvimrc file, Vim
  forked anyway. Now the "-f" flag is remembered for ":gui". Added "gui -b"
  to run gvim in the background anyway.

Motif GUI:
- Check for "-lXp" library in configure (but it doesn't work yet...).
- Let configure check for Lesstif in "/usr/local/Lesstif/Motif*". Changed the
  order to let a local Motif version override a system standard version.

Win32 GUI:
- When using "-register" or "-unregister" in the non-OLE version, give an
  error message.
- Use GTK toolbar icons. Make window border look better. Use sizing handles
  on the lower left&right corners of the window. (Negri)
- When starting an external command with ":!start" and the command can not be
  executed, give an error message. (Webb)
- Use sizing handles for the grey rectangles below the scrollbars. Can draw
  toolbar in flat mode now, looks better. (Negri)
- Preparations for MS-Windows 3.1 addition. Mostly changing WIN32 to MSWIN
  and USE_GUI_WIN32 to USE_GUI_MSWIN. (Negri)

Avoid allocating the same string four times in buflist_findpat(). (Williams)

Set title and icon text with termcap options 't_ts', 't_fs', 't_IS' and
't_IE'. Allows doing this on any terminal that supports setting the title
and/or icon text. (Schild)

New 'x' flag in 'comments': Automatically insert the end part when its last
character is typed. Helps to close a /* */ comment in C. (Webb)

When expand() has a second argument which is non-zero, don't use 'suffixes'

and 'wildignore', return all matches.

'O' flag in 'cpoptions' When not included, Vim will not overwrite a file, if it didn't exist when editing started but it does exist when the buffer is written to the file. The file must have been created outside of Vim, possibly without the user knowing it. When this is detected after a shell command, give a warning message.

When editing a new file, CTRL-G will show [New file]. When there were errors while reading the file, CTRL-G will show [Read errors].

":wall" can now use a dialog and file-browsing when needed.

Grouped functionality into new features, mainly to reduce the size of the minimal version:

+linebreak:	'showbreak', 'breakat' and 'linebreak'
+visualextra:	"I"nsert and "A"ppend in Visual block mode, "c"hange all lines in a block, ">" and "<": Shifting a block, "r": Replacing a Visual area with one character.
+comments:	'comments'
+cmdline_info:	'ruler' and 'showcmd'. Replaces +showcmd.
"+title"	Don't add code to set title or icon for MSDOS, this was not possible anyway.
+cmdline_compl	Disable commandline completion at compile time, except for files, directories and help items.

Moved features from a list of function calls into an array. Should save a bit of space.

While entering the body of a function, adjust indent according to "if" and "while" commands.

VMS: Adjusted os_vms.mms a bit according to suggestions from Arpadffy.

The flags in the 'comments' option can now include an offset. This makes it possible to align "/*****", "/*   xxx" and "/*" comments with the same 'comments' setting. The default value for 'comments' uses this.
Added 'O' flag: Don't use this part for the "O" command. Useful for "set com=sO:*\ -,mO:*\ \ ,exO:*/"

FileType autocommands recognize ".bak", ".orig" and "~" extensions and remove them to find the relevant extension.

The tutorial for writing a Vim script file has been extended.

Some more highlighting in help files, for items that are not typed literally.

Can use "CTRL-W CTRL-G" like "CTRL-W g".

"make test" for OS/2.

Adjusted configure to automatically use the GUI for BeOS.

Fixed fixed-5.4

5.3.1: When using an autocommand for BufWritePre that changes the name of the buffer, freed memory would be used. (Geddes)

Mac: Compiler didn't understand start of skip_class_name().

Win32 GUI:
- When cancelling the font requester, don't give an error message.
- When a tearoff-menu is open and its menu is deleted, Vim could crash. (Negri)
- There was a problem on Windows 95 with (un)maximizing the window. (Williams)
- when 'mousehide' is set, the mouse would stay hidden when a menu is dropped with the keyboard. (Ralston)
- The tempname() function already created the file. Caused problems when using ":w". Now the file is deleted.
- Cursor disappeared when ending up in the top-left character on the screen after scrolling. (Webb)
- When adding a submenu for a torn-off menu, it was not updated.
- Menu tooltip was using the toolbar tooltip. (Negri)
- Setting 'notitle' didn't remove the title. (Steed)
- Using ":!start cmd" scrolled the screen one line up, and didn't wait for return when the command wasn't found.

Cscope interface: Sorting of matches was wrong. Starting the interface could fail. (Kahn)

Motif GUI: Could not compile with Motif 1.1, because some tear-off functionality was not in #ifdefs.

Configure could sometimes not compile or link the test program for sizeof(int) properly. This caused alignment problems for the undo structure allocations. Added a safety check that SIZEOF_INT is not zero.

Added configure check to test if strings.h can be included after string.h. Some systems can't handle it.
Some systems need both string.h and strings.h included. Adjusted vim.h for that. Removed including string.h from os_unixx.h, since it's already in vim.h. (Savage)
AIX: defining _NO_PROTO in os_unix.h causes a conflict between string.h and strings.h, but after the configure check said it was OK. Also define _NO_PROTO for AIX in the configure check. (Winn)

When closing a window with CTRL-W c, the value of 'hidden' was not taken into account, the buffer was always unloaded. (Negri)

Unix Makefile: "make install" always tried to rename an older executable and remove it. This caused an error message when it didn't exit. Added a check for the existence of an old executable.
The command line for "make install" could get too long, because of the many syntax files. Now first do a "cd" to reduce the length.

On RISCOS and MSDOS, reading a file could fail, because the short filename was used, which can be wrong after a ":!cd".

In the DOS versions, the wrong install.exe was included (required Windows). Now the install.exe version is included that is the same as the Vim version. This also supports long file names where possible.

When recording, and stopping while in Insert mode with CTRL-O q, the CTRL-O would also be recorded.

32bit DOS version: "vim \file", while in a subdirectory, resulted in "new file" for "file" in the local directory, while "\file" did exist. When "file" in the current directory existed, this didn't happen.

MSDOS: Mouse could not go beyond 80 columns in 132 columns mode. (Young)

"make test" failed in the RedHat RPM, because compatible is off by default.

In Insert mode <C-O><C-W><C-W> changes to other window, but the status bars were not updated until another character was typed.

MSDOS: environment options in lowercase didn't work, although they did in the Win32 versions. (Negri)

After ":nohlsearch", a tag command switched highlighting back on.

When using "append" command as the last line in an autocommand, Vim would crash.

RISCOS: The scroll bumpers (?) were not working properly. (Leonard)

"zl" and "zh" could move the cursor, but this didn't set the column in which e.g., "k" would move the cursor.

When doing ":set all&" the value of 'scroll' was not set correctly. This caused an error message when later setting any other number option.

When 'hlsearch' highlighting has been disabled with ":nohlsearch", incremental searching would switch it back on too early.

When listing tags for ":tselect", and using a non-search command, and the last character was equal to the first (e.g., "99"), the last char would not be shown.

When searching for tags with ":tag" Vim would assume that all matches had been found when there were still more (e.g. from another tags file).

Win32: Didn't recognize "c:\" (e.g., in tags file) as absolute path when upper/lowercase was different.

Some xterms (Debian) send <Esc>OH for HOME and <Esc>OF for END. Added these to the builtin-xterm.

In ex mode, any CR was seen as the end of the line. Only a NL should be

handled that way. broke ":s/foo/some^Mtext/".

In menu.vim, a vmenu was used to override an amenu. That didn't work, because the system menu file doesn't overwrite existing menus. Added explicit vunmenu to solve this.

Configure check for terminal library could find a library that doesn't work at runtime (Solaris: shared library not found). Added a check that a program with tgoto() can run correctly.

Unix: "echo -n" in the Makefile doesn't work on all systems, causing errors compiling pathdef.c. Replaced it with "tr".

Perl: DO_JOIN was redefined by Perl. Undefined it in the perl files.

Various XIM and multi-byte fixes:
- Fix user cannot see his language while he is typing his language with off-the-spot method. (Nagano)
- Fix preedit position using text/edit area (using gui.wid). (Nagano)
- remove 'fix dead key' codes. It was needed since XNFocusWindow was "x11_window", XNFocusWindow is now gui.wid. (Nagano)
- Remove some compile warnings and fix typos. (Namsh)
- For status area, check the gtk+ version while Vim runs. I believe it is better than compile time check. (Namsh)
- Remove one FIXME for gtk+-xim. (Namsh)
- XIM: Dead keys didn't work for Czech. (Vyskovsky)
- Multibyte: If user input only 3byte such as mb1_mb2_eng or eng_mb1_mb2 VIM could convert it to special character. (Nam)
- Athena/Motif with XIM: fix preedit area. (Nam)
- XIM: Composed strings were sometimes ignored. Vim crashed when compose string was longer than 256 bytes. IM's geometry control is fixed. (Nam, Nagano)
- Win32 multi-byte: hollowed cursor width on a double byte char was wrong. (Nagano)
- When there is no GUI, selecting XIM caused compilation problems. Automatically disable XIM when there is no GUI in configure.
- Motif and Athena: When compiled with XIM, but the input method was not enabled, there would still be a status line. Now the status line is gone if the input method doesn't work. (Nam)

Win32: tooltip was not removed when selecting a parent menu (it was when selecting a menu entry). (Negri)

Unix with X: Some systems crash on exit, because of the XtCloseDisplay() call. Removed it, it should not be necessary when exiting.

Win32: Crash on keypress when compiled with Borland C++. (Aaron)

When checking for Motif library files, prefer the same location as the include files (with "include" replaced with "lib") above another entry.

Athena GUI: Changed "XtOffset()" in gui_at_fs.c to "XtOffsetOf()", like it's used in gui_x11.c.

Win32: When testing for a timestamp of a file on floppy, would get a dialog box when the floppy has been removed. Now return with an error. (Negri)

Win32 OLE: When forced to come to the foreground, a minimized window was still minimized, now it's restored. (Zivkov)

There was no check for a positive 'shiftwidth'. A negative value could cause a hangup, a zero value a crash.

Athena GUI: horizontal scrollbar wasn't updated correctly when clicking right or left of the thumb.

When making a Visual-block selection in one window, and trying to scroll another, could cause errors for accessing non-existent line numbers.

When 'matchpairs' contains "`:'", jumping from the ` to the ' didn't work properly.

Changed '\"' to '"' to make it compatible with old C compilers.

The command line expansion for mappings caused a script with a TAB between lhs and rhs of a map command to fail. Assume the TAB is to separate lhs and rhs when there are no mappings to expand.

When editing a file with very long lines with 'scrolloff' set, "j" would sometimes end up in a line which wasn't displayed.

When editing a read-only file, it was completely read into memory, even when it would not fit. Now create a swap file for a read-only file when running out of memory while reading the file.

When using ":set cino={s,e-s", a line after "} else {" was not indented properly. Also added a check for this in test3.in.

The Hebrew mapping for the command line was remembered for the next command line. That isn't very useful, a command is not Hebrew. (Kol)

When completing file names with embedded spaces, like "Program\ files", this didn't work. Also for user commands. Moved backslash_halve() down to mch_expandpath().

When using "set mouse=a" in Ex mode, mouse events were handled like typed text. Then typing "quit" screwed up the mouse behavior of the xterm.

When repeating an insert with "." that contains a CTRL-Y, a number 5 was inserted as "053".

Yanking a Visual area, with the cursor past the line, didn't move the cursor back onto the line. Same for "~", "u", "U" and "g?"

Win32: Default for 'grepprg' could be "findstr /n" even though there is no findstr.exe (Windows 95). Check if it exists, and fall back to "grep -n" if it doesn't.

Because gui_mouse_moved() inserted a leftmouse click in the input buffer,
remapping a leftmouse click caused strange effects. Now Insert another code
in the input buffer. Also insert a leftmouse release, to avoid the problem
with ":map <LeftMouse> l" that the next release is seen as the release for the
focus click.

With 'wrap' on, when using a line that doesn't fit on the screen, if the start
of the Visual area is before the start of the screen, there was no
highlighting. Also, 'showbreak' doesn't work properly.

DOS, Win32: A pattern "[0-9]\+" didn't work in autocommands.

When creating a swap file for a buffer which isn't the current buffer, could
get a mixup of short file name, resulting in a long file name when a short
file name was required. makeswapname() was calling modname() instead of
buf_modname().

When a function caused an error, and the error message was very long because
of recursiveness, this would cause a crash.

'suffixes' were always compared with matching case. For MS-DOS, Win32 and
OS/2 case is now ignored.

The use of CHARBITS in regexp.c didn't work on some Linux. Don't use it.

When generating a script file, 'cpo' was made empty. This caused backslashes
to disappear from mappings. Set it to "B" to avoid that.

Lots of typos in the documentation. (Campbell)

When editing an existing (hidden) buffer, jump to the last used cursor
position. (Madsen)

On a Sun the xterm screen was not restored properly when suspending. (Madsen)

When $VIMINIT is processed, 'nocompatible' was only set after processing it.

Unix: Polling for a character wasn't done for GPM, Sniff and Xterm clipboard
all together. Cleaned up the code for using select() too.

When executing external commands from the GUI, some typeahead was lost. Added
some code to regain as much typeahead as possible.

When the window height is 5 lines or fewer, <PageDown> didn't use a one-line
overlap, while <PageUp> does. Made sure that <PageUp> uses the same overlap
as <PageDown>, so that using them both always displays the same lines.

Removed a few unused functions and variables (found with lint).

Dictionary completion didn't use 'infercase'. (Raul)

Configure tests failed when the Perl library was not in LD_LIBRARY_PATH.
Don't use the Perl library for configure tests, add it to the linker line only
when linking Vim.

When using ncurses/terminfo, could get a 't_Sf' and 't_Sb' termcap entry that has "%d" instead of "%p1%d". The light background colors didn't work then.

GTK GUI with ncurses: Crashed when starting up in tputs(). Don't use tputs() when the GUI is active.

Could use the ":let" command to set the "count", "shell_error" and "version" variables, but that didn't work. Give an error message when trying to set them.

On FreeBSD 3.0, tclsh is called tclsh8.0. Adjusted configure.in to find it.

When Vim is linked with -lncurses, but python uses -ltermcap, this causes trouble: "OOPS". Configure now removes the -ltermcap.

:@" and :*" didn't work properly, because the " was recognized as the start of a comment.

Win32s GUI: Minimizing the console where a filter command runs in caused trouble for detecting that the filter command has finished. (Negri)

After executing a filter command from an xterm, the mouse would be disabled. It would work again after changing the mode.

Mac GUI: Crashed in newenv(). (St-Amant)

The menus and mappings in mswin.vim didn't handle text ending in a NL correctly. (Acevedo)

The ":k" command didn't check if it had a valid argument or extra characters. Now give a meaningful error message. (Webb)

On SGI, the signal function doesn't always have three arguments. Check for struct sigcontext to find out. Might still be wrong...

Could crash when using 'hlsearch' and search pattern is "^".

When search patterns were saved and restored, status of no_hlsearch was not also saved and restored (from ":nohlsearch" command).

When using setline() to make a line shorter, the cursor position was not adjusted.

MS-DOS and Win95: When trying to edit a file and accidentally adding a slash or backslash at the end, the file was deleted. Probably when trying to create the swap file. Explicitly check for a trailing slash or backslash before trying to read a file.

X11 GUI: When starting the GUI failed and received a deadly signal while setting the title, would lock up when trying to exit, because the title is reset again. Avoid using mch_settitle() recursively.

X11 GUI: When starting the GUI fails, and then trying it again, would crash,

because argv[] has been freed and x11_display was reset to NULL.

Win32: When $HOME was set, would put "~user" in the swap file, which would never compare with a file name, and never cause the attention message. Put the full path in the swap file instead.

Win32 console: There were funny characters at the end of the "vim -r" swap files message (direct output of CR CR LF).

DOS 32 bit: "vim -r" put the text at the top of the window.

GUI: With 'mousefocus' set, got mouse codes as text with "!sleep 100" or "Q".

Motif and Win32 GUI: When changing 'guifont' to a font of the same size the screen wasn't redrawn.

Unix: When using ":make", jumping to a file b.c, which is already open as a symbolic link a.c, opened a new buffer instead of using the existing one.

Inserting text in the current buffer while sourcing the .vimrc file would cause a crash or hang. The memfile for the current buffer was never allocated. Now it's allocated as soon as something is written in the buffer.

DOS 32 bit: "lightblue" background worked for text, but not drawn parts were black.

DOS: Colors of console were not restored upon exiting.

When recording, with 'cmdheight' set to 2 and typing Esc> in Insert mode caused the "recording" message to be doubled.

Spurious "file changed" messages could happen on Windows. Now tolerate a one second difference, like for Linux.

GUI: When returning from Ex mode, scrollbars were not updated.

Win32: Copying text to the clipboard containing a <CR>, pasting it would replace it with a <NL> and drop the next character.

Entering a double byte character didn't work if the second byte is in [xXoO]. (Eric Lee)

vim_realloc was both defined and had a prototype in proto/misc2.pro. Caused conflicts on Solaris.

A pattern in an autocommand was treated differently on DOS et al. than on Unix. Now it's the same, also when using backslashes.

When using <Tab> twice for command line completion, without a match, the <Tab> would be inserted. (Negri)

Bug in MS-Visual C++ 6.0 when compiling ex_docmd.c with optimization. (Negri)

Testing the result of mktemp() for failure was wrong. Could cause a crash.

(Peters)

GUI: When checking for a ".gvimrc" file in the current directory, didn't check for a "_gvimrc" file too.

Motif GUI: When using the popup menu and then adding an item to the menu bar, the menu bar would get very high.

Mouse clicks and special keys (e.g. cursor keys) quit the more prompt and dialogs. Now they are ignored.

When at the more-prompt, xterm selection didn't work. Now use the 'r' flag in 'mouse' also for the more-prompt.

When selecting a Visual area of more than 1023 lines, with 'guioptions' set to "a", could mess up the display because of a message in free_yank(). Removed that message, except for the Amiga.

Moved auto-selection from ui_write() to the screen update functions. Avoids unexpected behavior from a low-level function. Also makes the different feedback of owning the selection possible.

Vi incompatibility: Using "i<CR>" in an indent, with 'ai' set, used the original indent instead of truncating it at the cursor. (Webb)

":echo x" didn't stop at "q" for the more prompt.

Various fixes for Macintosh. (St-Amant)

When using 'selectmode' set to "exclusive", selecting a word and then using CTRL-] included the character under the cursor.

Using ":let a:name" in a function caused a crash. (Webb)

When using ":append", an empty line didn't scroll up.

DOS etc.: A file name starting with '!' didn't work. Added '!' to default for 'isfname'.

BeOS: Compilation problem with prototype of skip_class_name(). (Price)

When deleting more than one line, e.g., with "de", could still use "U" command, which didn't work properly then.

Amiga: Could not compile ex_docmd.c, it was getting too big. Moved some functions to ex_cmds.c.

The expand() function would add a trailing slash for directories.

Didn't give an error message when trying to assign a value to an argument of a function. (Webb)

Moved including sys/ptem.h to after termios.h. Needed for Sinix.

OLE interface: Don't delete the object in CVimCF::Release() when the reference count becomes zero. (Cordell)
VisVim could still crash on exit. (Erhardt)

"case a: case b:" (two case statements in one line) aligned with the second case. Now it uses one 'sw' for indent. (Webb)

Font initialisation wasn't right for Athena/Motif GUI. Moved the call to highlight_gui_started() gui_mch_init() to gui_mch_open(). (Nam)

In Replace mode, backspacing over a TAB before where the replace mode started while 'sts' is different from 'ts', would delete the TAB.

Win32 console: When executing external commands and switching between the two console screens, Vim would copy the text between the buffers. That caused the screen to be messed up for backtick expansion.

":winpos -1" then ":winpos" gave wrong error message.

Windows commander creates files called c:\tmp\$wc\abc.txt. Don't remove the backslash before the $. Environment variables were not expanded anyway, because of the backslash before the dollar.

Using "-=" with ":set" could remove half a part when it contains a "\,".
E.g., ":set path+=a\\,b" and then "set path-=b" removed ",b".

When Visually selecting lines, with 'selection' set to "inclusive", including the last char of the line, "<<" moved an extra line. Also for other operators that always work on lines.

link.sh changed "-lnsl_s" to "_s" when looking for "nsl" to be removed.
Now it only remove whole words.

When jumped to a mark or using "fz", and there is an error, the current column was lost. E.g. when using "$fzj".

The "g CTRL-G" command could not be interrupted, even though it can take a long time.

Some terminals do have <F4> and <xF4>. <xF4> was always interpreted as <F4>.
Now map <xF4> to <F4>, so that the user can override this.

When compiling os_win32.c with MIN_FEAT the apply_autocmds() should not be used. (Aaron)

This autocommand looped forever: ":au FileChangedShell * nested e <afile>"
Now FileChangeShell never nests. (Roemer)

When evaluating an ":elseif" that was not going to matter anyway, ignore errors. (Roemer)

GUI Lesstif: Tearoff bar was the last item, instead of the first.

GUI Motif: Colors of tear-off widgets was wrong when 't' flag added to

'guioptions' afterwards. When 't' flag in 'guioptions' is excluded, would still get a tearoff item in a new menu.

An inode number can be "long long". Use ino_t instead of long. Added configure check for ino_t.

Binary search for tags was using a file offset "long" instead of "off_t".

Insert mode completion of tags was not using 'ignorecase' properly.

In Insert mode, the <xFn> keys were not properly mapped to <Fn> for the default mappings. Also caused errors for ":mkvimrc" and ":mksession".

When jumping to another window while in Insert mode, would get the "warning: changing readonly file" even when not making a change.

A '(' or '{' inside a trailing "//" comment would disturb C-indenting.
When using two labels below each other, the second one was not indented properly. Comments could mess up C-indenting in many places. (Roemer)

Could delete or redefine a function while it was being used. Could cause a crash.
In a function it's logical to prepend "g:" to a system variable, but this didn't work. (Roemer)

Hangul input: Buffer would overflow when user inputs invalid key sequence. (Nam)

When BufLoad or BufEnter autocommands change the topline of the buffer in the window, it was overruled and the cursor put halfway the window. Now only put the cursor halfway if the autocommands didn't change the topline.

Calling exists("&option") always returned 1. (Roemer)

Win32: Didn't take actually available memory into account. (Williams)

White space after an automatically inserted comment leader was not removed when 'ai' is not set and <CR> hit just after inserting it. (Webb)

A few menus had duplicated accelerators. (Roemer)

Spelling errors in documentation, quite a few "the the". (Roemer)

Missing prototypes for Macintosh. (Kielhorn)

Win32: When using 'shellquote' or 'shellxquote', the "!start cmd" wasn't executed in a disconnected process.

When resizing the window, causing a line before the cursor to wrap or unwrap, the cursor was displayed in the wrong position.

There was quite a bit of dead code when compiling with minimal features.

When doing a ":%s///" command that makes lines shorter, such that lines above

the final cursor position no longer wrap, the cursor position was not updated.

get_id_list() could allocate an array one too small, when a "contains=" item
has a wildcard that matches a group name that is added just after it. E.g.:
"contains=a.*b,axb". Give an error message for it.

When yanking a Visual area and using the middle mouse button -> crash. When
clipboard doesn't work, now make "* always use "".

Win32: Using ":buf a\ b\file" didn't work, it was interpreted as "ab\file".

Using ":ts ident", then hit <CR>, with 'cmdheight' set to 2: command line was
not cleared, the tselect prompt was on the last but one line.

mksession didn't restore the cursor column properly when it was after a tab.
Could not get all windows back when using a smaller terminal screen. Didn't
restore all windows when "winsize" was not in 'sessionoptions'. (Webb)

Command line completion for ":buffer" depended on 'ignorecase' for Unix, but
not for DOS et al. Now don't use 'ignorecase', but let it depend on whether
file names are case sensitive or not (like when expanding file names).

Win32 GUI: (Negri)
- Redrawing the background caused flicker when resizing the window. Removed
  _OnEraseBG(). Removed CS_HREDRAW and CS_VREDRAW flags from the
  sndclass.style.
- Some parts of the window were drawn in grey, instead of using the color from
  the user color scheme.
- Dropping a file on gvim didn't activate the window.
- When there is no menu ('guioptions' excludes 'm'), never use the ALT key for
  it.

GUI: When resizing the window, would make the window height a bit smaller.
Now round off to the nearest char cell size. (Negri)

In Vi the ")" and "(" commands don't stop at a single space after a dot.
Added 'J' flag in 'cpoptions' to make this behave Vi compatible. (Roemer)

When saving a session without any buffers loaded, there would be a ":normal"
command without arguments in it. (Webb)

Memory leaks fixed: (Madsen)
- eval.c: forgot to release func structure when func deleted
- ex_docmd.c: forgot to release string after "<sfile>"
- misc1.c: leak when completion pattern had no matches.
- os_unix.c: forgot to release regexp after file completions

Could crash when using a buffer without a name. (Madsen)
Could crash when doing file name completion, because of backslash_halve().
(Madsen)

":@a" would do mappings on register a, which is not Vi compatible. (Roemer)

":g/foo.*()/s/foobar/_&/gc" worked fine, but then "n" searched for "foobar"

and displayed "/foo.*()". (Roemer)

OS/2: get_cmd_output() was not included. Didn't check for $VIM/.vimrc file.

Command line completion of options didn't work after "+=" and "-=".

Unix configure: Test for memmove()/bcopy()/memcpy() tried redefining these functions, which could fail if they are defined already. Use mch_memmove() to redefine.

Unix: ":let a = expand("`xterm`&")" started an xterm asynchronously, but ":let a = expand("`xterm&`")" generated an error message, because the redirection was put after the '&'.

Win32 GUI: Dialog buttons could not be selected properly with cursor keys, when the default is not the first button. (Webb)

The "File has changed since editing started" (when regaining focus) could not always be seen. (Webb)

When starting with "ex filename", the file message was overwritten with the "entering Ex mode" message.

Output of ":tselect" listed name of file directly from the tags file. Now it is corrected for the position of the tags file.

When 'backspace' is 0, could backspace over autoindent. Now it is no longer allowed (Vi compatible).

In Replace mode, when 'noexpandtab' and 'smarttab' were set, and inserting Tabs, backspacing didn't work correctly for Tabs inserted at the start of the line (unless 'sts' was set too). Also, when replacing the first non-blank after which is a space, rounding the indent was done on the first non-blank instead of on the character under the cursor.

When 'sw' at 4, 'ts' at 8 and 'smarttab' set: When a tab was appended after four spaces (they are replaced with a tab) couldn't backspace over the tab.

In Insert mode, with 'bs' set to 0, couldn't backspace to before autoindent, even when it was removed with CTRL-D.

When repeating an insert command where a <BS>, <Left> or other key causes an error, would flush buffers and remain in Insert mode. No longer flush buffers, only beep and continue with the insert command.

Dos and Win32 console: Setting t_me didn't work to get another color. Made this works backwards compatible.

For Turkish (LANG = "tr") uppercase 'i' is not an 'I'. Use ASCII uppercase translation in vim_strup() to avoid language problems. (Komur)

Unix: Use usleep() or nanosleep() for mch_delay() when available. Hopefully this avoids a hangup in select(0, ..) for Solaris 2.6.

Vim would crash when using a script file with 'let &sp = "| tee"', starting
vim with "vim -u test", then doing ":set sp=". The P_WAS_SET flag wasn't set
for a string option, could cause problems with any string option.

When using "cmd | vim -", stdin is not a terminal. This gave problems with
GPM (Linux console mouse) and when executing external commands. Now close
stdin and re-open it as a copy of stderr.

Syntax highlighting: A "nextgroup" item was not properly stored in the state
list. This caused missing of next groups when not redrawing from start to
end, but starting halfway.

Didn't check for valid values of 'ttymouse'.

When executing an external command from the GUI, waiting for the child to
terminate might not work, causing a hang. (Parmelan)

"make uninstall" didn't delete the vimrc_example.vim and gvimrc_example.vim
files and the vimtutor.

Win32: "expand("%:p:h")" with no buffer name removed the directory name.
"fnamemodify("", ":p")" did not add a trailing slash, fname_case() removed it.

Fixed: When 'hlsearch' was set and the 'c' flag was not in 'cpoptions':
highlighting was not correct. Now overlapping matches are handled correctly.

Athena, Motif and GTK GUI: When started without focus, cursor was shown as if
with focus.

Don't include 'shellpipe' when compiled without quickfix, it's not used.
Don't include 'dictionary' option when compiled without the +insert_expand
feature.
Only include the 'shelltype' option for the Amiga.

When making a change to a line, with 'hlsearch' on, causing it to wrap, while
executing a register, the screen would not be updated correctly. This was a
generic problem in update_screenline() being called while must_redraw is
VALID.

Using ":bdelete" in a BufUnload autocommand could cause a crash. The window
height was added to another window twice in close_window().

Win32 GUI: When removing a menu item, the tearoff wasn't updated. (Negri)

Some performance bottlenecks removed. Allocating memory was not efficient.
For Win32 checking for available memory was slow, don't check it every time
now. On NT obtaining the user name takes a long time, cache the result (for
all systems).

fnamemodify() with an argument ":~:." or ":.:~" didn't work properly.

When editing a new file and exiting, the marks for the buffer were not saved
in the viminfo file.

":confirm only" didn't put up a dialog.

These text objects didn't work when 'selection' was "exclusive": va(vi(va{ vi{ va< vi< vi[va[.

The dialog for writing a readonly file didn't have a valid default. (Negri)

The line number used for error messages when sourcing a file was reset when modelines were inspected. It was wrong when executing a function.

The file name and line number for an error message wasn't displayed when it was the same as for the last error, even when this was long ago. Now reset the name/lnum after a hit-enter prompt.

In a session file, a "%" in a file name caused trouble, because fprintf() was used to write it to the file.

When skipping statements, a mark in an address wasn't skipped correctly: "ka|if 0 'ad|else|echo endif". (Roemer)

":wall" could overwrite a not-edited file without asking.

GUI: When $DISPLAY was not set or starting the GUI failed in another way, the console mode then started with wrong colors and skipped initializations. Now do an early check if the GUI can be started. Don't source the menu.vim or gvimrc when it will not. Also do normal terminal initializations if the GUI might not start.

When using a BufEnter autocommand to position the cursor and scroll the window, the cursor was always put at the last used line and halfway the window anyhow.

When 'wildmode' was set to "longest,list:full", ":e *.c<Tab><Tab>" didn't list the matches. Also avoid that listing after a "longest" lists the wrong matches when the first expansion changed the string in front of the cursor.

When using ":insert", ":append" or ":change" inside a while loop, was not able to break out of it with a CTRL-C.

Win32: ":e ." took an awful long time before an error message when used in "C:\". Was caused by adding another backslash and then trying to get the full name for "C:\\".

":winpos -10 100" was working like ":winpos -10 -10", because a pointer was not advanced past the '-' sign.

When obtaining the value of a hidden option, would give an error message. Now just use a zero value.

OS/2: Was using argv[0], even though it was not a useful name. It could be just "vim", found in the search path.

Xterm: ":set columns=78" didn't redraw properly (when lines wrap/unwrap) until after a delay of 'updatetime'. Didn't check for the size-changed signal.

'scrollbind' didn't work in Insert mode.
Horizontal scrollbinding didn't always work for "0" and "$" commands (e.g., when 'showcmd' was off).

When compiled with minimal features but with GUI, switching on the mouse in an xterm caused garbage, because the mouse codes were not recognized. Don't enable the mouse when it can't be recognized. In the GUI it also didn't work, the arguments to the mouse code were not interpreted.

When 'showbreak' used, in Insert mode, when the cursor is just after the last character in the line, which is also the in the rightmost column, the cursor position would be like the 'showbreak' string is shown, but it wasn't.

Autocommands could move the cursor in a new file, so that CTRL-W i didn't show the right line. Same for when using a filemark to jump to another file.

When redefining the argument list, the title used for other windows could be showing the wrong info about the position in the argument list. Also update this for a ":split" command without arguments.

When editing file 97 of 13, ":Next" didn't work. Now it goes to the last file in the argument list.

Insert mode completion (for dictionaries or included files) could not be interrupted by typing an <Esc>. Could get hit-enter prompt after line completion, or whenever the informative message would get too long.

When using the ":edit" command to re-edit the same file, an autocommand to jump to the last cursor position caused the cursor to move. Now set the last used cursor position to avoid this.

When 'comments' has a part that starts with white space, formatting the comment didn't work.

At the ":tselect" prompt Normal mode mappings were used. That has been disabled.

When 'selection' is not "old", some commands still didn't allow the cursor past the end-of-line in Visual mode.

Athena: When a menu was deleted, it would appear again (but not functional) when adding another menu. Now they don't reappear anymore (although they are not really deleted either).

Borland C++ 4.x had an optimizer problem in fill_breakat_flags(). (Negri)

"ze" didn't work when 'number' was on. (Davis)

Win32 GUI: Intellimouse code didn't work properly on Windows 98. (Robinson)

A few files were including proto.h a second time, after vim.h had already done that, which could cause problems with the vim_realloc() macro.

Win32 console: <M-x> or ALT-x was not recognized. Also keypad '+', '-' and '*'. (Negri)
MS-DOS: <M-x> didn't work, produced a two-byte code. Now the alphabetic and number keys work. (Negri)

When finding a lot of matches for a tag completion, the check for avoiding double matches could take a lot of time. Add a line_breakcheck() to be able to interrupt this. (Deshpande)

When the command line was getting longer than the screen, the more-prompt would be given regularly, and the cursor position would be wrong. Now only show the part of the command line that fits on the screen and force the cursor to be positioned on the visible part. There can be text after the cursor which isn't editable.

At the more prompt and with the console dialog, a cursor key was interpreted as <Esc> and OA. Now recognize special keys in get_keystroke(). Ignore mouse and scrollbar events.

When typing a BS after inserting a middle comment leader, typing the last char of the end comment leader still changed it into the end comment leader. (Webb)

When a file system is full, writing to a swap file failed. Now first try to write one block to the file. Try next entry in 'dir' if it fails.

When "~" is in 'whichwrap', doing "~" on last char of a line didn't update the display.

Unix: Expanding wildcards for ":file {\\}" didn't work, because "\}" was translated to "}" before the shell got it. Now don't remove backslashes when wildcards are going to be expanded.

Unix: ":e /tmp/$uid" didn't work. When expanding environment variables in a file name doesn't work, use the shell to expand the file name. ":e /tmp/$tty" still doesn't work though.

"make test" didn't always work on DOS/Windows for test30, because it depended on the external "echo" command.

The link.sh script used "make" instead of $MAKE from the Makefile. Caused problems for generating pathdef.c when "make" doesn't work properly.

On versions that can do console and GUI: In the console a typed CSI code could cause trouble.

The patterns in expression evaluation didn't ignore the 'l' flag in 'cpoptions'. This broke the working of <CR> in the options window.

When 'hls' off and 'ai' on, "O<Esc>" did remove the indent, but it was still highlighted red for trailing space.

Win32 GUI: Dropping an encrypted file on a running gvim didn't work right. Vim would loop while outputting "*" characters. vgetc() was called recursively, thus it returns NUL. Added safe_vgetc(), which reads input directly from the

user in this situation.

While reading text from stdin, only an empty screen was shown. Now show that
Vim is reading from stdin.

The cursor shape wasn't set properly when returning to Insert mode, after
using a CTRL-O /asdf command which fails. It would be OK after a few seconds.
Now it's OK right away.

The 'isfname' default for DOS/Windows didn't include the '@' character. File
names that contained "dir\@file" could not be edited.

Win32 console: <C-S-Left> could cause a crash when compiled with Borland or
egcs. (Aaron)

Unix and VMS: "#if HAVE_DIRENT_H" caused problems for some compilers. Use
"#ifdef HAVE_DIRENT_H" instead. (Jones)

When a matching tag is in the current file but has a search pattern that
doesn't match, the cursor would jump to the first line.

Unix: Dependencies for pty.c were not included in Makefile. Dependency of
ctags/config.h was not included (only matters for parallel make).

Removed a few Uninitialized Memory Reads (potential crashes). In do_call()
calling clear_var() when not evaluating. In win32_expandpath() and
dos_expandpath() calling backslash_halve() past the end of a file name.

Removed memory leaks: Set_vim_var_string() never freed the value. The
next_list for a syntax keyword was never freed.

On non-Unix systems, using a file name with wildcards without a match would
silently fail. E.g., ":e *.sh". Now give a "No match" error message.

The life/life.mac, urm/urm.mac and hanoi/hanoi.mac files were not recognized
as Vim scripts. Renamed them to *.vim.

[Note: some numbered patches are not relevant when upgrading from version 5.3,
they have been removed]

Patch 5.4m.1
Problem: When editing a file with a long name, would get the hit-enter
            prompt, even though all settings are such that the name should be
            truncated to avoid that. filemess() was printing the file name
            without truncating it.
Solution: Truncate the message in filemess(). Use the same code as for
            msg_trunc_attr(), which is moved to the new function
            msg_may_trunc().
Files: src/message.c, src/proto/message.pro, src/fileio.c

Patch 5.4m.3
Problem: The Motif libraries were not found by configure for Digital Unix.
Solution: Add "/usr/shlib" to the search path. (Andy Kahn)
Files: src/configure.in, src/configure

```
Patch 5.4m.5
Problem:    Win32 GUI: When using the Save-As menu entry and selecting an
            existing file in the file browser, would get a dialog to confirm
            overwriting twice.  (Ed Krall)
Solution:   Removed the dialog from the file browser.  It would be nicer to
            set the "forceit" flag and skip Vim's ":confirm" dialog, but it
            requires quite a few changes to do that.
Files:      src/gui_w32.c

Patch 5.4m.6
Problem:    Win32 GUI: When reading text from stdin, e.g., "cat foo | gvim -",
            a message box would pop up with "-stdin-" (when exiting). (Michael
            Schaap)
Solution:   Don't switch off termcap mode for versions that are GUI-only.
            They use another terminal to read from stdin.
Files:      src/main.c, src/fileio.c

Patch 5.4m.7
Problem:    Unix: running configure with --enable-gtk-check,
            --enable-motif-check, --enable-athena-check or --enable-gtktest
            had the reverse effect. (Thomas Koehler)
Solution:   Use $enable_gtk_check variable correctly in AC_ARG_ENABLE().
Files:      src/configure.in, src/configure

Patch 5.4m.9
Problem:    Multi-byte: With wrapping lines, the cursor was sometimes 2
            characters to the left.  Syntax highlighting was wrong when a
            double-byte character was split for a wrapping line.  When
            'showbreak' was on the splitting also didn't work.
Solution:   Adjust getvcol() and win_line(). (Chong-Dae Park)
Files:      src/charset.c, src/screen.c

Patch 5.4m.11
Problem:    The ":call" command didn't check for illegal trailing characters.
            (Stefan Roemer)
Solution:   Add the check in do_call().
Files:      src/eval.c

Patch 5.4m.13
Problem:    With the ":s" command:
            1. When performing a substitute command, the mouse would be
               disabled and enabled for every substitution.
            2. The cursor position could be beyond the end of the line.
               Calling line_breakcheck() could try to position the cursor,
               which causes a crash in the Win32 GUI.
            3. When using ":s" in a ":g" command, the cursor was not put on
               the first non-white in the line.
            4. There was a hit-enter prompt when confirming the substitution
               and the replacement was a bit longer.
Solution:   1. Only disable/enable the mouse when asking for confirmation.
            2. Always put the cursor on the first character, it is going to be
               moved to the first non-blank anyway.
               Don't use the cursor position in gui_mch_draw_hollow_cursor(),
```

```
              get the character from the screen buffer.
           3. Added global_need_beginline flag to call beginline() after ":g"
              has finished all substitutions.
           4. Clear the need_wait_return flag after prompting the user.
Files:     src/ex_cmds.c, src/gui_w32.c

Patch 5.4m.14
Problem:   When doing "vim xxx", ":opt", ":only" and then ":e xxx" we end
           up with two swapfiles for "xxx".  That is caused by the ":bdel"
           command which is executed when unloading the option-window.
           Also, there was no check if closing a buffer made the new one
           invalid, this could cause a crash.
Solution:  When closing a buffer causes the current buffer to be deleted,
           use the new buffer to replace it.  Also detect that the new buffer
           has become invalid as a side effect of closing the current one.
           Make autocommand that calls ":bdel" in optwin.vim nested, so that
           the buffer loading it triggers also executes autocommands.
           Also added a test for this in test13.
Files:     runtime/optwin.vim, src/buffer.c, src/ex_cmds.c, src/globals.h
           src/testdir/test13.in, src/testdir/test13.ok

Patch 5.4m.15
Problem:   When using a BufEnter autocommand to reload the syntax file,
           conversion to HTML caused a crash. (Sung-Hyun Nam)
Solution:  When using ":syntax clear" the current stack of syntax items was
           not cleared.  This will cause memory to be used that has already
           been freed.  Added call to invalidate_current_state() in
           syntax_clear().
Files:     src/syntax.c

Patch 5.4m.17
Problem:   When omitting a ')' in an expression it would not be seen as a
           failure.
           When detecting an error inside (), there would be an error message
           for a missing ')' too.
           When using ":echo 1+|echo 2" there was no error message. (Roemer)
           When using ":exe 1+" there was no error message.
           When using ":return 1+" there was no error message.
Solution:  Fix do_echo(), do_execute() and do_return() to give an error
           message when eval1() returns FAIL.
           Fix eval6() to handle trailing ')' correctly and return FAIL when
           it's missing.
Files:     src/eval.c

Patch 5.4m.18
Problem:   When using input() from inside an expression entered with
           "CTRL-R =" on the command line, there could be a crash.  And the
           resulting command line was wrong.
Solution:  Added getcmdline_prompt(), which handles recursive use of
           getcmdline() correctly.  It also sets the command line prompt.
           Removed cmdline_prompt().  Also use getcmdline_prompt() for
           getting the crypt key in get_crypt_key().
Files:     src/proto/ex_getln.pro, src/ex_getln.c, src/eval.c, src/misc2.c
```

```
Patch 5.4m.21
Problem:    When starting up, the screen structures were first allocated at
            the minimal size, then initializations were done with Rows
            possibly different from screen_Rows.  Caused a crash in rare
            situations (GTK with XIM and fontset).
Solution:   Call screenalloc() in main() only after calling ui_get_winsize().
            Also avoids a potential delay because of calling screenclear()
            while "starting" is non-zero.
Files:      src/main.c

Patch 5.4m.22
Problem:    In the GUI it was possible that the screen was resized and the
            screen structures re-allocated while redrawing the screen.  This
            could cause a crash (hard to reproduce).  The call sequence goes
            through update_screen() .. syntax_start() .. ui_breakcheck() ..
            gui_resize_window() .. screenalloc().
Solution:   Set updating_screen while redrawing.  If the window is resized
            remember the new size and handle it only after redrawing is
            finished.
            This also fixes that resizing the screen while still redrawing
            (slow syntax highlighting) would not work properly.
            Also disable display_hint, it was never used.
Files:      src/globals.h, src/gui.c, src/screen.c, src/proto/gui.pro

Patch 5.4m.23
Problem:    When using expand("<cword>") when there was no word under the
            cursor, would get an error message.  Same for <cWORD> and <cfile>.
Solution:   Don't give an error message, return an empty string.
Files:      src/eval.c

Patch 5.4m.24
Problem:    ":help \|" didn't find anything.  It was translated to "/\\|".
Solution:   Translate "\|" into "\\bar".  First check the table for specific
            translations before checking for "\x".
Files:      src/ex_cmds.c

Patch 5.4m.25
Problem:    Unix: When using command line completion on files that contain
            ''', '"' or '|' the file name could not be used.
            Adding this file name to the Buffers menu caused an error message.
Solution:   Insert a backslash before these three characters.
            Adjust Mungename() function to insert a backslash before '|'.
Files:      src/ex_getln.c, runtime/menu.vim

Patch 5.4m.26
Problem:    When using a mapping of two function keys, e.g., <F1><F1>, and
            only the first char of the second key has been read, the mapping
            would not be recognized.  Noticed on some Unix systems with xterm.
Solution:   Add 'K' flag to 'cpoptions' to wait for the whole key code, even
            when halfway a mapping.
Files:      src/option.h, src/term.c

Patch 5.4m.27
Problem:    When making test33 without the lisp feature it hangs. Interrupting
```

```
            the execution of the script then might cause a crash.
Solution:   In inchar(), after closing a script, don't use buf[] anymore.
            closescript() has freed typebuf[] and buf[] might be pointing
            inside typebuf[].
            Avoid that test33 hangs when the lisp feature is missing.
Files:      src/getchar.c src/testdir/test33.in

"os2" was missing from the feature list.  Useful for has("os2").

BeOS:
- Included patches from Richard Offer for BeOS R4.5.
- menu code didn't work right.  Crashed in the Buffers menu.  The window title
  wasn't set. (Offer)

Patch 5.4n.3
Problem:    C-indenting was wrong after "  } else".  The white space was not
            skipped.  Visible when 'cino' has "+10".
Solution:   Skip white space before calling cin_iselse(). (Norbert Zeh)
Files:      src/misc1.c

Patch 5.4n.4
Problem:    When the 't' flag in 'cpoptions' is included, after a
            ":nohlsearch" the search highlighting would not be enabled again
            after a tag search. (Norbert Zeh)
Solution:   When setting the new search pattern in jumpto_tag(), don't restore
            no_hlsearch.
Files:      src/tag.c

Patch 5.4n.5
Problem:    When using ":normal" from a CursorHold autocommand Vim hangs.  The
            autocommand is executed down from vgetc().  Calling vgetc()
            recursively to execute the command doesn't work then.
Solution:   Forbid the use of ":normal" when vgetc_busy is set.  Give an error
            message when this happens.
Files:      src/ex_docmd.c, runtime/doc/autocmd.txt

Patch 5.4n.6
Problem:    "gv" could reselect a Visual that starts and/or ends past the end
            of a line. (Robert Webb)
Solution:   Check that the start and end of the Visual area are on a valid
            character by calling adjust_cursor().
Files:      src/normal.c

Patch 5.4n.8
Problem:    When a mark was on a non existing line (e.g., when the .viminfo
            was edited), jumping to it caused ml_get errors. (Alexey
            Marinichev).
Solution:   Added check_cursor_lnum() in nv_gomark().
Files:      src/normal.c

Patch 5.4n.9
Problem:    ":-2" moved the cursor to a negative line number. (Ralf Schandl)
Solution:   Give an error message for a negative line number.
Files:      src/ex_docmd.c
```

Patch 5.4n.10
Problem: Win32 GUI: At the hit-enter prompt, it was possible to scroll the
            text. This erased the prompt and made Vim look like it is in
            Normal mode, while it is actually still waiting for a <CR>.
Solution: Disallow scrolling at the hit-enter prompt for systems that use
            on the fly scrolling.
Files: src/message.c

Patch 5.4n.14
Problem: Win32 GUI: When using ":winsize 80 46" and the height is more than
            what fits on the screen, the window size was made smaller than
            asked for (that's OK) and Vim crashed (that's not OK)>
Solution: Call check_winsize() from gui_set_winsize() to resize the windows.
Files: src/gui.c

Patch 5.4n.16
Problem: Win32 GUI: The <F10> key both selected the menu and was handled as
            a key hit.
Solution: Apply 'winaltkeys' to <F10>, like it is used for Alt keys.
Files: src/gui_w32.c

Patch 5.4n.17
Problem: Local buffer variables were freed when the buffer is unloaded.
            That's not logical, since options are not freed. (Ron Aaron)
Solution: Free local buffer variables only when deleting the buffer.
Files: src/buffer.c

Patch 5.4n.19
Problem: Doing ":e" (without argument) in an option-window causes trouble.
            The mappings for <CR> and <Space> are not removed. When there is
            another buffer loaded, the swap file for it gets mixed up.
            (Steve Mueller)
Solution: Also remove the mappings at the BufUnload event, if they are still
            present.
            When re-editing the same file causes the current buffer to be
            deleted, don't try editing it.
            Also added a test for this situation.
Files: runtime/optwin.vim, src/ex_cmds.c, src/testdir/test13.in,
            src/testdir/test13.ok

Patch 5.4n.24
Problem: BeOS: configure never enabled the GUI, because $with_x was "no".
            Unix prototypes caused problems, because Display and Widget are
            undefined.
            Freeing fonts on exit caused a crash.
Solution: Only disable the GUI when $with_x is "no" and $BEOS is not "yes".
            Add dummy defines for Display and Widget in proto.h.
            Don't free the fonts in gui_exit() for BeOS.
Files: src/configure.in, src/configure, src/proto.h, src/gui.c.

The runtime/vim48x48.xpm icon didn't have a transparent background. (Schild)

Some versions of the mingw32/egcs compiler didn't have WINBASEAPI defined.
(Aaron)

VMS:
- mch_setenv() had two arguments instead of three.
- The system vimrc and gvimrc files were called ".vimrc" and ".gvimrc".
  Removed the dot.
- call to RealWaitForChar() had one argument too many. (Campbell)
- WaitForChar() is static, removed the prototype from proto/os_vms.pro.
- Many file accesses failed, because Unix style file names were used.
  Translate file names to VMS style by using vim_fopen().
- Filtering didn't work, because the temporary file name was generated wrong.
- There was an extra newline every 9192 characters when writing a file. Work
  around it by writing line by line. (Campbell)
- os_vms.c contained "# typedef int DESC". Should be "typedef int DESC;".
  Only mattered for generating prototypes.
- Added file name translation to many places. Made easy by defining macros
  mch_access(), mch_fopen(), mch_fstat(), mch_lstat() and mch_stat().
- Set default for 'tagbsearch' to off, because binary tag searching apparently
  doesn't work for VMS.
- make mch_get_host_name() work with /dec and /standard=vaxc. (Campbell)

Patch 5.4o.2
Problem: Crash when using "gf" on "file.c://comment here". (Scott Graham)
Solution: Fix wrong use of pointers in get_file_name_in_path().
Files: src/window.c

Patch 5.4o.3
Problem: The horizontal scrollbar was not sized correctly when 'number' is
            set and 'wrap' not set.
            Athena: Horizontal scrollbar wasn't updated when the cursor was
            positioned with a mouse click just after dragging.
Solution: Subtract 8 from the size when 'number' set and 'wrap' not set.
            Reset gui.dragged_sb when a mouse click is received.
Files: src/gui.c

Patch 5.4o.4
Problem: When running in an xterm and $WINDOWID is set to an illegal value,
            Vim would exit with "Vim: Got X error".
Solution: When using the display which was opened for the xterm clipboard,
            check if x11_window is valid by trying to obtain the window title.
            Also add a check in setup_xterm_clip(), for when using X calls to
            get the pointer position in an xterm.
Files: src/os_unix.c

Patch 5.4o.5
Problem: Motif version with Lesstif: When removing the menubar and then
            using a menu shortcut key, Vim would crash. (raf)
Solution: Disable the menu mnemonics when the menu bar is removed.
Files: src/gui_motif.c

Patch 5.4o.9
Problem: The DOS install.exe program used the "move" program. That doesn't

```
            work on Windows NT, where "move" is internal to cmd.exe.
Solution:   Don't use an external program for moving the executables.  Use C
            functions to copy the file and delete the original.
Files:      src/dosinst.c

Motif and Athena obtained the status area height differently from GTK.  Moved
status_area_enabled from global.h to gui_x11.c and call
xim_get_status_area_height() to get the status area height.

Patch 5.4p.1
Problem:    When using auto-select, and the "gv" command is used, would not
            always obtain ownership of the selection.  Caused by the Visual
            area still being the same, but ownership taken away by another
            program.
Solution:   Reset the clipboard Visual mode to force updating the selection.
Files:      src/normal.c

Patch 5.4p.2
Problem:    Motif and Athena with XIM: Typing 3-byte
            <multibyte><multibyte><space> doesn't work correctly with Ami XIM.
Solution:   Avoid using key_sym XK_VoidSymbol. (Nam)
Files:      src/multbyte.c, src/gui_x11.c

Patch 5.4p.4
Problem:    Win32 GUI: The scrollbar values were reduced for a file with more
            than 32767 lines.  But this info was kept global for all
            scrollbars, causing a mixup between the windows.
            Using the down arrow of a scrollbar in a large file didn't work.
            Because of round-off errors there is no scroll at all.
Solution:   Give each scrollbar its own scroll_shift field.  When the down
            arrow is used, scroll several lines.
Files:      src/gui.h, src/gui_w32.c

Patch 5.4p.5
Problem:    When changing buffers in a BufDelete autocommand, there could be
            ml_line errors and/or a crash. (Schandl)  Was caused by deleting
            the current buffer.
Solution:   When the buffer to be deleted unexpectedly becomes the current
            buffer, don't delete it.
            Also added a check for this in test13.
Files:      src/buffer.c, src/testdir/test13.in, src/testdir/test13.ok

Patch 5.4p.7
Problem:    Win32 GUI: When using 'mousemodel' set to "popup_setpos" and
            clicking the right mouse button outside of the selected area, the
            selected area wasn't removed until the popup menu has gone.
            (Aaron)
Solution:   Set the cursor and update the display before showing the popup
            menu.
Files:      src/normal.c

Patch 5.4p.8
Problem:    The generated bugreport didn't contain information about
            $VIMRUNTIME and whether runtime files actually exist.
```

Solution: Added a few checks to the bugreport script.
Files: runtime/bugreport.vim

Patch 5.4p.9
Problem: The windows install.exe created a wrong entry in the popup menu.
            The "%1" was "". The full directory was included, even when the
            executable had been moved elsewhere. (Ott)
Solution: Double the '%' to get one from printf. Only include the path to
            gvim.exe when it wasn't moved and it's not in $PATH.
Files: src/dosinst.c

Patch 5.4p.10
Problem: Win32: On top of 5.4p.9: The "Edit with Vim" entry sometimes used
            a short file name for a directory.
Solution: Change the "%1" to "%L" in the registry entry.
Files: src/dosinst.c

Patch 5.4p.11
Problem: Motif, Athena and GTK: When closing the GUI window when there is a
            changed buffer, there was only an error message and Vim would not
            exit.
Solution: Put up a dialog, like for ":confirm qa". Uses the code that was
            already used for MS-Windows.
Files: src/gui.c, src/gui_w32.c

Patch 5.4p.12
Problem: Win32: Trying to expand a string that is longer than 256
            characters could cause a crash. (Steed)
Solution: For the buffer in win32_expandpath() don't use a fixed size array,
            allocate it.
Files: src/os_win32.c

MSDOS: Added "-Wall" to Makefile.djg compile flags. Function prototypes for
fname_case() and mch_update_cursor() were missing. "fd" was unused in
mf_sync(). "puiLocation" was unused in myputch(). "newcmd" unused in
mch_call_shell() for DJGPP version.

==
VERSION 5.5   version-5.5

Version 5.5 is a bug-fix version of 5.4.

Changed   changed-5.5

The DJGPP version is now compiled with "-O2" instead of "-O4" to reduce the
size of the executables.

Moved the src/STYLE file to runtime/doc/develop.txt. Added the design goals
to it.

'backspace' is now a string option. See patch 5.4.15.

Added   added-5.5

Included Exuberant Ctags version 3.3. (Darren Hiebert)

In runtime/mswin.vim, map CTRL-Q to CTRL-V, so that CTRL-Q can be used
everywhere to do what CTRL-V used to do.

Support for decompression of bzip2 files in vimrc_example.vim.

When a patch is included, the patch number is entered in a table in version.c.
This allows skipping a patch without breaking a next one.

Support for mouse scroll wheel in X11. See patch 5.5a.14.

line2byte() can be used to get the size of the buffer. See patch 5.4.35.

The CTRL-R CTRL-O r and CTRL-R CTRL-P r commands in Insert mode are used to
insert a register literally. See patch 5.4.48.

Uninstall program for MS-Windows. To be able to remove the registry entries
for "Edit with Vim". It is registered to be run from the "Add/Remove
programs" application. See patch 5.4.x7.

Fixed   fixed-5.5

When using vimrc_example.vim: An error message when the cursor is on a line
higher than the number of lines in the compressed file. Move the autocommand
for jumping to the last known cursor position to after the decompressing
autocommands.

":mkexrc" and ":mksession" wrote the current value of 'textmode'. That may
mark a file as modified, which causes problems. This is a buffer-specific
setting, it should not affect all files.

"vim --version" wrote two empty lines.

Unix: The alarm signal could kill Vim. It is generated by the Perl alarm()
function. Ignore SIGALRM.

Win32 GUI: Toolbar still had the yellow bitmap for running a Vim script.

BeOS: "tmo" must be bigtime_t, instead of double. (Seibert)

Patch 5.4.1
Problem: Test11 fails when $GZIP is set to "-v". (Matthew Jackson)
Solution: Set $GZIP to an empty string.
Files: src/testdir/test11.in

Patch 5.4.2
Problem: Typing <Esc> at the crypt key prompt caused a crash. (Kallingal)

```
Solution:   Check for a NULL pointer returned from get_crypt_key().
Files:      src/fileio.c

Patch 5.4.3
Problem:    Python: Trying to use the name of an unnamed buffer caused a
            crash. (Daniel Burrows)
Solution:   Check for b_fname being a NULL pointer.
Files:      src/if_python.c

Patch 5.4.4
Problem:    Win32: When compiled without toolbar, but the 'T' flag is in
            'guioptions', there would be an empty space for the toolbar.
Solution:   Add two #ifdefs where checking for the 'T' flag. (Vince Negri)
Files:      src/gui.c

Patch 5.4.5
Problem:    Athena GUI: Using the Buffers.Refresh menu entry caused a crash.
            Looks like any ":unmenu" command may cause trouble.
Solution:   Disallow ":unmenu" in the Athena version.  Disable the Buffers
            menu, because the Refresh item would not work.
Files:      src/menu.c, runtime/menu.vim

Patch 5.4.6
Problem:    GTK GUI: Using ":gui" in the .gvimrc file caused an error.  Only
            happens when the GUI forks.
Solution:   Don't fork in a recursive call of gui_start().
Files:      src/gui.c

Patch 5.4.7
Problem:    Typing 'q' at the more prompt for the ATTENTION message causes the
            file loading to be interrupted. (Will Day)
Solution:   Reset got_int after showing the ATTENTION message.
Files:      src/memline.c

Patch 5.4.8
Problem:    Edit some file, ":he", ":opt": options from help window are shown,
            but pressing space updates from the other window. (Phillipps)
            Also: When there are changes in the option-window, ":q!" gives an
            error message.
Solution:   Before creating the option-window, go to a non-help window.
            Use ":bdel!" to delete the buffer.
Files:      runtime/optwin.vim

Patch 5.4.9
            Just updates version.h.  The real patch has been moved to 5.4.x1.
            This patch is just to keep the version number correct.

Patch 5.4.10
Problem:    GTK GUI: When $DISPLAY is invalid, "gvim -f" just exits.  It
            should run in the terminal.
Solution:   Use gtk_init_check() instead of gtk_init().
Files:      src/gui_gtk_x11.c

Patch 5.4.11
```

Problem: When using the 'S' flag in 'cpoptions', 'tabstop' is not copied to
            the next buffer for some commands, e.g., ":buffer".
Solution: When the BCO_NOHELP flag is given to buf_copy_options(), still
            copy the options used by do_help() when neither the "from" or "to"
            buffer is a help buffer.
Files: src/option.c

Patch 5.4.12
Problem: When using 'smartindent', there would be no extra indent if the
            current line did not have any indent already. (Hanus Adler)
Solution: There was a wrongly placed "else", that previously matched with
            the "if" that set trunc_line. Removed the "else" and added a
            check for trunc_line to be false.
Files: src/misc1.c

Patch 5.4.13
Problem: New SGI C compilers need another option for optimisation.
Solution: Add a check in configure for "-OPT:Olimit". (Chin A Young)
Files: src/configure.in, src/configure

Patch 5.4.14
Problem: Motif GUI: When the popup menu is present, a tiny window appears
            on the desktop for some users.
Solution: Set the menu widget ID for a popup menu to 0. (Thomas Koehler)
Files: src/gui_motif.c

Patch 5.4.15
Problem: Since 'backspace' set to 0 has been made Vi compatible, it is no
            longer possible to only allow deleting autoindent.
Solution: Make 'backspace' a list of parts, to allow each kind of
            backspacing separately.
Files: src/edit.c, src/option.c, src/option.h, src/proto/option.pro,
            runtime/doc/option.txt, runtime/doc/insert.txt

Patch 5.4.16
Problem: Multibyte: Locale zh_TW.Big5 was not checked for in configure.
Solution: Add zh_TW.Big5 to configure check. (Chih-Tsun Huang)
Files: src/configure.in, src/configure

Patch 5.4.17
Problem: GUI: When started from inside gvim with ":!gvim", Vim would not
            start. ":!gvim -f" works fine.
Solution: After forking, wait a moment in the parent process, to give the
            child a chance to set its process group.
Files: src/gui.c

Patch 5.4.18
Problem: Python: The clear_history() function also exists in a library.
Solution: Rename clear_history() to clear_hist().
Files: src/ex_getln.c, src/eval.c, src/proto/ex_getln.pro

Patch 5.4.19
Problem: In a terminal with 25 lines, there is a more prompt after the
            ATTENTION message. When hitting 'q' here the dialog prompt

```
            doesn't appear and file loading is interrupted. (Will Day)
Solution:   Don't allow quitting the printing of a message for the dialog
            prompt.  Added the msg_noquit_more flag for this.
Files:      src/message.c

Patch 5.4.20
Problem:    GTK: When starting gvim, would send escape sequences to the
            terminal to switch the cursor off and on.
Solution:   Don't call msg_start() if the GUI is expected to start.
Files:      src/main.c

Patch 5.4.21
Problem:    Motif: Toplevel menu ordering was wrong when using tear-off items.
Solution:   Don't add one to the index for a toplevel menu.
Files:      src/gui_motif.c

Patch 5.4.22
Problem:    In Insert mode, <C-Left>, <S-Left>, <C-Right> and <S-Right> didn't
            update the column used for vertical movement.
Solution:   Set curwin->w_set_curswant for those commands.
Files:      src/edit.c

Patch 5.4.23
Problem:    When a Visual selection is lost to another program, and then the
            same text is Visually selected again, the clipboard ownership
            wasn't regained.
Solution:   Set clipboard.vmode to NUL to force regaining the clipboard.
Files:      src/normal.c

Patch 5.4.24
Problem:    Encryption: When using ":r file" while 'key' has already entered,
            the 'key' option would be messed up.  When writing the file it
            would be encrypted with an unknown key and lost! (Brad Despres)
Solution:   Don't free cryptkey when it is equal to the 'key' option.
Files:      src/fileio.c

Patch 5.4.25
Problem:    When 'cindent' is set, but 'autoindent' isn't, comments are not
            properly indented when starting a new line. (Mitterand)
Solution:   When there is a comment leader for the new line, but 'autoindent'
            isn't set, do C-indenting.
Files:      src/misc1.c

Patch 5.4.26
Problem:    Multi-byte: a multi-byte character is never recognized in a file
            name, causing a backslash before it to be removed on Windows.
Solution:   Assume that a leading-byte character is a file name character in
            vim_isfilec().
Files:      src/charset.c

Patch 5.4.27
Problem:    Entries in the PopUp[nvic] menus were added for several modes, but
            only deleted for the mode they were used for.  This resulted in
            the  entry remaining in the PopUp menu.
```

```
            When removing a PopUp[nvic] menu, the name had been truncated,
            could result in greying-out the whole PopUp menu.
Solution:   Remove entries for all modes from the PopUp[nvic] menus.  Remove
            the PopUp[nvic] menu entries first, before the name is changed.
Files:      src/menu.c

Patch 5.4.28
Problem:    When using a BufWritePre autocommand to change 'fileformat', the
            new value would not be used for writing the file.
Solution:   Check 'fileformat' after executing the autocommands instead of
            before.
Files:      src/fileio.c

Patch 5.4.29
Problem:    Athena GUI: When removing the 'g' flag from 'guioptions', using a
            menu can result in a crash.
Solution:   Always grey-out menus for Athena, don't hide them.
Files:      src/menu.c

Patch 5.4.30
Problem:    BeOS: Suspending Vim with CTRL-Z didn't work (killed Vim).  The
            first character typed after ":sh" goes to Vim, instead of the
            started shell.
Solution:   Don't suspend Vim, start a new shell.  Kill the async read thread
            when starting a new shell.  It will be restarted later. (Will Day)
Files:      src/os_unix.c, src/ui.c

Patch 5.4.31
Problem:    GUI: When 'mousefocus' is set, moving the mouse over where a
            window boundary was, causes a hit-enter prompt to be finished.
            (Jeff Walker)
Solution:   Don't use 'mousefocus' at the hit-enter prompt.  Also ignore it
            for the more prompt and a few other situations.  When an operator
            is pending, abort it first.
Files:      src/gui.c

Patch 5.4.32
Problem:    Unix: $LDFLAGS was not passed to configure.
Solution:   Pass $LDFLAGS to configure just like $CFLAGS. (Jon Miner)
Files:      src/Makefile

Patch 5.4.33
Problem:    Unix: After expanding an environment variable with the shell, the
            next expansion would also use the shell, even though it is not
            needed.
Solution:   Reset "recursive" before returning from gen_expand_wildcards().
Files:      src/misc1.c

Patch 5.4.34 (also see 5.4.x5)
Problem:    When editing a file, and the file name is relative to a directory
            above the current directory, the file name was made absolute.
            (Gregory Margo)
Solution:   Add an argument to shorten_fnames() which indicates if all file
            names should be shortened, or only absolute names.  In main() only
```

```
            use shorten_fnames() to shorten absolute names.
Files:      src/ex_docmd.c, src/fileio.c, src/main.c, src/proto/fileio.pro

Patch 5.4.35
Problem:    There is no function to get the current file size.
Solution:   Allow using line2byte() with the number of lines in the file plus
            one.  This returns the offset of the line past the end of the
            file, which is the file size plus one.
Files:      src/eval.c, runtime/doc/eval.txt

Patch 5.4.36
Problem:    Comparing strings while ignoring case didn't work correctly for
            some machines. (Mide Steed)
Solution:   vim_stricmp() and vim_strnicmp() only returned 0 or 1.  Changed
            them to return -1 when the first argument is smaller.
Files:      src/misc2.c

Patch 5.4.37 (also see 5.4.40 and 5.4.43)
Problem:    Long strings from the viminfo file are truncated.
Solution:   When writing a long string to the viminfo file, first write a line
            with the length, then the string itself in a second line.
Files:      src/eval.c, src/ex_cmds.c, src/ex_getln.c, src/mark.c, src/ops.c,
            src/search.c, src/proto/ex_cmds.pro, runtime/syntax/viminfo.vim

Patch 5.4.38
Problem:    In the option-window, ":set go&" resulted in 'go' being handled
            like a boolean option.
            Mappings for <Space> and <CR> were overruled by the option-window.
Solution:   When the value of an option isn't 0 or 1, don't handle it like a
            boolean option.
            Save and restore mappings for <Space> and <CR> when entering and
            leaving the option-window.
Files:      runtime/optwin.vim

Patch 5.4.39
Problem:    When setting a hidden option, spaces before the equal sign were
            not skipped and cause an error message.  E.g., ":set csprg =cmd".
Solution:   When skipping over a hidden option, check for a following "=val"
            and skip it too.
Files:      src/option.c

Patch 5.4.40 (depends on 5.4.37)
Problem:    Compiler error for "atol(p + 1)". (Axel Kielhorn)
Solution:   Add a typecast: "atol((char *)p + 1)".
Files:      src/ex_cmds.c

Patch 5.4.41
Problem:    Some commands that were not included would give an error message,
            even when after "if 0".
Solution:   Don't give an error message for an unsupported command when not
            executing the command.
Files:      src/ex_docmd.c

Patch 5.4.42
```

```
Problem:    ":w" would also cause a truncated message to appear in the message
            history.
Solution:   Don't put a kept message in the message history when it starts
            with "<".
Files:      src/message.c

Patch 5.4.43 (depends on 5.4.37)
Problem:    Mixing long lines with multiple lines in a register causes errors
            when writing the viminfo file. (Robinson)
Solution:   When reading the viminfo file to skip register contents, skip
            lines that start with "<".
Files:      src/ops.c

Patch 5.4.44
Problem:    When 'whichwrap' includes '~', a "~" command that goes on to the
            next line cannot be properly undone. (Zellner)
Solution:   Save each line for undo in n_swapchar().
Files:      src/normal.c

Patch 5.4.45 (also see 5.4.x8)
Problem:    When expand("$ASDF") fails, there is an error message.
Solution:   Remove the global expand_interactively.  Pass a flag down to skip
            the error message.
            Also: expand("$ASDF") returns an empty string if $ASDF isn't set.
            Previously it returned "$ASDF" when 'shell' is "sh".
            Also: system() doesn't print an error when the command returns an
            error code.
Files:      many

Patch 5.4.46
Problem:    Backspacing did not always use 'softtabstop' after hitting <CR>,
            inserting a register, moving the cursor, etc.
Solution:   Reset inserted_space much more often in edit().
Files:      src/edit.c

Patch 5.4.47
Problem:    When executing BufWritePre or BufWritePost autocommands for a
            hidden buffer, the cursor could be moved to a non-existing
            position. (Vince Negri)
Solution:   Save and restore the cursor and topline for the current window
            when it is going to be used to execute autocommands for a hidden
            buffer.  Use an existing window for the buffer when it's not
            hidden.
Files:      src/fileio.c

Patch 5.4.48
Problem:    A paste with the mouse in Insert mode was not repeated exactly the
            same with ".".  For example, when 'autoindent' is set and pasting
            text with leading indent. (Perry)
Solution:   Add the CTRL-R CTRL-O r and CTRL-R CTRL-P r commands in Insert
            mode, which insert the contents of a register literally.
Files:      src/edit.c, src/normal.c, runtime/doc/insert.txt

Patch 5.4.49
```

```
Problem:    When pasting text with [ <MiddleMouse>, the cursor could end up
            after the last character of the line.
Solution:   Correct the cursor position for the change in indent.
Files:      src/ops.c

Patch 5.4.x1 (note: Replaces patch 5.4.9)
Problem:    Win32 GUI: menu hints were never used, because WANT_MENU is not
            defined until vim.h is included.
Solution:   Move the #ifdef WANT_MENU from where MENUHINTS is defined to where
            it is used.
Files:      src/gui_w32.c

Patch 5.4.x2
Problem:    BeOS: When pasting text, one character was moved to the end.
Solution:   Re-enable the BeOS code in fill_input_buf(), and fix timing out
            with acquire_sem_etc(). (Will Day)
Files:      src/os_beos.c, src/ui.c

Patch 5.4.x3
Problem:    Win32 GUI: When dropping a directory on a running gvim it crashes.
Solution:   Avoid using a NULL file name.  Also display a message to indicate
            that the current directory was changed.
Files:      src/gui_w32.c

Patch 5.4.x4
Problem:    Win32 GUI: Removing an item from the popup menu doesn't work.
Solution:   Don't remove the item from the menubar, but from the parent popup
            menu.
Files:      src/gui_w32.c

Patch 5.4.x5 (addition to 5.4.34)
Files:      src/gui_w32.c

Patch 5.4.x6
Problem:    Win32: Expanding (dir)name starting with a dot doesn't work.
            (McCormack)  Only when there is a path before it.
Solution:   Fix the check, done before expansion, if the file name pattern
            starts with a dot.
Files:      src/os_win32.c

Patch 5.4.x7
Problem:    Win32 GUI: Removing "Edit with Vim" from registry is difficult.
Solution:   Add uninstall program to remove the registry keys. It is installed
            in the "Add/Remove programs" list for ease of use.
            Also: don't set $VIM when the executable is with the runtime files.
            Also: Add a text file with a step-by-step description of how to
            uninstall Vim for DOS and Windows.
Files:      src/uninstal.c, src/dosinst.c, src/Makefile.w32, uninstal.txt

Patch 5.4.x8 (addition to 5.4.45)
Files:      many

Patch 5.4.x9
Problem:    Win32 GUI: After executing an external command, focus is not
```

            always regained (when using focus-follows-mouse).
Solution: Add SetFocus() in mch_system(). (Mike Steed)
Files: src/os_win32.c

Patch 5.5a.1
Problem: ":let @* = @:" did not work. The text was not put on the
        I   clipboard. (Fisher)
Solution: Own the clipboard and put the text on it.
Files: src/ops.c

Patch 5.5a.2
Problem: append() did not mark the buffer modified. Marks below the
            new line were not adjusted.
Solution: Fix the f_append() function.
Files: src/eval.c

Patch 5.5a.3
Problem: Editing compressed ".gz" files doesn't work on non-Unix systems,
            because there is no "mv" command.
Solution: Add the rename() function and use it instead of ":!mv".
            Also: Disable the automatic jump to the last position, because it
            changes the jumplist.
Files: src/eval.c, runtime/doc/eval.txt, runtime/vimrc_example.vim

Patch 5.5a.4
Problem: When using whole-line completion in insert mode while the cursor
            is in the indent, get "out of memory" error. (Stekrt)
Solution: Don't allocate a negative amount of memory in ins_complete().
Files: src/edit.c

Patch 5.5a.5
Problem: Win32: The 'path' option can hold only up to 256 characters,
            because _MAX_PATH is 256. (Robert Webb)
Solution: Use a fixed path length of 1024.
Files: src/os_win32.h

Patch 5.5a.6
Problem: Compiling with gcc on Win32, using the Unix Makefile, didn't work.
Solution: Add $(SUFFIX) to all places where an executable is used. Also
            pass it to ctags. (Reynolds)
Files: src/Makefile

Patch 5.5a.7
Problem: When using "cat | vim -" in an xterm, the xterm version reply
            would end up in the file.
Solution: Read the file from stdin before switching the terminal to RAW
            mode. Should also avoid problems with programs that use a
            specific terminal setting.
            Also: when using the GUI, print "Reading from stdin..." in the GUI
            window, to give a hint why it doesn't do anything.
Files: src/main.c, src/fileio.c

Patch 5.5a.8

```
Problem:    On multi-threaded Solaris, suspending doesn't work.
Solution:   Call pause() when the SIGCONT signal was not received after
            sending the SIGTSTP signal. (Nagano)
Files:      src/os_unix.c

Patch 5.5a.9
Problem:    'winaltkeys' could be set to an empty argument, which is illegal.
Solution:   Give an error message when doing ":set winaltkeys=".
Files:      src/option.c

Patch 5.5a.10
Problem:    Win32 console: Using ALTGR on a German keyboard to produce "}"
            doesn't work, because the 8th bit is set when ALT is pressed.
Solution:   Don't set the 8th bit when ALT and CTRL are used. (Leipert)
Files:      src/os_win32.c

Patch 5.5a.11
Problem:    Tcl: Configure always uses tclsh8.0.
            Also: Loading a library doesn't work.
Solution:   Add "--with-tclsh" configure argument to allow specifying another
            name for the tcl shell.
            Call Tcl_Init() in tclinit() to make loading libraries work.
            (Johannes Zellner)
Files:      src/configure.in, src/configure, src/if_tcl.c

Patch 5.5a.12
Problem:    The "user_commands" feature is called "user-commands".
Solution:   Replace "user-commands" with "user_commands". (Kim Sung-bom)
            Keep "user-commands" for the has() function, to remain backwards
            compatible with 5.4.
Files:      src/eval.c, src/version.c

Patch 5.5a.13
Problem:    OS/2: When $HOME is not defined, "C:/" is used for the viminfo
            file.  That is very wrong when OS/2 is on another partition.
Solution:   Use $VIM for the viminfo file when it is defined, like for MSDOS.
            Also: Makefile.os2 didn't depend on os_unix.h.
Files:      src/os_unix.h, src/Makefile.os2

Patch 5.5a.14
Problem:    Athena, Motif and GTK: The Mouse scroll wheel doesn't work.
Solution:   Interpret a click of the wheel as a key press of the <MouseDown>
            or <MouseUp> keys.  Default behavior is to scroll three lines, or
            a full page when Shift is used.
Files:      src/edit.c, src/ex_getln.c, src/gui.c, src/gui_gtk_x11.c,
            src/gui_x11.c, src/keymap.h, src/message.c, src/misc1.c,
            src/misc2.c, src/normal.c,  src/proto/normal.pro, src/vim.h,
            runtime/doc/scroll.txt

Patch 5.5a.15
Problem:    Using CTRL-A in Insert mode doesn't work correctly when the insert
            started with the <Insert> key. (Andreas Rohrschneider)
Solution:   Replace <Insert> with "i" before setting up the redo buffer.
Files:      src/normal.c
```

Patch 5.5a.16
Problem: VMS: GUI does not compile and run.
Solution: Various fixes. (Zoltan Arpadffy)
            Moved functions from os_unix.c to ui.c, so that VMS can use them
            too: open_app_context(), x11_setup_atoms() and clip_x11* functions.
            Made xterm_dpy global, it's now used by ui.c and os_unix.c.
            Use gethostname() always, sys_hostname doesn't exist.
Files: src/globals.h, src/gui_x11.c, src/os_vms.mms, src/os_unix.c,
            src/os_vms.c, src/ui.c, src/proto/os_unix.pro, src/proto/ui.pro

Renamed AdjustCursorForMultiByteCharacter() to AdjustCursorForMultiByteChar()
to avoid symbol length limit of 31 characters. (Steve P. Wall)

Patch 5.5b.1
Problem: SASC complains about dead assignments and implicit type casts.
Solution: Removed the dead assignments. Added explicit type casts.
Files: src/buffer.c, src/edit.c, src/eval.c, src/ex_cmds.c,
            src/ex_getln.c, src/fileio.c, src/getchar.c, src/memline.c,
            src/menu.c, src/misc1.c, src/normal.c, src/ops.c, src/quickfix.c,
            src/screen.c

Patch 5.5b.2
Problem: When using "CTRL-O O" in Insert mode, hit <Esc> and then "o" in
            another line truncates that line. (Devin Weaver)
Solution: When using a command that starts Insert mode from CTRL-O, reset
            "restart_edit" first. This avoids that edit() is called with a
            mix of starting a new edit command and restarting a previous one.
Files: src/normal.c

==
VERSION 5.6   version-5.6

Version 5.6 is a bug-fix version of 5.5.

Changed   changed-5.6

Small changes to OleVim files. (Christian Schaller)

Inserted "/**/" between patch numbers in src/version.c. This allows for one
line of context, which some versions of patch need.

Reordered the Syntax menu to avoid long submenus. Removed keyboard shortcuts
for alphabetical items to avoid a clash with fixed items.

Added   added-5.6

Included Exuberant Ctags version 3.4. (Darren Hiebert)

OpenWithVim in Python. (Christian Schaller)

Win32 GUI: gvimext.dll, for the context menu "Edit with Vim" entry. Avoids
the reported problems with the MS Office taskbar. Now it's a Shell Extension.
(Tianmiao Hu)

New syntax files:
abel   Abel (John Cook)
aml   Arc Macro Language (Nikki Knuit)
apachestyle   Apache-style config file (Christian Hammers)
cf   Cold Fusion (Jeff Lanzarotta)
ctrlh   files with CTRL-H sequences (Bram Moolenaar)
cupl   CUPL (John Cook)
cuplsim   CUPL simulation (John Cook)
erlang   Erlang (Kresimir Marzic)
gedcom   Gedcom (Paul Johnson)
icon   Icon (Wendell Turner)
ist   MakeIndex style (Peter Meszaros)
jsp   Java Server Pages (Rafael Garcia-Suarez)
rcslog   Rcslog (Joe Karthauser)
remind   Remind (Davide Alberani)
sqr   Structured Query Report Writer (Paul Moore)
tads   TADS (Amir Karger)
texinfo   Texinfo (Sandor Kopanyi)
xpm2   X Pixmap v2 (Steve Wall)

The 'C' flag in 'cpoptions' can be used to switch off concatenation for
sourced lines. See patch 5.5.013 below. line-continuation

"excludenl" argument for the ":syntax" command. See patch 5.5.032 below.
 :syn-excludenl

Implemented z+ and z^ commands. See patch 5.5.050 below.

Vim logo in Corel Draw format. Can be scaled to any resolution.

Fixed   fixed-5.6

Using this mapping in Select mode, terminated completion:
":vnoremap <C-N> <Esc>a<C-N>" (Benji Fisher)
Ignore K_SELECT in ins_compl_prep().

VMS (Zoltan Arpadffy, David Elins):
- ioctl() in pty.c caused trouble, #ifndef VMS added.
- Cut & paste mismatch corrected.
- Popup menu line crash corrected. (Patch 5.5.047)
- Motif directories during open and save as corrected.
- Handle full file names with version numbers. (Patch 5.5.046)
- Directory handling (CD command etc.)
- Corrected file name conversion VMS to Unix and v.v.
- Recovery was not working.
- Terminal and signal handling was outdated compared to os_unix.c.
- Improved os_vms.txt.

Configure used fprintf() instead of printf() to check for __DATE__ and
__TIME__. (John Card II)

BeOS: Adjust computing the char_height and char_ascent. Round them up
separately, avoids redrawing artifacts. (Mike Steed)

Fix a few multi-byte problems in menu_name_skip(), set_reg_ic(), searchc() and
findmatchlimit(). (Taro Muraoka)

GTK GUI:
- With GTK 1.2.5 and later the scrollbars were not redrawn correctly.
- Adjusted the gtk_form_draw() function.
- SNiFF connection didn't work.
- 'mousefocus' was not working. (Dalecki)
- Some keys were not working with modifiers: Shift-Tab, Ctrl-Space and CTRL-@.

Patch 5.5.001
Problem: Configure in the top directory did not pass on an argument with a
            space correctly. For example "./configure --previs="/My home".
            (Stephane Chazelas)
Solution: Use '"$@"' instead of '$*' to pass on the arguments.
Files: configure

Patch 5.5.002
Problem: Compilation error for using "fds[] & POLLIN". (Jeff Walker)
Solution: Use "fds[].revents & POLLIN".
Files: src/os_unix.c

Patch 5.5.003
Problem: The autoconf check for sizeof(int) is wrong on machines where
            sizeof(size_t) != sizeof(int).
Solution: Use our own configure check. Also fixes the warning for
            cross-compiling.
Files: src/configure.in, src/configure

Patch 5.5.004
Problem: On Unix it's not possible to interrupt ":sleep 100".
Solution: Switch terminal to cooked mode while asleep, to allow a SIGINT to
            wake us up. But switch off echo, added TMODE_SLEEP.
Files: src/term.h, src/os_unix.c

Patch 5.5.005
Problem: When using <f-args> with a user command, an empty argument to the
            command resulted in one empty string, while no string was
            expected.
Solution: Catch an empty argument and pass no argument to the function.
            (Paul Moore)
Files: src/ex_docmd.c

Patch 5.5.006
Problem: Python: When platform-dependent files are in another directory
            than the platform-independent files it doesn't work.

```
Solution:   Also check the executable directory, and add it to CFLAGS. (Tessa
            Lau)
Files:      src/configure.in, src/configure

Patch 5.5.007 (extra)
Problem:    Win32 OLE: Occasional crash when exiting while still being used
            via OLE.
Solution:   Move OleUninitialize() to before deleting the application object.
            (Vince Negri)
Files:      src/if_ole.cpp

Patch 5.5.008
Problem:    10000@@ takes a long time and cannot be interrupted.
Solution:   Check for CTRL-C typed while in the loop to push the register.
Files:      src/normal.c

Patch 5.5.009
Problem:    Recent Sequent machines don't link with "-linet". (Kurtis Rader)
Solution:   Remove configure check for Sequent.
Files:      src/configure.in, src/configure

Patch 5.5.010
Problem:    Ctags freed a memory block twice when exiting.  When out of
            memory, a misleading error message was given.
Solution:   Update to ctags 3.3.2.  Also fixes a few other problems. (Darren
            Hiebert)
Files:      src/ctags/*

Patch 5.5.011
Problem:    After "CTRL-V s", the cursor jumps back to the start, while all
            other operators leave the cursor on the last changed character.
            (Xiangjiang Ma)
Solution:   Position cursor on last changed character, if possible.
Files:      src/ops.c

Patch 5.5.012
Problem:    Using CTRL-] in Visual mode doesn't work when the text includes a
            space (just where it's useful). (Stefan Bittner)
Solution:   Don't escape special characters in a tag name with a backslash.
Files:      src/normal.c

Patch 5.5.013
Problem:    The ":append" and ":insert" commands allow using a leading
            backslash in a line.  The ":source" command concatenates those
            lines. (Heinlein)
Solution:   Add the 'C' flag in 'cpoptions' to switch off concatenation.
Files:      src/ex_docmd.c, src/option.h, runtime/doc/options.txt,
            runtime/filetype.vim, runtime/scripts.vim

Patch 5.5.014
Problem:    When executing a register with ":@", the ":append" command would
            get text lines with a ':' prepended. (Heinlein)
Solution:   Remove the ':' characters.
Files:      src/ex_docmd.c, src/ex_getln.c, src/globals.h
```

Patch 5.5.015
Problem: When using ":g/pat/p", it's hard to see where the output starts,
            the ":g" command is overwritten. Vi keeps the ":g" command.
Solution: Keep the ":g" command, but allow overwriting it with the report
            for the number of changes.
Files: src/ex_cmds.c

Patch 5.5.016 (extra)
Problem: Win32: Using regedit to install Vim in the popup menu requires the
            user to confirm this in a dialog.
Solution: Use "regedit /s" to avoid the dialog
Files: src/dosinst.c

Patch 5.5.017
Problem: If an error occurs when closing the current window, Vim could get
            stuck in the error handling.
Solution: Don't set curwin to NULL when closing the current window.
Files: src/window.c

Patch 5.5.018
Problem: Absolute paths in shell scripts do not always work.
Solution: Use /usr/bin/env to find out the path.
Files: runtime/doc/vim2html.pl, runtime/tools/efm_filter.pl,
            runtime/tools/shtags.pl

Patch 5.5.019
Problem: A function call in 'statusline' stops using ":q" twice from
            exiting, when the last argument hasn't been edited.
Solution: Don't decrement quitmore when executing a function. (Madsen)
Files: src/ex_docmd.c

Patch 5.5.020
Problem: When the output of CTRL-D completion in the commandline goes all
            the way to the last column, there is an empty line.
Solution: Don't add a newline when the cursor wrapped already. (Madsen)
Files: src/ex_getln.c

Patch 5.5.021
Problem: When checking if a file name in the tags file is relative,
            environment variables were not expanded.
Solution: Expand the file name before checking if it is relative. (Madsen)
Files: src/tag.c

Patch 5.5.022
Problem: When setting or resetting 'paste' the ruler wasn't updated.
Solution: Update the status lines when 'ruler' changes because of 'paste'.
Files: src/option.c

Patch 5.5.023
Problem: When editing a new file and autocommands change the cursor
            position, the cursor was moved back to the first non-white, unless
            'startofline' was reset.
Solution: Keep the new column, just like the line number.

```
Files:      src/ex_cmds.c

Patch 5.5.024 (extra)
Problem:    Win32 GUI: When using confirm() to put up a dialog without a
            default button, the dialog would not have keyboard focus.
            (Krishna)
Solution:   Always set focus to the dialog window.  Only set focus to a button
            when a default one is specified.
Files:      src/gui_w32.c

Patch 5.5.025
Problem:    When using "keepend" in a syntax region, a contained match that
            includes the end-of-line could still force that region to
            continue, if there is another contained match in between.
Solution:   Check the keepend_level in check_state_ends().
Files:      src/syntax.c

Patch 5.5.026
Problem:    When starting Vim in a white-on-black xterm, with 'bg' set to
            "dark", and then starting the GUI with ":gui", setting 'bg' to
            "light" in the gvimrc, the highlighting isn't set.  (Tsjokwing)
Solution:   Set the highlighting when 'bg' is changed in the gvimrc, even
            though full_screen isn't set.
Files:      src/option.c

Patch 5.5.027
Problem:    Unix: os_unix.c doesn't compile when XTERM_CLIP is used but
            WANT_TITLE isn't. (Barnum)
Solution:   Move a few functions that are used by the X11 title and clipboard
            and put another "#if" around it.
Files:      src/os_unix.c

Patch 5.5.028 (extra)
Problem:    Win32 GUI: When a file is dropped on Win32 gvim while at the ":"
            prompt, the file is edited but the command line is actually still
            there, the cursor goes back to command line on the next command.
            (Krishna)
Solution:   When dropping a file or directory on gvim while at the ":" prompt,
            insert the name of the file/directory.  Allows using the
            file/directory name for any Ex command.
Files:      src/gui_w32.c

Patch 5.5.029
Problem:    "das" at the end of the file didn't delete the last character of
            the sentence.
Solution:   When there is no character after the sentence, make the operation
            inclusive in current_sent().
Files:      src/search.c

Patch 5.5.030
Problem:    Unix: in os_unix.c, "term_str" is used, which is also defined in
            vim.h as a macro. (wuxin)
Solution:   Renamed "term_str" to "buf" in do_xterm_trace().
Files:      src/os_unix.c
```

```
Patch 5.5.031 (extra)
Problem:    Win32 GUI: When exiting Windows, gvim will leave swap files behind
            and will be killed ungracefully. (Krishna)
Solution:   Catch the WM_QUERYENDSESSION and WM_ENDSESSION messages and try to
            exit gracefully.  Allow the user to cancel the shutdown if there
            is a changed buffer.
Files:      src/gui_w32.c

Patch 5.5.032
Problem:    Patch 5.5.025 wasn't right.  And C highlighting was still not
            working correctly for a #define.
Solution:   Added "excludenl" argument to ":syntax", to be able not to extend
            a containing item when there is a match with the end-of-line.
Files:      src/syntax.c, runtime/doc/syntax.txt, runtime/syntax/c.vim

Patch 5.5.033
Problem:    When reading from stdin, a long line in viminfo would mess up the
            file message.  readfile() uses IObuff for keep_msg, which could be
            overwritten by anyone.
Solution:   Copy the message from IObuff to msg_buf and set keep_msg to that.
            Also change vim_fgets() to not use IObuff any longer.
Files:      src/fileio.c

Patch 5.5.034
Problem:    "gvim -rv" caused a crash.  Using 't_Co' before it's set.
Solution:   Don't try to initialize the highlighting before it has been
            initialized from main().
Files:      src/syntax.c

Patch 5.5.035
Problem:    GTK with XIM: Resizing with status area was messy, and
            ":set guioptions+=b" didn't work.
Solution:   Make status area a separate widget, but not a separate window.
            (Chi-Deok Hwang)
Files:      src/gui_gtk_f.c, src/gui_gtk_x11.c, src/multbyte.c

Patch 5.5.036
Problem:    The GZIP_read() function in $VIMRUNTIME/vimrc_example.vim to
            uncompress a file did not do detection for 'fileformat'.  This is
            because the filtering is done with 'binary' set.
Solution:   Split the filtering into separate write, filter and read commands.
Files:      runtime/vimrc_example.vim

Patch 5.5.037
Problem:    The "U" command didn't mark the buffer as changed. (McCormack)
Solution:   Set the 'modified' flag when using "U".
Files:      src/undo.c

Patch 5.5.038
Problem:    When typing a long ":" command, so that the screen scrolls up,
            causes the hit-enter prompt, even though the user just typed
            return to execute the command.
Solution:   Reset need_wait_return if (part of) the command was typed in
```

```
            getcmdline().
Files:      src/ex_getln.c

Patch 5.5.039
Problem:    When using a custom status line, "%a" (file # of #) reports the
            index of the current window for all windows.
Solution:   Pass a window pointer to append_arg_number(), and pass the window
            being updated from build_stl_str_hl(). (Stephen P. Wall)
Files:      src/buffer.c, src/screen.c, src/proto/buffer.pro

Patch 5.5.040
Problem:    Multi-byte: When there is some error in xim_real_init(), it can
            close XIM and return.  After this there can be a segv.
Solution:   Test "xic" for being non-NULL, don't set "xim" to NULL.  Also try
            to find more matches for supported styles. (Sung-Hyun Nam)
Files:      src/multbyte.c

Patch 5.5.041
Problem:    X11 GUI: CTRL-_ requires the SHIFT key only on some machines.
Solution:   Translate CTRL-- to CTRL-_. (Robert Webb)
Files:      src/gui_x11.c

Patch 5.5.042
Problem:    X11 GUI: keys with ALT were assumed to be used for the menu, even
            when the menu has been disabled by removing 'm' from 'guioptions'.
Solution:   Ignore keys with ALT only when gui.menu_is_active is set. (Raf)
Files:      src/gui_x11.c

Patch 5.5.043
Problem:    GTK: Handling of fontset fonts was not right when 'guifontset'
            contains exactly 14 times '-'.
Solution:   Avoid setting fonts when working with a fontset. (Sung-Hyun Nam)
Files:      src/gui_gtk_x11.c

Patch 5.5.044
Problem:    pltags.pl contains an absolute path "/usr/local/bin/perl".  That
            might not work everywhere.
Solution:   Use "/usr/bin/env perl" instead.
Files:      runtime/tools/pltags.pl

Patch 5.5.045
Problem:    Using "this_session" variable does not work, requires preceding it
            with "v:".  Default filename for ":mksession" isn't mentioned
            in the docs. (Fisher)
Solution:   Support using "this_session" to be backwards compatible.
Files:      src/eval.c, runtime/doc/options.txt

Patch 5.5.046 (extra)
Problem:    VMS: problems with path and filename.
Solution:   Truncate file name at last ';', etc. (Zoltan Arpadffy)
Files:      src/buffer.c, src/fileio.c, src/gui_motif.c, src/os_vms.c,
            src/proto/os_vms.pro

Patch 5.5.047
```

```
Problem:    VMS: Crash when using the popup menu
Solution:   Turn the #define MENU_MODE_CHARS into an array. (Arpadffy)
Files:      src/structs.h, src/menu.c

Patch 5.5.048
Problem:    HP-UX 11: Compiling doesn't work, because both string.h and
            strings.h are included. (Squassabia)
Solution:   The configure test for including both string.h and strings.h
            must include <Xm/Xm.h> first, because it causes problems.
Files:      src/configure.in, src/configure, src/config.h.in

Patch 5.5.049
Problem:    Unix: When installing Vim, the protection bits of files might be
            influenced by the umask.
Solution:   Add $(FILEMOD) to Makefile. (Shetye)
Files:      src/Makefile

Patch 5.5.050
Problem:    "z+" and "z^" commands are missing.
Solution:   Implemented "z+" and "z^".
Files:      src/normal.c, runtime/doc/scroll.txt, runtime/doc/index.txt

Patch 5.5.051
Problem:    Several Unix systems have a problem with the optimization limits
            check in configure.
Solution:   Removed the configure check, let the user add it manually in
            Makefile or the environment.
Files:      src/configure.in, src/configure, src/Makefile

Patch 5.5.052
Problem:    Crash when using a cursor key at the ATTENTION prompt. (Alberani)
Solution:   Ignore special keys at the console dialog.  Also ignore characters
            > 255 for other uses of tolower() and toupper().
Files:      src/menu.c, src/message.c, src/misc2.c

Patch 5.5.053
Problem:    Indenting is wrong after a function when 'cino' has "fs".  Another
            problem when 'cino' has "{s".
Solution:   Put line after closing "}" of a function at the left margin.
            Apply ind_open_extra in the right way after a '{'.
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 5.5.054
Problem:    Unix: ":e #" doesn't work if the alternate file name contains a
            space or backslash. (Hudacek)
Solution:   When replacing "#", "%" or other items that stand for a file name,
            prepend a backslash before special characters.
Files:      src/ex_docmd.c

Patch 5.5.055
Problem:    Using "<C-V>$r-" in blockwise Visual mode replaces one character
            beyond the end of the line. (Zivkov)
Solution:   Only replace existing characters.
Files:      src/ops.c
```

```
Patch 5.5.056
Problem:    After "z20<CR>" messages were printed at the old command line
            position once.  (Veselinovic)
Solution:   Set msg_row and msg_col when changing cmdline_row in
            win_setheight().
Files:      src/window.c

Patch 5.5.057
Problem:    After "S<Esc>" it should be possible to restore the line with "U".
            (Veselinovic)
Solution:   Don't call u_clearline() in op_delete() when changing only one
            line.
Files:      src/ops.c

Patch 5.5.058
Problem:    Using a long search pattern and then "n" causes the hit-enter
            prompt.  (Krishna)
Solution:   Truncate the echoed pattern, like other messages.  Moved code for
            truncating from msg_attr() to msg_strtrunc().
Files:      src/message.c, src/proto/message.pro, src/search.c

Patch 5.5.059
Problem:    GTK GUI: When $term is invalid, using "gvim" gives an error
            message, even though $term isn't really used.  (Robbins)
Solution:   When the GUI is about to start, skip the error messages for a
            wrong $term.
Files:      src/term.c

Patch 5.5.060 (extra)
Problem:    Dos 32 bit: When a directory in 'backupdir' doesn't exist, ":w"
            causes the file to be renamed to "axlqwqhy.ba~". (Matzdorf)
Solution:   The code to work around a LFN bug in Windows 95 doesn't handle a
            non-existing target name correctly.  When renaming fails, make
            sure the file has its original name.  Also do this for the Win32
            version, although it's unlikely that it runs into this problem.
Files:      src/os_msdos.c, src/os_win32.c

Patch 5.5.061
Problem:    When using "\:" in a modeline, the backslash is included in the
            option value. (Mohsin)
Solution:   Remove one backslash before the ':' in a modeline.
Files:      src/buffer.c, runtime/doc/options.txt

Patch 5.5.062 (extra)
Problem:    Win32 console: Temp files are created in the root of the current
            drive, which may be read-only. (Peterson)
Solution:   Use the same mechanism of the GUI version: Use $TMP, $TEMP or the
            current directory.  Cleaned up vim_tempname() a bit.
Files:      src/fileio.c, src/os_win32.h, runtime/doc/os_dos.txt

Patch 5.5.063
Problem:    When using whole-line completion in Insert mode, 'cindent' is
            applied, even after changing the indent of the line.
```

```
Solution:   Don't reindent the completed line after inserting/removing indent.
            (Robert Webb)
Files:      src/edit.c

Patch 5.5.064
Problem:    has("sniff") doesn't work correctly.
Solution:   Return 1 when Vim was compiled with the +sniff feature. (Pruemmer)
Files:      src/eval.c

Patch 5.5.065
Problem:    When dropping a file on Vim, the 'shellslash' option is not
            effective. (Krishna)
Solution:   Fix the slashes in the dropped file names according to
            'shellslash'.
Files:      src/ex_docmd.c, runtime/doc/options.txt

Patch 5.5.066
Problem:    For systems with backslash in file name: Setting a file name
            option to a value starting with "\\machine" removed a backslash.
Solution:   Keep the double backslash for "\\machine", but do change
            "\\\\machine" to "\\machine" for backwards compatibility.
Files:      src/option.c, runtime/doc/options.txt

Patch 5.5.067
Problem:    With 'hlsearch' set, the pattern "\>" doesn't highlight the first
            match in a line. (Benji Fisher)
Solution:   Fix highlighting an empty match.  Also highlight the first
            character in an empty line for "$".
Files:      src/screen.c

Patch 5.5.068
Problem:    Crash when a ":while" is used with an argument that has an error.
            (Sylvain Viart)
Solution:   Was using an uninitialized index in the cs_line[] array.  The
            crash only happened when the index was far off.  Made sure the
            uninitialized index isn't used.
Files:      src/ex_docmd.c

Patch 5.5.069
Problem:    Shifting lines in blockwise Visual mode didn't set the 'modified'
            flag.
Solution:   Do set the 'modified' flag.
Files:      src/ops.c

Patch 5.5.070
Problem:    When editing a new file, creating that file outside of Vim, then
            editing it again, ":w" still warns for overwriting an existing
            file. (Nam)
Solution:   The BF_NEW flag in the "b_flags" field wasn't cleared properly.
Files:      src/buffer.c, src/fileio.c

Patch 5.5.071
Problem:    Using a matchgroup in a ":syn region", which is the same syntax
            group as the region, didn't stop a contained item from matching in
```

```
            the start pattern.
Solution:   Also push an item on the stack when the syntax ID of the
            matchgroup is the same as the syntax ID of the region.
Files:      src/syntax.c

Patch 5.5.072 (extra)
Problem:    Dos 32 bit: When setting 'columns' to a too large value, Vim may
            crash, and the DOS console too.
Solution:   Check that the value of 'columns' isn't larger than the number of
            columns that the BIOS reports.
Files:      src/os_msdos.c, src/proto/os_msdos.pro, src/option.c

Patch 5.5.073 (extra)
Problem:    Win 32 GUI: The Find and Find/Replace dialogs didn't show the
            "match case" checkbox.  The Find/Replace dialog didn't handle the
            "match whole word" checkbox.
Solution:   Support the "match case" and "match whole word" checkboxes.
Files:      src/gui_w32.c

Patch 5.6a.001
Problem:    Using <C-End> with a count doesn't work like it does with "G".
            (Benji Fisher)
Solution:   Accept a count for <C-End> and <C-Home>.
Files:      src/normal.c

Patch 5.6a.002
Problem:    The script for conversion to HTML was an older version.
Solution:   Add support for running 2html.vim on a color terminal.
Files:      runtime/syntax/2html.vim

Patch 5.6a.003
Problem:    Defining a function inside a function didn't give an error
            message.  A missing ":endfunction" doesn't give an error message.
Solution:   Allow defining a function inside a function.
Files:      src/eval.c, runtime/doc/eval.txt

Patch 5.6a.004
Problem:    A missing ":endwhile" or ":endif" doesn't give an error message.
            (Johannes Zellner)
Solution:   Check for missing ":endwhile" and ":endif" in sourced files.
            Add missing ":endif" in file selection macros.
Files:      src/ex_docmd.c, runtime/macros/file_select.vim

Patch 5.6a.005
Problem:    'hlsearch' was not listed alphabetically.  The value of 'toolbar'
            was changed when 'compatible' is set.
Solution:   Moved entry of 'hlsearch' in options[] table down.
            Don't reset 'toolbar' option to the default value when
            'compatible' is set.
Files:      src/option.c

Patch 5.6a.006
Problem:    Using a backwards range inside ":if 0" gave an error message.
Solution:   Don't complain about a range when it is not going to be used.
```

(Stefan Roemer)
Files: src/ex_docmd.c

Patch 5.6a.007
Problem: ":let" didn't show internal Vim variables. (Ron Aaron)
Solution: Do show ":v" variables for ":let" and ":let v:name".
Files: src/eval.c

Patch 5.6a.008
Problem: Selecting a syntax from the Syntax menu gives an error message.
Solution: Replace "else if" in SetSyn() with "elseif". (Ronald Schild)
Files: runtime/menu.vim

Patch 5.6a.009
Problem: When compiling with +extra_search but without +syntax, there is a compilation error in screen.c. (Axel Kielhorn)
Solution: Adjust the #ifdef for declaring and initializing "line" in win_line(). Also solve compilation problem when +statusline is used without +eval. Another one when +cmdline_compl is used without +eval.
Files: src/screen.c, src/misc2.c

Patch 5.6a.010
Problem: In a function, ":startinsert!" does not append to the end of the line if a ":normal" command was used to move the cursor. (Fisher)
Solution: Reset "w_set_curswant" to avoid that w_curswant is changed again.
Files: src/ex_docmd.c

Patch 5.6a.011 (depends on 5.6a.004)
Problem: A missing ":endif" or ":endwhile" in a function doesn't give an error message.
Solution: Give that error message.
Files: src/ex_docmd.c

Patch 5.6a.012 (depends on 5.6a.008)
Problem: Some Syntax menu entries caused a hit-enter prompt.
Solution: Call a function to make the command shorter. Also rename a few functions to avoid name clashes.
Files: runtime/menu.vim

Patch 5.6a.013
Problem: Command line completion works different when another completion was done earlier. (Johannes Zellner)
Solution: Reset wim_index when starting a new completion.
Files: src/ex_getln.c

Patch 5.6a.014
Problem: Various warning messages when compiling and running lint with different combinations of features.
Solution: Fix the warning messages.
Files: src/eval.c, src/ex_cmds.c, src/ex_docmd.c, src/gui_gtk_x11.c, src/option.c, src/screen.c, src/search.c, src/syntax.c, src/feature.h, src/globals.h

Patch 5.6a.015
Problem: The vimtutor command doesn't always know the value of $VIMRUNTIME.
Solution: Let Vim expand $VIMRUNTIME, instead of the shell.
Files: src/vimtutor

Patch 5.6a.016 (extra)
Problem: Mac: Window size is restricted when starting. Cannot drag the
            window all over the desktop.
Solution: Get real screen size instead of assuming 640x400. Do not use a
            fixed number for the drag limits. (Axel Kielhorn)
Files: src/gui_mac.c

Patch 5.6a.017
Problem: The "Paste" entry in popup menu for Visual, Insert and Cmdline
            mode is in the wrong position. (Stol)
Solution: Add priority numbers for all Paste menu entries.
Files: runtime/menu.vim

Patch 5.6a.018
Problem: GTK GUI: submenu priority doesn't work.
            Help dialog could be destroyed too soon.
            When closing a dialog window (e.g. the "ATTENTION" one), Vim would
            just hang.
            When GTK theme is changed, Vim doesn't adjust to the new colors.
            Argument for ":promptfind" isn't used.
Solution: Fixed the mentioned problems.
            Made the dialogs look&feel nicer.
            Moved functions to avoid the need for a forward declaration.
            Fixed reentrancy of the file browser dialog.
            Added drag&drop support for GNOME.
            Init the text for the Find/replace dialog from the last used
            search string. Set "match whole word" toggle button correctly.
            Made repeat rate for drag outside of window depend on the
            distance from the window. (Marcin Dalecki)
            Made the drag in Visual mode actually work.
            Removed recursiveness protection from gui_mch_get_rgb(), it might
            cause more trouble than it solves.
Files: src/ex_docmd.c, src/gui_gtk.c, src/gui_gtk_x11.c, src/ui.c,
            src/proto/ui.pro, src/misc2.c

Patch 5.6a.019
Problem: When trying to recover through NFS, which uses a large block size,
            Vim might think the swap file is empty, because mf_blocknr_max is
            zero. (Scott McDermott)
Solution: When computing the number of blocks of the file in mf_open(),
            round up instead of down.
Files: src/memfile.c

Patch 5.6a.020
Problem: GUI GTK: Could not set display for gvim.
Solution: Add "-display" and "--display" arguments. (Marcin Dalecki)
Files: src/gui_gtk_x11.c

Patch 5.6a.021

```
Problem:    Recovering still may not work when the block size of the device
            where the swap file is located is larger than 4096.
Solution:   Read block 0 with the minimal block size.
Files:      src/memline.c, src/memfile.c, src/vim.h

Patch 5.6a.022 (extra)
Problem:    Win32 GUI: When an error in the vimrc causes a dialog to pop up
            (e.g., for an existing swap file), Vim crashes. (David Elins)
Solution:   Before showing a dialog, open the main window.
Files:      src/gui_w32.c

Patch 5.6a.023
Problem:    Using expand("%:gs??/?") causes a crash. (Ron Aaron)
Solution:   Check for running into the end of the string in do_string_sub().
Files:      src/eval.c

Patch 5.6a.024
Problem:    Using an autocommand to delete a buffer when leaving it can cause
            a crash when jumping to a tag. (Franz Gorkotte)
Solution:   In do_tag(), store tagstacklen before jumping to another buffer.
            Check tagstackidx after jumping to another buffer.
            Add extra check in win_split() if tagname isn't NULL.
Files:      src/tag.c, src/window.c

Patch 5.6a.025 (extra)
Problem:    Win32 GUI: The tables for toupper() and tolower() are initialized
            too late. (Mike Steed)
Solution:   Move the initialization to win32_init() and call it from main().
Files:      src/main.c, src/os_w32.c, src/proto/os_w32.pro

Patch 5.6a.026
Problem:    When the SNiFF connection is open, shell commands hang. (Pruemmer)
Solution:   Skip a second wait() call if waitpid() already detected that the
            child has exited.
Files:      src/os_unix.c

Patch 5.6a.027 (extra)
Problem:    Win32 GUI: The "Edit with Vim" popup menu entry causes problems
            for the Office toolbar.
Solution:   Use a shell extension dll. (Tianmiao Hu)
            Added it to the install and uninstal programs, replaces the old
            "Edit with Vim" menu registry entries.
Files:      src/dosinst.c, src/uninstal.c, gvimext/*, runtime/doc/gui_w32.txt

Patch 5.6a.028 (extra)
Problem:    Win32 GUI: Dialogs and tear-off menus can't handle multi-byte
            characters.
Solution:   Adjust nCopyAnsiToWideChar() to handle multi-byte characters
            correctly.
Files:      src/gui_w32.c

==============================================================================
VERSION 5.7                                                  version-5.7
```

Version 5.7 is a bug-fix version of 5.6.

Changed   changed-5.7

Renamed src/INSTALL.mac to INSTALL_mac.txt to avoid it being recognized with a
wrong file type. Also renamed src/INSTALL.amiga to INSTALL_ami.txt.

Added   added-5.7

New syntax files:
stp   Stored Procedures (Jeff Lanzarotta)
snnsnet, snnspat, snnsres   SNNS (Davide Alberani)
mel   MEL (Robert Minsk)
ruby   Ruby (Mirko Nasato)
tli   TealInfo (Kurt W. Andrews)
ora   Oracle config file (Sandor Kopanyi)
abaqus   Abaqus (Carl Osterwisch)
jproperties   Java Properties (Simon Baldwin)
apache   Apache config (Allan Kelly)
csp   CSP (Jan Bredereke)
samba   Samba config (Rafael Garcia-Suarez)
kscript   KDE script (Thomas Capricelli)
hb   Hyper Builder (Alejandro Forero Cuervo)
fortran   Fortran (rewritten) (Ajit J. Thakkar)
sml   SML (Fabrizio Zeno Cornelli)
cvs   CVS commit (Matt Dunford)
aspperl   ASP Perl (Aaron Hope)
bc   BC calculator (Vladimir Scholtz)
latte   Latte (Nick Moffitt)
wml   WML (Gerfried Fuchs)

Included Exuberant ctags 3.5.1. (Darren Hiebert)

"display" and "fold" arguments for syntax items. For future extension, they
are ignored now.

strftime() function for the Macintosh.

macros/explorer.vim: A file browser script (M A Aziz Ahmed)

Fixed   fixed-5.7

The 16 bit MS-DOS version is now compiled with Bcc 3.1 instead of 4.0. The
executable is smaller.

When a "make test" failed, the output file was lost. Rename it to
test99.failed to be able to see what went wrong.

After sourcing bugreport.vim, it's not clear that bugreport.txt has been

written in the current directory. Edit bugreport.txt to avoid that.

Adding IME support when using Makefile.w32 didn't work. (Taro Muraoka)

Win32 console: Mouse drags were passed on even when the mouse didn't move.

Perl interface: In Buffers(), type of argument to SvPV() was int, should be
STRLEN. (Tony Leneis)

Problem with prototype for index() on AIX 4.3.0. Added check for _AIX43 in
os_unix.h. (Jake Hamby)

Mappings in mswin.vim could break when some commands are mapped. Add "nore"
to most mappings to avoid re-mapping.

modify_fname() made a copy of a file name for ":p" when it already was a full
path name, which is a bit slow.

Win32 with Borland C++ 5.5: Pass the path to the compiler on to xxd and ctags,
to avoid depending on $PATH. Fixed "make clean".

Many fixes to Macintosh specific parts: (mostly by Dany StAmant)
- Only one Help menu.
- No more crash when removing a menu item.
- Support as External Editor for Codewarrior (still some little glitches).
- Popup menu support.
- Fixed crash when pasting after application switch.
- Color from rgb.txt properly displayed.
- 'isprint' default includes all chars above '~'. (Axel Kielhorn)
- mac_expandpath() was leaking memory.
- Add digraphs table. (Axel Kielhorn)
- Multi-byte support: (Kenichi Asai)
  Switch keyscript when going in/out of Insert mode.
  Draw multi-byte character correctly.
  Don't use mblen() but highest bit of char to detect multi-byte char.
  Display value of multi-byte in statusline (also for other systems).
- mouse button was not initialized properly to MOUSE_LEFT when
  USE_CTRLCLICKMENU not defined.
- With Japanese SJIS characters: Make "w", "b", and "e" work
  properly. (Kenichi Asai)
- Replaced old CodeWarrior file os_mac.CW9.hqx with os_mac.cw5.sit.hqx.

Fixes for VMS: (Zoltan Arpadffy) (also see patch 5.6.045 below)
- Added Makefile_vms.mms and vimrc.vms to src/testdir to be able to run the
  tests.
- Various fixes.
- Set 'undolevels' to 1000 by default.
- Made mch_settitle() equivalent to the one in os_unix.c.

RiscOS: A few prototypes for os_riscos.c were outdated. Generate prototypes
automatically.

Previously released patches:

```
Patch 5.6.001
Problem:    When using "set bs=0 si cin", Inserting "#<BS>" or "}<BS>" which
            reduces the indent doesn't delete the "#" or "}". (Lorton)
Solution:   Adjust ai_col in ins_try_si().
Files:      src/edit.c

Patch 5.6.002
Problem:    When using the vim.vim syntax file, a comment with all uppercase
            characters causes a hang.
Solution:   Adjust pattern for vimCommentTitle (Charles Campbell)
Files:      runtime/syntax/vim.vim

Patch 5.6.003
Problem:    GTK GUI: Loading a user defined toolbar bitmap gives a warning
            about the colormap.  Probably because the window has not been
            opened yet.
Solution:   Use gdk_pixmap_colormap_create_from_xpm() to convert the xpm file.
            (Keith Radebaugh)
Files:      src/gui_gtk.c

Patch 5.6.004 (extra)
Problem:    Win32 GUI with IME: When setting 'guifont' to "*", the font
            requester appears twice.
Solution:   In gui_mch_init_font() don't call get_logfont() but copy
            norm_logfont from fh. (Yasuhiro Matsumoto)
Files:      src/gui_w32.c

Patch 5.6.005
Problem:    When 'winminheight' is zero, CTRL-W - with a big number causes a
            crash.  (David Kotchan)
Solution:   Check for negative window height in win_setheight().
Files:      src/window.c

Patch 5.6.006
Problem:    GTK GUI: Bold font cannot always be used.  Memory is freed too
            early in gui_mch_init_font().
Solution:   Move call to g_free() to after where sdup is used. (Artem Hodyush)
Files:      src/gui_gtk_x11.c

Patch 5.6.007 (extra)
Problem:    Win32 IME: Font is not changed when screen font is changed. And
            IME composition window does not trace the cursor.
Solution:   Initialize IME font.  When cursor is moved, set IME composition
            window with ImeSetCompositionWindow().  Add call to
            ImmReleaseContext() in several places. (Taro Muraoka)
Files:      src/gui.c, src/gui_w32.c, src/proto/gui_w32.pro

Patch 5.6.008 (extra)
Problem:    Win32: When two files exist with the same name but different case
            (through NFS or Samba), fixing the file name case could cause the
            wrong one to be edited.
Solution:   Prefer a perfect match above a match while ignoring case in
            fname_case().  (Flemming Madsen)
```

```
Files:      src/os_win32.c

Patch 5.6.009 (extra)
Problem:    Win32 GUI: Garbage in Windows Explorer help line when selecting
            "Edit with Vim" popup menu entry.
Solution:   Only return the help line when called with the GCS_HELPTEXT flag.
            (Tianmiao Hu)
Files:      GvimExt/gvimext.cpp

Patch 5.6.010
Problem:    A file name which contains a TAB was not read correctly from the
            viminfo file and the ":ls" listing was not aligned properly.
Solution:   Parse the buffer list lines in the viminfo file from the end
            backwards.  Count a Tab for two characters to align the ":ls" list.
Files:      src/buffer.c

Patch 5.6.011
Problem:    When 'columns' is huge (using a tiny font) and 'statusline' is
            used, Vim can crash.
Solution:   Limit maxlen to MAXPATHL in win_redr_custom(). (John Mullin)
Files:      src/screen.c

Patch 5.6.012
Problem:    When using "zsh" for /bin/sh, toolcheck may hang until "exit" is
            typed. (Kuratczyk)
Solution:   Add "-c exit" when checking for the shell version.
Files:      src/toolcheck

Patch 5.6.013
Problem:    Multibyte char in tooltip is broken.
Solution:   Consider multibyte char in replace_termcodes(). (Taro Muraoka)
Files:      src/term.c

Patch 5.6.014
Problem:    When cursor is at the end of line and the character under cursor
            is a multibyte character, "yl" doesn't yank 1 multibyte-char.
            (Takuhiro Nishioka)
Solution:   Recognize a multibyte-char at end-of-line correctly in oneright().
            (Taro Muraoka)
            Also: make "+quickfix" in ":version" output appear alphabetically.
Files:      src/edit.c

Patch 5.6.015
Problem:    New xterm delete key sends <Esc>[3~ by default.
Solution:   Added <kDel> and <kIns> to make the set of keypad keys complete.
Files:      src/edit.c, src/ex_getln.c, src/keymap.h, src/misc1.c,
            src/misc2.c, src/normal.c, src/os_unix.c, src/term.c

Patch 5.6.016
Problem:    When deleting a search string from history from inside a mapping,
            another entry is deleted too. (Benji Fisher)
Solution:   Reset last_maptick when deleting the last entry of the search
            history.  Also: Increment maptick when starting a mapping from
            typed characters to avoid a just added search string being
```

```
            overwritten or removed from history.
Files:      src/ex_getln.c, src/getchar.c

Patch 5.6.017
Problem:    ":s/e/\^M/" should replace an "e" with a CTRL-M, not split the
            line. (Calder)
Solution:   Replace the backslash with a CTRL-V internally. (Stephen P. Wall)
Files:      src/ex_cmds.c

Patch 5.6.018
Problem:    ":help [:digit:]" takes a long time to jump to the wrong place.
Solution:   Insert a backslash to avoid the special meaning of '[]'.
Files:      src/ex_cmds.c

Patch 5.6.019
Problem:    "snd.c", "snd.java", etc. were recognized as "mail" filetype.
Solution:   Make pattern for mail filetype more strict.
Files:      runtime/filetype.vim

Patch 5.6.020 (extra)
Problem:    The DJGPP version eats processor time (Walter Briscoe).
Solution:   Call __dpmi_yield() in the busy-wait loop.
Files:      src/os_msdos.c

Patch 5.6.021
Problem:    When 'selection' is "exclusive", a double mouse click in Insert
            mode doesn't select last char in line. (Lutz)
Solution:   Allow leaving the cursor on the NUL past the line in this case.
Files:      src/edit.c

Patch 5.6.022
Problem:    ":e \~<Tab>" expands to ":e ~\$ceelen", which doesn't work.
Solution:   Re-insert the backslash before the '~'.
Files:      src/ex_getln.c

Patch 5.6.023 (extra)
Problem:    Various warnings for the Ming compiler.
Solution:   Changes to avoid the warnings. (Bill McCarthy)
Files:      src/ex_cmds.c, src/gui_w32.c, src/os_w32exe.c, src/os_win32.c,
            src/syntax.c, src/vim.rc

Patch 5.6.024 (extra)
Problem:    Win32 console: Entering CTRL-_ requires the shift key. (Kotchan)
Solution:   Specifically catch keycode 0xBD, like the GUI.
Files:      src/os_win32.c

Patch 5.6.025
Problem:    GTK GUI: Starting the GUI could be interrupted by a SIGWINCH.
            (Nils Lohner)
Solution:   Repeat the read() call to get the gui_in_use value when
            interrupted by a signal.
Files:      src/gui.c

Patch 5.6.026 (extra)
```

```
Problem:    Win32 GUI: Toolbar bitmaps are searched for in
            $VIMRUNTIME/bitmaps, while GTK looks in $VIM/bitmaps. (Keith
            Radebaugh)
Solution:   Use $VIM/bitmaps for both, because these are not part of the
            distribution but defined by the user.
Files:      src/gui_w32.c, runtime/doc/gui.txt

Patch 5.6.027
Problem:    TCL: Crash when using a Tcl script (reported for Win32).
Solution:   Call Tcl_FindExecutable() in main(). (Brent Fulgham)
Files:      src/main.c

Patch 5.6.028
Problem:    Xterm patch level 126 sends codes for mouse scroll wheel.
            Fully works with xterm patch level 131.
Solution:   Recognize the codes for button 4 (0x60) and button 5 (0x61).
Files:      src/term.c

Patch 5.6.029
Problem:    GTK GUI: Shortcut keys cannot be used for a dialog. (Johannes
            Zellner)
Solution:   Add support for shortcut keys. (Marcin Dalecki)
Files:      src/gui_gtk.c

Patch 5.6.030
Problem:    When closing a window and 'ea' is set, Vim can crash. (Yasuhiro
            Matsumoto)
Solution:   Set "curbuf" to a valid value in win_close().
Files:      src/window.c

Patch 5.6.031
Problem:    Multi-byte: When a double-byte character ends in CSI, Vim waits
            for another character to be typed.
Solution:   Recognize the CSI as the second byte of a character and don't wait
            for another one. (Yasuhiro Matsumoto)
Files:      src/getchar.c

Patch 5.6.032
Problem:    Functions with an argument that is a line number don't all accept
            ".", "$", etc. (Ralf Arens)
Solution:   Add get_art_lnum() and use it for setline(), line2byte() and
            synID().
Files:      src/eval.c

Patch 5.6.033
Problem:    Multi-byte: "f " sometimes skips to the second space.  (Sung-Hyun
            Nam)
Solution:   Change logic in searchc() to skip trailing byte of a double-byte
            character.
            Also: Ask for second byte when searching for double-byte
            character. (Park Chong-Dae)
Files:      src/search.c

Patch 5.6.034 (extra)
```

```
Problem:    Compiling with Borland C++ 5.5 fails on tolower() and toupper().
Solution:   Use TO_LOWER() and TO_UPPER() instead.  Also adjust the Makefile
            to make using bcc 5.5 easier.
Files:      src/edit.c, src/ex_docmd.c, src/misc1.c, src/Makefile.bor

Patch 5.6.035
Problem:    Listing the"+comments" feature in the ":version" output depended
            on the wrong ID. (Stephen P. Wall)
Solution:   Change "CRYPTV" to "COMMENTS".
Files:      src/version.c

Patch 5.6.036
Problem:    GTK GUI: Copy/paste text doesn't work between gvim and Eterm.
Solution:   Support TEXT and COMPOUND_TEXT selection targets. (ChiDeok Hwang)
Files:      src/gui_gtk_x11.c

Patch 5.6.037
Problem:    Multi-byte: Can't use "f" command with multi-byte character in GUI.
Solution:   Enable XIM in Normal mode for the GUI. (Sung-Hyun Nam)
Files:      src/gui_gtk_x11.c, src/multbyte.c

Patch 5.6.038
Problem:    Multi-clicks in GUI are interpreted as a mouse wheel click.  When
            'ttymouse' is "xterm" a mouse click is interpreted as a mouse
            wheel click.
Solution:   Don't recognize the mouse wheel in check_termcode() in the GUI.
            Use 0x43 for a mouse drag in do_xterm_trace(), not 0x63.
Files:      src/term.c, src/os_unix.c

Patch 5.6.039
Problem:    Motif GUI under KDE: When trying to logout, Vim hangs up the
            system. (Hermann Rochholz)
Solution:   When handling the WM_SAVE_YOURSELF event, set the WM_COMMAND
            property of the window to let the session manager know we finished
            saving ourselves.
Files:      src/gui_x11.c

Patch 5.6.040
Problem:    When using ":s" command, matching the regexp is done twice.
Solution:   After copying the matched line, adjust the pointers instead of
            finding the match again. (Loic Grenie)  Added vim_regnewptr().
Files:      src/ex_cmds.c, src/regexp.c, src/proto/regexp.pro

Patch 5.6.041
Problem:    GUI: Athena, Motif and GTK don't give more than 10 dialog buttons.
Solution:   Remove the limit on the number of buttons.
            Also support the 'v' flag in 'guioptions'.
            For GTK: Center the buttons.
Files:      src/gui_athena.c, src/gui_gtk.c, src/gui_motif.c

Patch 5.6.042
Problem:    When doing "vim -u vimrc" and vimrc contains ":q", the cursor in
            the terminal can remain off.
Solution:   Call cursor_on() in mch_windexit().
```

```
Files:      src/os_unix.c

Patch 5.6.043 (extra)
Problem:    Win32 GUI: When selecting guifont with the dialog, 'guifont'
            doesn't include the bold or italic attributes.
Solution:   Append ":i" and/or ":b" to 'guifont' in gui_mch_init_font().
Files:      src/gui_w32.c

Patch 5.6.044 (extra)
Problem:    MS-DOS and Windows: The line that dosinst.exe appends to
            autoexec.bat to set PATH is wrong when Vim is in a directory with
            an embedded space.
Solution:   Use double quotes for the value when there is an embedded space.
Files:      src/dosinst.c

Patch 5.6.045 (extra) (fixed version)
Problem:    VMS: Various small problems.
Solution:   Many small changes. (Zoltan Arpadffy)
            File name modifier ":h" keeps the path separator.
            File name modifier ":e" also removes version.
            Compile with MAX_FEAT by default.
            When checking for autocommands ignore version in file name.
            Be aware of file names being case insensitive.
            Added vt320 builtin termcap.
            Be prepared for an empty default_vim_dir.
Files:      runtime/gvimrc_example.vim, runtime/vimrc_example.vim,
            runtime/doc/os_vms.txt, src/eval.c, src/feature.h, src/fileio.c,
            src/gui_motif.c, src/gui_vms_conf.h, src/main.c, src/memline.c,
            src/misc1.c, src/option.c, src/os_vms_conf.h, src/os_vms.c,
            src/os_vms.h, src/os_vms.mms, src/tag.c, src/term.c, src/version.c

Patch 5.6.046
Problem:    Systems with backslash in file name: With 'shellslash' set, "vim
            */*.c" only uses a slash for the first file name.  (Har'El)
Solution:   Fix slashes in file name arguments after reading the vimrc file.
Files:      src/option.c

Patch 5.6.047
Problem:    $CPPFLAGS is not passed on to ctags configure.
Solution:   Add it. (Walter Briscoe)
Files:      src/config.mk.in, src/Makefile

Patch 5.6.048
Problem:    CTRL-R in Command-line mode is documented to insert text as typed,
            but inserts text literally.
Solution:   Make CTRL-R insert text as typed, use CTRL-R CTRL-R to insert
            literally.  This is consistent with Insert mode.  But characters
            that end Command-line mode are inserted literally.
Files:      runtime/doc/index.txt, runtime/doc/cmdline.txt, src/ex_getln.c,
            src/ops.c, src/proto/ops.pro

Patch 5.6.049
Problem:    Documentation for [!] after ":ijump" is wrong way around. (Benji
            Fisher)
```

```
Solution:   Fix the documentation.  Also improve the code to check for a match
            after a /* */ comment.
Files:      runtime/doc/tagsearch.txt, src/search.c

Patch 5.6.050
Problem:    Replacing is wrong when replacing a single-byte char with
            double-byte char or the other way around.
Solution:   Shift the text after the character when it is replaced.
            (Yasuhiro Matsumoto)
Files:      src/normal.c, src/misc1.c

Patch 5.6.051
Problem:    ":tprev" and ":tnext" don't give an error message when trying to
            go before the first or beyond the last tag. (Robert Webb)
Solution:   Added error messages.  Also: Delay a second when a file-read
            message is going to overwrite an error message, otherwise it won't
            be seen.
Files:      src/fileio.c, src/tag.c

Patch 5.6.052
Problem:    Multi-byte: When an Ex command has a '|' or '"' as a second byte,
            it terminates the command.
Solution:   Skip second byte of multi-byte char when checking for '|' and '"'.
            (Asai Kenichi)
Files:      src/ex_docmd.c

Patch 5.6.053
Problem:    CTRL-] doesn't work on a tag that contains a '|'. (Cesar Crusius)
Solution:   Escape '|', '"' and '\' in tag names when using CTRL-] and also
            for command-line completion.
Files:      src/ex_getln.c, src/normal.c

Patch 5.6.054
Problem:    When using ":e" and ":e #" the cursor is put in the first column
            when 'startofline' is set. (Cordell)
Solution:   Use the last known column when 'startofline' is set.
            Also, use ECMD_LAST more often to simplify the code.
Files:      src/buffer.c, src/ex_cmds.c, src/ex_docmd.c, src/proto/buffer.pro

Patch 5.6.055
Problem:    When 'statusline' only contains a text without "%" and doesn't fit
            in the window, Vim crashes. (Ron Aaron)
Solution:   Don't use the pointer for the first item if there is no item.
Files:      src/screen.c

Patch 5.6.056 (extra)
Problem:    MS-DOS: F11 and F12 don't work when 'bioskey' is set.
Solution:   Use enhanced keyboard functions. (Vince Negri)
            Detect presence of enhanced keyboard and set bioskey_read and
            bioskey_ready.
Files:      src/os_msdos.c

Patch 5.6.057 (extra)
Problem:    Win32 GUI: Multi-byte characters are wrong in dialogs and tear-off
```

menus.
Solution: Use system font instead of a fixed font. (Matsumoto, Muraoka)
Files: src/gui_w32.c

Patch 5.6.058
Problem: When the 'a' flag is not in 'guioptions', non-Windows systems
           copy Visually selected text to the clipboard/selection on a yank
           or delete command anyway. On Windows it isn't done even when the
           'a' flag is included.
Solution: Respect the 'a' flag in 'guioptions' on all systems.
Files: src/normal.c

Patch 5.6.059 (extra)
Problem: When moving the cursor over italic text and the characters spill
           over to the cell on the right, that spill-over is deleted.
           Noticed in the Win32 GUI, can happen on other systems too.
Solution: Redraw italic text starting from a blank, like this is already
           done for bold text. (Vince Negri)
Files: src/gui.c, src/gui.h, src/gui_w32.c

Patch 5.6.060
Problem: Some bold characters spill over to the cell on the left, that
           spill-over can remain sometimes.
Solution: Redraw a character when the next character was bold and needs
           redrawing. (Robert Webb)
Files: src/screen.c

Patch 5.6.061
Problem: When xterm sends 8-bit controls, recognizing the version response
           doesn't work.
           When using CSI instead of <Esc>[for the termcap color codes,
           using 16 colors doesn't work. (Neil Bird)
Solution: Also accept CSI in place of <Esc>[for the version string.
           Also check for CSI when handling colors 8-15 in term_color().
           Use CSI for builtin xterm termcap entries when 'term' contains
           "8bit".
Files: runtime/doc/term.txt, src/ex_cmds.c, src/option.c, src/term.c,
           src/os_unix.c, src/proto/option.pro, src/proto/term.pro

Patch 5.6.062
Problem: The documentation says that setting 'smartindent' doesn't have an
           effect when 'cindent' is set, but it does make a difference for
           lines starting with "#". (Neil Bird)
Solution: Really ignore 'smartindent' when 'cindent' is set.
Files: src/misc1.c, src/ops.c

Patch 5.6.063
Problem: Using "I" in Visual-block mode doesn't accept a count. (Johannes
           Zellner)
Solution: Pass the count on to do_insert() and edit(). (Allan Kelly)
Files: src/normal.c, src/ops.c, src/proto/ops.pro

Patch 5.6.064
Problem: MS-DOS and Win32 console: Mouse doesn't work correctly after

```
            including patch 5.6.28. (Vince Negri)
Solution:   Don't check for mouse scroll wheel when the mouse code contains
            the number of clicks.
Files:      src/term.c

Patch 5.6.065
Problem:    After moving the cursor around in Insert mode, typing a space can
            still trigger an abbreviation. (Benji Fisher)
Solution:   Don't check for an abbreviation after moving around in Insert mode.
Files:      src/edit.c

Patch 5.6.066
Problem:    Still a few bold character spill-over remains after patch 60.
Solution:   Clear character just in front of blanking out rest of the line.
            (Robert Webb)
Files:      src/screen.c

Patch 5.6.067
Problem:    When a file name contains a NL, the viminfo file is corrupted.
Solution:   Use viminfo_writestring() to convert the NL to CTRL-V n.
            Also fix the Buffers menu and listing a menu name with a newline.
Files:      runtime/menu.vim, src/buffer.c, src/mark.c, src/menu.c

Patch 5.6.068
Problem:    Compiling the Perl interface doesn't work with Perl 5.6.0.
            (Bernhard Rosenkraenzer)
Solution:   Also check xs_apiversion for the version number when prepending
            defines for PL_*.
Files:      src/Makefile

Patch 5.6.069
Problem:    "go" doesn't always end up at the right character when
            'fileformat' is "dos". (Bruce DeVisser)
Solution:   Correct computations in ml_find_line_or_offset().
Files:      src/memline.

Patch 5.6.070 (depends on 5.6.068)
Problem:    Compiling the Perl interface doesn't work with Perl 5.6.0.
            (Bernhard Rosenkraenzer)
Solution:   Simpler check instead of the one from patch 68.
Files:      src/Makefile

Patch 5.6.071
Problem:    "A" in Visual block mode on a Tab positions the cursor one char to
            the right. (Michael Haumann)
Solution:   Correct the column computation in op_insert().
Files:      src/ops.c

Patch 5.6.072
Problem:    When starting Vim with "vim +startinsert", it enters Insert mode
            only after typing the first command. (Andrew Pimlott)
Solution:   Insert a dummy command in the stuff buffer.
Files:      src/main.c
```

Patch 5.6.073 (extra) (depends on 5.6.034)
Problem: Win32 GUI: When compiled with Bcc 5.5 menus don't work.
            In dosinst.c toupper() and tolower() give an "internal compiler
            error" for Bcc 5.5.
Solution: Define WINVER to 4 to avoid compiling for Windows 2000. (Dan
            Sharp) Also cleaned up compilation arguments.
            Use our own implementation of toupper() in dosinst.c. Use
            mytoupper() instead of tolower().
Files: src/Makefile.bor, src/dosinst.c

Patch 5.6.074 (extra)
Problem: Entering CSI directly doesn't always work, because it's recognized
            as the start of a special key. Mostly a problem with multi-byte
            in the GUI.
Solution: Use K_CSI for a typed CSI character. Use <CSI> for a normal CSI,
            <xCSI> for a CSI typed in the GUI.
Files: runtime/doc/intro.txt, src/getchar.c, src/gui_amiga.c,
            src/gui_gtk_x11.c, src/gui_mac.c, src/gui_riscos.c, src/gui_w32.c,
            src/keymap.h, src/misc2.c

Patch 5.6.075
Problem: When using "I" or "A" in Visual block mode while 'sts' is set may
            change spaces to a Tab the inserted text is not correct. (Mike
            Steed) And some other problems when using "A" to append after the
            end of the line.
Solution: Check for change in spaces/tabs after inserting the text. Append
            spaces to fill the gap between the end-of-line and the right edge
            of the block.
Files: src/ops.c

Patch 5.6.076
Problem: GTK GUI: Mapping <M-Space> doesn't work.
Solution: Don't use the "Alt" modifier twice in key_press_event().
Files: src/gui_gtk_x11.c

Patch 5.6.077
Problem: GUI: When interrupting an external program with CTRL-C, gvim might
            crash. (Benjamin Korvemaker)
Solution: Avoid using a NULL pointer in ui_inchar_undo().
Files: src/ui.c

Patch 5.6.078
Problem: Locale doesn't always work on FreeBSD. (David O'Brien)
Solution: Link with the "xpg4" library when available.
Files: src/configure.in, src/configure

Patch 5.6.079
Problem: Vim could crash when several Tcl interpreters are created and
            destroyed.
Solution: handle the "exit" command and nested ":tcl" commands better. (Ingo
            Wilken)
Files: runtime/doc/if_tcl.txt, src/if_tcl.c

Patch 5.6.080

```
Problem:    When jumping to a tag, generating the tags file and jumping to the
            same tag again uses the old search pattern. (Sung-Hyun Nam)
Solution:   Flush cached tag matches when executing an external command.
Files:      src/misc2.c, src/proto/tag.pro, src/tag.c

Patch 5.6.081
Problem:    ":syn include" uses a level for the included file, this confuses
            contained items included at the same level.
Solution:   Use a unique tag for each included file.  Changed sp_syn_inc_lvl
            to sp_syn_inc_tag. (Scott Bigham)
Files:      src/syntax.c, src/structs.h

Patch 5.6.082
Problem:    When using cscope, Vim can crash.
Solution:   Initialize tag_fname in find_tags(). (Anton Blanchard)
Files:      src/tag.c

Patch 5.6.083 (extra)
Problem:    Win32: The visual beep can't be seen. (Eric Roesinger)
Solution:   Flush the output before waiting with GdiFlush(). (Maurice S. Barnum)
            Also: Allow specifying the delay in t_vb for the GUI.
Files:      src/gui.c, src/gui_amiga.c, src/gui_gtk_x11.c, src/gui_mac.c,
            src/gui_riscos.c, src/gui_w32.c, src/gui_x11.c, src/gui_beos.cc,
            src/proto/gui_amiga.pro, src/proto/gui_gtk_x11.pro,
            src/proto/gui_mac.pro, src/proto/gui_riscos.pro,
            src/proto/gui_w32.pro, src/proto/gui_x11.pro,
            src/proto/gui_beos.pro

Patch 5.6.084 (depends on 5.6.074)
Problem:    GUI: Entering CSI doesn't always work for Athena and Motif.
Solution:   Handle typed CSI as <xCSI> (forgot this bit in 5.6.074).
Files:      src/gui_x11.c

Patch 5.6.085
Problem:    Multi-byte: Using "r" to replace a double-byte char with a
            single-byte char moved the cursor one character. (Matsumoto)
            Also, using a count when replacing a single-byte char with a
            double-byte char didn't work.
Solution:   Don't use del_char() to delete the second byte.
            Get "ptr" again after calling ins_char().
Files:      src/normal.c

Patch 5.6.086 (extra)
Problem:    Win32: When using libcall() and the returned value is not a valid
            pointer, Vim crashes.
Solution:   Use IsBadStringPtr() to check if the pointer is valid.
Files:      src/os_win32.c

Patch 5.6.087
Problem:    Multi-byte: Commands and messages with multi-byte characters are
            displayed wrong.
Solution:   Detect double-byte characters. (Yasuhiro Matsumoto)
Files:      src/ex_getln.c, src/message.c, src/misc2.c, src/screen.c
```

```
Patch 5.6.088
Problem:    Multi-byte with Motif or Athena: The message "XIM requires
            fontset" is annoying when Vim was compiled with XIM support but it
            is not being used.
Solution:   Remove that message.
Files:      src/multbyte.c

Patch 5.6.089
Problem:    On non-Unix systems it's possible to overwrite a read-only file
            without using "!".
Solution:   Check if the file permissions allow overwriting before moving the
            file to become the backup file.
Files:      src/fileio.c

Patch 5.6.090
Problem:    When editing a file in "/home/dir/home/dir" this was replaced with
            "~~".  (Andreas Jellinghaus)
Solution:   Replace the home directory only once in home_replace().
Files:      src/misc1.c

Patch 5.6.091
Problem:    When editing many "no file" files, can't create swap file, because
            .sw[a-p] have all been used.  (Neil Bird)
Solution:   Also use ".sv[a-z]", ".su[a-z]", etc.
Files:      src/memline.c

Patch 5.6.092
Problem:    FreeBSD: When setting $TERM to a non-valid terminal name, Vim
            hangs in tputs().
Solution:   After tgetent() returns an error code, call it again with the
            terminal name "dumb".  This apparently creates an environment in
            which tputs() doesn't fail.
Files:      src/term.c

Patch 5.6.093 (extra)
Problem:    Win32 GUI: "ls | gvim -" will show a message box about reading
            stdin when Vim exits. (Donohue)
Solution:   Don't write a message about the file read from stdin until the GUI
            has started.
Files:      src/fileio.c

Patch 5.6.094
Problem:    Problem with multi-byte string for ":echo var".
Solution:   Check for length in msg_outtrans_len_attr(). (Sung-Hyun Nam)
            Also make do_echo() aware of multi-byte characters.
Files:      src/eval.c, src/message.c

Patch 5.6.095
Problem:    With an Emacs TAGS file that include another a relative path
            doesn't always work.
Solution:   Use expand_tag_fname() on the name of the included file.
            (Utz-Uwe Haus)
Files:      src/tag.c
```

```
Patch 5.6.096
Problem:    Unix: When editing many files, startup can be slow. (Paul
            Ackersviller)
Solution:   Halve the number of stat() calls used to add a file to the buffer
            list.
Files:      src/buffer.c

Patch 5.7a.001
Problem:    GTK doesn't respond on drag&drop from ROX-Filer.
Solution:   Add "text/uri-list" target. (Thomas Leonard)
            Also: fix problem with checking for trash arguments.
Files:      src/gui_gtk_x11.c

Patch 5.7a.002
Problem:    Multi-byte: 'showmatch' is performed when second byte of an
            inserted double-byte char is a paren or brace.
Solution:   Check IsTrailByte() before calling showmatch(). (Taro Muraoka)
Files:      src/misc1.c

Patch 5.7a.003
Problem:    Multi-byte: After using CTRL-O in Insert mode with the cursor at
            the end of the line on a multi-byte character the cursor moves to
            the left.
Solution:   Check for multi-byte character at end-of-line. (Taro Muraoka)
            Also: fix cls() to detect a double-byte character. (Chong-Dae Park)
Files:      src/edit.c, src/search.c

Patch 5.7a.004
Problem:    When reporting the search pattern offset, the string could be
            unterminated, which may cause a crash.
Solution:   Terminate the string for the search offset. (Stephen P. Wall)
Files:      src/search.c

Patch 5.7a.005
Problem:    When ":s//~/" doesn't find a match it reports "[NULL]" for the
            pattern.
Solution:   Use get_search_pat() to obtain the actually used pattern.
Files:      src/ex_cmds.c, src/proto/search.pro, src/search.c

Patch 5.7a.006 (extra)
Problem:    VMS: Various problems, also with the VAXC compiler.
Solution:   In many places use the Unix code for VMS too.
            Added time, date and compiler version to version message.
            (Zoltan Arpadffy)
Files:      src/ex_cmds.c, src/ex_docmd.c, src/globals.h, src/gui_vms_conf.h,
            src/main.c, src/message.c, src/misc1.c, src/os_vms.c,
            src/os_vms.h, src/os_vms.mms, src/os_vms_conf.h,
            src/proto/os_vms.pro, src/proto/version.pro, src/term.c,
            src/version.c, src/xxd/os_vms.mms, src/xxd/xxd.c

Patch 5.7a.007
Problem:    Motif and Athena GUI: CTRL-@ is interpreted as CTRL-C.
Solution:   Only use "intr_char" when it has been set.
Files:      src/gui_x11.c
```

Patch 5.7a.008
Problem: GTK GUI: When using CTRL-L the screen is redrawn twice, causing
            trouble for bold characters. Also happens when moving with the
            scrollbar. Best seen when 'writedelay' is non-zero.
            When starting the GUI with ":gui" the screen is redrawn once with
            the wrong colors.
Solution: Only set the geometry hints when the window size really changed.
            This avoids setting it each time the scrollbar is forcefully
            redrawn.
            Don't redraw in expose_event() when gui.starting is still set.
Files: src/gui_gtk_x11.c

==
VERSION 5.8   version-5.8

Version 5.8 is a bug-fix version of 5.7.

Changed   changed-5.8

Ctags is no longer included with Vim. It has grown into a project of its own.
You can find it here: http://ctags.sf.net. It is highly recommended as a Vim
companion when you are writing programs.

Added   added-5.8

New syntax files:
acedb   AceDB (Stewart Morris)
aflex   Aflex (Mathieu Clabaut)
antlr   Antlr (Mathieu Clabaut)
asm68k   68000 Assembly (Steve Wall)
automake   Automake (John Williams)
ayacc   Ayacc (Mathieu Clabaut)
b   B (Mathieu Clabaut)
bindzone   BIND zone (glory hump)
blank   Blank (Rafal Sulejman)
cfg   Configure files (Igor Prischepoff)
changelog   ChangeLog (Gediminas Paulauskas)
cl   Clever (Phil Uren)
crontab   Crontab (John Hoelzel)
csc   Essbase script (Raul Segura Acevedo)
cynlib   Cynlib(C++) (Phil Derrick)
cynpp   Cyn++ (Phil Derrick)
debchangelog   Debian Changelog (Wichert Akkerman)
debcontrol   Debian Control (Wichert Akkerman)
dns   DNS zone file (Jehsom)
dtml   Zope's DTML (Jean Jordaan)
dylan   Dylan, Dylan-intr and Dylan-lid (Brent Fulgham)
ecd   Embedix Component Description (John Beppu)

```
fgl             Informix 4GL (Rafal Sulejman)
foxpro          FoxPro (Powing Tse)

wsh             Windows Scripting Host (Paul Moore)
xkb             X Keyboard Extension (David Necas)

Renamed php3 to php, it now also supports php4 (Lutz Eymers)
```

Patch 5.7.015
Problem: Syntax files for Vim 6.0 can't be used with 5.x.
Solution: Add the "default" argument to the ":highlight" command: Ignore the
            command if highlighting was already specified.
Files: src/syntax.c

Generate the Syntax menu with makemenu.vim, so that it doesn't have to be done
when Vim is starting up. Reduces the startup time of the GUI.

Fixed   fixed-5.8

Conversion of docs to HTML didn't convert " tag s" to a hyperlink.

Fixed compiling under NeXT. (Jeroen C.M. Goudswaard)

optwin.vim gave an error when used in Vi compatible mode ('cpo' contains 'C').

Tcl interpreter: "buffer" command didn't check for presence of an argument.
(Dave Bodenstab)

dosinst.c: Added checks for too long file name.

Amiga: a file name starting with a colon was considered absolute but it isn't.
Amiga: ":pwd" added a slash when in the root of a drive.

Macintosh: Warnings for unused variables. (Bernhard Pruemmer)

Unix: When catching a deadly signal, handle it in such a way that it's
unlikely that Vim will hang. Call _exit() instead of exit() in case of a
severe problem.

Setting the window title from nothing to something didn't work after patch 29.

Check for ownership of .exrc and .vimrc was done with stat(). Use lstat() as
well for extra security.

Win32 GUI: Printing a file with 'fileformat' "unix" didn't work. Set
'fileformat' to "dos" before writing the temp file.

Unix: Could start waiting for a character when checking for a CTRL-C typed
when an X event is received.

Could not use Perl and Python at the same time on FreeBSD, because Perl used
"-lc" and Python used the threaded C library.

Win32: The Mingw compiler gave a few warning messages.

When using "ZZ" and an autocommand for writing uses an abbreviation it didn't
work. Don't stuff the ":x" command but execute it directly. (Mikael Berthe)

VMS doesn't always have lstat(), added an #ifdef around it.

Added a few corrections for the Macintosh. (Axel Kielhorn)

Win32: GvimExt could not edit more than a few files at once, the length of the
argument was fixed.

Previously released patches for Vim 5.7:

Patch 5.7.001
Problem: When the current buffer is crypted, and another modified buffer
            isn't, ":wall" will encrypt the other buffer.
Solution: In buf_write() use "buf" instead of "curbuf" to check for the
            crypt key.
Files: src/fileio.c

Patch 5.7.002
Problem: When 'showmode' is set, using "CTRL-O :r file" waits three seconds
            before displaying the read text. (Wichert Akkerman)
Solution: Set "keep_msg" to the file message so that the screen is redrawn
            before the three seconds wait for displaying the mode message.
Files: src/fileio.c

Patch 5.7.003
Problem: Searching for "[[:cntrl:]]" doesn't work.
Solution: Exclude NUL from the matching characters, it terminates the list.
Files: src/regexp.c

Patch 5.7.004
Problem: GTK: When selecting a new font, Vim can crash.
Solution: In gui_mch_init_font() unreference the old font, not the new one.
Files: src/gui_gtk_x11.c

Patch 5.7.005
Problem: Multibyte: Inserting a wrapped line corrupts kterm screen.
            Pasting TEXT/COMPOUND_TEXT into Vim does not work.
            On Motif no XIM status line is displayed even though it is
            available.
Solution: Don't use xterm trick for wrapping lines for multibyte mode.
            Correct a missing "break", added TEXT/COMPOUND_TEXT selection
            request.
            Add XIMStatusArea fallback code.
            (Katsuhito Nagano)
Files: src/gui_gtk_x11.c, src/multbyte.c, src/screen.c, src/ui.c

Patch 5.7.006
Problem: GUI: redrawing the non-Visual selection is wrong when the window
            is unobscured. (Jean-Pierre Etienne)
Solution: Redraw the selection properly and don't clear it. Added "len"
            argument to clip_may_redraw_selection().
Files: src/gui.c, src/ui.c, src/proto/ui.pro

Patch 5.7.007
Problem: Python: Crash when using the current buffer twice.

```
Solution:   Increase the reference count for buffer and window objects.
            (Johannes Zellner)
Files:      src/if_python.c

Patch 5.7.008
Problem:    In Ex mode, backspacing over the first TAB doesn't work properly.
            (Wichert Akkerman)
Solution:   Switch the cursor on before printing the newline.
Files:      src/ex_getln.c

Patch 5.7.009 (extra)
Problem:    Mac: Crash when using a long file.
Solution:   Don't redefine malloc() and free(), because it will break using
            realloc().
Files:      src/os_mac.h

Patch 5.7.010
Problem:    When using CTRL-A on a very long number Vim can crash.  (Michael
            Naumann)
Solution:   Truncate the length of the new number to avoid a buffer overflow.
Files:      src/ops.c

Patch 5.7.011 (extra)
Problem:    Win32 GUI on NT 5 and Win98: Displaying Hebrew is reversed.
Solution:   Output each character separately, to avoid that Windows reverses
            the text for some fonts. (Ron Aaron)
Files:      src/gui_w32.c

Patch 5.7.012
Problem:    When using "-complete=buffer" for ":command" the user command
            fails.
Solution:   In a user command don't replace the buffer name with a count for
            the  buffer number.
Files:      src/ex_docmd.c

Patch 5.7.013
Problem:    "gD" didn't always find a match in the first line, depending on
            the column the search started at.
Solution:   Reset the column to zero before starting to search.
Files:      src/normal.c

Patch 5.7.014
Problem:    Rot13 encoding was done on characters with accents, which is
            wrong. (Sven Gottwald)
Solution:   Only do rot13 encoding on ASCII characters.
Files:      src/ops.c

Patch 5.7.016
Problem:    When hitting 'n' for a ":s///c" command, the ignore-case flag was
            not restored, some matches were skipped. (Daniel Blaustein)
Solution:   Restore the reg_ic variable when 'n' was hit.
Files:      src/ex_cmds.c

Patch 5.7.017
```

```
Problem:    When using a Vim script for Vim 6.0 with <SID> before a function
            name, it produces an error message even when inside an "if version
            >= 600".  (Charles Campbell)
Solution:   Ignore errors in the function name when the function is not going
            to be defined.
Files:      src/eval.c

Patch 5.7.018
Problem:    When running "rvim" or "vim -Z" it was still possible to execute a
            shell command with system() and backtick-expansion. (Antonios A.
            Kavarnos)
Solution:   Disallow executing a shell command in get_cmd_output() and
            mch_expand_wildcards().
Files:      src/misc1.c, src/os_unix.c

Patch 5.7.019
Problem:    Multibyte: In a substitute string, a multi-byte character isn't
            skipped properly, can be a problem when the second byte is a
            backslash.
Solution:   Skip an extra byte for a double-byte character. (Muraoka Taro)
Files:      src/ex_cmds.c

Patch 5.7.020
Problem:    Compilation doesn't work on MacOS-X.
Solution:   Add a couple of #ifdefs. (Jamie Curmi)
Files:      src/regexp.c, src/ctags/general.h

Patch 5.7.021
Problem:    Vim sometimes produces a beep when started in an xterm.  Only
            happens when compiled without mouse support.
Solution:   Requesting the xterm version results in a K_IGNORE.  This wasn't
            handled when mouse support is disabled.  Accept K_IGNORE always.
Files:      src/normal.c

Patch 5.7.022
Problem:    %v in 'statusline' is not displayed when it's equal to %c.
Solution:   Check if %V or %v is used and handle them differently.
Files:      src/screen.c

Patch 5.7.023
Problem:    Crash when a WinLeave autocommand deletes the buffer in the other
            window.
Solution:   Check that after executing the WinLeave autocommands there still
            is a window to be closed.  Also update the test that was supposed
            to check for this problem.
Files:      src/window.c, testdir/test13.in, testdir/test13.ok

Patch 5.7.024
Problem:    Evaluating an expression for 'statusline' can have side effects.
Solution:   Evaluate the expression in a sandbox.
Files:      src/edit.c, src/eval.c, src/proto/eval.pro, src/ex_cmds.c,
            src/ex_cmds.h, src/ex_docmd.c, src/globals.h, src/option.c,
            src/screen.c, src/undo.c
```

```
Patch 5.7.025 (fixed)
Problem:    Creating a temp file has a race condition.
Solution:   Create a private directory to write the temp files in.
Files:      src/fileio.c, src/misc1.c, src/proto/misc1.pro,
            src/proto/fileio.pro, src/memline.c, src/os_unix.h

Patch 5.7.026 (extra)
Problem:    Creating a temp file has a race condition.
Solution:   Create a private directory to write the temp files in.
            This is the extra part of patch 5.7.025.
Files:      src/os_msdos.h

Patch 5.7.027
Problem:    Starting to edit a file can cause a crash.  For example when in
            Insert mode, using CTRL-O :help abbr<Tab> to scroll the screen and
            then <CR>, which edits a help file. (Robert Bogomip)
Solution:   Check if keep_msg is NULL before copying it.
Files:      src/fileio.c

Patch 5.7.028
Problem:    Creating a backup or swap file could fail in rare situations.
Solution:   Use O_EXCL for open().
Files:      src/fileio.c, src/memfile.c

Patch 5.7.029
Problem:    Editing a file with an extremely long name crashed Vim.
Solution:   Check for length of the name when setting the window title.
Files:      src/buffer.c

Patch 5.7.030
Problem:    A ":make" or ":grep" command with a very long argument could cause
            a crash.
Solution:   Allocate the buffer for the shell command.
Files:      src/ex_docmd.c

version6.txt For Vim version 8.1. Last change: 2018 Mar 18

VIM REFERENCE MANUAL by Bram Moolenaar

Welcome to Vim Version 6.0! A large number of features has been added. This file mentions all the new items that have been added, changes to existing features and bug fixes compared to Vim 5.x.

See vi_diff.txt for an overview of differences between Vi and Vim 6.0.
See version4.txt for differences between Vim 3.0 and Vim 4.0.
See version5.txt for differences between Vim 4.0 and Vim 5.0.

==
INCOMPATIBLE CHANGES   incompatible-6

These changes are incompatible with previous releases. Check this list if you
run into a problem when upgrading from Vim 5.x to 6.0

Cursor position in Visual mode   curpos-visual

When going from one window to another window on the same buffer while in
Visual mode, the cursor position of the other window is adjusted to keep the
same Visual area. This can be used to set the start of the Visual area in one
window and the end in another. In vim 5.x the cursor position of the other
window would be used, which could be anywhere and was not very useful.

Substitute command Vi compatible   substitute-CR

The substitute string (the "to" part of the substitute command) has been made

Vi compatible. Previously a CTRL-V had a special meaning and could be used to prevent a <CR> to insert a line break. This made it impossible to insert a CTRL-V before a line break. Now a backslash is used to prevent a <CR> to cause a line break. Since the number of backslashes is halved, it is still possible to insert a line break at the end of the line. This now works just like Vi, but it's not compatible with Vim versions before 6.0.

When a ":s" command doesn't make any substitutions, it no longer sets the '[and '] marks. This is not related to Vi, since it doesn't have these marks.

Global option values introduced new-global-values

There are now global values for options which are local to a buffer or window. Previously the local options were copied from one buffer to another. When editing another file this could cause option values from a modeline to be used for the wrong file. Now the global values are used when entering a buffer that has not been used before. Also, when editing another buffer in a window, the local window options are reset to their global values. The ":set" command sets both the local and global values, this is still compatible. But a modeline only sets the local value, this is not backwards compatible.

":let &opt = val" now sets the local and global values, like ":set". New commands have been added to set the global or local value:

```
        :let &opt = val         like ":set"
        :let &g:opt = val       like ":setglobal"
        :let &l:opt = val       like ":setlocal"
```

'fileencoding' changed fileencoding-changed

'fileencoding' was used in Vim 5.x to set the encoding used inside all of Vim. This was a bit strange, because it was local to a buffer and worked for all buffers. It could never be different between buffers, because it changed the way text in all buffers was interpreted.
It is now used for the encoding of the file related to the buffer. If you still set 'fileencoding' it is likely to be overwritten by the detected encoding from 'fileencodings', thus it is "mostly harmless".
The old FileEncoding autocommand now does the same as the new EncodingChanged event.

Digraphs changed digraphs-changed

The default digraphs now correspond to RFC1345. This is very different from what was used in Vim 5.x. digraphs

Filetype detection changed filetypedetect-changed

The filetype detection previously was using the "filetype" autocommand group.
This caused confusion with the FileType event name (case is ignored). The
group is now called "filetypedetect". It still works, but if the "filetype"
group is used the autocommands will not be removed by ":filetype off".
   The support for 'runtimepath' has made the "myfiletypefile" and
"mysyntaxfile" mechanism obsolete. They are still used for backwards
compatibility.

The connection between the FileType event and setting the 'syntax' option was
previously in the "syntax" autocommand group. That caused confusion with the
Syntax event name. The group is now called "syntaxset".

The distributed syntax files no longer contain "syntax clear". That makes it
possible to include one in the other without tricks. The syntax is now
cleared when the 'syntax' option is set (by an autocommand added from
synload.vim). This makes the syntax cleared when the value of 'syntax' does
not correspond to a syntax file. Previously the existing highlighting was
kept.

Unlisted buffers introduced new-unlisted-buffers

There is now a difference between buffers which don't appear in the buffer
list and buffers which are really not in the buffer list. Commands like
":ls", ":bnext", ":blast" and the Buffers menu will skip buffers not in the
buffer list. unlisted-buffer
The 'buflisted' option can be used to make a buffer appear in the buffer list
or not.

Several commands that previously added a buffer to the buffer list now create
an unlisted buffer. This means that a ":bnext" and ":ball" will not find these
files until they have actually been edited. For example, buffers used for the
alternative file by ":write file" and ":read file".
   Other commands previously completely deleted a buffer and now only remove
the buffer from the buffer list. Commands relying on a buffer not to be
present might fail. For example, a ":bdelete" command in an autocommand that
relied on something following to fail (was used in the automatic tests).
 :bwipeout can be used for the old meaning of ":bdelete".

The BufDelete autocommand event is now triggered when a buffer is removed from
the buffer list. The BufCreate event is only triggered when a buffer is
created that is added to the buffer list, or when an existing buffer is added
to the buffer list. BufAdd is a new name for BufCreate.
The new BufNew event is for creating any buffer and BufWipeout for really
deleting a buffer.

When doing Insert mode completion, only buffers in the buffer list are
scanned. Added the 'U' flag to 'complete' to do completion from unlisted
buffers.

Unlisted buffers are not stored in a viminfo file.

CTRL-U in Command-line mode changed		CTRL-U-changed

Using CTRL-U when editing the command line cleared the whole line. Most
shells only delete the characters before the cursor. Made it work like that.
(Steve Wall)

You can get the old behavior with CTRL-E CTRL-U:
	:cnoremap <C-U> <C-E><C-U>

Ctags gone		ctags-gone

Ctags is no longer part of the Vim distribution. It's now a grown-up program
by itself, it deserves to be distributed separately.
Ctags can be found here: http://ctags.sf.net/.

Documentation reorganized		documentation-6

The documentation has been reorganized, an item may not be where you found it
in Vim 5.x.
- The user manual was added, some items have been moved to it from the
  reference manual.
- The quick reference is now in a separate file (so that it can be printed).

The examples in the documentation were previously marked with a ">" in the
first column. This made it difficult to copy/paste them. There is now a
single ">" before the example and it ends at a "<" or a non-blank in the first
column. This also looks better without highlighting.

'helpfile' is no longer used to find the help tags file. This allows a user
to add its own help files (e.g., for plugins).

Modeless selection and clipboard		modeless-and-clipboard

The modeless selection is used to select text when Visual mode can't be used,
for example when editing the command line or at the more prompt.
In Vim 5.x the modeless selection was always used. On MS-Windows this caused
the clipboard to be overwritten, with no way to avoid that. The modeless
selection now obeys the 'a' and 'A' flags in 'guioptions' and "autoselect" and
"autoselectml" in 'clipboard'. By default there is no automatic copy on
MS-Windows. Use the c_CTRL-Y command to manually copy the selection.

To get the old behavior back, do this:

	:set clipboard^=autoselectml guioptions+=A

Small incompatibilities		incomp-small-6

'backupdir', 'cdpath', 'directory', 'equalprg', 'errorfile', 'formatprg',
'grepprg', 'helpfile', 'makeef', 'makeprg', 'keywordprg', 'cscopeprg',
'viminfo' and 'runtimepath' can no longer be set from a modeline, for better
security.

Removed '_' from the 'breakat' default: It's commonly used in keywords.

The default for 'mousehide' is on, because this works well for most people.

The Amiga binary is now always compiled with "big" features. The "big" binary
archive no longer exists.

The items "[RO]", "[+]", "[help]", "[Preview]" and "[filetype]" in
'statusline' no longer have a leading space.

Non-Unix systems: When expanding wildcards for the Vim arguments, don't use
'suffixes'. It now works as if the shell had expanded the arguments.

The 'lisp', 'smartindent' and 'cindent' options are not switched off when
'paste' is set. The auto-indenting is disabled when 'paste' is set, but
manual indenting with "=" still works.

When formatting with "=" uses 'cindent' or 'indentexpr' indenting, and there
is no change in indent, this is not counted as a change ('modified' isn't set
and there is nothing to undo).

Report 'modified' as changed when 'fileencoding' or 'fileformat' was set.
Thus it reflects the possibility to abandon the buffer without losing changes.

The "Save As" menu entry now edits the saved file. Most people expect it to
work like this.

A buffer for a directory is no longer added to the Buffers menu.

Renamed <Return> to <Enter>, since that's what it's called on most keyboards.
Thus it's now the hit-enter prompt instead of the hit-return prompt.
Can map <Enter> just like <CR> or <Return>.

The default for the 'viminfo' option is now '20,"50,h when 'compatible' isn't
set. Most people will want to use it, including beginners, but it required
setting the option, which isn't that easy.

After using ":colder" the newer error lists are overwritten. This makes it
possible to use ":grep" to browse in a tree-like way. Must use ":cnewer 99"
to get the old behavior.

The patterns in 'errorformat' would sometimes ignore case (MS-Windows) and
sometimes not (Unix). Now case is always ignored. Add "\C" to the pattern to
match case.

The 16 bit MS-DOS version is now compiled without the +listcmds feature
(buffer list manipulation commands). They are not often needed and this

executable needs to be smaller.

'sessionoptions' now includes "curdir" by default. This means that restoring
a session will result in the current directory being restored, instead of
going to the directory where the session file is located.

A session deleted all buffers, deleting all marks. Now keep the buffer list,
it shouldn't hurt for some existing buffers to remain present.
When the argument list is empty ":argdel *" caused an error message.

No longer put the search pattern from a tag jump in the history.

Use "SpecialKey" highlighting for unprintable characters instead of "NonText".
The idea is that unprintable text or any text that's displayed differently
from the characters in the file is using "SpecialKey", and "NonText" is used
for text that doesn't really exist in the file.

Motif now uses the system default colors for the menu and scrollbar. Used to
be grey. It's still possible to set the colors with ":highlight" commands and
resources.

Formatting text with "gq" breaks a paragraph at a non-empty blank line.
Previously the line would be removed, which wasn't very useful.

":normal" does no longer hang when the argument ends in half a command.
Previously Vim would wait for more characters to be typed, without updating
the screen. Now it pretends an <Esc> was typed.

Bitmaps for the toolbar are no longer searched for in "$VIM/bitmaps" but in
the "bitmaps" directories in 'runtimepath'.

Now use the Cmdline-mode menus for the hit-enter prompt instead of the Normal
mode menus. This generally works better and allows using the "Copy" menu to
produce CTRL-Y to copy the modeless selection.

Moved the font selection from the Window to the Edit menu, together with the
other settings.

The default values for 'isfname' include more characters to make "gf" work
better.

Changed the license for the documentation to the Open Publication License.
This seemed fair, considering the inclusion of parts of the Vim book, which is
also published under the OPL. The downside is that we can't force someone who
would sell copies of the manual to contribute to Uganda.

After "ayy don't let ""yy or :let @" = val overwrite the "a register.
Use the unnamed register instead.

MSDOS: A pattern "*.*" previously also matched a file name without a dot.
This was inconsistent with other versions.

In Insert mode, CTRL-O CTRL-\ CTRL-N {cmd} remains in Normal mode. Previously
it would go back to Insert mode, thus confusing the meaning of CTRL-\ CTRL-N,

which is supposed to take us to Normal mode (especially in ":amenu").

Allow using ":" commands after an operator. Could be used to implement a new movement command. Thus it no longer aborts a pending operator.

For the Amiga the "-d {device}" argument was possible. When compiled with the diff feature, this no longer works. Use "-dev {device}" instead. -dev

Made the default mappings for <S-Insert> in Insert mode insert the text literally, avoids that special characters like BS cause side effects.

Using ":confirm" applied to the rest of the line. Now it applies only to the command right after it. Thus ":confirm if x | edit | endif" no longer works, use ":if x | confirm edit | endif". This was the original intention, that it worked differently was a bug.

==
NEW FEATURES   new-6

Folding   new-folding

Vim can now display a buffer with text folded. This allows overviewing the structure of a file quickly. It is also possible to yank, delete and put folded text, for example to move a function to another position.

There is a whole bunch of new commands and options related to folding.
See folding .

Vertically split windows   new-vertsplit

Windows can also be split vertically. This makes it possible to have windows side by side. One nice use for this is to compare two similar files (see new-diff-mode). The 'scrollbind' option can be used to synchronize scrolling.

A vertical split can be created with the commands:
        :vsplit   or CTRL-W v or CTRL-W CTRL-V   :vsplit
        :vnew   :vnew
        :vertical {cmd}   :vertical
The last one is a modifier, which has a meaning for any command that splits a window. For example:
        :vertical stag main
Will vertically split the window and jump to the tag "main" in the new window.

Moving from window to window horizontally can be done with the CTRL-W_h and CTRL-W_l commands. The CTRL-W_k and CTRL-W_j commands have been changed to jump to the window above or below the cursor position.

The vertical and horizontal splits can be mixed as you like. Resizing windows is easy when using the mouse, just position the pointer on a status line or vertical separator and drag it. In the GUI a special mouse pointer shape

indicates where you can drag a status or separator line.

To resize vertically split windows use the CTRL-W_< and CTRL-W_> commands.
To make a window the maximum width use the CTRL-W | command CTRL-W_bar .

To force a new window to use the full width or height of the Vim window,
these two modifiers are available:
	:topleft {cmd}		New window appears at the top with full
				width or at the left with full height.
	:botright {cmd}		New window appears at the bottom with full
				width or at the right with full height.
This can be combined with ":vertical" to force a vertical split:
	:vert bot dsplit DEBUG
This will open a window at the far right, occupying the full height of the Vim
window, with the cursor on the first definition of "DEBUG".
The help window is opened at the top, like ":topleft" was used, if the current
window is fewer than 80 characters wide.

A few options can be used to set the preferences for vertically split windows.
They work similar to their existing horizontal equivalents:
	horizontal	vertical
	'splitbelow'	'splitright'
	'winheight'	'winwidth'
	'winminheight'	'winminwidth'
It's possible to set 'winminwidth' to zero, so that temporarily unused windows
hardly take up space without closing them.

The new 'eadirection' option tells where 'equalalways' applies:
	:set eadirection=both		both directions
	:set eadirection=ver		equalize window heights
	:set eadirection=hor		equalize windows widths
This can be used to avoid changing window sizes when you want to keep them.

Since windows can become quite narrow with vertical splits, text lines will
often not fit. The 'sidescrolloff' has been added to keep some context left
and right of the cursor. The 'listchars' option has been extended with the
"precedes" item, to show a "<" for example, when there is text left off the
screen. (Utz-Uwe Haus)

"-O" command line argument: Like "-o" but split windows vertically. (Scott
Urban)

Added commands to move the current window to the very top (CTRL-W K), bottom
(CTRL-W J), left (CTRL-W H) and right (CTRL-W L). In the new position the
window uses the full width/height of the screen.

When there is not enough room in the status line for both the file name and
the ruler, use up to half the width for the ruler. Useful for narrow windows.

Diff mode   new-diff-mode

In diff mode Vim shows the differences between two, three or four files.

Folding is used to hide the parts of the file that are equal.
Highlighting is used to show deleted and changed lines.
See diff-mode .

An easy way to start in diff mode is to start Vim as "vimdiff file1 file2".
Added the vimdiff manpage.

In a running Vim the :diffsplit command starts diff mode for the current file and another file. The :diffpatch command starts diff mode using the current file and a patch file. The :diffthis command starts diff mode for the current window.

Differences can be removed with the :diffget and :diffput commands.

- The 'diff' option switches diff mode on in a window.
- The :diffupdate command refreshes the diffs.
- The 'diffopt' option changes how diffs are displayed.
- The 'diffexpr' option can be set how a diff is to be created.
- The 'patchexpr' option can be set how patch is applied to a file.
- Added the "diff" folding method. When opening a window for diff-mode, set 'foldlevel' to zero and 'foldenable' on, to close the folds.
- Added the DiffAdd, DiffChange, DiffDelete and DiffText highlight groups to specify the highlighting for differences. The defaults are ugly...
- Unix: make a vimdiff symbolic link for "make install".
- Removed the now obsolete "vimdiff.vim" script from the distribution.
- Added the "[c" and "]c" commands to move to the next/previous change in diff mode.

Easy Vim: click-and-type new-evim
---

eVim stands for "Easy Vim". This is a separate program, but can also be started as "vim -y".

This starts Vim with 'insertmode' set to allow click-and-type editing. The $VIMRUNTIME/evim.vim script is used to add mappings and set options to be able to do most things like Notepad. This is only for people who can't stand two modes.

eView does the same but in readonly mode.

In the GUI a CTRL-C now only interrupts when busy with something, not when waiting for a character. Allows using CTRL-C to copy text to the clipboard.

User manual new-user-manual

The user manual has been added. It is organised around editing tasks. It reads like a book, from start to end. It should allow beginners to start learning Vim. It helps everybody to learn using the most useful Vim features. It is much easier to read than the reference manual, but omits details. See user-manual .

The user manual includes parts of the Vim book by Steve Oualline frombook .
It is published under the OPL manual-copyright .

When syntax highlighting is not enabled, the characters in the help file which
mark examples ('>' and '<') and header lines ('~') are replaced with a space.

When closing the help window, the window layout is restored from before
opening it, if the window layout didn't change since then.
When opening the help window, put it at the top of the Vim window if the
current window is fewer than 80 characters and not full width.

Flexible indenting new-indent-flex

Automatic indenting is now possible for any language. It works with a Vim
script, which makes it very flexible to compute the indent.

The ":filetype indent on" command enables using the provided indent scripts.
This is explained in the user manual: 30.3 .

The 'indentexpr' option is evaluated to get the indent for a line. The
'indentkeys' option tells when to trigger re-indenting. Normally these
options are set from an indent script. Like Syntax files, indent scripts will
be created and maintained by many people.

Extended search patterns new-searchpat

Added the possibility to match more than one line with a pattern. (partly by
Loic Grenie)
New items in a search pattern for multi-line matches:
\n   match end-of-line, also in []
_[]   match characters in range and end-of-line
_x   match character class and end-of-line
_.   match any character or end-of-line
_^   match start-of-line, can be used anywhere in the regexp
_$ match end-of-line, can be used anywhere in the regexp

Various other new items in search patterns:
\c   ignore case for the whole pattern
\C   match case for the whole pattern
\m   magic on for the following
\M   magic off for the following
\v   make following characters "very magic"
\V   make following characters "very nomagic"

\@!   don't match atom before this.
                Example: "foo\(bar\)\@!" matches "foo " but not "foobar".
\@=   match atom, resulting in zero-width match
                Example: "foo\(bar\)\@=" matches "foo" in "foobar".
\@<!   don't match preceding atom before the current position

```
\@<=            match preceding atom before the current position
\@>             match preceding atom as a subexpression

\&              match only when branch before and after it match

\%[]            optionally match a list of atoms; "end\%[if]" matches "end",
                "endi" and "endif"
\%(\)           like \(\), but without creating a back-reference; there can be
                any number of these, overcomes the limit of nine \( \) pairs
\%^             match start-of-file (Chase Tingley)
\%$             match end-of-file (Chase Tingley)
\%#             Match with the cursor position. (Chase Tingley)
\?              Just like "\=" but can't be used in a "?" command.

\%23l           match in line 23
\%<23l          match before line 23
\%>23l          match after line 23
\%23c, \%<23c, \%>23c   match in/before/after column 23
\%23v, \%<23v, \%>23v   match in/before/after virtual column 23

For syntax items:
\z(...\)        external reference match set (in region start pattern)
\z1 - \z9       external reference match use (in region skip or end pattern)
        (Scott Bigham)

\zs             use position as start of match
\ze             use position as end of match

Removed limit of matching only up to 32767 times with *, \+, etc.

Added support to match multi-byte characters. (partly by Muraoka Taro)
Made "\<" and "\>" work for UTF-8. (Muraoka Taro)

UTF-8 support                                                   new-utf-8
-------------

Vim can now edit files in UTF-8 encoding.  Up to 31 bit characters can be
used, but only 16 bit characters are displayed.  Up to two combining
characters are supported, they overprint the preceding character.
Double-wide characters are also supported.  See  UTF-8 .

UCS-2, UCS-4 and UTF-16 encodings are supported too, they are converted to
UTF-8 internally.  There is also support for editing Unicode files in a Latin1
environment.  Other encodings are converted with iconv() or an external
converter specified with 'charconvert'.

Many new items for Multi-byte support:
- Added 'encoding' option: specifies character encoding used inside Vim.  It
  can be any 8-bit encoding, some double-byte encodings or Unicode.
  It is initialized from the environment when a supported value is found.
- Added 'fileencoding' and 'fileencodings': specify character coding in a
  file, similar to 'fileformat' and 'fileformats'.
```

  When 'encoding' is "utf-8" and 'fileencodings' is "utf-8,latin1" this will
  automatically switch to latin1 if a file does not contain valid UTF-8.
- Added 'bomb' option and detection of a BOM at the start of a file. Can be
  used with "ucs-bom" in 'fileencodings' to automatically detect a Unicode
  file if it starts with a BOM. Especially useful on MS-Windows (NT and
  2000), which uses ucs-2le files with a BOM (e.g., when exporting the
  registry).
- Added the 'termencoding' option: Specifies the encoding used for the
  terminal. Useful to put Vim in utf-8 mode while in a non-Unicode locale:
    :let &termencoding = &encoding
    :set encoding=utf-8
- When 'viminfo' contains the 'c' flag, the viminfo file is converted from the
  'encoding' it was written with to the current 'encoding'.
- Added ":scriptencoding" command: convert lines in a sourced script to
  'encoding'. Useful for menu files.
- Added 'guifontwide' to specify a font for double-wide characters.
- Added Korean support for character class detection. Also fix cls() in
  search.c. (Chong-Dae Park)
- Win32: Typing multi-byte characters without IME. (Alexander Smishlajev)
- Win32 with Mingw: compile with iconv library. (Ron Aaron)
- Win32 with MSVC: dynamically load iconv.dll library. (Muraoka Taro)
- Make it possible to build a version with multi-byte and iconv support with
  Borland 5.5. (Yasuhiro Matsumoto)
- Added 'delcombine' option: Delete combining character separately. (Ron
  Aaron)
- The "xfontset" feature isn't required for "xim". These are now two
  independent features.
- XIM: enable XIM when typing a language character (Insert mode, Search
  pattern, "f" or "r" command). Disable XIM when typing a Normal mode
  command.
- When the XIM is active, show "XIM" in the 'showmode' message. (Nam SungHyun)
- Support "CursorIM" for XIM. (Nam SungHyun)
- Added 'm' flag to 'formatoptions': When wrapping words, allow splitting at
  each multibyte character, not only at a space.
- Made ":syntax keyword" work with multi-byte characters.
- Added support for Unicode upper/lowercase flipping and comparing. (based on
  patch by Raphael Finkel)
  Let "~" on multi-byte characters that have a third case ("title case")
  switch between the three cases. (Raphael Finkel)

Allow defining digraphs for multi-byte characters.
Added RFC1345 digraphs for Unicode.
Most Normal mode commands that accept a character argument, like "r", "t" and
"f" now accept a digraph. The 'D' flag in 'cpoptions' disables this to remain
Vi compatible.

Added Language mapping and 'keymap' to be able to type multi-byte characters:
- Added the ":lmap" command and friends: Define mappings that are used when
  typing characters in the language of the text. Also for "r", "t", etc. In
  Insert and Command-line mode CTRL-^ switches the use of the mappings on/off.
  CTRL-^ also toggles the use of an input method when no language mappings are
  present. Allows switching the IM back on halfway typing.
- "<char-123>" argument to ":map", allows to specify the decimal, octal or
  hexadecimal value of a character.

- Implemented the 'keymap' option: Load a keymap file. Uses ":lnoremap" to
  define mappings for the keymap. The new ":loadkeymap" command is used in
  the keymap file.
- Added 'k' flag in 'statusline': Value of "b:keymap_name" or 'keymap' when
  it's being used. Uses "<lang>" when no keymap is loaded and ":lmap"s are
  active. Show this text in the default statusline too.
- Added the 'iminsert' and 'imsearch' options: Specify use of langmap mappings
  and Input Method with an option. (Muraoka Taro)
  Added 'imcmdline' option: When set the input method is always enabled when
  starting to edit a command line. Useful for a XIM that uses dead keys to
  type accented characters.
  Added 'imactivatekey' option to better control XIM. (Muraoka Taro)
- When typing a mapping that's not finished yet, display the last character
  under the cursor in Insert mode and Command-line mode. Looks good for dead
  characters.
- Made the 'langmap' option recognize multi-byte characters. But mapping only
  works for 8-bit characters. Helps when using UTF-8.
- Use a different cursor for when ":lmap" mappings are active. Can specify
  two highlight groups for an item in 'guicursor'. By default "lCursor" and
  "Cursor" are equal, the user must set a color he likes.
  Use the cursor color for hangul input as well. (Sung-Hyun Nam)
- Show "(lang)" for 'showmode' when language mapping is enabled.
- UTF-8: Made "r" work with a ":lmap" that includes a composing character.
  Also works for "f", which now works to find a character that includes a
  composing character.

Other multi-byte character additions:
- Support double-byte single-width characters for euc-jp: Characters starting
  with 0x8E. Added ScreenLines2[] to store the second byte.

Multi-language support   new-multi-lang

The messages used in Vim can be translated. Several translations are
available. This uses the gettext mechanism. It allows adding a translation
without recompiling Vim. multi-lang (partly by Marcin Dalecki)

The translation files are in the src/po directory. The src/po/README.txt file
explains a few things about doing a translation.

Menu translations are available as well. This uses the new :menutranslate
command. The translations are found in the runtime directory "lang". This
allows a user to add a translation.

Added :language command to set the language (locale) for messages, time and
character type. This allows switching languages in Vim without changing the
locale outside of Vim.

Made it possible to have vimtutor use different languages. (Eduardo Fernandez)
Spanish (Eduardo Fernandez), Italian (Antonio Colombo), Japanese (Yasuhiro
Matsumoto) and French (Adrien Beau) translations are included.
Added "vimtutor.bat": script to start Vim on a copy of the tutor file for
MS-Windows. (Dan Sharp)

- Added v:lang variable to be able to get current language setting.
  (Marcin Dalecki) Also v:lc_time and v:ctype.
- Make it possible to translate the dialogs used by the menus. Uses global
  "menutrans_" variables. ":menutrans clear" deletes them.
- removed "broken locale" (Marcin Dalecki).
- Don't use color names in icons, use RGB values. The names could be
  translated.
- Win32: Added global IME support (Muraoka)
- Win32: Added dynamic loading of IME support.
- ":messages" prints a message about who maintains the messages or the
  translations. Useful to find out where to make a remark about a wrong
  translation.
- --disable-nls argument for configure: Disable use of gettext(). (Sung-Hyun
  Nam)
- Added NLS support for Win32 with the MingW compiler. (Eduardo Fernandez)
- When available, call bind_textdomain_codeset() to have gettext() translate
  messages to 'encoding'. This requires GNU gettext 0.10.36 or later.
- Added gettext support for Win32. This means messages will be translated
  when the locale is set and libintl.dll can be found. (Muraoka Taro)
  Also made it work with MingW compiler. (Eduardo Fernandez)
  Detect the language and set $LANG to get the appropriate translated messages
  (if supported). Also use $LANG to select a language, v:lang is a very
  different kind of name.
- Made gvimext.dll use translated messages, if possible. (Yasuhiro Matsumoto)

Plugin support   new-plugins

To make it really easy to load a Vim script when starting Vim, the "plugin"
runtime directory can be used. All "*.vim" files in it will be automatically
loaded. For Unix, the directory "~/.vim/plugin" is used by default. The
'runtimepath' option can be set to look in other directories for plugins.
 load-plugins   add-plugin

The :runtime command has been added to load one or more files in
'runtimepath'.

Standard plugins:
netrw.vim - Edit files over a network new-network-files
gzip.vim - Edit compressed files
explorer.vim - Browse directories new-file-browser

Added support for local help files. add-local-help .
When searching for help tags, all "doc/tags" files in 'runtimepath' are used.
Added the ":helptags" command: Generate a tags file for a help directory.
The first line of each help file is automagically added to the "LOCAL
ADDITIONS" section in doc/help.txt.

Added the <unique> argument to ":map": only add a mapping when it wasn't
defined before.

When displaying an option value with 'verbose' set will give a message about

where the option was last set. Very useful to find out which script did set the value.

The new :scriptnames command displays a list of all scripts that have been sourced.

GUI: For Athena, Motif and GTK look for a toolbar bitmap in the "bitmaps" directories in 'runtimepath'. Allows adding your own bitmaps.

Filetype plugins new-filetype-plugins

A new group of files has been added to do settings for specific file types. These can be options and mappings which are specifically used for one value of 'filetype'.

The files are located in "$VIMRUNTIME/ftplugin". The 'runtimepath' option makes it possible to use several sets of plugins: Your own, system-wide, included in the Vim distribution, etc.

To be able to make this work, several features were added:
- Added the "s:" variables, local to a script. Avoids name conflicts with global variables. They can be used in the script and in functions, autocommands and user commands defined in the script. They are kept between invocations of the same script. s:var
- Added the global value for local options. This value is used when opening a new buffer or editing another file. The option value specified in a modeline or filetype setting is not carried over to another buffer.
  ":set" sets both the local and the global value.
  ":setlocal" sets the local option value only.
  ":setglobal" sets or displays the global value for a local option.
  ":setlocal name<" sets a local option to its global value.
- Added the buffer-local value for some global options: 'equalprg', 'makeprg', 'errorformat', 'grepprg', 'path', 'dictionary', 'thesaurus', 'tags', 'include' and 'define'. This allows setting a local value for these global options, without making it incompatible.
- Added mappings and abbreviations local to a buffer: ":map <buffer>".
- In a mapping "<Leader>" can be used to get the value of the "mapleader" variable. This simplifies mappings that use "mapleader". "<Leader>" defaults to "\". "<LocalLeader>" does the same with "maplocalleader". This is to be used for mappings local to a buffer.
- Added <SID> Script ID to define functions and mappings local to a script.
- Added <script> argument to ":noremap" and ":noremenu": Only remap script-local mappings. Avoids that mappings from other scripts get in the way, but does allow using mappings defined in the script.
- User commands can be local to a buffer: ":command -buffer".

The new ":setfiletype" command is used in the filetype detection autocommands, to avoid that 'filetype' is set twice.

File browser new-file-browser

When editing a directory, the explorer plugin will list the files in the directory. Pressing <Enter> on a file name edits that file. Pressing <Enter> on a directory moves the browser to that directory.

There are several other possibilities, such as opening a file in the preview window, renaming files and deleting files.

Editing files over a network new-network-files

Files starting with scp://, rcp://, ftp:// and http:// are recognized as remote files. An attempt is made to access these files with the indicated method. For http:// only reading is possible, for the others writing is also supported. Uses the netrw.vim script as a standard "plugin". netrw

Made "gf" work on a URL. It no longer assumes the file is local on the computer (mostly didn't work anyway, because the full path was required). Adjusted test2 for this.

Allow using a URL in 'path'. Makes ":find index.html" work.

GTK: Allow dropping a http:// and ftp:// URL on Vim. The netrw plugin takes care of downloading the file. (Mikael Berthe)

Window for command-line editing new-cmdwin

The Command-line window can be used to edit a command-line with Normal and Insert mode commands. When it is opened it contains the history. This allows copying parts of previous command lines. cmdwin

The command-line window can be opened from the command-line with the key specified by the 'cedit' option (like Nvi). It can also be opened directly from Normal mode with "q:", "q/" and "q?".

The 'cmdwinheight' is used to specify the initial height of the window.

In Insert mode CTRL-X CTRL-V can be used to complete an Ex command line, like it's done on the command-line. This is also useful for writing Vim scripts!

Additionally, there is "improved Ex mode". Entered when Vim is started as "exim" or "vim -E", and with the "gQ" command. Works like repeated use of ":", with full command-line editing and completion. (Ulf Carlsson)

Debugging mode new-debug-mode

In debugging mode sourced scripts and user functions can be executed line by line. There are commands to step over a command or step into it. debug-mode

Breakpoints can be set to run until a certain line in a script or user function is executed. :breakadd

Debugging can be started with ":debug {cmd}" to debug what happens when a command executes. The -D argument can be used to debug while starting up.

Cursor in virtual position new-virtedit

Added the 'virtualedit' option: Allow positioning the cursor where there is no actual character in Insert mode, Visual mode or always. (Matthias Kramm) This is especially useful in Visual-block mode. It allows positioning a corner of the area where there is no text character. (Many improvements by Chase Tingley)

Debugger interface new-debug-itf

This was originally made to work with Sun Visual Workshop. (Gordon Prieur) See debugger.txt , sign.txt and workshop.txt .

Added the ":sign" command to define and place signs. They can be displayed with two ASCII characters or an icon. The line after it can be highlighted. Useful to display breakpoints and the current PC position.

Added the :wsverb command to execute debugger commands.

Added balloon stuff: 'balloondelay' and 'ballooneval' options.

Added "icon=" argument for ":menu". Allows defining a specific icon for a ToolBar item.

Communication between Vims new-vim-server

Added communication between two Vims. Makes it possible to send commands from one Vim to another. Works for X-Windows and MS-Windows clientserver .

Use "--remote" to have files be edited in an already running Vim.
Use "--remote-wait" to do the same and wait for the editing to finish.
Use "--remote-send" to send commands from one Vim to another.
Use "--remote-expr" to have an expression evaluated in another Vim.
Use "--serverlist" to list the currently available Vim servers. (X only)
There are also functions to communicate between the server and the client.
remote_send() remote_expr()

(X-windows version implemented by Flemming Madsen, MS-Windows version by Paul Moore)

Added the command server name to the window title, so you can see which server name belongs to which Vim.

Removed the OleVim directory and SendToVim.exe and EditWithVim.exe from the distribution. Can now use "gvim --remote" and "gvim --remote-send", which is portable.

GTK+: Support running Vim inside another window. Uses the --socketid argument (Neil Bird)

Buffer type options new-buftype

The 'buftype' and 'bufhidden' options have been added. They can be set to have different kinds of buffers. For example:
- 'buftype' = "quickfix": buffer with error list
- 'buftype' = "nofile" and 'bufhidden' = "delete": scratch buffer that will be deleted as soon as there is no window displaying it.

'bufhidden' can be used to overrule the 'hidden' option for one buffer.

In combination with 'buflisted' and 'swapfile' this offers the possibility to use various kinds of special buffers. See special-buffers .

Printing new-printing

Included first implementation of the ":hardcopy" command for printing to paper. For MS-Windows any installed printer can be used. For other systems a PostScript file is generated, which can be printed with the 'printexpr' option.
(MS-Windows part by Vince Negri, Vipin Aravind, PostScript by Vince Negri and Mike Williams)

Made ":hardcopy" work with multi-byte characters. (Muraoka Taro, Yasuhiro Matsumoto)

Added options to tune the way printing works: (Vince Negri)
- 'printoptions' defines various things.
- 'printheader' specifies the header format. Added "N" field to 'statusline' for the page number.
- 'printfont' specifies the font name and attributes.
- 'printdevice' defines the default printer for ":hardcopy!".

Ports ports-6

Port to OS/390 Unix (Ralf Schandl)
- A lot of changes to handle EBCDIC encoding.
- Changed Ctrl('x') to Ctrl_x define.

Included jsbmouse support. (Darren Garth)
Support for dec mouse in Unix. (Steve Wall)

Port to 16-bit MS Windows (Windows 3.1x) (Vince Negri)

Port to QNX. Supports the Photon GUI, mouse, etc. (Julian Kinraid)

Allow cross-compiling the Win32 version with Make_ming.mak. (Ron Aaron)
Added Python support for compiling with Mingw. (Ron Aaron)

Dos 32 bit: Added support the Windows clipboard. (David Kotchan)

Win32: Dynamically load Perl and Python. Allows compiling Vim with these
interfaces and will try to find the DLLs at runtime. (Muraoka Taro)

Compiling the Win32 GUI with Cygwin. Also compile vimrun, dosinst and
uninstall. (Gerfried)

Mac: Make Vim compile with the free MPW compiler supplied by Apple. And
updates for CodeWarrior. (Axel Kielhorn)

Added typecasts and ifdefs as a start to make Vim work on Win64 (George
Reilly)

Quickfix extended quickfix-6

Added the "error window". It contains all the errors of the current error
list. Pressing <Enter> in a line makes Vim jump to that line (in another
window). This makes it easy to navigate through the error list.
 quickfix-window .

- :copen opens the quickfix window.
- :cclose closes the quickfix window.
- :cwindow takes care that there is a quickfix window only when there are
  recognized errors. (Dan Sharp)

- Quickfix also knows "info", next to "warning" and "error" types. "%I" can be
  used for the start of a multi-line informational message. (Tony Leneis)
- The "%p" argument can be used in 'errorformat' to get the column number from
  a line where "^" points to the column. (Stefan Roemer)
- When using "%f" in 'errorformat' on a DOS/Windows system, also include "c:"
  in the filename, even when using "%f:".

Operator modifiers new-operator-mod

Insert "v", "V" or CTRL-V between an operator and a motion command to force
the operator to work characterwise, linewise or blockwise. o_v

Search Path new-search-path

Vim can search in a directory tree not only in downwards but also upwards.
Works for the 'path', 'cdpath' and 'tags' options. (Ralf Schandl)

Also use "**" for 'tags' option. (Ralf Schandl)

Added 'includeexpr', can be used to modify file name found by 'include'
option.
Also use 'includeexpr' for "gf" and "<cfile>" when the file can't be found
without modification. Useful for doing "gf" on the name after an include or
import statement.

Added the 'cdpath' option: Locations to find a ":cd" argument. (Raf)

Added the 'suffixesadd' option: Suffixes to be added to a file name when
searching for a file for the "gf", "[I", etc. commands.

Writing files improved   new-file-writing

Added the 'backupcopy' option: Select whether a file is to be copied or
renamed to make a backup file. Useful on Unix to speed up writing an ordinary
file. Useful on other systems to preserve file attributes and when editing a
file on a Unix filesystem.

Added the 'autowriteall' option. Works like 'autowrite' but for more
commands.

Added the 'backupskip' option: A list of file patterns to skip making a backup
file when it matches. The default for Unix includes "/tmp/*", this makes
"crontab -e" work.

Added support for Access Control Lists (ACL) for FreeBSD and Win32. The ACL
is copied from the original file to the new file (or the backup if it's
copied).
ACL is also supported for AIX, Solaris and generic POSIX. (Tomas Ogren)
And on SGI.

Argument list   new-argument-list

The support for the argument list has been extended. It can now be
manipulated to contain the files you want it to contain.

The argument list can now be local to a window. It is created with the
:arglocal command. The :argglobal command can be used to go back to the
global argument list.

The :argdo command executes a command on all files in the argument list.

File names can be added to the argument list with :argadd . File names can
be removed with :argdelete .

"##" can be used like "#", it is replaced by all the names in the argument
list concatenated. Useful for ":grep foo ##".

The :argedit adds a file to the argument list and edits it. Like ":argadd"
and then ":edit".

Restore a View new-View

The ":mkview" command writes a Vim script with the settings and mappings for
one window. When the created file is sourced, the view of the window is
restored. It's like ":mksession" for one window.
The View also contains the local argument list and manually created, opened
and closed folds.

Added the ":loadview" command and the 'viewdir' option: Allows for saving and
restoring views of a file with simple commands. ":mkview 1" saves view 1 for
the current file, ":loadview 1" loads it again. Also allows quickly switching
between two views on one file. And saving and restoring manual folds and the
folding state.

Added 'viewoptions' to specify how ":mkview" works.

":mksession" now also works fine with vertical splits. It has been further
improved and restores the view of each window. It also works properly with
preview and quickfix windows.

'sessionoptions' is used for ":mkview" as well.
Added "curdir" and "sesdir" to 'sessionoptions'. Allows selection of what
the current directory will be restored to.

The session file now also contains the argument list(s).

Color schemes new-color-schemes

Support for loading a color scheme. Added the ":colorscheme" command.
Automatically add menu entries for available schemes.
Should now properly reset the colors when 'background' or 't_Co' is changed.
":highlight clear" sets the default colors again.
":syntax reset" sets the syntax highlight colors back to the defaults.
For ":set bg&" guess the value. This allows a color scheme to switch back to
the default colors.
When syntax highlighting is switched on and a color scheme was defined, reload
the color scheme to define the colors.

Various new items new-items-6

Normal mode commands:

"gi"   Jump to the ^ mark and start Insert mode. Also works when the
                mark is just after the line. gi

"g'm" and "g`m"
                Jump to a mark without changing the jumplist. Now you can use
                g`" to jump to the last known position in a file without side
                effects. Also useful in mappings.

[', [`, ]' and ]`
                move the cursor to the next/previous lowercase mark.

g_   Go to last non-blank in line. (Steve Wall)

Options:

'autoread'   When detected that a file changed outside of Vim,
                automatically read a buffer again when it's not changed.
                It has a global and a local value. Use ":setlocal autoread<"
                to go back to using the global value for 'autoread'.

'debug'   When set to "msg" it will print error messages that would
                otherwise be omitted. Useful for debugging 'indentexpr' and
                'foldexpr'.

'lispwords'   List of words used for lisp indenting. It was previously hard
                coded. Added a number of Lisp names to the default.

'fold...'   Many new options for folding.

'modifiable'   When off, it is impossible to make changes to a buffer.
                The %m and %M items in 'statusline' show a '-'.

'previewwindow' Set in the preview window. Used in a session file to mark a
                window as the preview window.

'printfont'
'printexpr'
'printheader'
'printdevice'
'printoptions' for ":hardcopy".

'buflisted'   Makes a buffer appear in the buffer list or not.

Use "vim{version}:" for modelines, only to be executed when the version is
>= {version}. Also "vim>{version}", "vim<{version}" and "vim={version}".

Ex commands:

:sav[eas][!] {file}
                Works like ":w file" and ":e #", but without loading the file
                again and avoiding other side effects. :saveas

```
:silent[!] {cmd}
                Execute a command silently.  Also don't use a delay that would
                come after the message.  And don't do 'showmatch'.
                RISCOS: Removed that "!~cmd" didn't output anything, and
                didn't wait for <Enter> afterwards.  Can use ":silent !cmd"
                now.
:menu <silent>  Add a menu that won't echo Ex commands.
:map <silent>   Add a mapping that won't echo Ex commands.

:checktime      Check for changed buffers.

:verbose {cmd}  Set 'verbose' for one command.

:echomsg {expr}
:echoerr {expr} Like ":echo" but store the message in the history. (Mark
                Waggoner)

:grepadd        Works just like ":grep" but adds to the current error list
                instead of defining a new list.  :grepadd

:finish         Finish sourcing a file.  Can be used to skip the rest of a Vim
                script.  :finish

:leftabove
:aboveleft      Split left/above current window.

:rightbelow
:belowright     Split right/below current window.

:first, :bfirst, :ptfirst, etc.
                Alias for ":rewind".  It's more logical compared to ":last".

:enew           Edit a new, unnamed buffer.  This is needed, because ":edit"
                re-edits the same file. (Wall)

:quitall        Same as ":qall".

:match          Define match highlighting local to a window.  Allows
                highlighting an item in the current window without interfering
                with syntax highlighting.

:menu enable
:menu disable   Commands to enable/disable menu entries without removing them.
                (Monish Shah)

:windo          Execute a command in all windows.
:bufdo          Execute a command in all buffers.

:wincmd         Window (CTRL-W) command.  Useful when a Normal mode command
                can't be used (e.g., for a CursorHold autocommand).  See
                 CursorHold-example  for a nice application with it.

:lcd and :lchdir
                Set local directory for a window. (Benjie Chen)
```

:hide {command}
                Execute {command} with 'hidden' set.

:emenu   in Visual mode to execute a ":vmenu" entry.

:popup   Pop up a popup menu.

:redraw   Redraw the screen even when busy with a script or function.

:hardcopy   Print to paper.

:compiler   Load a Vim script to do settings for a specific compiler.

:z#   List numbered lines. (Bohdan Vlasyuk)

New marks:

'(and ')   Begin or end of current sentence. Useful in Ex commands.
'{ and '}   Begin or end of current paragraph. Useful in Ex commands.
'.   Position of the last change in the current buffer.
'^   Position where Insert mode was stopped.

Store the ^ and . marks in the viminfo file. Makes it possible to jump to the
last insert position or changed text.

New functions:
argidx()   Current index in argument list.
buflisted()   Checks if the buffer exists and has 'buflisted' set.
cindent()   Get indent according to 'cindent'.
eventhandler() Returns 1 when inside an event handler and interactive
                commands can't be used.
executable()   Checks if a program or batch script can be executed.
filewritable() Checks if a file can be written. (Ron Aaron)
foldclosed()   Find out if there is a closed fold. (Johannes Zellner).
foldcloseend() Find the end of a closed fold.
foldlevel()   Find out the foldlevel. (Johannes Zellner)
foreground()   Move the GUI window to the foreground.
getchar()   Get one character from the user. Can be used to define a
                mapping that takes an argument.
getcharmod()   Get last used key modifier.
getbufvar()   gets the value of an option or local variable in a buffer (Ron
                Aaron)
getfsize()   Return the size of a file.
getwinvar()   gets the value of an option or local variable in a window (Ron
                Aaron)
globpath()   Find matching files in a list of directories.
hasmapto()   Detect if a mapping to a string is already present.
iconv()   Convert a string from one encoding to another.
indent()   gets the indent of a line (Ron Aaron)
inputdialog()   Like input() but use a GUI dialog when possible. Currently
                only works for Win32, Motif, Athena and GTK.

```
                Use inputdialog() for the Edit/Settings/Text Width menu.  Also
                for the Help/Find.. and Toolbar FindHelp items.
                (Win32 support by Thore B. Karlsen)
                (Win16 support by Vince Negri)
inputsecret()   Ask the user to type a string without showing the typed keys.
                (Charles Campbell)
libcall()       for Unix (Neil Bird, Johannes Zellner, Stephen Wall)
libcallnr()     for Win32 and Unix
lispindent()    Get indent according to 'lisp'.
mode()          Return a string that indicates the current mode.
nextnonblank()  Skip blank lines forwards.
prevnonblank()  Skip blank lines backwards.  Useful to for indent scripts.
resolve()       MS-Windows: resolve a shortcut to the file it points to.
                Unix: resolve a symbolic link.
search()        Search for a pattern.
searchpair()    Search for matching pair.  Can be used in indent files to find
                the "if" matching an endif.
setbufvar()     sets an option or variable local to a buffer (Ron Aaron)
setwinvar()     sets an option or variable local to a window (Ron Aaron)
stridx()        Search for first occurrence of one string in another.
strridx()       Search for last occurrence of one string in another.
tolower()       Convert string to all-lowercase.
toupper()       Convert string to all-uppercase.
type()          Check the type of an expression.
wincol()        window column of the cursor
winwidth()      Width of a window. (Johannes Zellner)
winline()       window line of the cursor

Added expansion of curly braces in variable and function names.  This can be
used for variable names that include the value of an option.  Or a primitive
form of arrays. (Vince Negri)

New autocommand events:
BufWinEnter     Triggered when a buffer is displayed in a window, after using
                the modelines.  Can be used to load a view.
BufWinLeave     Triggered when a buffer is no longer in a window.  Also
                triggered when exiting Vim.  Can be used to save views.
FileChangedRO   Triggered before making the first change to a read-only file.
                Can be used to check-out the file. (Scott Graham)
TermResponse    Triggered when the terminal replies to the version-request.
                The v:termresponse internal variable holds the result.  Can be
                used to react to the version of the terminal.  (Ronald Schild)
FileReadCmd     Triggered before reading a file.
BufReadCmd      Triggered before reading a file into a buffer.
FileWriteCmd    Triggered before writing a file.
BufWriteCmd     Triggered before writing a buffer into a file.
FileAppendCmd   Triggered before appending to a file.
FuncUndefined   Triggered when a user function is not defined. (Ron Aaron)

The autocommands for the *Cmd events read or write the file instead of normal
file read/write.  Use this in netrw.vim to be able to edit files on a remote
system. (Charles Campbell)
```

New Syntax files:

```
bdf             BDF font definition (Nikolai Weibull)
catalog         SGML catalog (Johannes Zellner)
debchangelog    Debian Changelog (Wichert Akkerman)
debcontrol      Debian Control (Wichert Akkerman)
dot             dot (Markus Mottl)
dsl             DSSSL syntax (Johannes Zellner)
eterm           Eterm configuration (Nikolai Weibull)
indent          Indent profile (Nikolai Weibull)
lftp            LFTP (Nikolai Weibull)
lynx            Lynx config (Doug Kearns)
mush            mush sourcecode (Bek Oberin)
natural         Natural (Marko Leipert)
pilrc           Pal resource compiler (Brian Schau)
plm             PL/M (Philippe Coulonges)
povini          Povray configuration (David Necas)
ratpoison       Ratpoison config/command (Doug Kearns)
readline        readline config (Nikolai Weibull)
screen          Screen RC (Nikolai Weibull)
specman         Specman (Or Freund)
sqlforms        SQL*Forms (Austin Ziegler)
terminfo        terminfo (Nikolai Weibull)
tidy            Tidy configuration (Doug Kearns)
wget            Wget configuration (Doug Kearns)
```

Updated many syntax files to work both with Vim 5.7 and 6.0.

Interface to Ruby. (Shugo Maeda)
Support dynamic loading of the Ruby interface on MS-Windows. (Muraoka Taro)
Support this for Mingw too. (Benoit Cerrina)

Win32: Added possibility to load TCL dynamically. (Muraoka Taro)
Also for Borland 5.5. (Dan Sharp)

Win32: When editing a file that is a shortcut (*.lnk file), edit the file it links to. Unless 'binary' is set, then edit the shortcut file itself. (Yasuhiro Matsumoto)

The ":command" command now accepts a "-bar" argument. This allows the user command to be followed by "| command".

The preview window is now also used by these commands:
- :pedit edits the specified file in the preview window
- :psearch searches for a word in included files, like :ijump , and displays the found text in the preview window.

Added the CTRL-W P command: go to preview window.

MS-DOS and MS-Windows also read the system-wide vimrc file $VIM/vimrc. Mostly for NT systems with multiple users.

A double-click of the mouse on a character that has a "%" match selects from that character to the match. Similar to "v%".

"-S session.vim" argument: Source a script file when starting up. Convenient way to start Vim with a session file.

Added "--cmd {command}" Vim argument to execute a command before a vimrc file is loaded. (Vince Negri)

Added the "-M" Vim argument: reset 'modifiable' and 'write', thus disallow making changes and writing files.

Added runtime/delmenu.vim. Source this to remove all menus and prepare for loading new menus. Useful when changing 'langmenu'.

Perl script to filter Perl error messages to quickfix usable format. (Joerg Ziefle)

Added runtime/macros/less.vim: Vim script to simulate less, but with syntax highlighting.

MS-Windows install program: (Jon Merz)
- The Win32 program can now create shortcuts on the desktop and install Vim in the Start menu.
- Possibly remove old "Edit with Vim" entries.
- The Vim executable is never moved or $PATH changed. A small batch file is created in a directory in $PATH. Fewer choices to be made.
- Detect already installed Vim versions and offer to uninstall them first.

Improved the MS-Windows uninstal program. It now also deletes the entries in the Start menu, icons from the desktop and the created batch files. (Jon Merz) Also made it possible to delete only some of these. Also unregister gvim for OLE.

Generate a self-installing Vim package for MS-Windows. This uses NSIS. (Jon Merz et al.)

Added ":filetype detect". Try detecting the filetype again. Helps when writing a new shell script, after adding "#!/bin/csh".

Added ":augroup! name" to delete an autocommand group. Needed for the client-server "--remote-wait".

Add the Vim version number to the viminfo file, useful for debugging.

==
IMPROVEMENTS   improvements-6

Added the 'n' flag in 'cpoptions': When omitted text of wrapped lines is not put between line numbers from 'number' option. Makes it a lot easier to read wrapped lines.

When there is a format error in a tags file, the byte position is reported so that the error can be located.

"gf" works in Visual mode: Use the selected text as the file name. (Chase Tingley)

Allow ambiguous mappings. Thus "aa" and "aaa" can both be mapped, the longest matching one is used. Especially useful for ":lmap" and 'keymap'.

Encryption: Ask the key to be typed twice when crypting the first time. Otherwise a typo might cause the text to be lost forever. (Chase Tingley)

The window title now has "VIM" on the end. The file name comes first, useful in the taskbar. A "+" is added when the file is modified. "=" is added for a read-only file. "-" is added for a file with 'modifiable' off.

In Visual mode, mention the size of the selected area in the 'showcmd' position.

Added the "b:changedtick" variable. Incremented at each change, also for undo. Can be used to take action only if the buffer has been changed.

In the replacement string of a ":s" command "\=" can be used to replace with the result of an expression. From this expression the submatch() function can be used to access submatches.

When doing ":qall" and there is a change in a buffer that is being edited in another window, jump to that window, instead of editing that buffer in the current window.

Added the "++enc=" and "++ff=" arguments to file read/write commands to force using the given 'encoding' or 'fileformat'. And added the "v:cmdarg" variable, to be used for FileReadCmd autocommands that read/write the file themselves.

When reading stdin, first read the text in binary mode and then re-read it with automatic selection of 'fileformat' and 'fileencoding'. This avoids problems with not being able to rewind the file (e.g., when a line near the end of the file ends in LF instead of CR-LF).
When reading text from stdin and the buffer is empty, don't mark it changed. Allows exiting without trouble.

Added an ID to many error messages. This will make it easier to find help for a message.

Insert mode:
- "CTRL-G j" and "CTRL-G k" can be used to insert in another line in the same column. Useful for editing a table.
- Added Thesaurus completion with CTRL-X CTRL-T. (Vince Negri)
- Added the 'thesaurus' option, to use instead of 'dictionary' for thesaurus completion. Added the 's' flag in 'complete'.
- Made CTRL-X CTRL-L in Insert mode use the 'complete' option. It now also scans other loaded buffers for matching lines.
- CTRL-R now also works in Insert mode while doing completion with CTRL-X or CTRL-N. (Neil Bird)
- When doing Insert mode completion, when completion is finished check for a

match with words from 'cinkeys' or 'indentkeys'.

Performance:
- Made display updating more efficient. Insert/delete lines may be used for all changes, also for undo/redo.
- The display is not redrawn when there is typeahead in Insert mode. Speeds up CTRL-R a lot.
- Improved speed of screen output for 32 bit DOS version. (Vince Negri)
- When dragging with the mouse, there is a lookahead to skip mouse codes when there is another one next. Makes dragging with the mouse a lot faster.
- Also a memory usage improvement: When calling u_save with a single line, don't save it if the line was recently saved for the same undo already.
- When using a script that appends one character at a time, the amount of allocated memory was growing steadily. Also when 'undolevels' is -1. Caused by the line saved for "U" never to be freed. Now free an undo block when it becomes empty.
- GUI and Dos32: Use a vertical scroll region, to make scrolling in a vertically split window faster. No need to redraw the whole window.
- When scrolling isn't possible with terminal codes (e.g., for a vertically split window) redraw from ScreenLines[]. That should be faster than going through the lines with win_line(), especially when using syntax highlighting.
- The Syntax menu is now pre-generated by a separate script. Makes loading the menu 70% faster. This can halve the startup time of gvim.
- When doing ":help tag", don't open help.txt first, jump directly to the help tag. It's faster and avoids an extra message.
- Win32: When a file name doesn't end in ".lnk" don't try resolving a shortcut, it takes quite a bit of time.
- Don't update the mouse pointer shape while there are typeahead characters.
- Change META[] from a string into an array, avoids using strchr() on it.
- Don't clear the command line when adding characters, avoids that screen_fill is called but doesn't do anything.

Robustness:
- Unix: Check for running out of stack space when executing a regexp. Avoids a nasty crash. Only works when the system supports running the signal function on another stack.
- Disallow ":source <dirname>". On unix it's possible to read a directory, does not make sense to use it as Vim commands.

Security:
- When reading from or writing to a temporary file, check that it isn't a symbolic link. Gives some protection against symlink attacks.
- When creating a backup file copy or a swap file, check for it already existing to avoid a symlink attack. (Colin Phipps)
- Evaluating options which are an expression is done in a sandbox . If the option was set by a modeline, it cannot cause damage.
- Use a secure way to generate temp file names: Create a private directory for temp files. Used for Unix, MS-DOS and OS/2.
- 'makeef' can be empty, which means that an internally generated file name is used. The old default was "/tmp/file", which is a security risk. Writing 'makeef' in the current directory fails in a read-only directory and causes trouble when using ":grep" on all files. Made the default empty for all systems, so that a temp file is used.

- The command from a tags file is executed in the sandbox for better security.
- The Ruby, Tcl and Python interfaces cannot be used from the sandbox. They
  might do dangerous things. Perl is still possible, but limited to the Safe
  environment. (Donnie Smith)

Syntax highlighting:
- Optimized the speed by caching the state stack all over the file, not just
  the part being displayed. Required for folding.
- Added ":syntax sync fromstart": Always parse from the start of the file.
- Added the "display" argument for syntax items: use the item only when
  displaying the result. Can make parsing faster for text that isn't going to
  be displayed.
- When using CTRL-L, the cached states are deleted, to force parsing the text
  again.
- Use elfhash algorithm for table of keywords. This should give a better
  distribution and speedup keyword lookup. (Campbell)
- Also allow the "lc" leading context for skip and end patterns. (Scott
  Bigham)
- Syntax items can have the "extend" argument to undo the effect of a
  "keepend" argument of an item it is contained in. Makes it possible to have
  some contained items extend a region while others don't.
- ":syntax clear" now deletes the b:current_syntax variable. That's logical,
  since no syntax is defined after this command.
- Added ":syntax enable": switch on syntax highlighting without changing the
  colors. This allows specifying the colors in the .vimrc file without the
  need for a mysyntaxfile.
- Added ":syntax reset": reset the colors to their defaults.
- Added the "contains=TOP" and "contains=CONTAINED" arguments. Makes it
  possible to define a transparent item that doesn't contain itself.
- Added a "containedin" argument to syntax items. Allows adding a contained
  item to an existing item (e.g., to highlight a name in a comment).

Modeless selection:
- When in the command-line window, use modeless selection in the other
  windows. Makes it possible to copy visible text to the command-line window.
- Support modeless selection on the cmdline in a terminal. Previously it was
  only possible for the GUI.
- Make double-right-click in modeless selection select a whole word. Single
  right click doesn't use the word selection started by a double-left-click.
  Makes it work like in Visual mode.
- The modeless selection no longer has an implied automatic copy to the
  clipboard. It now obeys the 'a' and 'A' flags in 'guioptions' or
  "autoselect" and "autoselectml" in 'clipboard'.
- Added the CTRL-Y command in Cmdline-mode to copy the modeless selection to
  the clipboard. Also works at the hit-enter prompt and the more prompt.
  Removed the mappings in runtime/mswin.vim for CTRL-Y and CTRL-Z in
  cmdline-mode to be able to use CTRL-Y in the new way.

Reduced the amount of stack space used by regmatch() to allow it to handle
complicated patterns on a longer text.

'isfname' now includes '%' and '#'. Makes "vim dir\#file" work for MS-DOS.

Added keypad special keys <kEnter>, <k0> - <k9>. When not mapped they behave

like the ASCII equivalent. (Ivan Wellesz and Vince Negri)
Recognize a few more xterm keys: <C-Right>, <C-Left>, <C-End>, <C-Home>

Also trigger the BufUnload event when Vim is going to exit. Perhaps a script needs to do some cleaning up.

Expand expression in backticks: `={expr}`. Can be used where backtick expansion is done. (Vince Negri)

GUI:
- Added 'L' and 'R' flags in 'guioptions': Add a left or right scrollbar only when there is a vertically split window.
- X11: When a color can't be allocated, use the nearest match from the colormap. This avoids that black is used for many things. (Monish Shah)
  Also do this for the menu and scrollbar, to avoid that they become black.
- Win32 and X11: Added 'mouseshape' option: Adjust the mouse pointer shape to the current mode. (Vince Negri)
- Added the 'linespace' option: Insert a pixel line between lines. (Nam)
- Allow modeless selection (without moving the cursor) by keeping CTRL and SHIFT pressed. (Ivan Wellesz)
- Motif: added toolbar. (Gordon Prieur) Also added tooltips.
- Athena: added toolbar and tooltips. (David Harrison -- based on Gordon Prieur's work)
- Made the 'toolbar' option work for Athena and Motif. Can now switch between text and icons on the fly. (David Harrison)
- Support menu separator lines for Athena. (David Harrison)
- Athena: Adjust the arrow pixmap used in a pullright menu to the size of the font. (David Harrison)
- Win32: Added "c" flag to 'guifont' to be able to specify the charset. (Artem Khodush)
- When no --enable-xim argument is given, automatically enable it when a X GUI is used. Required for dead key support (and multi-byte input).
- After a file selection dialog, check that the edited files were not changed or deleted. The Win32 dialog allows deleting and renaming files.
- Motif and Athena: Added support for "editres". (Marcin Dalecki)
- Motif and Athena: Added "menuFont" to be able to specify a font or fontset for the menus. Can also be set with the "Menu" highlight group. Useful when the locale is different from 'encoding'. (David Harrison)
  When FONTSET_ALWAYS is defined, always use a fontset for the menus. Should avoid trouble with changing from a font to a fontset. (David Harrison)
- Highlighting and font for the tooltips can be specified with the "Tooltip" highlight group. (David Harrison)
- The Cmdline-mode menus can be used at the more-prompt. This mostly works fine, because they start with a CTRL-C. The "Copy" menu works to copy the modeless selection. Allows copying the output of ":set all" or ":intro" without auto-selection.
- When starting the GUI when there is no terminal connected to stdout and stderr, display error messages in a dialog. Previously they wouldn't be displayed at all.
- Allow setting 'browsedir' to the name of a directory, to be used for the file dialog. (Dan Sharp)
- b:browsefilter and g:browsefilter can be set to the filters used for the file dialog. Supported for Win32 and Motif GUI. (Dan Sharp)

X11:
- Support for the clipboard selection as register "+. When exiting or
  suspending copy the selection to cut buffer 0. Should allow copy/paste with
  more applications in a X11-standard way. (Neil Bird)
- Use the X clipboard in any terminal, not just in an xterm.
  Added "exclude:" in 'clipboard': Specify a pattern to match against terminal
  names for which no connection should be made to the X server. The default
  currently work for FreeBSD and Linux consoles.
- Added a few messages for when 'verbose' is non-zero to show what happens
  when trying to connect to the X server. Should help when trying to find out
  why startup is slow.

GTK GUI: (partly by Marcin Dalecki)
- With some fonts the characters can be taller than ascent + descent. E.g.,
  "-misc-fixed-*-*-*-*-18-*-*-*-*-*-iso10646-1". Add one to the character
  cell height.
- Implement "no" value for 'winaltkeys': don't use Alt-Key as a menu shortcut,
  when 'wak' changed after creating the menus.
- Setting 'wak' after the GUI started works.
- recycle text GC's to reduce communication.
- Adjust icon size to window manager.
- Cleanup in font handling.
- Replace XQueryColor with GDK calls.
- Gnome support. Detects Gnome in configure and uses different widgets.
  Otherwise it's much like GTK. (Andy Kahn)
  It is disabled by default, because it causes a few problems.
- Removed the special code to fork first and then start the GUI. Now use
  _exit() instead of exit(), this works fine without special tricks.
- Dialogs sometimes appeared a bit far away. Position the dialogs inside
  the gvim window. (Brent Verner)
- When dropping a file on Vim, remove extra slashes from the start of the
  path. Also shorten the file name if possible.

Motif: (Marcin Dalecki)
- Made the dialog layout better.
- Added find and find/replace dialogs.
- For the menus, change "iso-8859" to "iso_8859", Linux appears to need this.
- Added icon to dialogs, like for GTK.
- Use XPM bitmaps for the icon when possible. Use the Solaris XpmP.h include
  file when it's available.
- Change the shadow of the toolbar items to get a visual feedback of it being
  pressed on non-LessTif.
- Use gadgets instead of windows for some items for speed.

Command line completion:
- Complete environment variable names. (Mike Steed)
- For ":command", added a few completion methods: "mapping", "function",
  "expression" and "environment".
- When a function doesn't take arguments, let completion add () instead of (.

For MS-DOS, MS-Windows and OS/2: Expand %VAR% environment variables like $VAR.
(Walter Briscoe)

Redirect messages to the clipboard ":redir @*" and to the unnamed register

":redir @"". (Wall)

":let @/ = '"" clears the search pattern, instead of setting it to an empty
string.

Expression evaluation:
- "? :" can be used like in C.
- col("$") returns the length of the cursor line plus one. (Stephen P. Wall)
- Optional extra argument for match(), matchend() and matchstr(): Offset to
  start looking for a match.
- Made third argument to strpart() optional. (Paul Moore, Zdenek Sekera)
- exists() can also be used to check for Ex commands and defined autocommands.
- Added extra argument to input(): Default text.
- Also set "v:errmsg" when using ":silent! cmd".
- Added the v:prevcount variable: v:count for the previous command.
- Added "v:progname", name with which Vim was started. (Vince Negri)
- In the verbose message about returning from a function, also show the return
  value.

Cscope:
- Added the cscope_connection() function. (Andy Kahn)
- ":cscope kill -1" kills all cscope connections. (Andy Kahn)
- Added the 'cscopepathcomp' option. (Scott Hauck)
- Added ":scscope" command, split window and execute Cscope command. (Jason
  Duell)

VMS:
- Command line arguments are always uppercase. Interpret a "-X" argument as
  "-x" and "-/X" as "-X".
- Set 'makeprg' and 'grepprg' to meaningful defaults. (Zoltan Arpadffy)
- Use the X-clipboard feature and the X command server. (Zoltan Arpadffy)

Macintosh: (Dany St-Amant)
- Allow a tags file to have CR, CR-LF or LF line separator. (Axel Kielhorn)
- Carbonized (while keeping non Carbon code)
  (Some work "stolen" from Ammon Skidmore)
- Improved the menu item index handling (should be faster)
- Runtime commands now handle / in file name (MacOS 9 version)
- Added ":winpos" support.
- Support using "~" in file names for home directory.

Options:
- When using set += or ^= , check for items used twice. Duplicates are
  removed. (Vince Negri)
- When setting an option that is a list of flags, remove duplicate flags.
- If possible, use getrlimit() to set 'maxmemtot' and 'maxmem'. (Pina)
- Added "alpha" to 'nrformats': increment or decrement an alphabetic character
  with CTRL-A and CTRL-X.
- ":set opt&vi" sets an option to its Vi default, ":set opt&vim" to its Vim
  default. Useful to set 'cpo' to its Vim default without knowing what flags
  that includes.
- 'scrolloff' now also applies to a long, wrapped line that doesn't fit in the
  window.
- Added more option settings to the default menus.

- Updated the option window with new options. Made it a bit easier to read.

Internal changes:
- Split line pointers in text part and attributes part. Allows for future
  change to make attribute more than one byte.
- Provide a qsort() function for systems that don't have it.
- Changed the big switch for Normal mode commands into a table. This cleans
  up the code considerably and avoids trouble for some optimizing compilers.
- Assigned a negative value to special keys, to avoid them being mixed up with
  Unicode characters.
- Global variables expand_context and expand_pattern were not supposed to be
  global. Pass them to ExpandOne() and all functions called by it.
- No longer use the global reg_ic flag. It caused trouble and in a few places
  it was not set.
- Removed the use of the stuff buffer for "*", "K", CTRL-], etc. Avoids
  problem with autocommands.
- Moved some code from ex_docmd.c to ex_cmds2.c. The file was getting too
  big. Also moved some code from screen.c to move.c.
- Don't include the CRC table for encryption, generate it. Saves quite a bit
  of space in the source code. (Matthias Kramm)
- Renamed multibyte.c to mbyte.c to avoid a problem with 8.3 filesystems.
- Removed the GTK implementation of ":findhelp", it now uses the
  ToolBar.FindHelp menu entry.
- Renamed mch_windexit() to mch_exit(), mch_init() to mch_early_init() and
  mch_shellinit() to mch_init().

Highlighting:
- In a ":highlight" listing, show "xxx" with the highlight color.
- Added support for xterm with 88 or 256 colors. The right color numbers will
  be used for the name used in a ":highlight" command. (Steve Wall)
- Added "default" argument for ":highlight". When included, the command is
  ignored if highlighting for the group was already defined.
  All syntax files now use ":hi default ..." to allow the user to specify
  colors in his vimrc file. Also, the "if did_xxx_syntax_inits" is not needed
  anymore. This greatly simplifies using non-default colors for a specific
  language.
- Adjusted colortest.vim: Included colors on normal background and reduced the
  size by using a while loop. (Rafael Garcia-Suarez)
- Added the "DarkYellow" color name. Just to make the list of standard colors
  consistent, it's not really a nice color to use.

When an xterm is in 8-bit mode this is detected by the code returned for
 t_RV . All key codes are automatically converted to their 8-bit versions.

The OPT_TCAP_QUERY in xterm patch level 141 and later is used to obtain the
actual key codes used and the number of colors for t_Co. Only when t_RV is
also used.

":browse set" now also works in the console mode. ":browse edit" will give an
error message.

":bdelete" and ":bunload" only report the number of deleted/unloaded buffers
when more than 'report'. The message was annoying when deleting a buffer in a
script.

Jump list:
- The number of marks kept in the jumplist has been increased from 50 to 100.
- The jumplist is now stored in the viminfo file. CTRL-O can be used to jump
  to positions from a previous edit session.
- When doing ":split" copy the jumplist to the new window.

Also set the '[and '] marks for the "~" and "r" commands. These marks are
now always set when making a change with a Normal mode command.

Python interface: Allow setting the width of a vertically split window. (John
Cook)

Added "=word" and "=~word" to 'cinkeys' (also used in 'indentkeys').

Added "j1" argument in 'cinoptions': indent {} inside () for Java. (Johannes
Zellner)
Added the "l" flag in 'cinoptions'. (Anduin Withers)
Added 'C', 'U', 'w' and 'm' flags to 'cinoptions'. (Servatius Brandt)

When doing ":wall" or ":wqall" and a modified buffer doesn't have a name,
mention its buffer number in the error message.

":function Name" lists the function with line numbers. Makes it easier to
find out where an error happened.

In non-blockwise Visual mode, "r" replaces all selected characters with the
typed one, like in blockwise Visual mode.

When editing the last file in the argument list in any way, allow exiting.
Previously this was only possible when getting to that file with ":next" or
":last".

Added the '1' flag to 'formatoptions'. (Vit Stradal)
Added 'n' flag in 'formatoptions': format a numbered list.

Swap file:
- When a swap file already exists, and the user selects "Delete" at the
  ATTENTION prompt, use the same ".swp" swapfile, to avoid creating a ".swo"
  file which won't always be found.
- When giving the ATTENTION message and the date of the file is newer than the
  date of swap file, give a warning about this.
- Made the info for an existing swap file a bit shorter, so that it still fits
  on a 24 line screen.
- It was possible to make a symlink with the name of a swap file, linking to a
  file that doesn't exist. Vim would then silently use another file (if open
  with O_EXCL refuses a symlink). Now check for a symlink to exist. Also do
  another check for an existing swap file just before creating it to catch a
  symlink attack.

The g CTRL-G command also works in Visual mode and counts the number of words.
(Chase Tingley)

Give an error message when using 'shell' and it's empty.

Added the possibility to include "%s" in 'shellpipe'.

Added "uhex" value for 'display': show non-printable characters as <xx>.
Show unprintable characters with NonText highlighting, also in the command
line.

When asked to display the value of a hidden option, tell it's not supported.

Win32:
- When dropping a shortcut on gvim (.lnk file) edit the target, not the
  shortcut itself. (Yasuhiro Matsumoto)
- Added C versions of the OpenWithVim and SendToVim programs. (Walter Briscoe)
- When 'shell' is "cmd" or "cmd.exe", set 'shellredir' to redirect stderr too.
  Also check for the Unix shell names.
- When $HOMEDRIVE and $HOMEPATH are defined, use them to define $HOME. (Craig
  Barkhouse)

Win32 console version:
- Includes the user and system name in the ":version" message, when available.
  It generates a pathdef.c file for this. (Jon Miner)
- Set the window icon to Vim's icon (only for Windows 2000). While executing
  a shell command, modify the window title to show this. When exiting,
  restore the cursor position too. (Craig Barkhouse)
- The Win32 console version can be compiled with OLE support. It can only
  function as a client, not as an OLE server.

Errorformat:
- Let "%p" in 'errorformat' (column of error indicated by a row of characters)
  also accept a line of dots.
- Added "%v" item in 'errorformat': Virtual column number. (Dan Sharp)
- Added a default 'errorformat' value for VMS. (Jim Bush)

The "p" command can now be used in Visual mode. It overwrites the selected
text with the contents of a register.

Highlight the <> items in the intro message to make clear they are special.

When using the "c" flag for ":substitute", allow typing "l" for replacing this
item and then stop: "last".

When printing a verbose message about sourcing another file, print the line
number.

When resizing the Vim window, don't use 'equalalways'. Avoids that making the
Vim window smaller makes split windows bigger. And it's what the docs say.

When typing CTRL-D in Insert mode, just after an autoindent, then hitting CR
kept the remaining white space. Now made it work like BS: delete the
autoindent to avoid a blank non-empty line results.

Added a GetHwnd() call to the OLE interface. (Vince Negri)

Made ":normal" work in an event handler. Useful when dropping a file on Vim

and for CursorHold autocommands.

For the MS-Windows version, don't change to the directory of the file when a slash is used instead of a backslash. Explorer should always use a backslash, the user can use a slash when typing the command.

Timestamps:
- When a buffer was changed outside of Vim and regaining focus, give a dialog to allow the user to reload the file. Now also for other GUIs than MS-Windows. And also used in the console, when compiled with dialog support.
- Inspect the file contents to find out if it really changed, ignore situations where only the time stamp changed (e.g., checking the file out from CVS).
- When checking the timestamp, first check if the file size changed, to avoid a file compare then. Makes it quicker for large (log) files that are appended to.
- Don't give a warning for a changed or deleted file when 'buftype' is set.
- No longer warn for a changed directory. This avoids that the file explorer produces warnings.
- Checking timestamps is only done for buffers that are not hidden. These will be checked when they become unhidden.
- When checking for a file being changed outside of Vim, also check if the file permissions changed. When the file contents didn't change but the permissions did, give a warning.
- Avoid checking too often, otherwise the dialog keeps popping up for a log file that steadily grows.

Mapping <M-A> when 'encoding' is "latin1" and then setting 'encoding' to "utf-8" causes the first byte of a multi-byte to be mapped. Can cause very hard to find problems. Disallow mapping part of a multi-byte character.

For ":python" and ":tcl" accept an in-line script. (Johannes Zellner)
Also for ":ruby" and ":perl". (Benoit Cerrina)

Made ":syn include" use 'runtimepath' when the file name is not a full path.

When 'switchbuf' contains "split" and the current window is empty, don't split the window.

Unix: Catch SIGPWR to preserve files when the power is about to go down.

Sniff interface: (Anton Leherbauer)
- fixed windows code, esp. the event handling stuff
- adaptations for sniff 4.x ($SNIFF_DIR4)
- support for adding sniff requests at runtime

Support the notation <A-x> as an alias for <M-x>. This logical, since the Alt key is used.

":find" accepts a count, which means that the count'th match in 'path' is used.

":ls" and ":buffers" output shows modified/readonly/modifiable flag. When a

buffer is active show "a" instead of nothing. When a buffer isn't loaded
show nothing instead of "-".

Unix install:
- When installing the tools, set absolute paths in tools scripts efm_perl.pl
  and mve.awk. Avoids that the user has to edit these files.
- Install Icons for KDE when the directories exist and the icons do not exist
  yet.

Added has("win95"), to be able to distinguish between MS-Windows 95/98/ME and
NT/2000/XP in a Vim script.

When a ":cd" command was typed, echo the new current directory. (Dan Sharp)

When using ":winpos" before the GUI window has been opened, remember the
values until it is opened.

In the ":version" output, add "/dyn" for features that are dynamically loaded.
This indicates the feature may not always work.

On Windows NT it is possible that a directory is read-only, but a file can be
deleted. When making a backup by renaming the file and 'backupdir' doesn't
use the current directory, this causes the original file to be deleted,
without the possibility to create a new file. Give an extra error message
then to warn to user about this.

Made CTRL-R CTRL-O at the command line work like CTRL-R CTRL-R, so that it's
consistent with Insert mode.

==
COMPILE TIME CHANGES   compile-changes-6

All generated files have been moved out of the "src" directory. This makes it
easy to see which files are not edited by hand. The files generated by
configure are now in the "src/auto" directory. For Unix, compiled object
files go in the objects directory.

The source archive was over the 1.4M floppy limit. The archives are now split
up into two runtime and two source archives. Also provide a bzip2 compressed
archive that contains all the sources and runtime files.

Added "reconfig" as a target for make. Useful when changing some of the
arguments that require flushing the cache, such as switching from GTK to
Motif. Adjusted the meaning of GUI_INC_LOC and GUI_LIB_LOC to be consistent
over different GUIs.

Added src/README.txt to give an overview of the main parts of the source code.

The Unix Makefile now fully supports using $(DESTDIR) to install to a specific
location. Replaces the manual setting of *ENDLOC variables.

Added the possibility for a maintainer of a binary version to include his
e-mail address with the --with-compiledby configure argument.

Included features are now grouped in "tiny", "small", "normal", "big" and
"huge". This replaces "min-features" and "max-features". Using "tiny"
disables multiple windows for a really small Vim.

For the tiny version or when FEAT_WINDOWS is not defined: Firstwin and lastwin
are equal to curwin and don't use w_next and w_prev.

Added the +listcmds feature. Can be used to compile without the Vim commands
that manipulate the buffer list and argument list (the buffer list itself is
still there, can't do without it).

Added the +vreplace feature. It is disabled in the "small" version to avoid
that the 16 bit DOS version runs out of memory.

Removed GTK+ support for versions older than 1.1.16.

The configure checks for using PTYs have been improved. Code taken from a
recent version of screen.

Added configure options to install Vim, Ex and View under another name (e.g.,
vim6, ex6 and view6).

Added "--with-global-runtime" configure argument. Allows specifying the
global directory used in the 'runtimepath' default.

Made enabling the SNiFF+ interface possible with a configure argument.

Configure now always checks /usr/local/lib for libraries and
/usr/local/include for include files. Helps finding the stuff for iconv() and
gettext().

Moved the command line history stuff into the +cmdline_hist feature, to
exclude the command line history from the tiny version.

MS-Windows: Moved common functions from Win16 and Win32 to os_mswin.c. Avoids
having to change two files for one problem. (Vince Negri)

Moved common code from gui_w16.c and gui_w32.c to gui_w48.c (Vince Negri)

The jumplist is now a separate feature. It is disabled for the "small"
version (16 bit MS-DOS).

Renamed all types ending in _t to end in _T. Avoids potential problems with
system types.

Added a configure check for X11 header files that implicitly define the return
type to int. (Steve Wall)

"make doslang" in the top directory makes an archive with the menu and .mo
files for Windows. This uses the files generated on Unix, these should work
on MS-Windows as well.

Merged a large part of os_vms.c with os_unix.c. The code was duplicated in
the past which made maintenance more work. (Zoltan Arpadffy)

Updated the Borland C version 5 Makefile: (Dan Sharp)
- Fixed the Perl build
- Added python and tcl builds
- Added dynamic perl and dynamic python builds
- Added uninstal.exe build
- Use "yes" and "no" for the options, like in Make_mvc.mak.

Win32: Merged Make_gvc.mak and Make_ovc.mak into one file: Make_ivc.mak. It's much smaller, many unnecessary text has been removed. (Walter Briscoe)
Added Make_dvc.mak to be able to debug exe generated with Make_mvc.mak in MS-Devstudio. (Walter Briscoe)

MS-Windows: The big gvim.exe, which includes OLE, now also includes dynamically loaded Tcl, Perl and Python. This uses ActivePerl 5.6.1, ActivePython 2.1.1 and ActiveTCL 8.3.3

Added AC_EXEEXT to configure.in, to check if the executable needs ".exe" for Cygwin or MingW. Renamed SUFFIX to EXEEXT in Makefile.

Win32: Load comdlg32.dll delayed for faster startup. Only when using VC 6. (Vipin Aravind)

Win32: When compiling with Borland, allow using IME. (Yasuhiro Matsumoto)

Win32: Added Makefile for Borland 5 to compile gvimext.dll. (Yasuhiro Matsumoto)

==
BUG FIXES bug-fixes-6

When checking the command name for "gvim", "ex", etc. ignore case. Required for systems where case is ignored in command names.

Search pattern "[a-c-e]" also matched a 'd' and didn't match a '-'.

When double-clicking in another window, wasn't recognized as double click, because topline is different. Added set_mouse_topline().

The BROKEN_LOCALE check was broken. (Marcin Dalecki)

When "t_Co" is set, the default colors remain the same, thus wrong. Reset the colors after changing "t_Co". (Steve Wall)

When exiting with ":wqall" the messages about writing files could overwrite each other and be lost forever.

When starting Vim with an extremely long file name (around 1024 characters) it would crash. Added a few checks to avoid buffer overflows.

CTRL-E could get stuck in a file with very long lines.

":au syntax<Tab>" expanded event names while it should expand groups starting with "syntax".

When expanding a file name caused an error (e.g., for <amatch>) it was
produced even when inside an "if 0".

'cindent' formatted C comments differently from what the 'comments' option
specified. (Steve Wall)

Default for 'grepprg' didn't include the file name when only grepping in one
file. Now /dev/null has been added for Unix.

Opening the option window twice caused trouble. Now the cursor goes to the
existing option window.

":sview" and ":view" didn't set 'readonly' for an existing buffer. Now do set
'readonly', unless the buffer is also edited in another window.

GTK GUI: When 'guioptions' excluded 'g', the more prompt caused the toolbar
and menubar to disappear and resize the window (which clears the text).
Now always grey-out the toplevel menus to avoid that the menubar changes size
or disappears.

When re-using the current buffer for a new buffer, buffer-local variables were
not deleted.

GUI: when 'scrolloff' is 0 dragging the mouse above the window didn't cause a
down scroll. Now pass on a mouse event with mouse_row set to -1.

Win32: Console version didn't work on telnet, because of switching between two
console screens. Now use one console screen and save/restore the contents
when needed. (Craig Barkhouse)

When reading a file the magic number for encryption was included in the file
length. (Antonio Colombo)

The quickfix window contained leading whitespace and NULs for multi-line
messages. (David Harrison)

When using cscope, redundant tags were removed. This caused a numbering
problem, because they were all listed. Don't remove redundant cscope tags.
(David Bustos).

Cscope: Test for which matches are in the current buffer sometimes failed,
causing a jump to another match than selected. (David Bustos)

Win32: Buffer overflow when adding a charset name in a font.

'titlestring' and 'iconstring' were evaluating an expression in the current
context, which could be a user function, which is a problem for local
variables vs global variables.

Win32 GUI: Mapping <M-F> didn't work. Now handle SHIFT and CTRL in
_OnSysChar().

Win32 GUI: (on no file), :vs<CR>:q<CR> left a trail of pixels down the middle.

Could also happen for the ruler. screen_puts() didn't clear the right char in ScreenLines[] for the bold trick.

Win32: ":%!sort|uniq" didn't work, because the input file name touches the "|". Insert a space before the "|".

OS/2: Expanding wildcards included non-existing files. Caused ":runtime" to fail, which caused syntax highlighting to fail.

Pasting a register containing CTRL-R on the command line could cause an endless loop that can't be interrupted. Now it can be stopped with CTRL-C.

When 'verbose' is set, a message for file read/write could overwrite the previous message.
When 'verbose' is set, the header from ":select" was put after the last message. Now start a new line.

The hit-enter prompt reacted to the response of the t_RV string, causing messages at startup to disappear.

When t_Co was set to 1, colors were still used. Now only use color when t_Co > 1.

Listing functions with ":function" didn't quit when 'q' or ':' was typed at the more prompt.

Use mkstemp() instead of mktemp() when it's available, avoids a warning for linking on FreeBSD.

When doing Insert mode completion it's possible that b_sfname is NULL. Don't give it to printf() for the "Scanning" message.

":set runtimepath-=$VIMRUNTIME" didn't work, because expansion of wildcards was done after trying to remove the string. Now for ":set opt+=val" and ":set opt-=val" the expansion of wildcards is done before adding or removing "val".

Using CTRL-V with the "r" command with a blockwise Visual selection inserted a CTRL-V instead of getting a special character.

Unix: Changed the order of libraries: Put -lXdmcp after -lX11 and -lSM -lICE after -lXdmcp. Should fix link problem on HP-UX 10.20.

Don't remove the last "-lm" from the link line. Vim may link but fail later when the GUI starts.

When the shell returns with an error when trying to expand wildcards, do include the pattern when the "EW_NOTFOUND" flag was set.
When expanding wildcards with the shell fails, give a clear error message instead of just "1 returned".

Selecting a Visual block, with the start partly on a Tab, deleting it leaves the cursor too far to the left. Causes "s" to work in the wrong position.

Pound sign in normal.c caused trouble on some compilers. Use 0xA3 instead.

Warning for changing a read-only file wasn't given when 'insertmode' was set.

Win32: When 'shellxquote' is set to a double quote (e.g., using csh), ":!start notepad file" doesn't work. Remove the double quotes added by 'shellxquote' when using ":!start". (Pavol Juhas)

The "<f-args>" argument of ":command" didn't accept Tabs for white space.
Also, don't add an empty argument when there are trailing blanks.

":e test\\je" edited "test\je", but ":next test\\je" edited "testje".
Backslashes were removed one time too many for ":next".

VMS: "gf" didn't work properly. Use vms_fixfilename() to translate the file name. (Zoltan Arpadffy)

After ":hi Normal ctermbg=black ctermfg=white" and suspending Vim not all characters are redrawn with the right background.

When doing "make test" without +eval or +windows feature, many tests failed.
Now have test1 generate a script to copy the correct output, so that a test that doesn't work is skipped.

On FreeBSD the Perl interface added "-lc" to the link command and Python added "-pthread". These two don't work together, because the libc_r library should be used. Removed "-lc" from Perl, it should not be needed.
Also: Add "-pthread" to $LIBS, so that the checks for functions is done with libc_r. Sigaltstack() appears to be missing from libc_r.

The Syntax sub-menus were getting too long, reorganized them and added another level for some languages.

Visual block "r"eplace didn't work well when a Tab is partly included.
(Matthias Kramm)

When yanking a Visual block, where some lines end halfway the block, putting the text somewhere else doesn't insert a block. Padd with spaces for missing characters. Added "y_width" to struct yankreg. (Matthias Kramm)

If a substitute string has a multibyte character after a backslash only the first byte of it was skipped. (Muraoka Taro)

Win32: Numeric keypad keys were missing from the builtin termcap entry.

When a file was read-only ":wa!" didn't force it to be written. (Vince Negri)

Amiga: A file name starting with a colon was considered absolute but it isn't.
Amiga: ":pwd" added a slash when in the root of a drive.

Don't let 'ttymouse' default to "dec" when compiled with dec mouse support.
It breaks the gpm mouse (Linux console).

The prototypes for the Perl interface didn't work for threaded Perl. Added a sed command to remove the prototypes from proto/if_perl.pro and added them

manually to if_perl.xs.

When ":w!" resets the 'readonly' option the title and status lines were not updated.

":args" showed the current file when the argument list was empty. Made this work like Vi: display nothing.

"99:<C-U>echo v:count" echoed "99" in Normal mode, but 0 in Visual mode. Don't set v:count when executing a stuffed command.

Amiga: Got a requester for "home:" because it's in the default runtime path. Don't bring up a requester when searching for a file in 'path', sourcing the .vimrc file or using ":runtime".

Win16 and Win32: Considered a file "\path\file" absolute. Can cause the same file to appear as two different buffers.

Win32: Renaming a file to an empty string crashed Vim. Happened when using explorer.vim and hitting ESC at the rename prompt.

Win32: strftime() crashed when called with a "-1" value for the time.

Win32 with Borland compiler: mch_FullName() didn't work, caused tag file not to be found.

Cscope sometimes jumped to the wrong tag. (David Bustos)

OS/2: Could not find the tags file. mch_expand_wildcards() added another slash to a directory name.

When using ">>" the `] mark was not in the last column.

When Vim was compiled without menu support, filetype.vim was still trying to source the menu.vim script. (Rafael Garcia-Suarez)

":ptag" added an item to the tag stack.

Win32 IME: "gr" didn't use IME mode.

In the "vim --help" message the term "options" was used for arguments. That's confusing, call them "arguments".

When there are two windows, and a BufUnload autocommand for closing window #1 closed window #2, Vim would crash.

When there is a preview window and only one other window, ":q" wouldn't exit.

In Insert mode, when cancelling a digraph with ESC, the '?' wasn't removed.

On Unix glob(".*") returned "." and "..", on Windows it didn't. On Windows glob("*") also returned files starting with a dot. Made this work like Unix on all systems.

Win32: Removed old code to open a console. Vimrun is now used and works fine.

Compute the room needed by the intro message accurately, so that it also fits on a 25 line console. (Craig Barkhouse)

":ptnext" was broken. Now remember the last tag used in the preview window separately from the tagstack.

Didn't check for "-display" being the last argument. (Wichert Akkerman)

GTK GUI: When starting "gvim" under some conditions there would be an X error. Don't replace the error handler when creating the xterm clipboard. (Wichert Akkerman)

Adding a space after a help tag caused the tag not to be found. E.g., ":he autoindent ".

Was trying to expand a URL into a full path name. On Windows this resulted in the current directory to be prepended to the URL. Added vim_isAbsName() and vim_FullName() to avoid that various machine specific functions do it differently.

":n *.c" ":cd .." ":n" didn't use the original directory of the file. Vi only does it for the current file (looks like a bug). Now remember the buffer used for the entry in the argument list and use its name (adjusted when doing ":cd"), unless it's deleted.

When inserting a special key as its name ("<F8>" as four characters) after moving around in Insert mode, undo didn't work properly.

Motif GUI: When using the right mouse button, for some people gvim froze for a couple of seconds (Motif 1.2?). This doesn't happen when there is no Popup menu. Solved by only creating a popup menu when 'mousemodel' is "popup" or "popup_setpos". (David Harrison)

Motif: When adding many menu items, the "Help" menu disappeared but the menubar didn't wrap. Now manually set the menubar height.

When using <BS> in Insert mode to remove a line break, or using "J" to join lines, the cursor could end up halfway a multi-byte character. (Muraoka Taro)

Removed defining SVR4 in configure. It causes problems for some X header files and doesn't appear to be used anywhere.

When 'wildignore' is used, 'ignorecase' for a tag match was not working.

When 'wildignore' contains "*~" it was impossible to edit a file ending in a "~". Now don't recognize a file ending in "~" as containing wildcards.

Disabled the mouse code for OS/2. It was not really used.

":mksession" always used the full path name for a buffer, also when the short name could be used.
":mkvimrc" and ":mksession" didn't save 'wildchar' and 'pastetoggle' in such a

way that they would be restored. Now use the key name if possible, this is portable.

After recovering a file and abandoning it, an ":edit" command didn't give the ATTENTION prompt again. Would be useful to be able to delete the file in an easy way. Reset the BF_RECOVERED flag when unloading the buffer.

histdel() could match or ignore case, depending on what happened before it. Now always match case.

When a window size was specified when splitting a window, it would still get the size from 'winheight' or 'winwidth' if it's larger.

When using "append" or "insert" inside a function definition, a line starting with "function" or "endfunction" caused confusion. Now recognize the commands and skip lines until a ".".

At the end of any function or sourced file need_wait_return could be reset, causing messages to disappear when redrawing.

When in a while loop the line number for error messages stayed fixed. Now the line number is remembered in the while loop.

"cd c:/" didn't work on MS-DOS. mch_isdir() removed a trailing slash.

MS-Windows: getftime() didn't work when a directory had a trailing slash or backslash. Didn't show the time in the explorer because of this.

When doing wildcard completion, a directory "a/" sorted after "a-b". Now recognize path separators when sorting files.

Non-Unix systems: When editing "c:/dir/../file" and "c:/file" they were created as different buffers, although it's the same file. Expand to a full file name also when an absolute name contains "..".

"g&" didn't repeat the last substitute properly.

When 'clipboard' was set to "unnamed", a "Y" command would not write to "0. Now make a copy of register 0 to the clipboard register.

When the search pattern matches in many ways, it could not always be interrupted with a CTRL-C. And CTRL-C would have to be hit once for every line when 'hlsearch' is on.
When 'incsearch' is on and interrupting the search for a match, don't abandon the command line.

When turning a directory name into a full path, e.g., with fnamemodify(), sometimes a slash was added. Make this consistent: Don't add a slash.

When a file name contains a "!", using it in a shell command will cause trouble: ":!cat %". Escape the "!" to avoid that. Escape it another time when 'shell' contains "sh".

Completing a file name that has a tail that starts with a "~" didn't work:

":e view/~<Tab>".

Using a ":command" argument that contains < and > but not for a special
argument was not skipped properly.

The DOS install program: On Win2000 the check for a vim.exe or gvim.exe in
$PATH didn't work, it always found it in the current directory.
Rename the vim.exe in the current dir to avoid this. (Walter Briscoe)

In the MS-DOS/Windows install program, use %VIM% instead of an absolute path,
so that moving Vim requires only one change in the batch file.

Mac: mch_FullName() changed the "fname" argument and didn't always initialize
the buffer.

MS-DOS: mch_FullName() didn't fix forward/backward slashes in an absolute file
name.

"echo expand("%:p:h")" with an empty file name removed one directory name on
MS-DOS. For Unix, when the file name is a directory, the directory name was
removed. Now make it consistent: "%:p" adds a path separator for all systems,
but no path separator is added in other situations.

Unix: When checking for a CTRL-C (could happen any time) and there is an X
event (e.g., clipboard updated) and there is typeahead, Vim would hang until a
character was typed.

MS-DOS, MS-Windows and Amiga: expanding "$ENV/foo" when $ENV ends in a colon,
had the slash removed.

":he \^=" gave an error for using _. ":he ^=" didn't find tag :set^=. Even
"he :set^=" didn't find it.

A tags file name "D:/tags" was used as file "tags" in "D:". That doesn't work
when the current path for D: isn't the root of the drive.

Removed calls to XtInitializeWidgetClass(), they shouldn't be necessary.

When using a dtterm or various other color terminals, and the Normal group has
been set to use a different background color, the background wouldn't always
be displayed with that color. Added check for "ut" termcap entry: If it's
missing, clearing the screen won't give us the current background color. Need
to draw each character instead. Vim now also works when the "cl" (clear
screen) termcap entry is missing.

When repeating a "/" search command with a line offset, the "n" did use the
offset but didn't make the motion linewise. Made "d/pat/+2" and "dn" do the
same.

Win32: Trying to use ":tearoff" for a menu that doesn't exist caused a crash.

OpenPTY() didn't work on Sequent. Add a configure check for getpseudotty().

C-indenting: Indented a line starting with ")" with the matching "(", but not

a line starting with "x)" looks strange. Also compute the indent for aligning with items inside the () and use the lowest indent.

MS-DOS and Windows: ":n *.vim" also matched files ending in "~".
Moved mch_expandpath() from os_win16.c and os_msdos.c to misc1.c, they are equal.

Macintosh: (Dany St-Amant)
- In Vi-compatible mode didn't read files with CR line separators.
- Fixed a bug in the handling of Activate/Deactivate Event
- Fixed a bug in gui_mch_dialog (using wrong pointer)

Multibyte GDK XIM: While composing a multibyte-word, if user presses a mouse button, then the word is removed. It should remain and composing end. (Sung-Hyun Nam)

MS-DOS, MS-Windows and OS/2: When reading from stdin, automatic CR-LF conversion by the C library got in the way of detecting a "dos" 'fileformat'.

When 'smartcase' is set, patterns with "\S" would also make 'ignorecase' reset.

When clicking the mouse in a column larger than 222, it moved to the first column. Can't encode a larger number in a character. Now limit the number to 222, don't jump back to the first column.

GUI: In some versions CSI would cause trouble, either when typed directly or when part of a multi-byte sequence.

When using multibyte characters in a ":normal" command, a trailing byte that is CSI or K_SPECIAL caused problems.

Wildmenu didn't handle multi-byte characters.

":sleep 10" could not be interrupted on Windows, while "gs" could. Made them both work the same.

Unix: When waiting for a character is interrupted by an X-windows event (e.g., to obtain the contents of the selection), the wait time would not be honored. A message could be overwritten quickly. Now compute the remaining waiting time.

Windows: Completing "\\share\c$\S" inserted a backslash before the $ and then the name is invalid. Don't insert the backslash.

When doing an auto-write before ":make", IObuff was overwritten and the wrong text displayed later.

On the Mac the directories "c:/tmp" and "c:/temp" were used in the defaults for 'backupdir' and 'directory', they don't exist.

The check for a new file not to be on an MS-DOS filesystem created the file temporarily, which can be slow. Don't do this if there is another check for the swap file being on an MS-DOS filesystem.

Don't give the "Changing a readonly file" warning when reading from stdin.

When using the "Save As" menu entry and not entering a file name, would get an error message for the trailing ":edit #". Now only do that when the alternate file name was changed.

When Vim owns the X11 selection and is being suspended, an application that tries to use the selection hangs. When Vim continues it could no longer obtain the selection. Now give up the selection when suspending.

option.h and globals.h were included in some files, while they were already included in vim.h. Moved the definition of EXTERN to vim.h to avoid doing it twice.

When repeating an operator that used a search pattern and the search pattern contained characters that have a special meaning on the cmdline (e.g., CTRL-U) it didn't work.

Fixed various problems with using K_SPECIAL (0x80) and CSI (0x9b) as a byte in a (multibyte) character. For example, the "r" command could not be repeated.

The DOS/Windows install program didn't always work from a directory with a long filename, because $VIM and the executable name would not have the same path.

Multi-byte:
- Using an any-but character range [^x] in a regexp didn't work for UTF-8. (Muraoka Taro)
- When backspacing over inserted characters in Replace mode multi-byte characters were not handled correctly. (Muraoka Taro)
- Search commands "#" and "*" didn't work with multibyte characters. (Muraoka Taro)
- Word completion in Insert mode didn't work with multibyte characters. (Muraoka Taro)
- Athena/Motif GUI: when 'linespace' is non-zero the cursor would be drawn too wide (number of bytes instead of cell width).
- When changing 'encoding' to "euc-jp" and inserting a character Vim would crash.
- For euc-jp characters positioning the cursor would sometimes be wrong. Also, with two characters with 0x8e leading byte only the first one would be displayed.
- When using DYNAMIC_ICONV on Win32 conversion might fail because of using the wrong error number. (Muraoka Taro)
- Using Alt-x in the GUI while 'encoding' was set to "utf-8" didn't produce the right character.
- When using Visual block selection and only the left halve of a double-wide character is selected, the highlighting continued to the end of the line.
- Visual-block delete didn't work properly when deleting the right halve of a double-wide character.
- Overstrike mode for the cmdline replaced only the first byte of a multibyte character.
- The cursor in Replace mode (also in the cmdline) was to small on a double-wide character.

- When a multibyte character contained a 0x80 byte, it didn't work (was using
  a CSI byte instead). (Muraoka Taro)
- Wordwise selection with the mouse didn't work.
- Yanking a modeless selection of multi-byte characters didn't work.
- When 'selection' is "exclusive", selecting a word that ends in a multi-byte
  character used wrong highlighting for the following character.

Win32 with Make_mvc.mak: Didn't compile for debugging. (Craig Barkhouse)

Win32 GUI: When "vimrun.exe" is used to execute an external command, don't
give a message box with the return value, it was already printed by vimrun.
Also avoid printing the return value of the shell when ":silent!" is used.

Win32: selecting a lot of text and using the "find/replace" dialog caused a
crash.

X11 GUI: When typing a character with the 8th bit set and the Meta/Alt
modifier, the modifier was removed without changing the character.

Truncating a message to make it fit on the command line, using "..." for the
middle, didn't always compute the space correctly.

Could not imap <C-@>. Now it works like <Nul>.

VMS:
- Fixed a few things for VAXC. os_vms_fix.com had some strange CTRL-M
  characters. (Zoltan Arpadffy and John W. Hamill)
- Added VMS-specific defaults for the 'isfname' and 'isprint' options.
  (Zoltan Arpadffy)
- Removed os_vms_osdef.h, it's no longer used.

The gzip plugin used a ":normal" command, this doesn't work when dropping a
compressed file on Vim.

In very rare situations a binary search for a tag would fail, because an
uninitialized value happens to be half the size of the tag file. (Narendran)

When using BufEnter and BufLeave autocommands to enable/disable a menu, it
wasn't updated right away.

When doing a replace with the "c"onfirm flag, the cursor was positioned after
the ruler, instead of after the question. With a long replacement string the
screen could scroll up and cause a "more" prompt. Now the message is
truncated to make it fit.

Motif: The autoconf check for the Xp library didn't work.

When 'verbose' is set to list lines of a sourced file, defining a function
would reset the counter used for the "more" prompt.

In the Win32 find/replace dialog, a '/' character caused problems. Escape it
with a backslash.

Starting a shell with ":sh" was different from starting a shell for CTRL-Z

when suspending doesn't work. They now work the same way.

Jumping to a file mark while in a changed buffer gave a "mark not set" error.

":execute histget("cmd")" causes an endless loop and crashed Vim. Now catch all commands that cause too much recursiveness.

Removed "Failed to open input method" error message, too many people got this when they didn't want to use a XIM.

GUI: When compiled without the +windows feature, the scrollbar would start below line one.

Removed the trick with redefining character class functions from regexp.c.

Win32 GUI: Find dialog gives focus back to main window, when typing a character mouse pointer is blanked, it didn't reappear when moving it in the dialog window. (Vince Negri)

When recording and typing a CTRL-C, no character was recorded. When in Insert mode or cancelling half a command, playing back the recorded sequence wouldn't work. Now record the CTRL-C.

When the GUI was started, mouse codes for DEC and netterm were still checked for.

GUI: When scrolling and 'writedelay' is non-zero, the character under the cursor was displayed in the wrong position (one line above/below with CTRL-E/CTRL-Y).

A ":normal" command would reset the 'scrollbind' info. Causes problems when using a ":normal" command in an autocommand for opening a file.

Windows GUI: a point size with a dot, like "7.5", wasn't recognized. (Muraoka Taro)

When 'scrollbind' wasn't set would still remember the current position, wasting time.

GTK: Crash when 'shell' doesn't exist and doing":!ls". Use _exit() instead of exit() when the child couldn't execute the shell.

Multi-byte:
- GUI with double-byte encoding: a mouse click in left halve of double-wide character put the cursor in previous char.
- Using double-byte encoding and 'selection' is "exclusive": "vey" and "^Vey" included the character after the word.
- When using a double-byte encoding and there is a lead byte at the end of the line, the preceding line would be displayed. "ga" also showed wrong info.
- "gf" didn't include multi-byte characters before the cursor properly. (Muraoka Taro)

GUI: The cursor was sometimes not removed when scrolling. Changed the policy from redrawing the cursor after each call to gui_write() to only update it at

the end of update_screen() or when setting the cursor position. Also only
update the scrollbars at the end of update_screen(), that's the only place
where the window text may have been scrolled.

Formatting "/*<Tab>long text", produced "* <Tab>" in the next line. Now
remove the space before the Tab.
Formatting "/*<Tab> long text", produced "* <Tab> long text" in the next
line. Now keep the space after the Tab.

In some places non-ASCII alphabetical characters were accepted, which could
cause problems. For example, ":X" (X being such a character).

When a pattern matches the end of the line, the last character in the line was
highlighted for 'hlsearch'. That looks wrong for "/\%3c". Now highlight the
character just after the line.

Motif: If a dialog was closed by clicking on the "X" of the window frame Vim
would no longer respond.

When using CTRL-X or CTRL-A on a number with many leading zeros, Vim would
crash. (Matsumoto)

When 'insertmode' is set, the mapping in mswin.vim for CTRL-V didn't work in
Select mode. Insert mode wasn't restarted after overwriting the text.
Now allow nesting Insert mode with insert and change commands. CTRL-O
cwfoo<Esc> now also works.

Clicking with the right mouse button in another window started Visual mode,
but used the start position of the current window. Caused ml_get errors when
the line number was invalid. Now stay in the same window.

When 'selection' is "exclusive", "gv" sometimes selected one character fewer.

When 'comments' contains more than one start/middle/end triplet, the optional
flags could be mixed up. Also didn't align the end with the middle part.

Double-right-click in Visual mode didn't update the shown mode.

When the Normal group has a font name, it was never used when starting up.
Now use it when 'guifont' and 'guifontset' are empty.
Setting a font name to a highlight group before the GUI was started didn't
work.

"make test" didn't use the name of the generated Vim executable.

'cindent' problems:
- Aligned with an "else" inside a do-while loop for a line below that loop.
  (Meikel Brandmeyer)
- A line before a function would be indented even when terminated with a
  semicolon. (Meikel Brandmeyer)
- 'cindent' gave too much indent to a line after a "};" that ends an array
  init.
- Support declaration lines ending in "," and "\". (Meikel Brandmeyer)
- A case statement inside a do-while loop was used for indenting a line after

  the do-while loop. (Meikel Brandmeyer)
- When skipping a string in a line with one double quote it could continue in
  the previous line. (Meikel Brandmeyer)

When 'list' is set, 'hlsearch' didn't highlight a match at the end of the
line. Now highlight the '$'.

The Paste menu item in the menu bar, the popup menu and the toolbar were all
different. Now made them all equal to how it was done in mswin.vim.

st_dev can be smaller than "unsigned". The compiler may give an overflow
warning. Added a configure check for dev_t.

Athena: closing a confirm() dialog killed Vim.

Various typos in the documentation. (Matt Dunford)

Python interface: The definition of _DEBUG could cause trouble, undefine it.
The error message for not being able to load the shared library wasn't
translated. (Muraoka Taro)

Mac: (Dany St-Amant and Axel Kielhorn)
- Several fixes.
- Vim was eating 80% of the CPU time.
- The project os_mac.pbxproj didn't work, Moved it to a subdirectory.
- Made the menu priority work for the menubar.
- Fixed a problem with dragging the scrollbar.
- Cleaned up the various #ifdefs.

Unix: When catching a deadly signal and we keep getting one use _exit() to
exit in a quick and dirty way.

Athena menu ordering didn't work correctly. (David Harrison)

A ":make" or ":grep" command with a long argument could cause a crash.

Doing ":new file" and using "Quit" for the ATTENTION dialog still opened a new
window.

GTK: When starting the GUI and there is an error in the .vimrc file, don't
present the wait-return prompt, since the message was given in the terminal.

When there was an error in a .vimrc file the terminal where gvim was started
could be cleared. Set msg_row in main.c before writing any messages.

GTK and X11 GUI: When trying to read characters from the user (e.g. with
input()) before the Vim window was opened caused Vim to hang when it was
started from the desktop.

OS/390 uses 31 bit pointers. That broke some computations with MAX_COL.
Reduce MAX_COL by one bit for OS/390. (Ralf Schandl)

When defining a function and it already exists, Vim didn't say it existed
until after typing it. Now do this right away when typing it.

The message remembered for displaying later (keep_msg) was sometimes pointing into a generic buffer, which might be changed by the time the message is displayed. Now make a copy of the message.

When using multi-byte characters in a menu and a trailing byte is a backslash, the menu would not be created correctly. (Muraoka Taro)
Using a multibyte character in the substitute string where a trail byte is a backslash didn't work. (Muraoka Taro)

When setting "t_Co" in a vimrc file, then setting it automatically from an xterm termresponse and then setting it again manually caused a crash.

When getting the value of a string option that is not supported, the number zero was returned. This breaks a check like "&enc == "asdf". Now an empty string is returned for string options.

Crashed when starting the GTK GUI while using 'notitle' in the vimrc, setting 'title' in the gvimrc and starting the GUI with ":gui". Closed the connection to the X server accidentally.

Had to hit return after selecting an entry for ":ts".

The message from ":cn" message was sometimes cleared. Now display it after redrawing if it doesn't cause a scroll (truncated when necessary).

hangulin.c didn't compile when the GUI was disabled. Disable it when it won't work.

When setting a termcap option like "t_CO", the value could be displayed as being for a normal key with a modifier, like "<M-=>".

When expanding the argument list, entries which are a directory name did not get included. This stopped "vim c:/" from opening the file explorer.

":syn match sd "^" nextgroup=asdf" skipped the first column and matched the nextgroup in the second column.

GUI: When 'lazyredraw' is set, 'showmatch' didn't work. Required flushing the output.

Don't define the <NetMouse> termcode in an xterm, reduces the problem when someone types <Esc> } in Insert mode.

Made slash_adjust() work correctly for multi-byte characters. (Yasuhiro Matsumoto)
Using a filename in Big5 encoding for autocommands didn't work (backslash in trailbyte). (Yasuhiro Matsumoto)

DOS and Windows: Expanding *.vim also matched file.vimfoo. Expand path like Unix to avoid problems with Windows dir functions. Merged the DOS and Win32 functions.

Win32: GvimExt could not edit more than a few files at once, the length of the

argument was fixed.

"ls -1 * | xargs vim" worked, but the input was in cooked mode. Now switch to raw mode when needed. Use dup() to copy the stderr file descriptor to stdin to make shell commands work. No longer requires an external program to do this.

When using ":filetype off", ftplugin and indent usage would be switched off at the same time. Don't do this, setting 'filetype' manually can still use them.

GUI: When writing a double-byte character, it could be split up in two calls to gui_write(), which doesn't work. Now flush before the output buffer becomes full.

When 'laststatus' is set and 'cmdheight' is two or bigger, the intro message would be written over the status line.
The ":intro" command didn't work when there wasn't enough room.

Configuring for Ruby failed with a recent version of Ruby. (Akinori Musha)

Athena: When deleting the directory in which Vim was started, using the file browser made Vim exit. Removed the use of XtAppError().

When using autoconf 2.50, UNIX was not defined. Moved the comment for "#undef UNIX" to a separate line.

Win32: Disabled _OnWindowPosChanging() to make maximize work better.

Win32: Compiling with VC 4.0 didn't work. (Walter Briscoe)

Athena:
- Finally fixed the problems with deleting a menu. (David Harrison)
- Athena: When closing the confirm() dialog, worked like OK was pressed,
  instead of Cancel.

The file explorer didn't work in compatible mode, because of line continuation.

Didn't give an error message for ":digraph a".

When using Ex mode in the GUI and typing a special key, <BS> didn't delete it correctly. Now display '?' for a special key.

When an operator is pending, clicking in another window made it apply to that window, even though the line numbers could be beyond the end of the buffer.

When a function call doesn't have a terminating ")" Vim could crash.

Perl interface: could crash on exit with perl 5.6.1. (Anduin Withers)

Using %P in 'errorformat' wasn't handled correctly. (Tomas Zellerin)

Using a syntax cluster that includes itself made Vim crash.

GUI: With 'ls' set to 2, dragging the status line all the way up, then making the Vim window smaller: Could not the drag status line anymore.

"vim -c startinsert! file" placed cursor on last char of a line, instead of after it. A ":set" command in the buffer menu set w_set_curswant. Now don't do this when w_curswant is MAXCOL.

Win32: When the gvim window was maximized and selecting another font, the window would no longer fill the screen.

The line with 'pastetoggle' in ":options" didn't show the right value when it is a special key. Hitting <CR> didn't work either.

Formatting text, resulting in a % landing in the first line, repeated the % in the following lines, like it's the start of a comment.

GTK: When adding a toolbar item while gvim is already running, it wasn't possible to use the tooltip. Now it works by adding the tooltip first.

The output of "g CTRL-G" mentioned "Char" but it's actually bytes.

Searching for the end of a oneline region didn't work correctly when there is an offset for the highlighting.

Syntax highlighting: When synchronizing on C-comments, //*/ was seen as the start of a comment.

Win32: Without scrollbars present, the MS mouse scroll wheel didn't work. Also handle the scrollbars when they are not visible.

Motif: When there is no right scrollbar, the bottom scrollbar would still leave room for it. (Marcin Dalecki)

When changing 'guicursor' and the value is invalid, some of the effects would still take place. Now first check for errors and only make the new value effective when it's OK.

Using "A" In Visual block mode, appending to lines that don't extend into the block, padding was wrong.

When pasting a block of text, a character that occupies more than one screen column could be deleted and spaces inserted instead. Now only do that with a tab.

Fixed conversion of documentation to HTML using Perl. (Dan Sharp)

Give an error message when a menu name starts with a dot.

Avoid a hang when executing a shell from the GUI on HP-UX by pushing "ptem" even when sys/ptem.h isn't present.

When creating the temp directory, make sure umask is 077, otherwise the directory is not accessible when it was set to 0177.

Unix: When resizing the window and a redraw is a bit slow, could get a window resize event while redrawing, resulting in a messed up window. Any input (e.g., a mouse click) would redraw.

The "%B" item in the status line became zero in Insert mode (that's normal) for another than the current window.

The menu entries to convert to xxd and back didn't work in Insert mode.

When ":vglobal" didn't find a line where the pattern doesn't match, the error message would be the wrong way around.

When ignoring a multi-line error message with "%-A", the continuation lines would be used anyway. (Servatius Brandt)

"grx" on a double-wide character inserted "x", instead of replacing the character with "x ". "gR" on <xx> ('display' set the "uhex") didn't replace at all. When doing "gRxx" on a control character the first "x" would be inserted, breaking the alignment.

Added "0)" to 'cinkeys', so that when typing a) it is put in the same place as where "==" would put it.

Win32: When maximized, adding/removing toolbar didn't resize the text area.

When using <C-RightMouse> a count was discarded.

When typing CTRL-V and <RightMouse> in the command line, would insert <LeftMouse>.

Using "vis" or "vas" when 'selection' is exclusive didn't include the last character.

When adding to an option like 'grepprg', leading space would be lost. Don't expand environment variables when there is no comma separating the items.

GUI: When using a bold-italic font, would still use the bold trick and underlining.

Motif: The default button didn't work in dialogs, the first one was always used. Had to give input focus to the default button.

When using CTRL-T to jump within the same file, the '' mark wasn't set.

Undo wasn't Vi compatible when using the 'c' flag for ":s". Now it undoes the whole ":s" command instead of each confirmed replacement.

The Buffers menu, when torn-off, disappeared when being refreshed. Add a dummy item to avoid this.

Removed calling msg_start() in main(), it should not be needed.

vim_strpbrk() did not support multibyte characters. (Muraoka Taro)

The Amiga version didn't compile, the code was too big for relative jumps.
Moved a few files from ex_docmd.c to ex_cmds2.c

When evaluating the "= register resulted in the "= register being changed, Vim
would crash.

When doing ":view file" and it fails, the current buffer was made read-only.

Motif: For some people the separators in the toolbar disappeared when resizing
the Vim window. (Marcin Dalecki)

Win32 GUI: when setting 'lines' to a huge number, would not compute the
available space correctly. Was counting the menu height twice.

Conversion of the docs to HTML didn't handle the line with the +quickfix tag
correctly. (Antonio Colombo)

Win32: fname_case() didn't handle multi-byte characters correctly. (Yasuhiro
Matsumoto)

The Cygwin version had trouble with fchdir(). Don't use that function for
Cygwin.

The generic check in scripts.vim for "conf" syntax was done before some checks
in filetype.vim, resulting in "conf" syntax too often.

Dos32: Typing lagged behind. Would wait for one biostick when checking if a
character is available.

GTK: When setting 'columns' while starting up "gvim", would set the width of
the terminal it was started in.

When using ESC in Insert mode, an autoindent that wraps to the next line
caused the cursor to move to the end of the line temporarily. When the
character before the cursor was a double-wide multi-byte character the cursor
would be on the right halve, which causes problems with some terminals.

Didn't handle multi-byte characters correctly when expanding a file name.
(Yasuhiro Matsumoto)

Win32 GUI: Errors generated before the GUI is decided to start were not
reported.

globpath() didn't reserve enough room for concatenated results. (Anduin
Withers)

When expanding an option that is very long already, don't do the expansion, it
would be truncated to MAXPATHL. (Anduin Withers)

When 'selection' is "exclusive", using "Fx" in Visual mode only moved until
just after the character.

When using IME on the console to enter a file name, the screen may scroll up.
Redraw the screen then. (Yasuhiro Matsumoto)

Motif: In the find/replace dialog the "Replace" button didn't work first time,
second time it replaced all matches. Removed the use of ":s///c".
GTK: Similar problems with the find/replace dialog, moved the code to a common
function.

X11: Use shared GC's for text. (Marcin Dalecki)

"]i" found the match under the cursor, instead of the first one below it.
Same for "]I", "] CTRL-I", "]d", "]D" and "] CTRL-D".

Win16: When maximized and the font is changed, don't change the window size.
(Vince Negri)

When 'lbr' is set, deleting a block of text could leave the cursor in the
wrong position.

Win32: When opening a file with the "Edit with Vim" popup menu entry,
wildcards would cause trouble. Added the "--literal" argument to avoid
expanding file names.

When using "gv", it didn't restore that "$" was used in Visual block mode.

Win32 GUI: While waiting for a shell command to finish, the window wasn't
redrawn at all. (Yasuhiro Matsumoto)

Syntax highlighting: A match that continues on a next line because of a
contained region didn't end when that region ended.

The ":s" command didn't allow flags like 'e' and 'i' right after it.

When using ":s" to split a line, marks were moved to the next line. Vi keeps
them in the first line.

When using ":n" ":rew", the previous context mark was at the top of the file,
while Vi puts it in the same place as the cursor. Made it Vi compatible.

Fixed Vi incompatibility: Text was not put in register 1 when using "c" and
"d" with a motion character, when deleting within one line with one of the
commands: % ( ) `<character> / ? N n { }

Win32 GUI: The tooltip for tear-off items remained when the tear-off item was
no longer selected.

GUI: When typing ":" at the more prompt, would return to Normal mode and not
redraw the screen.

When starting Vim with an argument "-c g/at/p" the printed lines would
overwrite each other.

BeOS: Didn't compile. Configure didn't add the os_beos files, the QNX check
removed them. Various changes to os_beos.cc. (Joshua Haberman)
Removed the check for the hardware platform, the BeBox has not been produced
for a long time now.

Win32 GUI: don't use a message box when the shell returns an error code,
display the message in the Vim window.

Make_mvc.mak always included "/debug" for linking. "GUI=no" argument didn't
work. Use "DEBUG=yes" instead of "DEBUG=1" to make it consistent. (Dan Sharp)

When a line in the tags file ended in ;" (no TAB following) the command would
not be recognized as a search command.

X11: The inputMethod resource never worked. Don't use the "none" input method
for SGI, it apparently makes the first character in Input method dropped.

Fixed incorrect tests in os_mac.h. (Axel Kielhorn)

Win32 console: When the console where Vim runs in is closed, Vim could hang in
trying to restore the window icon. (Yasuhiro Matsumoto)

When using ":3call func()" or ":3,3call func() the line number was ignored.

When 'showbreak' and 'linebreak' were both set, Visual highlighting sometimes
continued until the end of the line.

GTK GUI: Tearoff items were added even when 'guioptions' didn't contain 't'
when starting up.

MS-Windows: When the current directory includes a "~", searching files with
"gf" or ":find" didn't work. A "$" in the directory had the same problem.
Added mch_has_exp_wildcard() functions.

When reducing the Vim window height while starting up, would get an
out-of-memory error message.

When editing a very long search pattern, 'incsearch' caused the redraw of the
command line to fail.

Motif GUI: On some systems the "Help" menu would not be on the far right, as
it should be. On some other systems (esp. IRIX) the command line would not
completely show. Solution is to only resize the menubar for Lesstif.

Using "%" in a line that contains "\\" twice didn't take care of the quotes
properly. Now make a difference between \" and \\".

For non-Unix systems a dummy file is created when finding a swap name to
detect a 8.3 filesystem. When there is an existing swap file, would get a
warning for the file being created outside of Vim. Also, when closing the Vim
window the file would remain.

Motif: The menu height was always computed, using a "-menuheight" argument
was setting the room for the command line. Now make clear the argument is not
supported.

For some (EBCDIC) systems, POUND was equal to '#'. Added an #if for that to
avoid a duplicate case in a switch.

The GUI may have problems when forking. Always call _exit() instead of exit()
in the parent, the child will call exit().

Win32 GUI: Accented characters were often wrong in dialogs and tearoff menus.
Now use CP_ACP instead of CP_OEMCP. (Vince Negri)

When displaying text with syntax highlighting causes an error (e.g., running
out of stack) the syntax highlighting is disabled to avoid further messages.

When a command in a .vimrc or .gvimrc causes an ATTENTION prompt, and Vim was
started from the desktop (no place to display messages) it would hang. Now
open the GUI window early to be able to display the messages and pop up the
dialog.

"r<CR>" on a multi-byte character deleted only the first byte of the
character. "3r<CR>" deleted three bytes instead of three characters.

When interrupting reading a file, Vi considers the buffer modified. Added the
'i' flag in 'cpoptions' flag for this (we don't want it modified to be able to
do ":q").

When using an item in 'guicursor' that starts with a colon, Vim would get
stuck or crash.

When putting a file mark in a help file and later jumping back to it, the
options would not be set. Extended the modeline in all help files to make
this work better.

When a modeline contained "::" the local option values would be printed. Now
ignore it.

Some help files did not use a 8.3 names, which causes problems when using
MS-DOS unzip. Renamed "multibyte.txt" to "mbyte.txt", "rightleft.txt" to
"rileft.txt", "tagsearch.txt" to "tagsrch.txt", "os_riscos.txt" to
"os_risc.txt".

When Visual mode is blockwise, using "iw" or "aw" made it characterwise. That
doesn't seem right, only do this when in linewise mode. But then do it
always, not only when start and end of Visual mode are equal.

When using "viw" on a single-letter word and 'selection' is exclusive, would
not include the word.

When formatting text from Insert mode, using CTRL-O, could mess up undo
information.

While writing a file (also for the backup file) there was no check for an
interrupt (hitting CTRL-C). Vim could hang when writing a large file over a
slow network, and moving the mouse didn't make it appear (when 'mousehide' is
set) and the screen wasn't updated in the GUI. Also allow interrupting when
syncing the swap file, it can take a long time.

When using ":mksession" while there is help window, it would later be restored

to the right file but not marked as a help buffer. ":help" would then open another window. Now use the value "help" for 'buftype' to mark a help buffer.

The session file contained absolute path names in option values, that doesn't work when the home directory depends on the situation. Replace the home directory with ~/ when possible.

When using 'showbreak' a TAB just after the shown break would not be counted correctly, the cursor would be positioned wrong.

With 'showbreak' set to "--->" or "------->" and 'sts' set to 4, inserting tabs did not work right. Could cause a crash. Backspacing was also wrong, could get stuck at a line break.

Win32: crashed when tearing off a menu with over 300 items.

GUI: A menu or toolbar item would appear when only a tooltip was defined for it.

When 'scrolloff' is non-zero and "$" is in 'cpoptions', using "s" while the last line of the file is the first line on screen, the text wasn't displayed.

When running "autoconf", delete the configure cache to force starting cleanly when configure is run again.

When changing the Normal colors for cterm, the value of 'background' was changed even when the GUI was used.

The warning for a missing vimrun.exe was always given on startup, but some people just editing a file don't need to be bothered by it. Only show it when vimrun would be used.

When using "%" in a multibyte text it could get confused by trailbytes that match. (Muraoka Taro)

Termcap entry for RiscOS was wrong, using 7 and 8 in octal codes.

Athena: The title of a dialog window and the file selector window were not set. (David Harrison)

The "htmlLink" highlight group specified colors, which gives problems when using a color scheme. Added the "Underlined" highlight group for this.

After using ":insert" or ":change" the '[mark would be one line too low.

When looking for the file name after a match with 'include' one character was skipped. Same for 'define'.

Win32 and DJGPP: When editing a file with a short name in a directory, and editing the same file but using the long name, would end up with two buffers on the same file.

"gf" on a filename that starts with "../" only worked when the file being edited is in the current directory. An include file search didn't work

properly for files starting with "../" or ".". Now search both relative to the file and to the current directory.

When 'printheader', 'titlestring', 'iconstring', 'rulerformat' or 'statusline' contained "%{" but no following "}" memory was corrupted and a crash could happen.

":0append" and then inserting two lines did not redraw the blank lines that were scrolled back down.

When using insert mode completion in a narrow window, the message caused a scroll up. Now shorten the message if it doesn't fit and avoid writing the ruler over the message.

XIM still didn't work correctly on some systems, especially SGI/IRIX. Added the 'imdisable' option, which is set by default for that system.

Patch 6.0aw.008
Problem: When the first character of a file name is over 127, the Buffers
            menu entry would get a negative priority and cause problems.
Solution: Reduce the multiplier for the first character when computing
            the hash value for a Buffers menu entry.
Files: runtime/menu.vim

Patch 6.0aw.010
Problem: Win32: ":browse edit dir/dir" didn't work. (Vikas)
Solution: Change slashes to backslashes in the directory passed to the file
            browser.
Files: src/gui_w48.c

Athena file browser: On some systems wcstombs() can't be used to get the length of a multi-byte string. Use the maximum length then. (Yasuhiro Matsumoto)

Patch 6.0ax.001
Problem: When 'patchmode' is set, appending to a file gives an empty
            original file. (Ed Ralston)
Solution: Also make a backup copy when appending and 'patchmode' is set.
Files: src/fileio.c

Patch 6.0ax.002
Problem: When 'patchmode' is set, appending to a compressed file gives an
            uncompressed original file. (Ed Ralston)
Solution: Create the original file before decompressing.
Files: runtime/plugin/gzip.vim

Patch 6.0ax.005
Problem: Athena file selector keeps the title of the first invocation.
Solution: Set the title each time the file selector is opened. (David
            Harrison)
Files: src/gui_at_fs.c

Patch 6.0ax.007
Problem: When using GPM (mouse driver in a Linux console) a double click is

            interpreted as a scroll wheel click.
Solution: Check if GPM is being used when deciding if a mouse event is for
            the scroll wheel.
Files: src/term.c

Patch 6.0ax.010
Problem: The Edit.Save menu and the Save toolbar button didn't work when
            the buffer has no file name.
Solution: Use a file browser to ask for a file name. Also fix the toolbar
            Find item in Visual mode.
Files: runtime/menu.vim

Patch 6.0ax.012
Problem: When 'cpoptions' contains "$", breaking a line for 'textwidth'
            doesn't redraw properly. (Stefan Schulze)
Solution: Remove the dollar before breaking the line.
Files: src/edit.c

Patch 6.0ax.014
Problem: Win32: On Windows 98 ":make -f file" doesn't work when 'shell' is
            "command.com" and 'makeprg' is "nmake". The environment isn't
            passed on to "nmake".
Solution: Also use vimrun.exe when redirecting the output of a command.
Files: src/os_win32.c

Patch 6.0ax.016
Problem: The version number was reported wrong in the intro screen.
Solution: Check for a version number with two additional letters.
Files: src/version.c

Patch 6.0ax.019
Problem: When scrolling a window with folds upwards, switching to another
            vertically split window and back may not update the scrollbar.
Solution: Limit w_botline to the number of lines in the buffer plus one.
Files: src/move.c

==
VERSION 6.1   version-6.1

This section is about improvements made between version 6.0 and 6.1.

This is a bug-fix release, there are not really any new features.

Changed   changed-6.1

'iminsert' and 'imsearch' are no longer set as a side effect of defining a
language-mapping using ":lmap".

Added   added-6.1

Syntax files:
ampl   AMPL (David Krief)
ant   Ant (Johannes Zellner)
baan   Baan (Her van de Vliert)
cs   C# (Johannes Zellner)
lifelines   Lifelines (Patrick Texier)
lscript   LotusScript (Taryn East)
moo   MOO (Timo Frenay)
nsis   NSIS (Alex Jakushev)
ppd   Postscript Printer Description (Bjoern Jacke)
rpl   RPL/2 (Joel Bertrand)
scilab   Scilab (Benoit Hamelin)
splint   Splint (Ralf Wildenhues)
sqlj   SQLJ (Andreas Fischbach)
wvdial   WvDial (Prahlad Vaidyanathan)
xf86conf   XFree86 config (Nikolai Weibull)
xmodmap   Xmodmap (Nikolai Weibull)
xslt   Xslt (Johannes Zellner)
monk   Monk (Mike Litherland)
xsd   Xsd (Johannes Zellner)
cdl   CDL (Raul Segura Acevedo)
sendpr   Send-pr (Hendrik Scholz)

Added indent file for Scheme. (Dorai Sitaram)
Added indent file for Prolog. (Kontra Gergely)
Added indent file for Povray (David Necas)
Added indent file for IDL (Aleksandar Jelenak)
Added C# indent and ftplugin scripts.

Added Ukrainian menu translations. (Bohdan Vlasyuk)
Added ASCII version of the Czech menus. (Jiri Brezina)

Added Simplified Chinese translation of the tutor. (Mendel L Chan)

Added Russian keymap for yawerty keyboard.

Added an explanation of using the vimrc file in the tutor.
Changed tutor.vim to get the right encoding for the Taiwainese tutor.

Added Russian tutor. (Andrey Kiselev)
Added Polish tutor. (Mikolaj Machowski)

Added darkblue color scheme. (Bohdan Vlasyuk)

When packing the dos language archive automatically generate the .mo files
that are required.

Improved NSIS script to support NSIS 180. Added icons for the
enabled/disabled status. (Mirek Pruchnik)

cp1250 version of the Slovak message translations.

Compiler plugins for IRIX compilers. (David Harrison)

Fixed fixed-6.1

The license text was updated to make the meaning clearer and make it
compatible with the GNU GPL. Otherwise distributors have a problem when
linking Vim with a GPL'ed library.

When installing the "less.sh" script it was not made executable. (Chuck Berg)

Win32: The "9" key on the numpad wasn't working. (Julian Kinraid)

The NSIS install script didn't work with NSIS 1.80 or later. Also add
Vim-specific icons. (Pruchnik)

The script for conversion to HTML contained an "if" in the wrong place.
(Michael Geddes)

Allow using ":ascii" in the sandbox, it's harmless.

Removed creat() from osdef2.h.in, it wasn't used and may cause a problem when
it's redefined to creat64().

The text files in the VisVim directory were in "dos" format. This caused
problems when applying a patch. Now keep them in "unix" format and convert
them to "dos" format only for the PC archives.

Add ruby files to the dos source archive, they can be used by Make_mvc.mak.
(Mirek Pruchnik)

"cp -f" doesn't work on all systems. Change "cp -f" in the Makefile to "rm
-f" and "cp".

Didn't compile on a Compaq Tandem Himalaya OSS. (Michael A. Benzinger)

The GTK file selection dialog didn't include the "Create Dir", "Delete File"
and "Rename File" buttons.

When doing ":browse source" the dialog has the title "Run Macro". Better
would be "Source Vim script". (Yegappan Lakshmanan)

Win32: Don't use the printer font as default for the font dialog.

"make doslang" didn't work when configure didn't run (yet). Set $MAKEMO to
"yes". (Mirek Pruchnik)

The ToolBar TagJump item used "g]", which prompts for a selection even when
there is only one matching tag. Use "g<C-]>" instead.

The ming makefile for message translations didn't have the right list of
files.

The MS-Windows 3.1 version complains about LIBINTL.DLL not found. Compile

this version without message translations.

The Borland 5 makefile contained a check for Ruby which is no longer needed.
The URLs for the TCL library was outdated. (Dan Sharp)

The eviso.ps file was missing from the DOS runtime archive, it's needed for
printing PostScript in the 32bit DOS version.

In menu files ":scriptencoding" was used in a wrong way after patch 6.1a.032
Now use ":scriptencoding" in the file where the translations are given. Do
the same for all menus in latin1 encoding.

Included a lot of fixes for the Macintosh, mostly to make it work with Carbon.
(Dany StAmant, Axel Kielhorn, Benji Fisher)

Improved the vimtutor shell script to use $TMPDIR when it exists, and delete
the copied file when exiting in an abnormal way. (Max Ischenko)

When "iconv.dll" can't be found, try using "libiconv.dll".

When encryption is used, filtering with a shell command wasn't possible.

DJGPP: ":cd c:" always failed, can't get permissions for "c:".
Win32: ":cd c:/" failed if the previous current directory on c: had become
invalid.

DJGPP: Shift-Del and Del both produce \316\123. Default mapping for Del is
wrong. Disabled it.

Dependencies on header files in MingW makefile was wrong.

Win32: Don't use ACL stuff for MSVC 4.2, it's not supported. (Walter Briscoe)

Win32 with Borland: bcc.cfg was caching the value for $(BOR), but providing a
different argument to make didn't regenerate it.

Win32 with MSVC: Make_ivc.mak generates a new if_ole.h in a different
directory, the if_ole.h in the src directory may be used instead. Delete the
distributed file.

When a window is vertically split and then ":ball" is used, the window layout
is messed up, can cause a crash. (Muraoka Taro)

When 'insertmode' is set, using File/New menu and then double clicking, "i" is
soon inserted. (Merlin Hansen)

When Select mode is active and using the Buffers menu to switch to another
buffer, an old selection comes back. Reset VIsual_reselect for a ":buffer"
command.

When Select mode is active and 'insertmode' is set, using the Buffers menu to
switch to another buffer, did not return to Insert mode. Make sure
"restart_edit" is set.

When double clicking on the first character of a word while 'selection' is
"exclusive" didn't select that word.

Patch 6.0.001
Problem: Loading the sh.vim syntax file causes error messages. (Corinna
            Vinschen)
Solution: Add an "if". (Charles Campbell)
Files: runtime/syntax/sh.vim

Patch 6.0.002
Problem: Using a '@' item in 'viminfo' doesn't work. (Marko Leipert)
Solution: Add '@' to the list of accepted items.
Files: src/option.c

Patch 6.0.003
Problem: The configure check for ACLs on AIX doesn't work.
Solution: Fix the test program so that it compiles. (Tomas Ogren)
Files: src/configure.in, src/auto/configure

Patch 6.0.004
Problem: The find/replace dialog doesn't reuse a previous argument
            properly.
Solution: After removing a "\V" terminate the string. (Zwane Mwaikambo)
Files: src/gui.c

Patch 6.0.005
Problem: In Insert mode, "CTRL-O :ls" has a delay before redrawing.
Solution: Don't delay just after wait_return() was called. Added the
            did_wait_return flag.
Files: src/globals.h, src/message.c, src/normal.c, src/screen.c

Patch 6.0.006
Problem: With a vertical split, 'number' set and 'scrolloff' non-zero,
            making the window width very small causes a crash. (Niklas
            Lindstrom)
Solution: Check for a zero width.
Files: src/move.c

Patch 6.0.007
Problem: When setting 'filetype' while there is no FileType autocommand, a
            following ":setfiletype" would set 'filetype' again. (Kobus
            Retief)
Solution: Set did_filetype always when 'filetype' has been set.
Files: src/option.c

Patch 6.0.008
Problem: 'imdisable' is missing from the options window. (Michael Naumann)
Solution: Add an entry for it.
Files: runtime/optwin.vim

Patch 6.0.009
Problem: Nextstep doesn't have S_ISBLK. (John Beppu)
Solution: Define S_ISBLK using S_IFBLK.

```
Files:      src/os_unix.h

Patch 6.0.010
Problem:    Using "gf" on a file name starting with "./" or "../" in a buffer
            without a name causes a crash. (Roy Lewis)
Solution:   Check for a NULL file name.
Files:      src/misc2.c

Patch 6.0.011
Problem:    Python: After replacing or deleting lines get an ml_get error.
            (Leo Lipelis)
Solution:   Adjust the cursor position for deleted or added lines.
Files:      src/if_python.c

Patch 6.0.012
Problem:    Polish translations contain printf format errors, this can result
            in a crash when using one of them.
Solution:   Fix for translated messages. (Michal Politowski)
Files:      src/po/pl.po

Patch 6.0.013
Problem:    Using ":silent! cmd" still gives some error messages, like for an
            invalid range. (Salman Halim)
Solution:   Reset emsg_silent after calling emsg() in do_one_cmd().
Files:      src/ex_docmd.c

Patch 6.0.014
Problem:    When 'modifiable' is off and 'virtualedit' is "all", "rx" on a TAB
            still changes the buffer. (Muraoka Taro)
Solution:   Check if saving the line for undo fails.
Files:      src/normal.c

Patch 6.0.015
Problem:    When 'cpoptions' includes "S" and "filetype plugin on" has been
            used, can get an error for deleting the b:did_ftplugin variable.
            (Ralph Henderson)
Solution:   Only delete the variable when it exists.
Files:      runtime/ftplugin.vim

Patch 6.0.016
Problem:    bufnr(), bufname() and bufwinnr() don't find unlisted buffers when
            the argument is a string. (Hari Krishna Dara)
            Also for setbufvar() and getbufvar().
Solution:   Also find unlisted buffers.
Files:      src/eval.c

Patch 6.0.017
Problem:    When 'ttybuiltin' is set and a builtin termcap entry defines t_Co
            and the external one doesn't, it gets reset to empty. (David
            Harrison)
Solution:   Only set t_Co when it wasn't set yet.
Files:      src/term.c

Patch 6.0.018
```

```
Problem:    Initializing 'encoding' may cause a crash when setlocale() is not
            used. (Dany St-Amant)
Solution:   Check for a NULL pointer.
Files:      src/mbyte.c

Patch 6.0.019
Problem:    Converting a string with multi-byte characters to a printable
            string, e.g., with strtrans(), may cause a crash. (Tomas Zellerin)
Solution:   Correctly compute the length of the result in transstr().
Files:      src/charset.c

Patch 6.0.020
Problem:    When obtaining the value of a global variable internally, could
            get the function-local value instead.  Applies to using <Leader>
            and <LocalLeader> and resetting highlighting in a function.
Solution:   Prepend "g:" to the variable name. (Aric Blumer)
Files:      src/syntax.c, src/term.c

Patch 6.0.021
Problem:    The 'cscopepathcomp' option didn't work.
Solution:   Change USE_CSCOPE to FEAT_CSCOPE. (Mark Feng)
Files:      src/option.c

Patch 6.0.022
Problem:    When using the 'langmap' option, the second character of a command
            starting with "g" isn't adjusted.
Solution:   Apply 'langmap' to the second character. (Alex Kapranoff)
Files:      src/normal.c

Patch 6.0.023
Problem:    Loading the lhaskell syntax doesn't work. (Thore B. Karlsen)
Solution:   Use ":runtime" instead of "source" to load haskell.vim.
Files:      runtime/syntax/lhaskell.vim

Patch 6.0.024
Problem:    Using "CTRL-V u 9900" in Insert mode may cause a crash. (Noah
            Levitt)
Solution:   Don't insert a NUL byte in the text, use a newline.
Files:      src/misc1.c

Patch 6.0.025
Problem:    The pattern "\vx(.|$)" doesn't match "x" at the end of a line.
            (Preben Peppe Guldberg)
Solution:   Always see a "$" as end-of-line after "\v".  Do the same for "^".
Files:      src/regexp.c

Patch 6.0.026
Problem:    GTK: When using arrow keys to navigate through the menus, the
            separators are selected.
Solution:   Set the separators "insensitive". (Pavel Kankovsky)
Files:      src/gui_gtk.c, src/gui_gtk_x11.c

Patch 6.0.027
Problem:    VMS: Printing doesn't work, the file is deleted too quickly.
```

```
            No longer need the VMS specific printing menu.
            gethostname() is not available with VAXC.
            The makefile was lacking selection of the tiny-huge feature set.
Solution:   Adjust the 'printexpr' option default.  Fix the other problems and
            update the documentation.  (Zoltan Arpadffy)
Files:      runtime/doc/os_vms.txt, runtime/menu.vim, src/INSTALLvms.txt,
            src/Make_vms.mms, src/option.c, src/os_unix.c, src/os_vms_conf.h

Patch 6.0.028
Problem:    Can't compile without +virtualedit and with +visualextra. (Geza
            Lakner)
Solution:   Add an #ifdef for +virtualedit.
Files:      src/ops.c

Patch 6.0.029
Problem:    When making a change in line 1, then in line 2 and then deleting
            line 1, undo info could be wrong.  Only when the changes are undone
            at once. (Gerhard Hochholzer)
Solution:   When not saving a line for undo because it was already done
            before, remember for which entry the last line must be computed.
            Added ue_getbot_entry pointer for this.  When the number of lines
            changes, adjust the position of newer undo entries.
Files:      src/structs.h, src/undo.c

Patch 6.0.030
Problem:    Using ":source! file" doesn't work inside a loop or after
            ":argdo". (Pavol Juhas)
Solution:   Execute the commands in the file right away, do not let the main
            loop do it.
Files:      src/ex_cmds2.c, src/ex_docmd.c, src/getchar.c, src/globals.h,
            src/proto/ex_docmd.pro, src/proto/getchar.pro

Patch 6.0.031
Problem:    Nextstep doesn't have setenv() or putenv().  (John Beppu)
Solution:   Move putenv() from pty.c to misc2.c
Files:      src/misc2.c, src/pty.c

Patch 6.0.032
Problem:    When changing a setting that affects all folds, they are not
            displayed immediately.
Solution:   Set the redraw flag in foldUpdateAll().
Files:      src/fold.c

Patch 6.0.033
Problem:    Using 'wildmenu' on MS-Windows, file names that include a space
            are only displayed starting with that space. (Xie Yuheng)
Solution:   Don't recognize a backslash before a space as a path separator.
Files:      src/screen.c

Patch 6.0.034
Problem:    Calling searchpair() with three arguments could result in a crash
            or strange error message. (Kalle Bjorklid)
Solution:   Don't use the fifth argument when there is no fourth argument.
Files:      src/eval.c
```

Patch 6.0.035
Problem: The menu item Edit/Global_Settings/Toggle_Toolbar doesn't work
            when 'ignorecase' is set. (Allen Castaban)
Solution: Always match case when checking if a flag is already present in
            'guioptions'.
Files: runtime/menu.vim

Patch 6.0.036
Problem: OS/2, MS-DOS and MS-Windows: Using a path that starts with a
            slash in 'tags' doesn't work as expected. (Mathias Koehrer)
Solution: Only use the drive, not the whole path to the current directory.
            Also make it work for "c:dir/file".
Files: src/misc2.c

Patch 6.0.037
Problem: When the user has set "did_install_syntax_menu" to avoid the
            default Syntax menu it still appears. (Virgilio)
Solution: Don't add the three default items when "did_install_syntax_menu"
            is set.
Files: runtime/menu.vim

Patch 6.0.038
Problem: When 'selection' is "exclusive", deleting a block of text at the
            end of a line can leave the cursor beyond the end of the line.
Solution: Correct the cursor position.
Files: src/ops.c

Patch 6.0.039
Problem: "gP" leaves the cursor in the wrong position when 'virtualedit' is
            used. Using "c" in blockwise Visual mode leaves the cursor in a
            strange position.
Solution: For "gP" reset the "coladd" field for the '] mark. For "c" leave
            the cursor on the last inserted character.
Files: src/ops.c

Patch 6.0.040
Problem: When 'fileencoding' is invalid and writing fails because of
            this, the original file is gone. (Eric Carlier)
Solution: Restore the original file from the backup.
Files: src/fileio.c

Patch 6.0.041
Problem: Using ":language messages en" when LC_MESSAGES is undefined
            results in setting LC_CTYPE. (Eric Carlier)
Solution: Set $LC_MESSAGES instead.
Files: src/ex_cmds2.c

Patch 6.0.042
Problem: ":mksession" can't handle file names with a space.
Solution: Escape special characters in file names with a backslash.
Files: src/ex_docmd.c

Patch 6.0.043

```
Problem:    Patch 6.0.041 was wrong.
Solution:   Use mch_getenv() instead of vim_getenv().
Files:      src/ex_cmds2.c

Patch 6.0.044
Problem:    Using a "containedin" list for a syntax item doesn't work for an
            item that doesn't have a "contains" argument.  Also, "containedin"
            doesn't ignore a transparent item. (Timo Frenay)
Solution:   When there is a "containedin" argument somewhere, always check for
            contained items.  Don't check for the transparent item but the
            item it's contained in.
Files:      src/structs.h, src/syntax.c

Patch 6.0.045
Problem:    After creating a fold with a Visual selection, another window
            with the same buffer still has inverted text. (Sami Salonen)
Solution:   Redraw the inverted text.
Files:      src/normal.c

Patch 6.0.046
Problem:    When getrlimit() returns an 8 byte number the check for running
            out of stack may fail. (Anthony Meijer)
Solution:   Skip the stack check if the limit doesn't fit in a long.
Files:      src/auto/configure, src/config.h.in, src/configure.in,
            src/os_unix.c

Patch 6.0.047
Problem:    Using a regexp with "\(\)" inside a "\%[]" item causes a crash.
            (Samuel Lacas)
Solution:   Don't allow nested atoms inside "\%[]".
Files:      src/regexp.c

Patch 6.0.048
Problem:    Win32: In the console the mouse doesn't always work correctly.
            Sometimes after getting focus a mouse movement is interpreted like
            a button click.
Solution:   Use a different function to obtain the number of mouse buttons.
            Avoid recognizing a button press from undefined bits. (Vince Negri)
Files:      src/os_win32.c

Patch 6.0.049
Problem:    When using evim the intro screen is misleading. (Adrian Nagle)
Solution:   Mention whether 'insertmode' is set and the menus to be used.
Files:      runtime/menu.vim, src/version.c

Patch 6.0.050
Problem:    UTF-8: "viw" doesn't include non-ASCII characters before the
            cursor. (Bertilo Wennergren)
Solution:   Use dec_cursor() instead of decrementing the column number.
Files:      src/search.c

Patch 6.0.051
Problem:    UTF-8: Using CTRL-R on the command line doesn't insert composing
            characters. (Ron Aaron)
```

```
Solution:   Also include the composing characters and fix redrawing them.
Files:      src/ex_getln.c, src/ops.c

Patch 6.0.052
Problem:    The check for rlim_t in patch 6.0.046 does not work on some
            systems. (Zdenek Sekera)
Solution:   Also look in sys/resource.h for rlim_t.
Files:      src/auto/configure, src/configure.in

Patch 6.0.053 (extra)
Problem:    Various problems with QNX.
Solution:   Minor fix for configure.  Switch on terminal clipboard support in
            main.c.  Fix "pterm" mouse support.  os_qnx.c didn't build without
            photon. (Julian Kinraid)
Files:      src/auto/configure, src/configure.in, src/gui_photon.c,
            src/main.c, src/misc2.c, src/option.h, src/os_qnx.c, src/os_qnx.h,
            src/syntax.c

Patch 6.0.054
Problem:    When using mswin.vim, CTRL-V pastes a block of text like it is
            normal text.  Using CTRL-V in blockwise Visual mode leaves "x"
            characters behind.
Solution:   Make CTRL-V work as it should.  Do the same for the Paste menu
            entries.
Files:      runtime/menu.vim, runtime/mswin.vim

Patch 6.0.055
Problem:    GTK: The selection isn't copied the first time.
Solution:   Own the selection at the right moment.
Files:      src/gui_gtk_x11.c

Patch 6.0.056
Problem:    Using "CTRL-O cw" in Insert mode results in a nested Insert mode.
            <Esc> doesn't leave Insert mode then.
Solution:   Only use nested Insert mode when 'insertmode' is set or when a
            mapping is used.
Files:      src/normal.c

Patch 6.0.057
Problem:    Using ":wincmd g}" in a function doesn't work.  (Gary Holloway)
Solution:   Execute the command directly, instead of putting it in the
            typeahead buffer.
Files:      src/normal.c, src/proto/normal.pro, src/window.c

Patch 6.0.058
Problem:    When a Cursorhold autocommand moved the cursor, the ruler wasn't
            updated. (Bohdan Vlasyuk)
Solution:   Update the ruler after executing the autocommands.
Files:      src/gui.c

Patch 6.0.059
Problem:    Highlighting for 'hlsearch' isn't visible in lines that are
            highlighted for diff highlighting.  (Gary Holloway)
Solution:   Let 'hlsearch' highlighting overrule diff highlighting.
```

```
Files:      src/screen.c

Patch 6.0.060
Problem:    Motif: When the tooltip is to be popped up, Vim crashes.
            (Gary Holloway)
Solution:   Check for a NULL return value from gui_motif_fontset2fontlist().
Files:      src/gui_beval.c

Patch 6.0.061
Problem:    The toolbar buttons to load and save a session do not correctly
            use v:this_session.
Solution:   Check for v:this_session to be empty instead of existing.
Files:      runtime/menu.vim

Patch 6.0.062
Problem:    Crash when 'verbose' is > 3 and using ":shell". (Yegappan
            Lakshmanan)
Solution:   Avoid giving a NULL pointer to printf().  Also output a newline
            and switch the cursor on.
Files:      src/misc2.c

Patch 6.0.063
Problem:    When 'cpoptions' includes "$", using "cw" to type a ')' on top of
            the "$" doesn't update syntax highlighting after it.
Solution:   Stop displaying the "$" when typing a ')' in its position.
Files:      src/search.c

Patch 6.0.064 (extra)
Problem:    The NSIS install script doesn't work with newer versions of NSIS.
            The diff feature doesn't work when there isn't a good diff.exe on
            the system.
Solution:   Replace the GetParentDir instruction by a user function.
            Fix a few cosmetic problems.  Use defined constants for the
            version number, so that it's defined in one place only.
            Only accept the install directory when it ends in "vim".
            (Eduardo Fernandez)
            Add a diff.exe and use it from the default _vimrc.
Files:      nsis/gvim.nsi, nsis/README.txt, src/dosinst.c

Patch 6.0.065
Problem:    When using ":normal" in 'indentexpr' it may use redo characters
            before its argument.  (Neil Bird)
Solution:   Save and restore the stuff buffer in ex_normal().
Files:      src/ex_docmd.c, src/getchar.c, src/globals.h, src/structs.h

Patch 6.0.066
Problem:    Sometimes undo for one command is split into two undo actions.
            (Halim Salman)
Solution:   Don't set the undo-synced flag when reusing a line that was
            already saved for undo.
Files:      src/undo.c

Patch 6.0.067
Problem:    if_xcmdsrv.c doesn't compile on systems where fd_set isn't defined
```

```
            in the usual header file (e.g., AIX). (Mark Waggoner)
Solution:   Include sys/select.h in if_xcmdsrv.c for systems that have it.
Files:      src/if_xcmdsrv.c

Patch 6.0.068
Problem:    When formatting a Visually selected area with "gq" and the number
            of lines increases the last line may not be redrawn correctly.
            (Yegappan Lakshmanan)
Solution:   Correct the area to be redrawn for inserted/deleted lines.
Files:      src/ops.c

Patch 6.0.069
Problem:    Using "K" on a word that includes a "!" causes a "No previous
            command" error, because the "!" is expanded. (Craig Jeffries)
Solution:   Put a backslash before the "!".
Files:      src/normal.c

Patch 6.0.070
Problem:    Win32: The error message for a failed dynamic linking of a Perl,
            Ruby, Tcl and Python library is unclear about what went wrong.
Solution:   Give the name of the library or function that could not be loaded.
            Also for the iconv and gettext libraries when 'verbose' is set.
Files:      src/eval.c, src/if_perl.xs, src/if_python.c, src/if_ruby.c,
            src/if_tcl.c, src/mbyte.c, src/os_win32.c, src/proto/if_perl.pro,
            src/proto/if_python.pro, src/proto/if_ruby.pro,
            src/proto/if_tcl.pro, src/proto/mbyte.pro

Patch 6.0.071
Problem:    The "iris-ansi" builtin termcap isn't very good.
Solution:   Fix the wrong entries. (David Harrison)
Files:      src/term.c

Patch 6.0.072
Problem:    When 'lazyredraw' is set, a mapping that stops Visual mode, moves
            the cursor and starts Visual mode again causes a redraw problem.
            (Brian Silverman)
Solution:   Redraw both the old and the new Visual area when necessary.
Files:      src/normal.c, src/screen.c

Patch 6.0.073 (extra)
Problem:    DJGPP: When using CTRL-Z to start a shell, the prompt is halfway
            the text. (Volker Kiefel)
Solution:   Position the system cursor before starting the shell.
Files:      src/os_msdos.c

Patch 6.0.074
Problem:    When using "&" in a substitute string a multi-byte character with
            a trailbyte 0x5c is not handled correctly.
Solution:   Recognize multi-byte characters inside the "&" part. (Muraoka Taro)
Files:      src/regexp.c

Patch 6.0.075
Problem:    When closing a horizontally split window while 'eadirection' is
            "hor" another horizontally split window is still resized. (Aron
```

```
            Griffis)
Solution:   Only resize windows in the same top frame as the window that is
            split or closed.
Files:      src/main.c, src/proto/window.pro, src/window.c

Patch 6.0.076
Problem:    Warning for wrong pointer type when compiling.
Solution:   Use char instead of char_u pointer.
Files:      src/version.c

Patch 6.0.077
Problem:    Patch 6.0.075 was incomplete.
Solution:   Fix another call to win_equal().
Files:      src/option.c

Patch 6.0.078
Problem:    Using "daw" at the end of a line on a single-character word didn't
            include the white space before it.  At the end of the file it
            didn't work at all.  (Gavin Sinclair)
Solution:   Include the white space before the word.
Files:      src/search.c

Patch 6.0.079
Problem:    When "W" is in 'cpoptions' and 'backupcopy' is "no" or "auto", can
            still overwrite a read-only file, because it's renamed. (Gary
            Holloway)
Solution:   Add a check for a read-only file before renaming the file to
            become the backup.
Files:      src/fileio.c

Patch 6.0.080
Problem:    When using a session file that has the same file in two windows,
            the fileinfo() call in do_ecmd() causes a scroll and a hit-enter
            prompt. (Robert Webb)
Solution:   Don't scroll this message when 'shortmess' contains 'O'.
Files:      src/ex_cmds.c

Patch 6.0.081
Problem:    After using ":saveas" the new buffer name is added to the Buffers
            menu with a wrong number. (Chauk-Mean Proum)
Solution:   Trigger BufFilePre and BufFilePost events for the renamed buffer
            and BufAdd for the old name (which is with a new buffer).
Files:      src/ex_cmds.c

Patch 6.0.082
Problem:    When swapping screens in an xterm and there is an (error) message
            from the vimrc script, the shell prompt is after the message.
Solution:   Output a newline when there was output on the alternate screen.
            Also when starting the GUI.
Files:      src/main.c

Patch 6.0.083
Problem:    GTK: When compiled without menu support the buttons in a dialog
            don't have any text. (Erik Edelmann)
```

Solution: Add the text also when GTK_USE_ACCEL isn't defined. And define
            GTK_USE_ACCEL also when not using menus.
Files: src/gui_gtk.c

Patch 6.0.084
Problem: UTF-8: a "r" command with an argument that is a keymap for a
            character with a composing character can't be repeated with ".".
            (Raphael Finkel)
Solution: Add the composing characters to the redo buffer.
Files: src/normal.c

Patch 6.0.085
Problem: When 'mousefocus' is set, using "s" to go to Insert mode and then
            moving the mouse pointer to another window stops Insert mode,
            while this doesn't happen with "a" or "i". (Robert Webb)
Solution: Reset finish_op before calling edit().
Files: src/normal.c

Patch 6.0.086
Problem: When using "gu" the message says "~ed".
Solution: Make the message say "changed".
Files: src/ops.c

Patch 6.0.087 (lang)
Problem: Message translations are incorrect, which may cause a crash.
            (Peter Figura)
            The Turkish translations needed more work and the maintainer
            didn't have time.
Solution: Fix order of printf arguments. Remove %2$d constructs.
            Add "-v" to msgfmt to get a warning for wrong translations.
            Don't install the Turkish translations for now.
            Update a few more translations.
Files: src/po/Makefile, src/po/af.po, src/po/cs.po, src/po/cs.cp1250.po,
            src/po/de.po, src/po/es.po, src/po/fr.po, src/po/it.po,
            src/po/ja.po, src/po/ja.sjis.po, src/po/ko.po, src/po/pl.po,
            src/po/sk.po, src/po/uk.po, src/po/zh_CN.UTF-8.po,
            src/po/zh_CN.cp936.po, src/po/zh_CN.po, src/po/zh_TW.po

Patch 6.0.088
Problem: "." doesn't work after using "rx" in Visual mode. (Charles
            Campbell)
Solution: Also store the replacement character in the redo buffer.
Files: src/normal.c

Patch 6.0.089
Problem: In a C file, using "==" to align a line starting with "* " after
            a line with "* -" indents one space too few. (Piet Delport)
Solution: Align with the previous line if the comment-start-string matches
            there.
Files: src/misc1.c

Patch 6.0.090
Problem: When a wrapping line does not fit in a window and 'scrolloff' is
            bigger than half the window height, moving the cursor left or

```
            right causes the screen to flash badly. (Lubomir Host)
Solution:   When there is not enough room to show 'scrolloff' screen lines and
            near the end of the line, show the end of the line.
Files:      src/move.c

Patch 6.0.091
Problem:    Using CTRL-O in Insert mode, while 'virtualedit' is "all" and the
            cursor is after the end-of-line, moves the cursor left. (Yegappan
            Lakshmanan)
Solution:   Keep the cursor in the same position.
Files:      src/edit.c

Patch 6.0.092
Problem:    The explorer plugin doesn't ignore case of 'suffixes' on
            MS-Windows. (Mike Williams)
Solution:   Match or ignore case as appropriate for the OS.
Files:      runtime/plugin/explorer.vim

Patch 6.0.093
Problem:    When the Tcl library couldn't be loaded dynamically, get an error
            message when closing a buffer or window. (Muraoka Taro)
Solution:   Only free structures if already using the Tcl interpreter.
Files:      src/if_tcl.c

Patch 6.0.094
Problem:    Athena: When clicking in the horizontal scrollbar Vim crashes.
            (Paul Ackersviller)
Solution:   Use the thumb size instead of the window pointer of the scrollbar
            (which is NULL). (David Harrison)
            Also avoid that scrolling goes the wrong way in a narrow window.
Files:      src/gui_athena.c

Patch 6.0.095
Problem:    Perl: Deleting lines may leave the cursor beyond the end of the
            file.
Solution:   Check the cursor position after deleting a line. (Serguei)
Files:      src/if_perl.xs

Patch 6.0.096
Problem:    When ":saveas fname" fails because the file already exists, the
            file name is changed anyway and a following ":w" will overwrite
            the file. (Eric Carlier)
Solution:   Don't change the file name if the file already exists.
Files:      src/ex_cmds.c

Patch 6.0.097
Problem:    Re-indenting in Insert mode with CTRL-F may cause a crash with a
            multi-byte encoding.
Solution:   Avoid using a character before the start of a line. (Sergey
            Vlasov)
Files:      src/edit.c

Patch 6.0.098
Problem:    GTK: When using Gnome the "Search" and "Search and Replace" dialog
```

boxes are not translated.
Solution: Define ENABLE_NLS before including gnome.h. (Eduardo Fernandez)
Files: src/gui_gtk.c, src/gui_gtk_x11.c

Patch 6.0.099
Problem: Cygwin: When running Vi compatible MS-DOS line endings cause
            trouble.
Solution: Make the default for 'fileformats' "unix,dos" in Vi compatible
            mode. (Michael Schaap)
Files: src/option.h

Patch 6.0.100
Problem: ":badd +0 test%file" causes a crash.
Solution: Take into account that the "+0" is NUL terminated when allocating
            room for replacing the "%".
Files: src/ex_docmd.c

Patch 6.0.101
Problem: ":mksession" doesn't restore editing a file that has a '#' or '%'
            in its name. (Wolfgang Blankenburg)
Solution: Put a backslash before the '#' and '%'.
Files: src/ex_docmd.c

Patch 6.0.102
Problem: When changing folds the cursor may appear halfway a closed fold.
            (Nam SungHyun)
Solution: Set w_cline_folded correctly. (Yasuhiro Matsumoto)
Files: src/move.c

Patch 6.0.103
Problem: When using 'scrollbind' a large value of 'scrolloff' will make the
            scroll binding stop near the end of the file. (Coen Engelbarts)
Solution: Don't use 'scrolloff' when limiting the topline for scroll
            binding. (Dany StAmant)
Files: src/normal.c

Patch 6.0.104
Problem: Multi-byte: When '$' is in 'cpoptions', typing a double-wide
            character that overwrites the left halve of an old double-wide
            character causes a redraw problem and the cursor stops blinking.
Solution: Clear the right half of the old character. (Yasuhiro Matsumoto)
Files: src/edit.c, src/screen.c

Patch 6.0.105
Problem: Multi-byte: In a window of one column wide, with syntax
            highlighting enabled a crash might happen.
Solution: Skip getting the syntax attribute when the character doesn't fit
            anyway. (Yasuhiro Matsumoto)
Files: src/screen.c

Patch 6.0.106 (extra)
Problem: Win32: When the printer font is wrong, there is no error message.
Solution: Give an appropriate error message. (Yasuhiro Matsumoto)
Files: src/os_mswin.c

```
Patch 6.0.107 (extra)
Problem:    VisVim: When editing another file, a modified file may be written
            unexpectedly and without warning.
Solution:   Split the window if a file was modified.
Files:      VisVim/Commands.cpp

Patch 6.0.108
Problem:    When using folding could try displaying line zero, resulting in an
            error for a NULL pointer.
Solution:   Stop decrementing w_topline when the first line of a window is in
            a closed fold.
Files:      src/window.c

Patch 6.0.109
Problem:    XIM: When the input method is enabled, repeating an insertion with
            "." disables it. (Marcel Svitalsky)
Solution:   Don't store the input method status when a command comes from the
            stuff buffer.
Files:      src/ui.c

Patch 6.0.110
Problem:    Using undo after executing "Ox?jAx?kdd" from a register in
            an empty buffer gives an error message.  (Gerhard Hochholzer)
Solution:   Don't adjust the bottom line number of an undo block when it's
            zero.  Add a test for this problem.
Files:      src/undo.c, src/testdir/test20.in, src/testdir/test20.ok

Patch 6.0.111
Problem:    The virtcol() function doesn't take care of 'virtualedit'.
Solution:   Add the column offset when needed. (Yegappan Lakshmanan)
Files:      src/eval.c

Patch 6.0.112
Problem:    The explorer plugin doesn't sort directories with a space or
            special character after a directory with a shorter name.
Solution:   Ignore the trailing slash when comparing directory names.  (Mike
            Williams)
Files:      runtime/plugin/explorer.vim

Patch 6.0.113
Problem:    ":edit ~/fname" doesn't work if $HOME includes a space.  Also,
            expanding wildcards with the shell may fail. (John Daniel)
Solution:   Escape spaces with a backslash when needed.
Files:      src/ex_docmd.c, src/misc1.c, src/proto/misc1.pro, src/os_unix.c

Patch 6.0.114
Problem:    Using ":p" with fnamemodify() didn't expand "~/" or "~user/" to a
            full path.  For Win32 the current directory was prepended.
            (Michael Geddes)
Solution:   Expand the home directory.
Files:      src/eval.c

Patch 6.0.115 (extra)
```

```
Problem:    Win32: When using a dialog with a textfield it cannot scroll the
            text.
Solution:   Add ES_AUTOHSCROLL to the textfield style. (Pedro Gomes)
Files:      src/gui_w32.c

Patch 6.0.116 (extra)
Problem:    MS-Windows NT/2000/XP: filewritable() doesn't work correctly for
            filesystems that use ACLs.
Solution:   Use ACL functions to check if a file is writable. (Mike Williams)
Files:      src/eval.c, src/macros.h, src/os_win32.c, src/proto/os_win32.pro

Patch 6.0.117 (extra)
Problem:    Win32: when disabling the menu, "set lines=999" doesn't use all
            the available screen space.
Solution:   Don't subtract the fixed caption height but the real menu height
            from the available screen space.  Also: Avoid recursion in
            gui_mswin_get_menu_height().
Files:      src/gui_w32.c, src/gui_w48.c

Patch 6.0.118
Problem:    When $TMPDIR is a relative path, the temp directory is missing a
            trailing slash and isn't deleted when Vim exits. (Peter Holm)
Solution:   Add the slash after expanding the directory to an absolute path.
Files:      src/fileio.c

Patch 6.0.119 (depends on patch 6.0.116)
Problem:    VMS: filewritable() doesn't work properly.
Solution:   Use the same method as for Unix. (Zoltan Arpadffy)
Files:      src/eval.c

Patch 6.0.120
Problem:    The conversion to html isn't compatible with XHTML.
Solution:   Quote the values. (Jess Thrysoee)
Files:      runtime/syntax/2html.vim

Patch 6.0.121 (extra) (depends on patch 6.0.116)
Problem:    Win32: After patch 6.0.116 Vim doesn't compile with mingw32.
Solution:   Add an #ifdef HAVE_ACL.
Files:      src/os_win32.c

Patch 6.0.122 (extra)
Problem:    Win16: Same resize problems as patch 6.0.117 fixed for Win32.  And
            dialog textfield problem from patch 6.0.115.
Solution:   Set old_menu_height only when used.  Add ES_AUTOHSCROLL flag.
            (Vince Negri)
Files:      src/gui_w16.c

Patch 6.0.123 (depends on patch 6.0.119)
Problem:    Win16: Compilation problems.
Solution:   Move "&&" to other lines. (Vince Negri)
Files:      src/eval.c

Patch 6.0.124
Problem:    When using a ":substitute" command that starts with "\="
```

```
            (evaluated as an expression), "~" was still replaced with the
            previous substitute string.
Solution:   Skip the replacement when the substitute string starts with "\=".
            Also adjust the documentation about doubling backslashes.
Files:      src/ex_cmds.c, runtime/doc/change.txt

Patch 6.0.125 (extra)
Problem:    Win32: When using the multi_byte_ime feature pressing the shift
            key would be handled as if a character was entered, thus mappings
            with a shifted key didn't work. (Charles Campbell)
Solution:   Ignore pressing the shift, control and alt keys.
Files:      src/os_win32.c

Patch 6.0.126
Problem:    The python library was always statically linked.
Solution:   Link the python library dynamically. (Matthias Klose)
Files:      src/auto/configure, src/configure.in

Patch 6.0.127
Problem:    When using a terminal that swaps screens and the Normal background
            color has a different background, using an external command may
            cause the color of the wrong screen to be changed. (Mark Waggoner)
Solution:   Don't call screen_stop_highlight() in stoptermcap().
Files:      src/term.c

Patch 6.0.128
Problem:    When moving a vertically split window to the far left or right,
            the scrollbars are not adjusted. (Scott E Lee)  When 'mousefocus'
            is set the mouse pointer wasn't adjusted.
Solution:   Adjust the scrollbars and the mouse pointer.
Files:      src/window.c

Patch 6.0.129
Problem:    When using a very long file name, ":ls" (repeated a few times)
            causes a crash.  Test with "vim `perl -e 'print "A"x1000'`".
            (Tejeda)
Solution:   Terminate a string before getting its length in buflist_list().
Files:      src/buffer.c

Patch 6.0.130
Problem:    When using ":cprev" while the error window is open, and the new
            line at the top wraps, the window isn't correctly drawn.
            (Yegappan Lakshmanan)
Solution:   When redrawing the topline don't scroll twice.
Files:      src/screen.c

Patch 6.0.131
Problem:    When using bufname() and there are two matches for listed buffers
            and one match for an unlisted buffer, the unlisted buffer is used.
            (Aric Blumer)
Solution:   When there is a match with a listed buffer, don't check for
            unlisted buffers.
Files:      src/buffer.c
```

Patch 6.0.132
Problem: When setting 'iminsert' in the vimrc and using an xterm with two
            screens the ruler is drawn in the wrong screen. (Igor Goldenberg)
Solution: Only draw the ruler when using the right screen.
Files: src/option.c

Patch 6.0.133
Problem: When opening another buffer while 'keymap' is set and 'iminsert'
            is zero, 'iminsert' is set to one unexpectedly. (Igor Goldenberg)
Solution: Don't set 'iminsert' as a side effect of defining a ":lmap"
            mapping. Only do that when 'keymap' is set.
Files: src/getchar.c, src/option.c

Patch 6.0.134
Problem: When completing ":set tags=" a path with an embedded space causes
            the completion to stop. (Sektor van Skijlen)
Solution: Escape spaces with backslashes, like for ":set path=". Also take
            backslashes into account when searching for the start of the path
            to complete (e.g., for 'backupdir' and 'cscopeprg').
Files: src/ex_docmd.c, src/ex_getln.c, src/option.c, src/structs.h

Patch 6.0.135
Problem: Menus that are not supposed to do anything used "<Nul>", which
            still produced an error beep.
            When CTRL-O is mapped for Insert mode, ":amenu" commands didn't
            work in Insert mode.
            Menu language falls back to English when $LANG ends in "@euro".
Solution: Use "<Nop>" for a menu item that doesn't do anything, just like
            mappings.
            Use ":anoremenu" instead of ":amenu".
            Ignore "@euro" in the locale name.
Files: runtime/makemenu.vim, runtime/menu.vim, src/menu.c

Patch 6.0.136
Problem: When completing in Insert mode, a mapping could be unexpectedly
            applied.
Solution: Don't use mappings when checking for a typed character.
Files: src/edit.c

Patch 6.0.137
Problem: GUI: When using the find or find/replace dialog from Insert mode,
            the input mode is stopped.
Solution: Don't use the input method status when the main window doesn't
            have focus.
Files: src/ui.c

Patch 6.0.138
Problem: GUI: When using the find or find/replace dialog from Insert mode,
            the text is inserted when CTRL-O is mapped. (Andre Pang)
            When opening the dialog again, a whole word search isn't
            recognized.
            When doing "replace all" a whole word search was never done.
Solution: Don't put a search or replace command in the input buffer,
            execute it directly.

```
            Recognize "\<" and "\>" after removing "\V".
            Add "\<" and "\>" also for "replace all".
Files:      src/gui.c

Patch 6.0.139
Problem:    When stopping 'wildmenu' completion, the statusline of the
            bottom-left vertically split window isn't redrawn. (Yegappan
            Lakshmanan)
Solution:   Redraw all the bottom statuslines.
Files:      src/ex_getln.c, src/proto/screen.pro, src/screen.c

Patch 6.0.140
Problem:    Memory allocated for local mappings and abbreviations is leaked
            when the buffer is wiped out.
Solution:   Clear the local mappings when deleting a buffer.
Files:      src/buffer.c, src/getchar.c, src/proto/getchar.pro, src/vim.h

Patch 6.0.141
Problem:    When using ":enew" in an empty buffer, some buffer-local things
            are not cleared.  b:keymap_name is not set.
Solution:   Clear user commands and mappings local to the buffer when re-using
            the current buffer.  Reload the keymap.
Files:      src/buffer.c

Patch 6.0.142
Problem:    When Python is linked statically, loading dynamic extensions might
            fail.
Solution:   Add an extra linking flag when needed. (Andrew Rodionoff)
Files:      src/configure.in, src/auto/configure

Patch 6.0.143
Problem:    When a syntax item includes a line break in a pattern, the syntax
            may not be updated properly when making a change.
Solution:   Add the "linebreaks" argument to ":syn sync".
Files:      runtime/doc/syntax.txt, src/screen.c, src/structs.h, src/syntax.c

Patch 6.0.144
Problem:    After patch 6.0.088 redoing "veU" doesn't work.
Solution:   Don't add the "U" to the redo buffer, it will be used as an undo
            command.
Files:      src/normal.c

Patch 6.0.145
Problem:    When Vim can't read any input it might get stuck.  When
            redirecting stdin and stderr Vim would not read commands from a
            file.  (Servatius Brandt)
Solution:   When repeatedly trying to read a character when it's not possible,
            exit Vim.  When stdin and stderr are not a tty, still try reading
            from them, but don't do a blocking wait.
Files:      src/ui.c

Patch 6.0.146
Problem:    When 'statusline' contains "%{'-'}" this results in a zero.
            (Milan Vancura)
```

```
Solution:   Don't handle numbers with a minus as a number, they were not
            displayed anyway.
Files:      src/buffer.c

Patch 6.0.147
Problem:    It's not easy to mark a Vim version as being modified.  The new
            license requires this.
Solution:   Add the --modified-by argument to configure and the MODIFIED_BY
            define.  It's used in the intro screen and the ":version" output.
Files:      src/auto/configure, src/configure.in, src/config.h.in,
            src/feature.h, src/version.c

Patch 6.0.148
Problem:    After "p" in an empty line, `[ goes to the second character.
            (Kontra Gergely)
Solution:   Don't increment the column number in an empty line.
Files:      src/ops.c

Patch 6.0.149
Problem:    The pattern "\(.\{-}\)*" causes a hang.  When using a search
            pattern that causes a stack overflow to be detected Vim could
            still hang.
Solution:   Correctly report "operand could be empty" when using "\{-}".
            Check for "out_of_stack" inside loops to avoid a hang.
Files:      src/regexp.c

Patch 6.0.150
Problem:    When using a multi-byte encoding, patch 6.0.148 causes "p" to work
            like "P". (Sung-Hyun Nam)
Solution:   Compute the byte length of a multi-byte character.
Files:      src/ops.c

Patch 6.0.151
Problem:    Redrawing the status line and ruler can be wrong when it contains
            multi-byte characters.
Solution:   Use character width and byte length correctly. (Yasuhiro Matsumoto)
Files:      src/screen.c

Patch 6.0.152
Problem:    strtrans() could hang on an illegal UTF-8 byte sequence.
Solution:   Skip over illegal bytes. (Yasuhiro Matsumoto)
Files:      src/charset.c

Patch 6.0.153
Problem:    When using (illegal) double-byte characters and Vim syntax
            highlighting Vim can crash. (Yasuhiro Matsumoto)
Solution:   Increase a pointer over a character instead of a byte.
Files:      src/regexp.c

Patch 6.0.154
Problem:    MS-DOS and MS-Windows: The menu entries for xxd don't work when
            there is no xxd in the path.
            When converting back from Hex the filetype may remain "xxd" if it
            is not detected.
```

```
Solution:   When xxd is not in the path use the one in the runtime directory,
            where the install program has put it.
            Clear the 'filetype' option before detecting the new value.
Files:      runtime/menu.vim

Patch 6.0.155
Problem:    Mac: compilation problems in ui.c after patch 6.0.145. (Axel
            Kielhorn)
Solution:   Don't call mch_inchar() when NO_CONSOLE is defined.
Files:      src/ui.c

Patch 6.0.156
Problem:    Starting Vim with the -b argument and two files, ":next" doesn't
            set 'binary' in the second file, like Vim 5.7. (Norman Diamond)
Solution:   Set the global value for 'binary'.
Files:      src/option.c

Patch 6.0.157
Problem:    When defining a user command with "-complete=dir" files will also
            be expanded.  Also, "-complete=mapping" doesn't appear to work.
            (Michael Naumann)
Solution:   Use the expansion flags defined with the user command.
            Handle expanding mappings specifically.
Files:      src/ex_docmd.c

Patch 6.0.158
Problem:    When getting the warning for a file being changed outside of Vim
            and reloading the file, the 'readonly' option is reset, even when
            the permissions didn't change. (Marcel Svitalsky)
Solution:   Keep 'readonly' set when reloading a file and the permissions
            didn't change.
Files:      src/fileio.c

Patch 6.0.159
Problem:    Wildcard expansion for ":emenu" also shows separators.
Solution:   Skip menu separators for ":emenu", ":popup" and ":tearoff".
            Also, don't handle ":tmenu" as if it was ":tearoff".  And leave
            out the alternatives with "&" included.
Files:      src/menu.c

Patch 6.0.160
Problem:    When compiling with GCC 3.0.2 and using the "-O2" argument, the
            optimizer causes a problem that makes Vim crash.
Solution:   Add a configure check to avoid "-O2" for this version of gcc.
Files:      src/configure.in, src/auto/configure

Patch 6.0.161 (extra)
Problem:    Win32: Bitmaps don't work with signs.
Solution:   Make it possible to use bitmaps with signs. (Muraoka Taro)
Files:      src/ex_cmds.c, src/feature.h, src/gui_w32.c, src/gui_x11.c,
            src/proto/gui_w32.pro, src/proto/gui_x11.pro

Patch 6.0.162
Problem:    Client-server: An error message for a wrong expression appears in
```

            the server instead of the client.
Solution: Pass the error message from the server to the client. Also
            adjust the example code. (Flemming Madsen)
Files: src/globals.h, src/if_xcmdsrv.c, src/main.c, src/os_mswin.c,
            src/proto/if_xcmdsrv.pro, src/proto/os_mswin.pro,
            runtime/doc/eval.txt, runtime/tools/xcmdsrv_client.c

Patch 6.0.163
Problem: When using a GUI dialog, a file name is sometimes used like it was
            a directory.
Solution: Separate path and file name properly.
            For GTK, Motif and Athena concatenate directory and file name for
            the default selection.
Files: src/diff.c, src/ex_cmds.c, src/ex_cmds2.c, src/ex_docmd.c,
            src/gui_athena.c, src/gui_gtk.c, src/gui_motif.c, src/message.c

Patch 6.0.164
Problem: After patch 6.0.135 the menu entries for pasting don't work in
            Insert and Visual mode. (Muraoka Taro)
Solution: Add <script> to allow script-local mappings.
Files: runtime/menu.vim

Patch 6.0.165
Problem: Using --remote and executing locally gives unavoidable error
            messages.
Solution: Add --remote-silent and --remote-wait-silent to silently execute
            locally.
            For Win32 there was no error message when a server didn't exist.
Files: src/eval.c, src/if_xcmdsrv.c, src/main.c, src/os_mswin.c,
            src/proto/if_xcmdsrv.pro, src/proto/os_mswin.pro

Patch 6.0.166
Problem: GUI: There is no way to avoid dialogs to pop up.
Solution: Add the 'c' flag to 'guioptions': Use console dialogs. (Yegappan
            Lakshmanan)
Files: runtime/doc/options.txt, src/option.h, src/message.c

Patch 6.0.167
Problem: When 'fileencodings' is "latin2" some characters in the help files
            are displayed wrong.
Solution: Force the 'fileencoding' for the help files to be "latin1".
Files: src/fileio.c

Patch 6.0.168
Problem: ":%s/\n/#/" doesn't replace at an empty line. (Bruce DeVisser)
Solution: Don't skip matches after joining two lines.
Files: src/ex_cmds.c

Patch 6.0.169
Problem: When run as evim and the GUI can't be started we get stuck in a
            terminal without menus in Insert mode.
Solution: Exit when using "evim" and "gvim -y" when the GUI can't be
            started.
Files: src/main.c

Patch 6.0.170
Problem: When printing double-width characters the size of tabs after them
            is wrong. (Muraoka Taro)
Solution: Correctly compute the column after a double-width character.
Files: src/ex_cmds2.c

Patch 6.0.171
Problem: With 'keymodel' including "startsel", in Insert mode after the end
            of a line, shift-Left does not move the cursor. (Steve Hall)
Solution: CTRL-O doesn't move the cursor left, need to do that explicitly.
Files: src/edit.c

Patch 6.0.172
Problem: CTRL-Q doesn't replace CTRL-V after CTRL-X in Insert mode while it
            does in most other situations.
Solution: Make CTRL-X CTRL-Q work like CTRL-X CTRL-V in Insert mode.
Files: src/edit.c

Patch 6.0.173
Problem: When using "P" to insert a line break the cursor remains past the
            end of the line.
Solution: Check for the cursor being beyond the end of the line.
Files: src/ops.c

Patch 6.0.174
Problem: After using "gd" or "gD" the search direction for "n" may still be
            backwards. (Servatius Brandt)
Solution: Reset the search direction to forward.
Files: src/normal.c, src/search.c, src/proto/search.pro

Patch 6.0.175
Problem: ":help /\z(\)" doesn't work. (Thomas Koehler)
Solution: Double the backslashes.
Files: src/ex_cmds.c

Patch 6.0.176
Problem: When killed by a signal autocommands are still triggered as if
            nothing happened.
Solution: Add the v:dying variable to allow autocommands to work differently
            when a deadly signal has been trapped.
Files: src/eval.c, src/os_unix.c, src/vim.h

Patch 6.0.177
Problem: When 'commentstring' is empty and 'foldmethod' is "marker", "zf"
            doesn't work. (Thomas S. Urban)
Solution: Add the marker even when 'commentstring' is empty.
Files: src/fold.c, src/normal.c

Patch 6.0.178
Problem: Uninitialized memory read from xp_backslash field.
Solution: Initialize xp_backslash field properly.
Files: src/eval.c, src/ex_docmd.c, src/ex_getln.c, src/misc1.c, src/tag.c

```
Patch 6.0.179
Problem:    Win32: When displaying UTF-8 characters may read uninitialized
            memory.
Solution:   Add utfc_ptr2len_check_len() to avoid reading past the end of a
            string.
Files:      src/mbyte.c, src/proto/mbyte.pro, src/gui_w32.c

Patch 6.0.180
Problem:    Expanding environment variables in a string that ends in a
            backslash could go past the end of the string.
Solution:   Detect the trailing backslash.
Files:      src/misc1.c

Patch 6.0.181
Problem:    When using ":cd dir" memory was leaked.
Solution:   Free the allocated memory.  Also avoid an uninitialized memory
            read.
Files:      src/misc2.c

Patch 6.0.182
Problem:    When using a regexp on multi-byte characters, could try to read a
            character before the start of the line.
Solution:   Don't decrement a pointer to before the start of the line.
Files:      src/regexp.c

Patch 6.0.183
Problem:    Leaking memory when ":func!" redefines a function.
Solution:   Free the function name when it's not used.
Files:      src/eval.c

Patch 6.0.184
Problem:    Leaking memory when expanding option values.
Solution:   Don't always copy the expanded option into allocated memory.
Files:      src/option.c

Patch 6.0.185
Problem:    Crash in Vim when pasting a selection in another application, on a
            64 bit machine.
Solution:   Fix the format for an Atom to 32 bits. (Peter Derr)
Files:      src/ui.c

Patch 6.0.186
Problem:    X11: Three warnings when compiling the client-server code.
Solution:   Add a typecast to unsigned char.
Files:      src/if_xcmdsrv.c

Patch 6.0.187
Problem:    "I" in Visual mode and then "u" reports too many changes. (Andrew
            Stryker)
            "I" in Visual linewise mode adjusts the indent for no apparent
            reason.
Solution:   Only save those lines for undo that are changed.
            Don't change the indent after inserting in Visual linewise mode.
Files:      src/ops.c
```

Patch 6.0.188
Problem: Win32: After patch 6.0.161 signs defined in the vimrc file don't
            work.
Solution: Initialize the sign icons after initializing the GUI. (Vince
            Negri)
Files: src/gui.c, src/gui_x11.c

Patch 6.0.189
Problem: The size of the Visual area isn't always displayed when scrolling
            ('ruler' off, 'showcmd' on). Also not when using a search
            command. (Sylvain Hitier)
Solution: Redisplay the size of the selection after showing the mode.
Files: src/screen.c

Patch 6.0.190
Problem: GUI: when 'mouse' is empty a click with the middle button still
            moves the cursor.
Solution: Paste at the cursor position instead of the mouse position.
Files: src/normal.c

Patch 6.0.191
Problem: When no servers are available serverlist() gives an error instead
            of returning an empty string. (Hari Krishna)
Solution: Don't give an error message.
Files: src/eval.c

Patch 6.0.192
Problem: When 'virtualedit' is set, "ylj" goes to the wrong column. (Andrew
            Nikitin)
Solution: Reset the flag that w_virtcol is valid when moving the cursor back
            to the start of the operated area.
Files: src/normal.c

Patch 6.0.193
Problem: When 'virtualedit' is set, col(".") after the end of the line
            should return one extra.
Solution: Add one to the column.
Files: src/eval.c

Patch 6.0.194
Problem: "--remote-silent" tries to send a reply to the client, like it was
            "--remote-wait".
Solution: Properly check for the argument.
Files: src/main.c

Patch 6.0.195
Problem: When 'virtualedit' is set and a search starts in virtual space
            ":call search('x')" goes to the wrong position. (Eric Long)
Solution: Reset coladd when finding a match.
Files: src/search.c

Patch 6.0.196
Problem: When 'virtualedit' is set, 'selection' is "exclusive" and visually

            selecting part of a tab at the start of a line, "x" joins it with
            the previous line. Also, when the selection spans more than one
            line the whole tab is deleted.
Solution: Take coladd into account when adjusting for 'selection' being
            "exclusive". Also expand a tab into spaces when deleting more
            than one line.
Files: src/normal.c, src/ops.c

Patch 6.0.197
Problem: When 'virtualedit' is set and 'selection' is "exclusive", "v$x"
            doesn't delete the last character in the line. (Eric Long)
Solution: Don't reset the inclusive flag. (Helmut Stiegler)
Files: src/normal.c

Patch 6.0.198
Problem: When 'virtualedit' is set and 'showbreak' is not empty, moving the
            cursor over the line break doesn't work properly. (Eric Long)
Solution: Make getviscol() and getviscol2() use getvvcol() to obtain the
            virtual cursor position. Adjust coladvance() and oneleft() to
            skip over the 'showbreak' characters.
Files: src/edit.c, src/misc2.c

Patch 6.0.199
Problem: Multi-byte: could use iconv() after calling iconv_end().
            (Yasuhiro Matsumoto)
Solution: Stop converting input and output stream after calling iconv_end().
Files: src/mbyte.c

Patch 6.0.200
Problem: A script that starts with "#!perl" isn't recognized as a Perl
            filetype.
Solution: Ignore a missing path in a script header. Also, speed up
            recognizing scripts by simplifying the patterns used.
Files: runtime/scripts.vim

Patch 6.0.201
Problem: When scrollbinding and doing a long jump, switching windows jumps
            to another position in the file. Scrolling a few lines at a time
            is OK. (Johannes Zellner)
Solution: When setting w_topline reset the flag that indicates w_botline is
            valid.
Files: src/diff.c

Patch 6.0.202
Problem: The "icon=" argument for the menu command to define a toolbar icon
            with a file didn't work for GTK. (Christian J. Robinson)
            For Motif and Athena a full path was required.
Solution: Search the icon file using the specified path. Expand environment
            variables in the file name.
Files: src/gui_gtk.c, src/gui_x11.c

Patch 6.0.203
Problem: Can change 'fileformat' even though 'modifiable' is off.
            (Servatius Brandt)

```
Solution:   Correct check for kind of set command.
Files:      src/option.c

Patch 6.0.204
Problem:    ":unlet" doesn't work for variables with curly braces. (Thomas
            Scott Urban)
Solution:   Handle variable names with curly braces properly. (Vince Negri)
Files:      src/eval.c

Patch 6.0.205 (extra)
Problem:    "gvim -f" still forks when using the batch script to start Vim.
Solution:   Add an argument to "start" to use a foreground session (Michael
            Geddes)
Files:      src/dosinst.c

Patch 6.0.206
Problem:    Unix: if expanding a wildcard in a file name results in a
            wildcard character and there are more parts in the path with a
            wildcard, it is expanded again.
            Windows: ":edit \[abc]" could never edit the file "[abc]".
Solution:   Don't expand wildcards in already expanded parts.
            Don't remove backslashes used to escape the special meaning of a
            wildcard; can edit "[abc]" if '[' is removed from 'isfname'.
Files:      src/misc1.c, src/os_unix.c

Patch 6.0.207 (extra)
Problem:    Win32: The shortcuts and start menu entries let Vim startup in the
            desktop directory, which is not very useful.
Solution:   Let shortcuts start Vim in $HOME or $HOMEDIR$HOMEPATH.
Files:      src/dosinst.c

Patch 6.0.208
Problem:    GUI: When using a keymap and the cursor is not blinking, CTRL-^ in
            Insert mode doesn't directly change the cursor color.  (Alex
            Solow)
Solution:   Force a redraw of the cursor after CTRL-^.
Files:      src/edit.c

Patch 6.0.209
Problem:    GUI GTK: After selecting a 'guifont' with the font dialog there
            are redraw problems for multi-byte characters.
Solution:   Separate the font dialog from setting the new font name to avoid
            that "*" is used to find wide and bold fonts.
            When redrawing extra characters for the bold trick, take care of
            UTF-8 characters.
Files:      src/gui.c, src/gui_gtk_x11.c, src/option.c, src/proto/gui.pro,
            src/proto/gui_gtk_x11.pro

Patch 6.0.210
Problem:    After patch 6.0.167 it's no longer possible to edit a help file in
            another encoding than latin1.
Solution:   Let the "++enc=" argument overrule the encoding.
Files:      src/fileio.c
```

```
Patch 6.0.211
Problem:    When reading a file fails, the buffer is empty, but it might still
            be possible to write it with ":w" later.  The original file is
            lost then. (Steve Amerige)
Solution:   Set the 'readonly' option for the buffer.
Files:      src/fileio.c

Patch 6.0.212
Problem:    GUI GTK: confirm("foo", "") causes a crash.
Solution:   Don't make a non-existing button the default.  Add a default "OK"
            button if none is specified.
Files:      src/eval.c, src/gui_gtk.c

Patch 6.0.213
Problem:    When a file name contains unprintable characters, CTRL-G and other
            commands don't work well.
Solution:   Turn unprintable into printable characters. (Yasuhiro Matsumoto)
Files:      src/buffer.c, src/charset.c

Patch 6.0.214
Problem:    When there is a buffer without a name, empty entries appear in the
            jumplist saved in the viminfo file.
Solution:   Don't write jumplist entries without a file name.
Files:      src/mark.c

Patch 6.0.215
Problem:    After using "/" from Visual mode the Paste menu and Toolbar
            entries don't work.  Pasting with the middle mouse doesn't work
            and modeless selection doesn't work.
Solution:   Use the command line mode menus and use the mouse like in the
            command line.
Files:      src/gui.c, src/menu.c, src/ui.c

Patch 6.0.216
Problem:    After reloading a file, displayed in another window than the
            current one, which was changed outside of Vim the part of the file
            around the cursor set by autocommands may be displayed, but
            jumping back to the original cursor position when entering the
            window again.
Solution:   Restore the topline of the window.
Files:      src/fileio.c

Patch 6.0.217
Problem:    When getting help from a help file that was used before, an empty
            unlisted buffer remains in the buffer list. (Eric Long)
Solution:   Wipe out the buffer used to do the tag jump from.
Files:      src/buffer.c, src/ex_cmds.c, src/proto/buffer.pro

Patch 6.0.218
Problem:    With explorer plugin: "vim -o filename dirname" doesn't load the
            explorer window until entering the window.
Solution:   Call s:EditDir() for each window after starting up.
Files:      runtime/plugin/explorer.vim
```

```
Patch 6.0.219
Problem:    ":setlocal" and ":setglobal", without arguments, display terminal
            options. (Zdenek Sekera)
Solution:   Skip terminal options for these two commands.
Files:      src/option.c

Patch 6.0.220
Problem:    After patch 6.0.218 get a beep on startup. (Muraoka Taro)
Solution:   Don't try going to another window when there isn't one.
Files:      runtime/plugin/explorer.vim

Patch 6.0.221
Problem:    When using ":bdel" and all other buffers are unloaded the lowest
            numbered buffer is jumped to instead of the most recent one. (Dave
            Cecil)
Solution:   Prefer an unloaded buffer from the jumplist.
Files:      src/buffer.c

Patch 6.0.222
Problem:    When 'virtualedit' is set and using autoindent, pressing Esc after
            starting a new line leaves behind part of the autoindent. (Helmut
            Stiegler)
Solution:   After deleting the last char in the line adjust the cursor
            position in del_bytes().
Files:      src/misc1.c, src/ops.c

Patch 6.0.223
Problem:    When splitting a window that contains the explorer, hitting CR on
            a file name gives error messages.
Solution:   Set the window variables after splitting the window.
Files:      runtime/plugin/explorer.vim

Patch 6.0.224
Problem:    When 'sidescroll' and 'sidescrolloff' are set in a narrow window
            the text may jump left-right and the cursor is displayed in the
            wrong position. (Aric Blumer)
Solution:   When there is not enough room, compute the left column for the
            window to put the cursor in the middle.
Files:      src/move.c

Patch 6.0.225
Problem:    In Visual mode "gk" gets stuck in a closed fold. (Srinath
            Avadhanula)
Solution:   Behave differently in a closed fold.
Files:      src/normal.c

Patch 6.0.226
Problem:    When doing ":recover file" get the ATTENTION prompt.
            After recovering the same file five times get a read error or a
            crash.  (Alex Davis)
Solution:   Set the recoverymode flag before setting the file name.
            Correct the amount of used memory for the size of block zero.
Files:      src/ex_docmd.c
```

```
Patch 6.0.227 (extra)
Problem:    The RISC OS port has several problems.
Solution:   Update the makefile and fix some of the problems. (Andy Wingate)
Files:      src/Make_ro.mak, src/os_riscos.c, src/os_riscos.h,
            src/proto/os_riscos.pro, src/search.c

Patch 6.0.228
Problem:    After putting text in Visual mode the '] mark is not at the end of
            the put text.
            Undo doesn't work properly when putting a word into a Visual
            selection that spans more than one line.
Solution:   Correct the '] mark for the deleting the Visually selected text.
            #ifdef code that depends on FEAT_VISUAL properly.
            Also fix that "d" crossing line boundary puts '[ just before
            deleted text.
            Fix undo by saving all deleted lines at once.
Files:      src/ex_docmd.c, src/globals.h, src/normal.c, src/ops.c,
            src/structs.h, src/vim.h

Patch 6.0.229
Problem:    Multi-byte: With 'm' in 'formatoptions', formatting doesn't break
            at a multi-byte char followed by an ASCII char, and the other way
            around. (Muraoka Taro)
            When joining lines a space is inserted between multi-byte
            characters, which is not always wanted.
Solution:   Check for multi-byte character before and after the breakpoint.
            Don't insert a space before or after a multi-byte character when
            joining lines and the 'M' flag is in 'formatoptions'.  Don't
            insert a space between multi-byte characters when the 'B' flag is
            in 'formatoptions'.
Files:      src/edit.c, src/ops.c, src/option.h

Patch 6.0.230
Problem:    The ":" used as a motion after an operator is exclusive, but
            sometimes it should be inclusive.
Solution:   Make the "v" in between an operator and motion toggle
            inclusive/exclusive. (Servatius Brandt)
Files:      runtime/doc/motion.txt, src/normal.c

Patch 6.0.231
Problem:    "gd" and "gD" don't work when the variable matches in a comment
            just above the match to be found. (Servatius Brandt)
Solution:   Continue searching in the first column below the comment.
Files:      src/normal.c

Patch 6.0.232
Problem:    "vim --version" prints on stderr while "vim --help" prints on
            stdout.
Solution:   Make "vim --version" use stdout.
Files:      runtime/doc/starting.txt, src/globals.h, src/main.c, src/message.c

Patch 6.0.233
Problem:    "\1\{,8}" in a regexp is not allowed, but it should work, because
            there is an upper limit.  (Jim Battle)
```

```
Solution:   Allow using "\{min,max}" after an atom that can be empty if there
            is an upper limit.
Files:      src/regexp.c

Patch 6.0.234
Problem:    It's not easy to set the cursor position without modifying marks.
Solution:   Add the cursor() function. (Yegappan Lakshmanan)
Files:      runtime/doc/eval.txt, src/eval.c

Patch 6.0.235
Problem:    When writing a file and renaming the original file to make the
            backup, permissions could change when setting the owner.
Solution:   Only set the owner when it's needed and set the permissions again
            afterwards.
            When 'backupcopy' is "auto" check that the owner and permissions
            of a newly created file can be set properly.
Files:      src/fileio.c

Patch 6.0.236
Problem:    ":edit" without argument should move cursor to line 1 in Vi
            compatible mode.
Solution:   Add 'g' flag to 'cpoptions'.
Files:      runtime/doc/options.txt, src/ex_docmd.c, src/option.h

Patch 6.0.237
Problem:    In a C file, using the filetype plugin, re-indenting a comment
            with two spaces after the middle "*" doesn't align properly.
Solution:   Don't use a middle entry from a start/middle/end to line up with
            the start of the comment when the start part doesn't match with
            the actual comment start.
Files:      src/misc1.c

Patch 6.0.238
Problem:    Using a ":substitute" command with a substitute() call in the
            substitution expression causes errors. (Srinath Avadhanula)
Solution:   Save and restore pointers when doing substitution recursively.
Files:      src/regexp.c

Patch 6.0.239
Problem:    Using "A" to append after a Visually selected block which is after
            the end of the line, spaces are inserted in the wrong line and
            other unexpected effects. (Michael Naumann)
Solution:   Don't advance the cursor to the next line.
Files:      src/ops.c

Patch 6.0.240
Problem:    Win32: building with Python 2.2 doesn't work.
Solution:   Add support for Python 2.2 with dynamic linking. (Paul Moore)
Files:      src/if_python.c

Patch 6.0.241
Problem:    Win32: Expanding the old value of an option that is a path that
            starts with a backslash, an extra backslash is inserted.
Solution:   Only insert backslashes where needed.
```

```
            Also handle multi-byte characters properly when removing
            backslashes.
Files:      src/option.c

Patch 6.0.242
Problem:    GUI: On a system with an Exceed X server sometimes get a "Bad
            Window" error. (Tommi Maekitalo)
Solution:   When forking, use a pipe to wait in the parent for the child to
            have done the setsid() call.
Files:      src/gui.c

Patch 6.0.243
Problem:    Unix: "vim --version" outputs a NL before the last line instead of
            after it. (Charles Campbell)
Solution:   Send the NL to the same output stream as the text.
Files:      src/message.c, src/os_unix.c, src/proto/message.pro

Patch 6.0.244
Problem:    Multi-byte: Problems with (illegal) UTF-8 characters in menu and
            file name (e.g., icon text, status line).
Solution:   Correctly handle unprintable characters.  Catch illegal UTF-8
            characters and replace them with <xx>.  Truncating the status line
            wasn't done correctly at a multi-byte character. (Yasuhiro
            Matsumoto)
            Added correct_cmdspos() and transchar_byte().
Files:      src/buffer.c, src/charset.c, src/ex_getln.c, src/gui.c,
            src/message.c, src/screen.c, src/vim.h

Patch 6.0.245
Problem:    After using a color scheme, setting the 'background' option might
            not work. (Peter Horst)
Solution:   Disable the color scheme if it switches 'background' back to the
            wrong value.
Files:      src/option.c

Patch 6.0.246
Problem:    ":echomsg" didn't use the highlighting set by ":echohl". (Gary
            Holloway)
Solution:   Use the specified attributes for the message. (Yegappan
            Lakshmanan)
Files:      src/eval.c

Patch 6.0.247
Problem:    GTK GUI: Can't use gvim in a kpart widget.
Solution:   Add the "--echo-wid" argument to let Vim echo the window ID on
            stdout. (Philippe Fremy)
Files:      runtime/doc/starting.txt, src/globals.h, src/gui_gtk_x11.c,
            src/main.c

Patch 6.0.248
Problem:    When using compressed help files and 'encoding' isn't "latin1",
            Vim converts the help file before decompressing. (David Reviejo)
Solution:   Don't convert a help file when 'binary' is set.
Files:      src/fileio.c
```

```
Patch 6.0.249
Problem:    "vim -t edit -c 'sta ex_help'" doesn't move cursor to edit().
Solution:   Don't set the cursor on the first line for "-c" arguments when
            there also is a "-t" argument.
Files:      src/main.c

Patch 6.0.250 (extra)
Problem:    Macintosh: Various problems when compiling.
Solution:   Various fixes, mostly #ifdefs. (Dany St. Amant)
Files:      src/gui_mac.c, src/main.c, src/misc2.c, src/os_mac.h,
            src/os_mac.pbproj/project.pbxproj, src/os_unix.c

Patch 6.0.251 (extra)
Problem:    Macintosh: menu shortcuts are not very clear.
Solution:   Show the shortcut with the Mac clover symbol. (raindog)
Files:      src/gui_mac.c

Patch 6.0.252
Problem:    When a user function was defined with "abort", an error that is
            not inside if/endif or while/endwhile doesn't abort the function.
            (Servatius Brandt)
Solution:   Don't reset did_emsg when the function is to be aborted.
Files:      src/ex_docmd.c

Patch 6.0.253
Problem:    When 'insertmode' is set, after "<C-O>:edit file" the next <C-O>
            doesn't work. (Benji Fisher)  <C-L> has the same problem.
Solution:   Reset need_start_insertmode once in edit().
Files:      src/edit.c

Patch 6.0.254 (extra)
Problem:    Borland C++ 5.5: Checking for stack overflow doesn't work
            correctly.  Matters when using a complicated regexp.
Solution:   Remove -N- from Make_bc5.mak. (Yasuhiro Matsumoto)
Files:      src/Make_bc5.mak

Patch 6.0.255 (extra) (depends on patch 6.0.116 and 6.0.121)
Problem:    Win32: ACL support doesn't work well on Samba drives.
Solution:   Add a check for working ACL support. (Mike Williams)
Files:      src/os_win32.c

Patch 6.0.256 (extra)
Problem:    Win32: ":highlight Comment guifg=asdf" does not give an error
            message. (Randall W. Morris)  Also for other systems.
Solution:   Add gui_get_color() to give one error message for all systems.
Files:      src/gui.c, src/gui_amiga.c, src/gui_athena.c, src/gui_motif.c,
            src/gui_riscos.c, src/gui_x11.c, src/gui_gtk_x11.c,
            src/proto/gui.pro, src/syntax.c

Patch 6.0.257
Problem:    Win32: When 'mousefocus' is set and there is a BufRead
            autocommand, after the dialog for permissions changed outside of
            Vim: 'mousefocus' stops working. (Robert Webb)
```

```
Solution:   Reset need_mouse_correct after checking timestamps.
Files:      src/fileio.c

Patch 6.0.258
Problem:    When 'scrolloff' is 999 and there are folds, the text can jump up
            and down when moving the cursor down near the end of the file.
            (Lubomir Host)
Solution:   When putting the cursor halfway the window start counting lines at
            the end of a fold.
Files:      src/move.c

Patch 6.0.259
Problem:    MS-DOS: after editing the command line the cursor shape may remain
            like in Insert mode. (Volker Kiefel)
Solution:   Reset the cursor shape after editing the command line.
Files:      src/ex_getln.c

Patch 6.0.260
Problem:    GUI: May crash while starting up when giving an error message for
            missing color. (Servatius Brandt)
Solution:   Don't call gui_write() when still starting up.  Don't give error
            message for empty color name.  Don't use 't_vb' while the GUI is
            still starting up.
Files:      src/fileio.c, src/gui.c, src/misc1.c, src/ui.c

Patch 6.0.261
Problem:    nr2char() and char2nr() don't work with multi-byte characters.
Solution:   Use 'encoding' for these functions. (Yasuhiro Matsumoto)
Files:      runtime/doc/eval.txt, src/eval.c

Patch 6.0.262 (extra)
Problem:    Win32: IME doesn't work properly.  OnImeComposition() isn't used
            at all.
Solution:   Adjust various things for IME.
Files:      src/globals.h, src/gui_w32.c, src/mbyte.c, src/proto/ui.pro,
            src/structs.h, src/ui.c

Patch 6.0.263
Problem:    GTK: When a dialog is closed by the window manager, Vim hangs.
            (Christian J. Robinson)
Solution:   Use GTK_WIDGET_DRAWABLE() instead of GTK_WIDGET_VISIBLE().
Files:      src/gui_gtk.c, src/gui_gtk_x11.c

Patch 6.0.264
Problem:    The amount of virtual memory is used to initialize 'maxmemtot',
            which may be much more than the amount of physical memory,
            resulting in a lot of swapping.
Solution:   Get the amount of physical memory with sysctl(), sysconf() or
            sysinfo() when possible.
Files:      src/auto/configure, src/configure.in, src/config.h.in,
            src/os_unix.c, src/os_unix.h

Patch 6.0.265
Problem:    Win32: Using backspace while 'fkmap' is set causes a crash.
```

```
            (Jamshid Oasjmoha)
Solution:   Don't try mapping special keys.
Files:      src/farsi.c

Patch 6.0.266
Problem:    The rename() function deletes the file if the old and the new name
            are the same. (Volker Kiefel)
Solution:   Don't do anything if the names are equal.
Files:      src/fileio.c

Patch 6.0.267
Problem:    UTF-8: Although 'isprint' says a character is printable,
            utf_char2cells() still considers it unprintable.
Solution:   Use vim_isprintc() for characters upto 0x100. (Yasuhiro Matsumoto)
Files:      src/mbyte.c

Patch 6.0.268 (extra) (depends on patch 6.0.255)
Problem:    Win32: ACL check crashes when using forward slash in file name.
Solution:   Improve the check for the path in the file name.
Files:      src/os_win32.c

Patch 6.0.269
Problem:    Unprintable characters in a file name may cause problems when
            using the 'statusline' option or when 'buftype' is "nofile".
Solution:   call trans_characters() for the resulting statusline. (Yasuhiro
            Matsumoto)
Files:      src/buffer.c, src/screen.c, src/charset.c

Patch 6.0.270 (depends on patch 6.0.267)
Problem:    A tab causes UTF-8 text to be displayed in the wrong position.
            (Ron Aaron)
Solution:   Correct utf_char2cells() again.
Files:      src/mbyte.c

Patch 6.1a.001 (extra)
Problem:    32bit DOS: copying text to the clipboard may cause a crash.
            (Jonathan D Johnston)
Solution:   Don't copy one byte too much in SetClipboardData().
Files:      src/os_msdos.c

Patch 6.1a.002
Problem:    GTK: On some configurations, when closing a dialog from the window
            manager, Vim hangs.
Solution:   Catch the "destroy" signal. (Aric Blumer)
Files:      src/gui_gtk.c

Patch 6.1a.003
Problem:    Multi-byte: With UTF-8 double-wide char and 'virtualedit' set:
            yanking in Visual mode doesn't include the last byte. (Eric Long)
Solution:   Don't add a space for a double-wide character.
Files:      src/ops.c

Patch 6.1a.004 (extra)
Problem:    MINGW: undefined type. (Ron Aaron)
```

```
Solution:   Make GetCompositionString_inUCS2() static.
Files:      src/gui_w32.c, src/gui_w48.c, src/proto/gui_w32.pro

Patch 6.1a.005 (extra)
Problem:    Win32: ":hardcopy" doesn't work after ":hardcopy!". (Jonathan
            Johnston)
Solution:   Don't keep the driver context when using ":hardcopy!". (Vince
            Negri)
Files:      src/os_mswin.c

Patch 6.1a.006
Problem:    multi-byte: after setting 'encoding' the window title might be
            wrong.
Solution:   Force resetting the title. (Yasuhiro Matsumoto)
Files:      src/option.c

Patch 6.1a.007
Problem:    Filetype detection for "*.inc" doesn't work.
Solution:   Use a ":let" command. (David Schweikert)
Files:      runtime/filetype.vim

Patch 6.1a.008 (extra)
Problem:    Win32: ACL detection for network shares doesn't work.
Solution:   Include the trailing (back)slash in the root path. (Mike Williams)
Files:      src/os_win32.c

Patch 6.1a.009
Problem:    When using "\@<=" or "\@<!" in a pattern, a "\1" may refer to a ()
            part that follows, but it generates an error message.
Solution:   Allow a forward reference when there is a following "\@<=" or
            "\@<!".
Files:      runtime/doc/pattern.txt, src/regexp.c

Patch 6.1a.010
Problem:    When using ":help" and opening a new window, the alternate file
            isn't set.
Solution:   Set the alternate file to the previously edited file.
Files:      src/ex_cmds.c

Patch 6.1a.011
Problem:    GTK: ":set co=77", change width with the mouse, ":set co=77"
            doesn't resize the window. (Darren Hiebert)
Solution:   Set the form size after handling a resize event.
Files:      src/gui_gtk_x11.c

Patch 6.1a.012
Problem:    GTK: The file browser always returns a full path. (Lohner)
Solution:   Shorten the file name if possible.
Files:      src/gui_gtk.c

Patch 6.1a.013
Problem:    When using "=~word" in 'cinkeys' or 'indentkeys', the case of the
            last character of the word isn't ignored. (Raul Segura Acevedo)
Solution:   Ignore case when checking the last typed character.
```

```
Files:      src/edit.c

Patch 6.1a.014
Problem:    After patch 6.1a.006 can't compile without the title feature.
Solution:   Add an #ifdef.
Files:      src/option.c

Patch 6.1a.015
Problem:    MS-Windows: When expanding a file name that contains a '[' or '{'
            an extra backslash is inserted. (Raul Segura Acevedo)
Solution:   Avoid adding the backslash.
Files:      src/ex_getln.c

Patch 6.1a.016
Problem:    Completion after ":language" doesn't include "time". (Raul Segura
            Acevedo)
Solution:   Add the alternative to the completions.
Files:      src/ex_cmds2.c

Patch 6.1a.017
Problem:    Clicking the mouse in the top row of a window where the first line
            doesn't fit moves the cursor to the wrong column.
Solution:   Add the skipcol also for the top row of a window.
Files:      src/ui.c

Patch 6.1a.018
Problem:    When 'scrolloff' is one and the window height is one, "gj" can put
            the cursor above the window. (Raul Segura Acevedo)
Solution:   Don't let skipcol become bigger than the cursor column.
Files:      src/move.c

Patch 6.1a.019
Problem:    When using a composing character on top of an ASCII character, the
            "l" command clears the composing character.  Only when 'ruler' and
            'showcmd' are off. (Raphael Finkel)
Solution:   Don't move the cursor by displaying characters when there are
            composing characters.
Files:      src/screen.c

Patch 6.1a.020
Problem:    GTK: after patch 6.1a.011 resizing with the mouse doesn't always
            work well for small sizes. (Adrien Beau)
Solution:   Use another way to avoid the problem with ":set co=77".
Files:      src/gui_gtk_x11.c

Patch 6.1a.021
Problem:    Several Syntax menu entries are wrong or confusing.
Solution:   Rephrase and correct the menu entries. (Adrien Beau)
Files:      runtime/makemenu.vim, runtime/menu.vim

Patch 6.1a.022
Problem:    A tags file might be used twice on case insensitive systems.
            (Rick Swanton)
Solution:   Don't use the same file name twice in the default for the 'tags'
```

```
            option.  Ignore case when comparing names of already visited
            files.
Files:      src/misc2.c, src/option.c

Patch 6.1a.023
Problem:    When starting the GUI get "C" characters echoed in the terminal.
Solution:   Don't try sending a clear-screen command while the GUI is starting
            up.
Files:      src/screen.c

Patch 6.1a.024
Problem:    In other editors CTRL-F is often used for a find dialog.
Solution:   In evim use CTRL-F for the find dialog.
Files:      runtime/evim.vim

Patch 6.1a.025
Problem:    The choices for the fileformat dialog can't be translated.
Solution:   Add g:menutrans_fileformat_choices. (Adrien Beau)
Files:      runtime/menu.vim

Patch 6.1a.026
Problem:    Indenting Java files is wrong with "throws", "extends" and
            "implements" clauses.
Solution:   Update the Java indent script.
Files:      runtime/indent/java.vim

Patch 6.1a.027
Problem:    A few Syntax menu entries missing or incorrect.
Solution:   Add and correct the menu entries. (Adrien Beau)
            Shorten a few menus to avoid they become too long.
Files:      runtime/makemenu.vim, runtime/menu.vim

Patch 6.1a.028
Problem:    XIM: problems with feedback and some input methods.
Solution:   Use iconv for calculating the cells.  Remove the queue for
            key_press_event only when text was changed. (Yasuhiro Matsumoto)
Files:      src/globals.h, src/mbyte.c, src/screen.c

Patch 6.1a.029
Problem:    After patch 6.1a.028 can't compile GTK version with XIM but
            without multi-byte chars.
Solution:   Add an #ifdef. (Aschwin Marsman)
Files:      src/mbyte.c

Patch 6.1a.030
Problem:    With double-byte encodings toupper() and tolower() may have wrong
            results.
Solution:   Skip double-byte characters. (Eric Long)
Files:      src/eval.c

Patch 6.1a.031
Problem:    Accessing the 'balloondelay' variable may cause a crash.
Solution:   Make the variable for 'balloondelay' a long. (Olaf Seibert)
Files:      src/option.h
```

```
Patch 6.1a.032 (extra)
Problem:    Some menu files used a wrong encoding name for "scriptencoding".
Solution:   Move the translations to a separate file, which is sourced after
            setting "scriptencoding".
            Also add Czech menu translations in ASCII and update the other
            encodings.
Files:      runtime/lang/menu_cs_cz.iso_8859-1.vim,
            runtime/lang/menu_cs_cz.iso_8859-2.vim,
            runtime/lang/menu_czech_czech_republic.1250.vim,
            runtime/lang/menu_czech_czech_republic.1252.vim,
            runtime/lang/menu_czech_czech_republic.ascii.vim,
            runtime/lang/menu_de_de.iso_8859-1.vim,
            runtime/lang/menu_de_de.latin1.vim,
            runtime/lang/menu_fr_fr.iso_8859-1.vim,
            runtime/lang/menu_fr_fr.latin1.vim,
            runtime/lang/menu_french_france.1252.vim,
            runtime/lang/menu_german_germany.1252.vim,
            runtime/lang/menu_ja_jp.euc-jp.vim,
            runtime/lang/menu_ja_jp.utf-8.vim,
            runtime/lang/menu_japanese_japan.932.vim

Patch 6.1a.033
Problem:    XIM: doesn't reset input context.
Solution:   call xim_reset() with im_set_active(FALSE). (Takuhiro Nishioka)
Files:      src/mbyte.c

Patch 6.1a.034 (extra)
Problem:    Win32: The ACL checks for a readonly file still don't work well.
Solution:   Remove the ACL checks, go back to how it worked in Vim 6.0.
Files:      src/os_win32.c

Patch 6.1a.035
Problem:    multi-byte: When using ":sh" in the GUI, typed and displayed
            multi-byte characters are not handled correctly.
Solution:   Deal with multi-byte characters to and from the shell. (Yasuhiro
            Matsumoto)  Also handle UTF-8 composing characters.
Files:      src/os_unix.c

Patch 6.1a.036
Problem:    GTK: the save-yourself event was not handled.
Solution:   Catch the save-yourself event and preserve swap files. (Neil Bird)
Files:      src/gui_gtk_x11.c

Patch 6.1a.037
Problem:    The MS-Windows key mapping doesn't include CTRL-S for saving.
            (Vlad Sandrini)
Solution:   Map CTRL-S to ":update".
Files:      runtime/mswin.vim

Patch 6.1a.038
Problem:    Solaris: Including both sys/sysctl.h and sys/sysinfo.h doesn't
            work. (Antonio Colombo)
Solution:   Don't include sys/sysinfo.h when not calling sysinfo().
```

```
Files:      src/os_unix.c

Patch 6.1a.039
Problem:    Not all visual basic files are recognized.
Solution:   Add checks to catch *.ctl files. (Raul Segura Acevedo)
Files:      runtime/filetype.vim

Patch 6.1a.040
Problem:    A *.pl file is recognized as Perl, but it could be a prolog file.
Solution:   Check the first non-empty line. (Kontra Gergely)
Files:      runtime/filetype.vim

Patch 6.1a.041
Problem:    When pressing the left mouse button in the command line and them
            moving the mouse upwards, nearly all the text is selected.
Solution:   Don't try extending a modeless selection when there isn't one.
Files:      src/ui.c

Patch 6.1a.042
Problem:    When merging files, ":diffput" and ":diffget" are used a lot, but
            they require a lot of typing.
Solution:   Add "dp" for ":diffput" and "do" for ":diffget".
Files:      runtime/doc/diff.txt, src/diff.c, src/normal.c, src/proto/diff.pro

Patch 6.1b.001 (extra)
Problem:    Checking for wildcards in a path does not handle multi-byte
            characters with a trail byte which is a wildcard.
Solution:   Handle multi-byte characters correctly. (Muraoka Taro)
Files:      src/os_amiga.c, src/os_mac.c, src/os_msdos.c, src/os_mswin.c,
            src/os_unix.c

Patch 6.1b.002
Problem:    A regexp that ends in "\{" is not flagged as an error.  May cause
            a stack overflow when 'incsearch' is set. (Gerhard Hochholzer)
Solution:   Handle a missing "}" as an error.
Files:      src/regexp.c

Patch 6.1b.003 (extra)
Problem:    The RISC OS GUI doesn't compile.
Solution:   Include changes since Vim 5.7. (Andy Wingate)
Files:      src/Make_ro.mak, src/gui_riscos.c, src/os_riscos.c,
            src/os_riscos.h, src/proto/gui_riscos.pro

Patch 6.1b.004
Problem:    col("'>") returns a negative number for linewise selection. (Neil
            Bird)
Solution:   Don't add one to MAXCOL.
Files:      src/eval.c

Patch 6.1b.005
Problem:    Using a search pattern that causes an out-of-stack error while
            'hlsearch' is set keeps giving the hit-Enter prompt.
            A search pattern that takes a long time delays typing when
```

```
            'incsearch' is set.
Solution:   Stop 'hlsearch' highlighting when the regexp causes an error.
            Stop searching for 'incsearch' when a character is typed.
Files:      src/globals.h, src/message.c, src/screen.c, src/search.c,
            src/vim.h

Patch 6.1b.006
Problem:    When entering a composing character on the command line with
            CTRL-V, the text isn't redrawn correctly.
Solution:   Redraw the text under and after the cursor.
Files:      src/ex_getln.c

Patch 6.1b.007
Problem:    When the cursor is in the white space between two sentences, "dis"
            deletes the first character of the following sentence, "das"
            deletes a space after the sentence.
Solution:   Backup the cursor one character in these situations.
Files:      src/search.c

Patch 6.1b.008
Problem:    *.xsl files are not recognized as xslt but xml.
            Monk files are not recognized.
Solution:   Delete the duplicate line for *.xsl. (Johannes Zellner)
            Recognize monk files.
Files:      runtime/filetype.vim

Patch 6.1b.009
Problem:    Can't always compile small features and then adding eval feature,
            "sandbox" is undefined. (Axel Kielhorn)
Solution:   Always define "sandbox" when the eval feature is used.
Files:      src/globals.h

Patch 6.1b.010 (extra)
Problem:    When compiling gvimext.cpp with MSVC 4.2 get a number of warnings.
Solution:   Change "true" to "TRUE". (Walter Briscoe)
Files:      GvimExt/gvimext.cpp

Patch 6.1b.011
Problem:    When using a very long string for confirm(), can't quit the
            displaying at the more prompt. (Hari Krishna Dara)
Solution:   Jump to the end of the message to show the choices.
Files:      src/message.c

Patch 6.1b.012
Problem:    Multi-byte: When 'showbreak' is set and a double-wide character
            doesn't fit at the right window edge the cursor gets stuck there.
            Using cursor-left gets stuck when 'virtualedit' is set.  (Eric
            Long)
Solution:   Fix the way the extra ">" character is counted when 'showbreak' is
            set.  Don't correct cursor for virtual editing on a double-wide
            character.
Files:      src/charset.c, src/edit.c

Patch 6.1b.013
```

```
Problem:    A user command that partly matches with a buffer-local user
            command and matches full with a global user command unnecessarily
            gives an 'ambiguous command' error.
Solution:   Find the full global match even after a partly local match.
Files:      src/ex_docmd.c

Patch 6.1b.014
Problem:    EBCDIC: switching mouse events off causes garbage on screen.
            Positioning the cursor in the GUI causes garbage.
Solution:   Insert an ESC in the terminal code. (Ralf Schandl)
            Use "\b" instead of "\010" for KS_LE.
Files:      src/os_unix.c, src/term.c

Patch 6.1b.015
Problem:    Vimtutor has a typo.  Get a warning for "tempfile" if it
            doesn't exist.
Solution:   Move a quote to the end of a line. (Max Ischenko)
            Use "mktemp" first, more systems have it.
Files:      src/vimtutor

Patch 6.1b.016
Problem:    GTK: loading a fontset that works partly, Vim might hang or crash.
Solution:   Avoid that char_width becomes zero. (Yasuhiro Matsumoto)
Files:      src/gui_gtk_x11.c

Patch 6.1b.017
Problem:    GUI: When using ":shell" and there is a beep, nothing happens.
Solution:   Call vim_beep() to produce the beep from the shell. (Yasuhiro
            Matsumoto)
Files:      src/message.c

Patch 6.1b.018 (depends on 6.1b.006)
Problem:    When entering the encryption key, special keys may still reveal
            the typed characters.
Solution:   Make sure stars are used or nothing is shown in all cases.
Files:      src/digraph.c, src/getchar.c, src/ex_getln.c

Patch 6.1b.019 (depends on 6.1b.005)
Problem:    A search pattern that takes a long time slows down typing when
            'incsearch' is set.
Solution:   Pass SEARCH_PEEK to dosearch().
Files:      src/ex_getln.c

Patch 6.1b.020
Problem:    When using the matchit plugin, "%" finds a match on the "end" of a
            ":syntax region" command in Vim scripts.
Solution:   Skip over ":syntax region" commands by setting b:match_skip.
Files:      runtime/ftplugin/vim.vim

Patch 6.1b.021
Problem:    when 'mousefocus' is set, CTRL-W CTRL-] sometimes doesn't warp the
            pointer to the new window. (Robert Webb)
Solution:   Don't reset need_mouse_correct when checking the timestamp of a
            file.
```

```
Files:      src/fileio.c

Patch 6.1b.022
Problem:    With lots of folds "j" does not obey 'scrolloff' properly.
            (Srinath Avadhanula)
Solution:   Go to end of the fold before counting context lines.
Files:      src/move.c

Patch 6.1b.023
Problem:    On MS-Windows system() may cause checking timestamps, because Vim
            loses and gains input focus, while this doesn't happen on Unix.
Solution:   Don't check timestamps while system() is busy.
Files:      src/ex_cmds2.c, src/fileio.c, src/globals.h, src/misc1.c

Patch 6.1b.024 (extra)
Problem:    Gettext 0.11 complains that "sjis" is not a standard name.
Solution:   Use "cp932" instead.
Files:      src/po/sjiscorr.c

Patch 6.1b.025 (extra)
Problem:    Win32: When closing gvim while it is minimized  and has a changed
            file, the file-changed dialog pops up in a corner of the screen.
Solution:   Put the dialog in the middle of the screen.
Files:      src/gui_w48.c

Patch 6.1b.026
Problem:    When 'diffopt' contains 'iwhite' but not 'icase': differences in
            case are not highlighted properly. (Gerhard Hochholzer)
Solution:   Don't ignore case when ignoring white space differences.
Files:      src/diff.c

Patch 6.1b.027
Problem:    "vim --remote +" may cause a crash.
Solution:   Check for missing file name argument. (Martin Kahlert)
Files:      src/main.c

Patch 6.1b.028 (extra)
Problem:    Win16: Can't compile after patch 6.1b.025.
Solution:   Add code specifically for Win16. (Vince Negri)
Files:      src/gui_w48.c

Patch 6.1b.029
Problem:    Win32: When a directory on an NTFS partition is read/execute (no
            delete,modify,write) and the file has modify rights, trying to
            write the file deletes it.  Making the file read/write/execute
            (not delete) solves it. (Mark Canup)
Solution:   Use the Unix code to check for a writable directory.  If not, then
            make a backup copy and overwrite the file.
Files:      src/fileio.c

Patch 6.1b.030 (extra)
Problem:    Mac: small mistake in the build script and prototypes.
Solution:   Fix the build script and add the prototypes. (Axel Kielhorn)
Files:      src/os_mac.build, src/gui_mac.c
```

```
Patch 6.1b.031 (extra)
Problem:    Win32 GUI: ":set guifont=*" doesn't set 'guifont' to the resulting
            font name. (Vlad Sandrini)
Solution:   Put the code back in gui_mch_init_font() to form the font name out
            of the logfont.
Files:      src/gui_w48.c

Patch 6.1b.032
Problem:    Athena: Setting a color scheme before the GUI has started causes a
            crash. (Todd Blumer)
Solution:   Don't try using color names that haven't been set yet.
Files:      src/gui_athena.c

Patch 6.1b.033
Problem:    When using a count after a ":s" command may get ml_get errors.
            (Dietmar Lang)
Solution:   Check that the resulting range does not go past the end of the
            buffer.
Files:      src/ex_cmds.c

Patch 6.1b.034
Problem:    After sourcing mswin.vim, when using <C-S-Right> after
            auto-indenting and then <Del>, get warning for allocating
            ridiculous amount of memory. (Dave Delgreco)
Solution:   Adjust the start of the Visual area when deleting the auto-indent.
Files:      src/edit.c

Patch 6.1b.035
Problem:    When using evim, dropping a file on Vim and then double clicking
            on a word, it is changed to "i". (Merlin Hansen)
Solution:   Reset need_start_insertmode after editing the file.
Files:      src/ex_docmd.c

==============================================================================
VERSION 6.2                                                  version-6.2

This section is about improvements made between version 6.1 and 6.2.

This is mainly a bug-fix release.  There are also a few new features.

Main new features:
- Support for GTK 2. (Daniel Elstner)
- Support for editing Arabic text. (Nadim Shaikli & Isam Bayazidi)
- ":try" command and exception handling. (Servatius Brandt)
- Support for the neXtaw GUI toolkit (mostly like Athena). (Alexey Froloff)
- Cscope support for Win32. (Khorev Sergey)
- Support for PostScript printing in various 8-bit encodings. (Mike Williams)

Changed                                                      changed-6.2
-------
```

Removed the scheme indent file, the internal Lisp indenting works well now.

Moved the GvimEXt, OleVim and VisVim directories into the "src" directory.
This is more consistent with how xxd is handled.

The VisVim.dll file is installed in the top directory, next to gvimext.dll,
instead of in a subdirectory "VisVim". Fixes that NSIS was uninstalling it
from the wrong directory.

Removed the art indent file, it didn't do anything.

submatch() returned line breaks with CR instead of LF.

Changed the Win32 Makefiles to become more uniform and compile gvimext.dll.
(Dan Sharp)

'cindent': Align a "//" comment with a "//" comment in a previous line.
(Helmut Stiegler)

Previously only for xterm-like terminals parent widgets were followed to find
the title and icon label. Now do this for all terminal emulators.

Made it possible to recognize backslashes for "%" matching. The 'M' flag in
'cpoptions' disables it. (Haakon Riiser)

Removed the Make_tcc.mak makefile for Turbo C. It didn't work and we probably
can't make it work (the compiler runs out of memory).

Even though the documentation refers to keywords, "[CTRL-D" was using
'isident' to find matches. Changed it to use 'iskeyword'. Also applies to
other commands that search for defined words in included files such as
":dsearch", "[D" and "[d".

Made 'keywordprg' global-local. (Christian Robinson)

Enabled the Netbeans interface by default. Reversed the configure argument
from "--enable-netbeans" to "--disable-netbeans".

Added   added-6.2

New options:
	'arabic'
	'arabicshape'
	'ambiwidth'
	'autochdir'
	'casemap'
	'copyindent'
	'cscopequickfix'
	'preserveindent'
	'printencoding'
	'rightleftcmd'
	'termbidi'

```
        'toolbariconsize'
        'winfixheight'

New keymaps:
        Serbian (Aleksandar Veselinovic)
        Chinese Pinyin (Fredrik Roubert)
        Esperanto (Antoine J. Mechelynck)

New syntax files:
        Valgrind (Roger Luethi)
        Smarty template (Manfred Stienstra)
        MySQL (Kenneth Pronovici)
        RockLinux package description (Piotr Esden-Tempski)
        MMIX (Dirk Huesken)
        gkrellmrc (David Necas)
        Tilde (Tobias Rundtrom)
        Logtalk (Paulo Moura)
        PLP (Juerd Waalboer)
        fvwm2m4 (David Necas)
        IPfilter (Hendrik Scholz)
        fstab (Radu Dineiu)
        Quake (Nikolai Weibull)
        Occam (Mario Schweigler)
        lpc (Shizhu Pan)
        Exim conf (David Necas)
        EDIF (Artem Zankovich)
        .cvsrc (Nikolai Weibull)
        .fetchmailrc (Nikolai Weibull)
        GNU gpg (Nikolai Weibull)
        Grub (Nikolai Weibull)
        Modconf (Nikolai Weibull)
        RCS (Dmitry Vasiliev)
        Art (Dorai Sitaram)
        Renderman Interface Bytestream (Andrew J Bromage)
        Mailcap (Doug Kearns)
        Subversion commit file (Dmitry Vasiliev)
        Microsoft IDL (Vadim Zeitlin)
        WildPackets EtherPeek Decoder (Christopher Shinn)
        Spyce (Rimon Barr)
        Resolv.conf (Radu Dineiu)
        A65 (Clemens Kirchgatterer)
        sshconfig and sshdconfig (David Necas)
        Cheetah and HTMLCheetah (Max Ischenko)
        Packet filter (Camiel Dobbelaar)

New indent files:
        Eiffel (David Clarke)
        Tilde (Tobias Rundtrom)
        Occam (Mario Schweigler)
        Art (Dorai Sitaram)
        PHP (Miles Lott)
        Dylan (Brent Fulgham)

New tutor translations:
```

```
        Slovak (Lubos Celko)
        Greek (Christos Kontas)
        German (Joachim Hofmann)
        Norwegian (Øyvind Holm)

New filetype plugins:
        Occam (Mario Schweigler)
        Art (Dorai Sitaram)
        ant.vim, aspvbs.vim, config.vim, csc.vim, csh.vim, dtd.vim, html.vim,
        jsp.vim, pascal.vim, php.vim, sgml.vim, sh.vim, svg.vim, tcsh.vim,
        xhtml.vim, xml.vim, xsd.vim.  (Dan Sharp)

New compiler plugins:
        Checkstyle (Doug Kearns)
        g77 (Ralf Wildenhues)
        fortran (Johann-Guenter Simon)
        Xmllint (Doug Kearns)
        Ruby (Tim Hammerquist)
        Modelsim vcom (Paul Baleme)

New menu translations:
        Brazilian (José de Paula)
        British (Mike Williams)
        Korean in UTF-8. (Nam SungHyun)
        Norwegian (Øyvind Holm)
        Serbian (Aleksandar Jelenak)

New message translation for Norwegian. (Øyvind Holm)

New color scheme:
        desert (Hans Fugal)

Arabic specific features.  'arabicshape', 'termbidi', 'arabic' and
'rightleftcmd' options.  (Nadim Shaikli & Isam Bayazidi)

Support for neXtaw GUI toolkit, mostly like Athena. (Alexey Froloff)

Win32: cscope support. (Khorev Sergey)

VMS: various improvements to documentation and makefiles.  (Zoltan Arpadffy)

Added "x" key to the explorer plugin: execute the default action. (Yasuhiro
Matsumoto)

Compile gvimext.dll with MingW. (Rene de Zwart)

Add the "tohtml.vim" plugin.  It defines the ":TOhtml" user command, an easy
way to convert text to HTML.

Added ":try" / ":catch" / ":finally" / ":endtry" commands.  Add E999 numbers
to all error messages, so that they can be caught by the number.
(Servatius Brandt)
Moved part of ex_docmd.c to the new ex_eval.c source file.
```

Include support for GTK+ 2.2.x (Daniel Elstner)
Adds the "~" register: drag & drop text.
Adds the 'toolbariconsize' option.
Add -Dalloca when running lint to work around a problem with alloca()
prototype.

When selecting an item in the error window to jump to, take some effort to
find an ordinary window to show the file in (not a preview window).

Support for PostScript printing of various 8-bit encodings. (Mike Williams)

inputdialog() accepts a third argument that is used when the dialog is
cancelled. Makes it possible to see a difference between cancelling and
entering nothing.

Included Aap recipes. Can be used to update Vim to the latest version,
building and installing.

"/" option in 'cinoptions': extra indent for comment lines. (Helmut Stiegler)

Vim variable "v:register" and functions setreg(), getreg() and getregtype().
(Michael Geddes)

"v" flag in 'cpoptions': Leave text on screen with backspace in Insert mode.
(Phillip Vandry)

Dosinst.exe also finds gvimext.dll in the "GvimExt" directory. Useful when
running install in the "src" directory for testing.

Support tag files that were sorted with case ignored. (Flemming Madsen)

When completing a wildcard in a leading path element, as in "../*/Makefile",
only the last part ("Makefile") was listed. Support custom defined
command line completion. (Flemming Madsen)

Also recognize "rxvt" as an xterm-like terminal. (Tomas Styblo)

Proper X11 session management. Fixes that the WM_SAVE_YOURSELF event was not
used by popular desktops. (Neil Bird)
Not used for Gnome 2, it has its own handling.

Support BOR, DEBUG and SPAWNO arguments for the Borland 3 Makefile. (Walter
Briscoe)

Support page breaks for printing. Adds the "formfeed" field in
'printoptions'. (Mike Williams)

Mac OSX: multi-language support: iconv and gettext. (Muraoka Taro, Axel
Kielhorn)

"\Z" flag in patterns: ignore differences in combining characters. (Ron Aaron)

Added 'preserveindent' and 'copyindent' options. They use existing white
space characters instead of using Tabs as much as possible. (Chris Leishman)

Updated Unicode tables to Unicode 4.0. (Raphael Finkel)

Support for the mouse wheel in rxvt. (AIDA Shinra)

Win32: Added ":8" file modifier to get short filename. Test50 tests the ":8"
expansion on Win32 systems. (Michael Geddes)

'cscopequickfix' option: Open quickfix window for Cscope commands. Also
cleanup the code for giving messages. (Khorev Sergey)

GUI: Support more than 222 columns for mouse positions.

":stopinsert" command: Don't return to Insert mode.

"interrupt" command for debug mode. Useful for simulating CTRL-C. (Servatius
Brandt)

Fixed   fixed-6.2

Removed a few unused #defines from config.h.in, os_os2_cfg.h and os_vms_conf.h.

The Vim icons in PNG format didn't have a transparent background. (Greg
Roelofs)

Fixed a large number of spelling mistakes in the docs. (Adri Verhoef)

The #defines for prototype generation were causing trouble. Changed them to
typedefs.

A new version of libintl.h uses __asm__, which confuses cproto. Define a
dummy __asm__ macro.

When 'virtualedit' is set can't move to halfway an unprintable character.
Cripples CTRL-V selection. (Taro Muraoka)
Allow moving to halfway an unprintable character. Don't let getvvcol() change
the pos->coladd argument.

When a tab wraps to the next line, 'listchars' is set and 'foldcolumn' is
non-zero, only one character of the foldcolumn is highlighted. (Muraoka Taro)

When using ":catch" without an argument Vim crashes. (Yasuhiro Matsumoto)
When no argument given use the ".*" pattern.

Win32: When gvim.exe is started from a shortcut with the window style property
set to maximize Vim doesn't start with a maximized window. (Yasuhiro
Matsumoto) Open the window with the default size and don't call ShowWindow()
again when it's already visible. (Helmut Stiegler)

gui_gtk.c used MAX, but it's undefined to avoid a conflict with system header
files.

Win32: When closing a window from a mapping some pixels remain on the statusline. (Yasuhiro Matsumoto)

A column number in an errorformat that goes beyond the end of the line may cause a crash.

":throw 'test'" crashes Vim. (Yasuhiro Matsumoto)

The file selector's scrollbar colors are not set after doing a ":hi Scrollbar guifg=color". And the file selector's colors are not changed by the colorscheme command. (David Harrison)

Motif: When compiling with FEAT_FOOTER defined, the text area gets a few pixels extra space on the right. Remove the special case in gui_get_base_width(). (David Harrison)

Using CTRL-R CTRL-P in Insert mode puts the '] mark in the wrong position. (Helmut Stiegler)

When 'formatoptions' includes "awct" a non-comment wasn't auto-formatted.

Using a "--cmd" argument more than 10 times caused a crash.

DEC style mouse support didn't work if the page field is not empty. (Uribarri)

"vim -l one two" did only set 'lisp' in the first file. Vi does it for every file.

":set tw<" didn't work. Was checking for '^' instead of '<'.

In ":hardcopy > %.ps" the "%" was not expanded to the current filename.

Made ":redraw" also update the Visual area.

When a not implemented command, such as ":perl", has wrong arguments the less important error was reported, giving the user the idea the command could work.

On non-Unix systems autocommands for writing did not attempt a match with the short file name, causing a pattern like "a/b" to fail.

VMS: e_screenmode was not defined and a few other fixes for VMS. (Zoltan Arpadffy)

redraw_msg() depended on FEAT_ARABIC instead of FEAT_RIGHTLEFT. (Walter Briscoe)

Various changes for the PC Makefiles. (Walter Briscoe)

Use _truename() instead of our own code to expand a file name into a full path. (Walter Briscoe)

Error in filetype check for /etc/modutils. (Lubomir Host)

Cscope interface: allocated a buffer too small.

Win16: remove a trailing backslash from a path when obtaining the permission flags. (Vince Negri)

When searching for tags with case ignored Vim could hang.

When searching directories with a stopdir could get a crash. Did not re-allocate enough memory. (Vince Negri)

A user command may cause a crash. Don't use the command index when it's negative. (Vince Negri)

putenv() didn't work for MingW and Cygwin. (Dan Sharp)

Many functions were common between os_msdos.c and os_win16.c. Use os_msdos.c for compiling the Win16 version and remove the functions from os_win16.c. (Vince Negri)

For terminals that behave like an xterm but didn't have a name that is recognized, the window title would not always be set.

When syntax highlighting is off ":hardcopy" could still attempt printing colors.

Crash when using ":catch" without an argument. (Servatius Brandt)

Win32: ":n #" doubled the backslashes.

Fixed Arabic shaping for the command line. (Nadim Shaikli)

Avoid splitting up a string displayed on the command line into individual characters, it breaks Arabic shaping.

Updated Cygwin and MingW makefiles to use more dependencies. (Dan Sharp)

2html.vim didn't work with 'nomagic' set.

When a local argument list is used and doing ":only" Vim could crash later. (Muraoka Taro)

When using "%P" in 'statusline' and the fillchar is "-", a percentage of 3% could result in "-3%". Also avoid changing a space inside a filename to the fill character.

MSwin: Handling of backslashes and double quotes for command line arguments was not like what other applications do. (Walter Briscoe)

Test32 sometimes didn't work, because test11.out was written as TEST11.OUT.

Avoid pointer conversions warnings for Borland C 5.5 in dosinst.c and uninstal.c.

More improvements for Make_bc3.mak file. (Walter Briscoe)

When ":syn sync linebreaks=1" is used, editing the first line caused a redraw of the whole screen.

Making translated messages didn't work, if_perl.xs wasn't found. (Vlad Sandrini)

Motif and Athena: moving Vim to the foreground didn't uniconify it. Use XMapRaised() instead of XRaiseWindow(). (Srikanth Sankaran)

When using ":ptag" in a window where 'scrollbind' is set the preview window would also have 'scrollbind' set. Also reset 'foldcolumn' and 'diff'.

Various commands that split a window took over 'scrollbind', which is hardly ever desired. Esp. for "q:" and ":copen". Mostly reset 'scrollbind' when splitting a window.

When 'shellslash' is set in the vimrc file the first entry of ":scriptnames" would still have backslashes. Entries in the quickfix list could also have wrong (back)slashes.

Win32: printer dialog texts were not translated. (Yasuhiro Matsumoto)

When using a multi-byte character with a K_SPECIAL byte or a special key code with "--remote-send" the received byte sequence was mangled. Put it in the typeahead buffer instead of the input buffer.

Win32: The cursor position was incorrect after changing cursor shape. (Yasuhiro Matsumoto).

Win32: When 'encoding' is not the current codepage the title could not be set to non-ascii characters.

"vim -d scp://machine/file1 scp://machine/file2" did not work, there was only one window. Fixed the netrw plugin not to wipe out the buffer if it is displayed in other windows.

"/$" caused "e" in last column of screen to disappear, a highlighted blank was displayed instead.

":s/ *\ze\n//e" removed the line break and introduced arbitrary text. Was using the line count including what matched after the "\ze".

Using the "c" flag with ":s" changed the behavior when a line break is replaced and "\@<=" is used. Without "c" a following match was not found.

":%s/\vA@<=\nB@=//gce" got stuck on "A\nB" when entering "n".

VMS: add HAVE_STRFTIME in the config file. (Zoltan Arpadffy)

When a delete prompts if a delete should continue when yanking is not possible, restore msg_silent afterwards.

":sign" did not complain about a missing argument.

When adding or deleting a sign 'hlsearch' highlighting could disappear.
Use the generic functions for updating signs.

On MS-Windows NT, 2K and XP don't use command.com but cmd.exe for testing.
Makes the tests work on more systems.

In the DOS tests don't create "/tmp" to avoid an error.

Mac classic: Problems with reading files with CR vs CR/LF. Rely on the
library version of fgets() to work correctly for Metrowerks 2.2. (Axel
Kielhorn)

When typing a password a "*" was shown for each byte instead of for each
character. Added multi-byte handling to displaying the stars. (Yasuhiro
Matsumoto)

When using Perl 5.6 accessing $curbuf doesn't work. Add an #ifdef to use
different code for 5.6 and 5.8. (Dan Sharp)

MingW and Cygwin: Don't strip the debug executable. (Dan Sharp)

An assignment to a variable with curlies that includes "==" doesn't work.
Skip over the curlies before searching for an "=". (Vince Negri)

When cancelling the selection of alternate matching tags the tag stack index
could be advanced too far, resulting in an error message when using CTRL-T.

Patch 6.1.001
Problem: When formatting UTF-8 text it might be wrapped at a space that is
            followed by a composing character. (Raphael Finkel)
            Also correct a display error for removing a composing char on top
            of a space.
Solution: Check for a composing character on a space.
Files: src/edit.c, src/misc1.c, src/screen.c

Patch 6.1.002 (extra)
Problem: Win32: after a ":popup" command the mouse pointer stays hidden.
Solution: Unhide the mouse pointer before showing the menu.
Files: src/gui_w48.c

Patch 6.1.003
Problem: When 'laststatus' is zero and there is a vertical split, the
            vertical separator is drawn in the command line. (Srikant
            Sankaran)
Solution: Don't draw the vertical separator where there is no statusline.
Files: src/screen.c

Patch 6.1.004
Problem: Unicode 3.2 changes width and composing of a few characters.
            (Markus Kuhn)
Solution: Adjust the Unicode functions for the character width and composing
            characters.

```
Files:      src/mbyte.c

Patch 6.1.005
Problem:    When using more than 50 items in 'statusline' Vim might crash.
            (Steve Hall)
Solution:   Increment itemcnt in check_stl_option(). (Flemming Madsen)
Files:      src/option.c

Patch 6.1.006
Problem:    When using "P" in Visual mode to put linewise selected text, the
            wrong text is deleted. (Jakub Turski)
Solution:   Put the text before the Visual area and correct the text to be
            deleted for the inserted lines.
            Also fix that "p" of linewise text in Visual block mode doesn't
            work correctly.
Files:      src/normal.c, src/ops.c

Patch 6.1.007
Problem:    Using ":filetype plugin off" when filetype plugins were never
            enabled causes an error message. (Yiu Wing)
Solution:   Use ":silent!" to avoid the error message.
Files:      runtime/ftplugof.vim

Patch 6.1.008
Problem:    The "%" command doesn't ignore \" inside a string, it's seen as
            the end of the string. (Ken Clark)
Solution:   Skip a double quote preceded by an odd number of backslashes.
Files:      src/search.c

Patch 6.1.009
Problem:    Vim crashes when using a huge number for the maxwid value in a
            statusline. (Robert M. Nowotniak)
Solution:   Check for an overflow that makes maxwid negative.
Files:      src/buffer.c

Patch 6.1.010
Problem:    Searching backwards for a question mark with "?\?" doesn't work.
            (Alan Isaac)  Same problem in ":s?\??" and ":g?\??".
Solution:   Change the "\?" in a pattern to "?" when using "?" as delimiter.
Files:      src/ex_cmds.c, src/ex_docmd.c, src/proto/regexp.pro, src/regexp.c,
            src/search.c, src/syntax.c, src/tag.c

Patch 6.1.011
Problem:    XIM: doesn't work correctly when 'number' is set.  Also, a focus
            problem when selecting candidates.
Solution:   Fix the XIM problems. (Yasuhiro Matsumoto)
Files:      src/mbyte.c, src/screen.c

Patch 6.1.012
Problem:    A system() call might fail if fread() does CR-LF to LF
            translation.
Solution:   Open the output file in binary mode. (Pavol Huhas)
Files:      src/misc1.c
```

```
Patch 6.1.013
Problem:    Win32: The default for 'printexpr' doesn't work when there are
            special characters in 'printdevice'.
Solution:   Add double quotes around the device name. (Mike Williams)
Files:      runtime/doc/option.txt, src/option.c

Patch 6.1.014
Problem:    An operator like "r" used in Visual block mode doesn't use
            'virtualedit' when it's set to "block".
Solution:   Check for 'virtualedit' being active in Visual block mode when the
            operator was started.
Files:      src/ex_docmd.c, src/globals.h, src/misc2.c, src/normal.c,
            src/ops.c, src/undo.c

Patch 6.1.015
Problem:    After patch 6.1.014 can't compile with tiny features. (Christian
            J. Robinson)
Solution:   Add the missing define of virtual_op.
Files:      src/vim.h

Patch 6.1.016 (extra)
Problem:    Win32: Outputting Hebrew or Arabic text might have a problem with
            reversing.
Solution:   Replace the RevOut() function with ETO_IGNORELANGUAGE. (Ron Aaron)
Files:      src/gui_w32.c

Patch 6.1.017
Problem:    Cygwin: After patch 6.1.012 Still doesn't do binary file I/O.
            (Pavol Juhas)
Solution:   Define BINARY_FILE_IO for Cygwin.
Files:      src/os_unix.h

Patch 6.1.018
Problem:    Error message when using cterm highlighting. (Leonardo Di Lella)
Solution:   Remove a backslash before a question mark.
Files:      runtime/syntax/cterm.vim

Patch 6.1.019 (extra)
Problem:    Win32: File name is messed up when editing just a drive name.
            (Walter Briscoe)
Solution:   Append a NUL after the drive name. (Vince Negri)
Files:      src/os_win32.c

Patch 6.1.020
Problem:    col("'>") returns a huge number after using Visual line mode.
Solution:   Return the length of the line instead.
Files:      src/eval.c

Patch 6.1.021 (depends on patch 6.1.009)
Problem:    Vim crashes when using a huge number for the minwid value in a
            statusline. (Robert M. Nowotniak)
Solution:   Check for an overflow that makes minwid negative.
Files:      src/buffer.c
```

```
Patch 6.1.022
Problem:    Grabbing the status line above the command-line window works like
            the bottom status line was grabbed. (Jim Battle)
Solution:   Make it possible to grab the status line above the command-line
            window, so that it can be resized.
Files:      src/ui.c

Patch 6.1.023 (extra)
Problem:    VMS: running tests doesn't work properly.
Solution:   Adjust the makefile. (Zoltan Arpadffy)
Files:      src/testdir/Make_vms.mms

Patch 6.1.024
Problem:    When header files use a new syntax for declaring functions, Vim
            can't figure out missing prototypes properly.
Solution:   Accept braces around a function name. (M. Warner Losh)
Files:      src/osdef.sh

Patch 6.1.025
Problem:    Five messages for "vim --help" don't start with a capital. (Vlad
            Sandrini)
Solution:   Make the messages consistent.
Files:      src/main.c

Patch 6.1.026
Problem:    *.patch files are not recognized as diff files.  In a script a
            "VAR=val" argument after "env" isn't ignored.  PHP scripts are not
            recognized.
Solution:   Add *.patch for diff filetypes.  Ignore "VAR=val".  Recognize PHP
            scripts. (Roman Neuhauser)
Files:      runtime/filetype.vim, runtime/scripts.vim

Patch 6.1.027
Problem:    When 'foldcolumn' is non-zero, a special character that wraps to
            the next line disturbs the foldcolumn highlighting.  (Yasuhiro
            Matsumoto)
Solution:   Only use the special highlighting when drawing text characters.
Files:      src/screen.c

Patch 6.1.028
Problem:    Client-server: When a --remote-expr fails, Vim still exits with
            status zero.
Solution:   Exit Vim with a non-zero status to indicate the --remote-expr
            failed. (Thomas Scott Urban)
Files:      src/main.c

Patch 6.1.029
Problem:    When 'encoding' is an 8-bit encoding other than "latin1", editing
            a utf-8 or other Unicode file uses the wrong conversion. (Jan
            Fedak)
Solution:   Don't use Unicode to latin1 conversion for 8-bit encodings other
            than "latin1".
Files:      src/fileio.c
```

```
Patch 6.1.030
Problem:    When CTRL-N is mapped in Insert mode, it is also mapped after
            CTRL-X CTRL-N, while it is not mapped after CTRL-X CTRL-F.
            (Kontra Gergely)
Solution:   Don't map CTRL-N after CTRL-X CTRL-N.  Same for CTRL-P.
Files:      src/getchar.c

Patch 6.1.031
Problem:    Cygwin: Xxd could read a file in text mode instead of binary mode.
Solution:   Use "rb" or "rt" when needed. (Pavol Juhas)
Files:      src/xxd/xxd.c

Patch 6.1.032
Problem:    Can't specify a quickfix file without jumping to the first error.
Solution:   Add the ":cgetfile" command. (Yegappan Lakshmanan)
Files:      runtime/doc/index.txt, runtime/doc/quickfix.txt, src/ex_cmds.h,
            src/quickfix.c

Patch 6.1.033
Problem:    GUI: When the selection is lost and the Visual highlighting is
            changed to underlining, the cursor is left in a different
            position. (Christian Michon)
Solution:   Update the cursor position after redrawing the selection.
Files:      src/ui.c

Patch 6.1.034
Problem:    A CVS diff file isn't recognized as diff filetype.
Solution:   Skip lines starting with "? " before checking for an "Index:" line.
Files:      runtime/scripts.vim

Patch 6.1.035 (extra, depends on 6.1.016)
Problem:    Win32: Outputting Hebrew or Arabic text might have a problem with
            reversing on MS-Windows 95/98/ME.
Solution:   Restore the RevOut() function and use it in specific situations
            only. (Ron Aaron)
Files:      src/gui_w32.c

Patch 6.1.036
Problem:    This command may cause a crash: ":v/./,//-j". (Ralf Arens)
Solution:   Compute the right length of the regexp when it's empty.
Files:      src/search.c

Patch 6.1.037
Problem:    When 'lazyredraw' is set, pressing "q" at the hit-enter prompt
            causes an incomplete redraw and the cursor isn't positioned.
            (Lubomir Host)
Solution:   Overrule 'lazyredraw' when do_redraw is set.
Files:      src/main.c, src/screen.c

Patch 6.1.038
Problem:    Multi-byte: When a ":s" command contains a multi-byte character
            where the trail byte is '~' the text is messed up.
Solution:   Properly skip multi-byte characters in regtilde() (Muraoka Taro)
Files:      src/regexp.c
```

```
Patch 6.1.039
Problem:    When folds are defined and the file is changed outside of Vim,
            reloading the file doesn't update the folds. (Anders
            Schack-Nielsen)
Solution:   Recompute the folds after reloading the file.
Files:      src/fileio.c

Patch 6.1.040
Problem:    When changing directory for expanding a file name fails there is
            no error message.
Solution:   Give an error message for this situation.  Don't change directory
            if we can't return to the original directory.
Files:      src/diff.c, src/ex_docmd.c, src/globals.h, src/misc1.c,
            src/os_unix.c

Patch 6.1.041
Problem:    ":mkvimrc" doesn't handle a mapping that has a leading space in
            the rhs. (Davyd Ondrejko)
Solution:   Insert a CTRL-V before the leading space.  Also display leading
            and trailing white space in <> form.
Files:      src/getchar.c, src/message.c

Patch 6.1.042
Problem:    "vim -r" doesn't show all matches when 'wildignore' removes swap
            files. (Steve Talley)
Solution:   Keep all matching swap file names.
Files:      src/memline.c

Patch 6.1.043
Problem:    After patch 6.1.040 a few warnings are produced.
Solution:   Add a type cast to "char *" for mch_chdir(). (Axel Kielhorn)
Files:      src/diff.c, src/ex_docmd.c.c, src/misc1.c, src/os_unix.c

Patch 6.1.044 (extra)
Problem:    GUI: When using the find/replace dialog with text that contains a
            slash, an invalid substitute command is generated.
            On Win32 a find doesn't work when 'insertmode' is set.
Solution:   Escape slashes with a backslash.
            Make the Win32, Motif and GTK gui use common code for the
            find/replace dialog.
            Add the "match case" option for Motif and GTK.
Files:      src/feature.h, src/proto/gui.pro, src/gui.c, src/gui.h,
            src/gui_motif.c, src/gui_gtk.c, src/gui_w48.c

Patch 6.1.045
Problem:    In Visual mode, with lots of folds and 'scrolloff' set to 999,
            moving the cursor down near the end of the file causes the text to
            jump up and down. (Lubomir Host)
Solution:   Take into account that the cursor may be on the last line of a
            closed fold.
Files:      src/move.c

Patch 6.1.046
```

```
Problem:    X11 GUI: ":set lsp=2 gcr=n-v-i:hor1-blinkon0" draws a black
            rectangle.  ":set lsp=2 gcr=n-v-i:hor10-blinkon0" makes the cursor
            disappear.  (Nam SungHyun)
Solution:   Correctly compute the height of the horizontal cursor.
Files:      src/gui_gtk_x11.c, src/gui_x11.c

Patch 6.1.047
Problem:    When skipping commands after an error was encountered, expressions
            for ":if", ";elseif" and ":while" are still evaluated.
Solution:   Skip the expression after an error. (Servatius Brandt)
Files:      src/ex_docmd.c

Patch 6.1.048
Problem:    Unicode 3.2 changes were missing a few Hangul Jamo characters.
Solution:   Recognize more characters as composing characters. (Jungshik Shin)
Files:      src/mbyte.c

Patch 6.1.049 (extra)
Problem:    On a 32 bit display a valid color may cause an error message,
            because its pixel value is negative. (Chris Paulson-Ellis)
Solution:   Check for -11111 instead of the color being negative.
            Don't add one to the pixel value, -1 may be used for white.
Files:      src/globals.h, src/gui.c, src/gui.h, src/gui_amiga.c,
            src/gui_athena.c, src/gui_beos.cc, src/gui_gtk_x11.c,
            src/gui_mac.c, src/gui_motif.c, src/gui_photon.c,
            src/gui_riscos.c, src/gui_w16.c, src/gui_w32.c, src/gui_w48.c,
            src/gui_x11.c, src/mbyte.c, src/syntax.c

Patch 6.1.050 (depends on 6.1.049)
Problem:    After patch 6.1.049 the non-GUI version doesn't compile.
Solution:   Add an #ifdef FEAT_GUI.  (Robert Stanton)
Files:      src/syntax.c

Patch 6.1.051 (depends on 6.1.044)
Problem:    Doesn't compile with GUI and small features.
Solution:   Adjust the #if for ga_append().
Files:      src/misc2.c

Patch 6.1.052
Problem:    Unix: The executable() function doesn't work when the "which"
            command isn't available.
Solution:   Go through $PATH manually.  Also makes it work for VMS.
Files:      src/os_unix.c

Patch 6.1.053
Problem:    When 'sessionoptions' contains "globals", or "localoptions" and an
            option value contains a line break, the resulting script is wrong.
Solution:   Use "\n" and "\r" for a line break. (Srinath Avadhanula)
Files:      src/eval.c

Patch 6.1.054
Problem:    GUI: A mouse click is not recognized at the more prompt, even when
            'mouse' includes 'r'.
Solution:   Recognize a mouse click at the more prompt.
```

```
            Also accept a mouse click in the last line in the GUI.
            Add "ml" entry in 'mouseshape'.
Files:      src/gui.c, src/message.c, src/misc1.c, src/misc2.c, src/option.c,
            src/structs.h

Patch 6.1.055
Problem:    When editing a compressed file, Vim will inspect the contents to
            guess the filetype.
Solution:   Don't source scripts.vim for .Z, .gz, .bz2, .zip and .tgz files.
Files:      runtime/filetype.vim, runtime/plugin/gzip.vim

Patch 6.1.056
Problem:    Loading the Syntax menu can take quite a bit of time.
Solution:   Add the "skip_syntax_sel_menu" variable.  When it's defined the
            available syntax files are not in the Syntax menu.
Files:      runtime/doc/gui.txt, runtime/menu.vim

Patch 6.1.057
Problem:    An ESC inside a mapping doesn't work as documented when
            'insertmode' is set, it does go from Visual or Normal mode to
            Insert mode. (Benji Fisher)
Solution:   Make it work as documented.
Files:      src/normal.c

Patch 6.1.058
Problem:    When there is a closed fold just above the first line in the
            window, using CTRL-X CTRL-Y in Insert mode will show only one line
            of the fold. (Alexey Marinichev)
Solution:   Correct the topline by putting it at the start of the fold.
Files:      src/move.c

Patch 6.1.059
Problem:    ":redir > ~/file" doesn't work. (Stephen Rasku)
Solution:   Expand environment variables in the ":redir >" argument.
Files:      src/ex_docmd.c

Patch 6.1.060
Problem:    When 'virtualedit' is set and 'selection' is "exclusive", deleting
            a character just before a tab changes the tab into spaces.  Undo
            doesn't restore the tab. (Helmut Stiegler)
Solution:   Don't replace the tab by spaces when it's not needed.  Correctly
            save the line before it's changed.
Files:      src/ops.c

Patch 6.1.061
Problem:    When 'virtualedit' is set and 'selection' is "exclusive", a Visual
            selection that ends just after a tab doesn't include that tab in
            the highlighting.  (Helmut Stiegler)
Solution:   Use a different way to exclude the character under the cursor.
Files:      src/screen.c

Patch 6.1.062
Problem:    The "man" filetype plugin doesn't work properly on Solaris 5.
Solution:   Use a different way to detect that "man -s" should be used. (Hugh
```

```
            Sasse)
Files:      runtime/ftplugin/man.vim

Patch 6.1.063
Problem:    Java indenting doesn't work properly.
Solution:   Ignore comments when checking if the indent doesn't increase after
            a "}".
Files:      runtime/indent/java.vim

Patch 6.1.064
Problem:    The URLs that the netrw plugin recognized for ftp and rcp did not
            conform to the standard method://[user@]host[:port]/path.
Solution:   Use ftp://[user@]host[[:#]port]/path, which supports both the new
            and the previous style.  Also added a bit of dav/cadaver support.
            (Charles Campbell)
Files:      runtime/plugin/netrw.vim

Patch 6.1.065
Problem:    VMS: The colorscheme, keymap and compiler menus are not filled in.
Solution:   Ignore case when looking for ".vim" files. (Coen Engelbarts)
Files:      runtime/menu.vim

Patch 6.1.066 (extra)
Problem:    When calling system() in a plugin reading stdin hangs.
Solution:   Don't set the terminal to RAW mode when it wasn't in RAW mode
            before the system() call.
Files:      src/os_amiga.c, src/os_msdos.c, src/os_riscos.c, src/os_unix.c,
            src/os_win16.c, src/os_win32.c

Patch 6.1.067
Problem:    ":set viminfo+=f0" is not working. (Benji Fisher)
Solution:   Check the "f" flag instead of "'" in 'viminfo'.
Files:      src/mark.c

Patch 6.1.068
Problem:    When a file is reloaded after it was changed outside of Vim, diff
            mode isn't updated. (Michael Naumann)
Solution:   Invalidate the diff info so that it's updated when needed.
Files:      src/fileio.c

Patch 6.1.069
Problem:    When 'showmatch' is set and "$" is in 'cpoptions', using
            "C}<Esc>" may forget to remove the "$". (Preben Guldberg)
Solution:   Restore dollar_vcol after displaying the matching cursor position.
Files:      src/search.c

Patch 6.1.070 (depends on 6.1.060)
Problem:    Compiler warning for signed/unsigned mismatch. (Mike Williams)
Solution:   Add a typecast to int.
Files:      src/ops.c

Patch 6.1.071
Problem:    When 'selection' is exclusive, g CTRL-G in Visual mode counts one
            character too much. (David Necas)
```

```
Solution:   Subtract one from the end position.
Files:      src/ops.c

Patch 6.1.072
Problem:    When a file name in a tags file starts with http:// or something
            else for which there is a BufReadCmd autocommand, the file isn't
            opened anyway.
Solution:   Check if there is a matching BufReadCmd autocommand and try to
            open the file.
Files:      src/fileio.c, src/proto/fileio.pro, src/tag.c

Patch 6.1.073 (extra)
Problem:    BC5: Can't easily specify a tiny, small, normal, big or huge
            version.
Solution:   Allow selecting the version with the FEATURES variable. (Ajit
            Thakkar)
Files:      src/Make_bc5.mak

Patch 6.1.074
Problem:    When 'cdpath' includes "../..", changing to a directory in which
            we currently already are doesn't work.  ff_check_visited() adds
            the directory both when using it as the root for searching and for
            the actual matches. (Stephen Rasku)
Solution:   Use a separate list for the already searched directories.
Files:      src/misc2.c

Patch 6.1.075 (depends on 6.1.072)
Problem:    Can't compile fileio.c on MS-Windows.
Solution:   Add a declaration for the "p" pointer. (Madoka Machitani)
Files:      src/fileio.c

Patch 6.1.076 (extra)
Problem:    Macintosh: explorer plugin doesn't work on Mac Classic.
            IME doesn't work.  Dialog boxes don't work on Mac OS X
Solution:   Fix explorer plugin and key modifiers. (Axel Kielhorn)
            Fix IME support. (Muraoka Taro)
            Disable dialog boxes. (Benji Fisher)
Files:      src/edit.c, src/feature.h, src/gui_mac.c, src/os_mac.c

Patch 6.1.077
Problem:    On a Debian system with ACL linking fails. (Lubomir Host)
Solution:   When the "acl" library is used, check if the "attr" library is
            present and use it.
Files:      src/auto/configure, src/configure.in, src/link.sh

Patch 6.1.078
Problem:    When using 'foldmethod' "marker" and the end marker appears before
            the start marker in the file, no fold is found. (Nazri Ramliy)
Solution:   Don't let the fold depth go negative.
Files:      src/fold.c

Patch 6.1.079
Problem:    When using "s" in Visual block mode with 'virtualedit' set, when
            the selected block is after the end of some lines the wrong text
```

            is inserted and some lines are skipped. (Servatius Brandt)
Solution: Insert the right text and extend short lines.
Files: src/ops.c

Patch 6.1.080
Problem: When using gcc with /usr/local already in the search path, adding
            it again causes problems.
Solution: Adjust configure.in to avoid adding /usr/local/include and
            /usr/local/lib when using GCC and they are already used. (Johannes
            Zellner)
Files: src/auto/configure, src/configure.in

Patch 6.1.081
Problem: ":help CTRL-_CTRL-N" doesn't work. (Christian J. Robinson)
Solution: Double the backslash to avoid the special meaning of "_".
Files: src/ex_cmds.c

Patch 6.1.082
Problem: On MS-Windows the vimrc_example.vim script is sourced and then
            mswin.vim. This enables using select mode, but since "p" is
            mapped it doesn't replace the selection.
Solution: Remove the mapping of "p" from vimrc_example.vim, it's obsolete.
            (Vlad Sandrini)
Files: runtime/vimrc_example.vim

Patch 6.1.083
Problem: When $LANG is "sk" or "sk_sk", the Slovak menu file isn't found.
            (Martin Lacko)
Solution: Guess the right menu file based on the system.
Files: runtime/lang/menu_sk_sk.vim

Patch 6.1.084 (depends on 6.1.080)
Problem: "include" and "lib" are mixed up when checking the directories gcc
            already searches.
Solution: Swap the variable names. (SunHo Kim)
Files: src/auto/configure, src/configure.in

Patch 6.1.085
Problem: When using CTRL-O CTRL-\ CTRL-N from Insert mode, the displayed
            mode "(insert)" isn't removed. (Benji Fisher)
Solution: Clear the command line.
Files: src/normal.c

Patch 6.1.086 (depends on 6.1.049)
Problem: The guifg color for CursorIM doesn't take effect.
Solution: Use the foreground color when it's defined. (Muraoka Taro)
Files: src/gui.c

Patch 6.1.087
Problem: A thesaurus with Japanese characters has problems with characters
            in different word classes.
Solution: Only separate words with single-byte non-word characters.
            (Muraoka Taro)
Files: src/edit.c

```
Patch 6.1.088 (extra)
Problem:    Win32: no debugging info is generated.  Tags file excludes .cpp
            files.
Solution:   Add "/map" to compiler flags.  Add "*.cpp" to ctags command.
            (Muraoka Taro)
Files:      src/Make_mvc.mak

Patch 6.1.089
Problem:    On BSDI systems there is no ss_sp field in stack_t. (Robert Jan)
Solution:   Use ss_base instead.
Files:      src/auto/configure, src/configure.in, src/config.h.in,
            src/os_unix.c

Patch 6.1.090
Problem:    CTRL-F gets stuck when 'scrolloff' is non-zero and there is a mix
            of long wrapping lines and a non-wrapping line.
Solution:   Check that CTRL-F scrolls at least one line.
Files:      src/move.c

Patch 6.1.091
Problem:    GTK: Can't change preeditstate without setting 'imactivatekey'.
Solution:   Add some code to change preeditstate for OnTheSpot. (Yasuhiro
            Matsumoto)
Files:      src/mbyte.c

Patch 6.1.092
Problem:    ":mapclear <buffer>" doesn't work. (Srikanth Adayapalam)
Solution:   Allow an argument for ":mapclear".
Files:      src/ex_cmds.h

Patch 6.1.093 (extra)
Problem:    Mac and MS-Windows GUI: when scrolling while ":s" is working the
            results can be messed up, because the cursor is moved.
Solution:   Disallow direct scrolling when not waiting for a character.
Files:      src/gui_mac.c, src/gui_w16.c, src/gui_w32.c, src/gui_w48.c

Patch 6.1.094
Problem:    Cygwin: Passing a file name that has backslashes isn't handled
            very well.
Solution:   Convert file name arguments to Posix.  (Chris Metcalf)
Files:      src/main.c

Patch 6.1.095
Problem:    When using signs can free an item on the stack.
            Overruling sign colors doesn't work. (Srikanth Sankaran)
Solution:   Don't free the item on the stack.  Use NULL instead of "none" for
            the value of the color.
Files:      src/gui_x11.c

Patch 6.1.096
Problem:    When erasing the right halve of a double-byte character, it may
            cause further characters to be erased. (Yasuhiro Matsumoto)
Solution:   Make sure only one character is erased.
```

```
Files:      src/screen.c

Patch 6.1.097 (depends on 6.1.090)
Problem:    When 'scrolloff' is set to a huge value, CTRL-F at the end of the
            file scrolls one line. (Lubomir Host)
Solution:   Don't scroll when CTRL-F detects the end-of-file.
Files:      src/move.c

Patch 6.1.098
Problem:    MS-Windows: When the xxd program is under "c:\program files" the
            "Convert to Hex" menu doesn't work. (Brian Mathis)
Solution:   Put the path to xxd in double quotes.
Files:      runtime/menu.vim

Patch 6.1.099
Problem:    Memory corrupted when closing a fold with more than 99999 lines.
Solution:   Allocate more space for the fold text. (Walter Briscoe)
Files:      src/eval.c

Patch 6.1.100 (extra, depends on 6.1.088)
Problem:    Win32: VC5 and earlier don't support the /mapinfo option.
Solution:   Add "/mapinfo" only when "MAP=lines" is specified. (Muraoka Taro)
Files:      src/Make_mvc.mak

Patch 6.1.101
Problem:    After using ":options" the tabstop of a new window is 15.  Entry
            in ":options" window for 'autowriteall' is wrong. (Antoine J
            Mechelynck)  Can't insert a space in an option value.
Solution:   Use ":setlocal" instead of ":set".  Change "aw" to "awa".
            Don't map space in Insert mode.
Files:      runtime/optwin.vim

Patch 6.1.102
Problem:    Unprintable and multi-byte characters in a statusline item are not
            truncated correctly. (Yasuhiro Matsumoto)
Solution:   Count the width of characters instead of the number of bytes.
Files:      src/buffer.c

Patch 6.1.103
Problem:    A function returning from a while loop, with 'verbose' set to 12
            or higher, doesn't mention the return value.  A function with the
            'abort' attribute may return -1 while the verbose message says
            something else.
Solution:   Move the verbose message about returning from a function to
            call_func(). (Servatius Brandt)
Files:      src/eval.c

Patch 6.1.104
Problem:    GCC 3.1 appears to have an optimizer problem that makes test 3
            crash.
Solution:   For GCC 3.1 add -fno-strength-reduce to avoid the optimizer bug.
            Filter out extra info from "gcc --version".
Files:      src/auto/configure, src/configure.in
```

```
Patch 6.1.105
Problem:    Win32: The default for 'shellpipe' doesn't redirect stderr. (Dion
            Nicolaas)
Solution:   Redirect stderr, depending on the shell (like for 'shellredir').
Files:      src/option.c

Patch 6.1.106
Problem:    The maze program crashes.
Solution:   Change "11" to "27" and it works. (Greg Roelofs)
Files:      runtime/macros/maze/mazeansi.c

Patch 6.1.107
Problem:    When 'list' is set the current line in the error window may be
            displayed wrong. (Muraoka Taro)
Solution:   Don't continue the line after the $ has been displayed and the
            rightmost column is reached.
Files:      src/screen.c

Patch 6.1.108
Problem:    When interrupting a filter command such as "!!sleep 20" the file
            becomes read-only. (Mark Brader)
Solution:   Only set the read-only flag when opening a buffer is interrupted.
            When the shell command was interrupted, read the output that was
            produced so far.
Files:      src/ex_cmds.c, src/fileio.c

Patch 6.1.109
Problem:    When 'eadirection' is "hor", using CTRL-W = doesn't equalize the
            window heights. (Roman Neuhauser)
Solution:   Ignore 'eadirection' for CTRL-W =
Files:      src/window.c

Patch 6.1.110
Problem:    When using ":badd file" when "file" is already present but not
            listed, it stays unlisted. (David Frey)
Solution:   Set 'buflisted'.
Files:      src/buffer.c

Patch 6.1.111
Problem:    It's not possible to detect using the Unix sources on Win32 or Mac.
Solution:   Add has("macunix") and has("win32unix").
Files:      runtime/doc/eval.txt, src/eval.c

Patch 6.1.112
Problem:    When using ":argdo", ":bufdo" or ":windo", CTRL-O doesn't go to
            the cursor position from before this command but every position
            where the argument was executed.
Solution:   Only remember the cursor position from before the ":argdo",
            ":bufdo" and ":windo".
Files:      src/ex_cmds2.c, src/mark.c

Patch 6.1.113
Problem:    ":bufdo bwipe" only wipes out half the buffers.  (Roman Neuhauser)
Solution:   Decide what buffer to go to next before executing the command.
```

```
Files:      src/ex_cmds2.c

Patch 6.1.114
Problem:    ":python import vim", ":python vim.current.buffer[0:0] = []" gives
            a lalloc(0) error. (Chris Southern)
Solution:   Don't allocate an array when it's size is zero.
Files:      src/if_python.c

Patch 6.1.115
Problem:    "das" on the white space at the end of a paragraph does not delete
            the "." the sentence ends with.
Solution:   Don't exclude the last character when it is not white space.
Files:      src/search.c

Patch 6.1.116
Problem:    When 'endofline' is changed while 'binary' is set a file should be
            considered modified. (Olaf Buddenhagen)
Solution:   Remember the 'eol' value when editing started and consider the
            file changed when the current value is different and 'binary' is
            set.  Also fix that the window title isn't updated when 'ff' or
            'bin' changes.
Files:      src/option.c, src/structs.h

Patch 6.1.117
Problem:    Small problem with editing a file over ftp: and with Cygwin.
Solution:   Remove a dot from a ":normal" command.  Use "cygdrive" where
            appropriate.  (Charles Campbell)
Files:      runtime/plugin/netrw.vim

Patch 6.1.118
Problem:    When a file in diff mode is reloaded because it changed outside
            of Vim, other windows in diff mode are not always updated.
            (Michael Naumann)
Solution:   After reloading a file in diff mode mark all windows in diff mode
            for redraw.
Files:      src/diff.c

Patch 6.1.119 (extra)
Problem:    With the Sniff interface, using Sniff 4.0.X on HP-UX, there may be
            a crash when connecting to Sniff.
Solution:   Initialize sniff_rq_sep such that its value can be changed.
            (Martin Egloff)
Files:      src/if_sniff.c

Patch 6.1.120 (depends on 6.1.097)
Problem:    When 'scrolloff' is non-zero and there are folds, CTRL-F at the
            end of the file scrolls part of a closed fold.  (Lubomir Host)
Solution:   Adjust the first line to the start of a fold.
Files:      src/move.c

Patch 6.1.121 (depends on 6.1.098)
Problem:    When starting Select mode from Insert mode, then using the Paste
            menu entry, the cursor is left before the last pasted character.
            (Mario Schweigler)
```

```
Solution:   Set the cursor for Insert mode one character to the right.
Files:      runtime/menu.vim

Patch 6.1.122
Problem:    ":file name" creates a new buffer to hold the old buffer name,
            which becomes the alternate file.  This buffer is unexpectedly
            listed.
Solution:   Create the buffer for the alternate name unlisted.
Files:      src/ex_cmds.c

Patch 6.1.123
Problem:    A ":match" command with more than one argument doesn't report an
            error.
Solution:   Check for extra characters. (Servatius Brandt)
Files:      src/ex_docmd.c

Patch 6.1.124
Problem:    When trying to exit and there is a hidden buffer that had 'eol'
            off and 'bin' set exiting isn't possible. (John McGowan)
Solution:   Set b_start_eol when clearing the buffer.
Files:      src/buffer.c

Patch 6.1.125
Problem:    Explorer plugin asks for saving a modified buffer even when it's
            open in another window as well.
Solution:   Count the number of windows using the buffer.
Files:      runtime/plugin/explorer.vim

Patch 6.1.126
Problem:    Adding the choices in the syntax menu is consuming much of the
            startup time of the GUI while it's not often used.
Solution:   Only add the choices when the user wants to use them.
Files:      Makefile, runtime/makemenu.vim, runtime/menu.vim,
            runtime/synmenu.vim, src/Makefile

Patch 6.1.127
Problem:    When using "--remote file" and the server has 'insertmode' set,
            commands are inserted instead of being executed. (Niklas Volbers)
Solution:   Go to Normal mode again after the ":drop" command.
Files:      src/main.c

Patch 6.1.128
Problem:    The expression "input('very long prompt')" puts the cursor in the
            wrong line (column is OK).
Solution:   Add the wrapped lines to the indent. (Yasuhiro Matsumoto)
Files:      src/ex_getln.c

Patch 6.1.129
Problem:    On Solaris editing "file/" and then "file" results in using the
            same buffer.  (Jim Battle)
Solution:   Before using stat(), check that there is no illegal trailing
            slash.
Files:      src/auto/configure, src/config.h.in, src/configure.in,
            src/macros.h src/misc2.c, src/proto/misc2.pro
```

Patch 6.1.130
Problem: The documentation for some of the 'errorformat' items is unclear.
Solution: Add more examples and explain hard to understand items. (Stefan
            Roemer)
Files: runtime/doc/quickfix.txt

Patch 6.1.131
Problem: X11 GUI: when expanding a CSI byte in the input stream to K_CSI,
            the CSI byte itself isn't copied.
Solution: Copy the CSI byte.
Files: src/gui_x11.c

Patch 6.1.132
Problem: Executing a register in Ex mode may cause commands to be skipped.
            (John McGowan)
Solution: In Ex mode use an extra check if the register contents was
            consumed, to avoid input goes into the typeahead buffer.
Files: src/ex_docmd.c

Patch 6.1.133
Problem: When drawing double-wide characters in the statusline, may clear
            half of a character. (Yasuhiro Matsumoto)
Solution: Force redraw of the next character by setting the attributes
            instead of putting a NUL in ScreenLines[]. Do put a NUL in
            ScreenLines[] when overwriting half of a double-wide character.
Files: src/screen.c

Patch 6.1.134
Problem: An error for a trailing argument of ":match" should not be given
            after ":if 0". (Servatius Brandt)
Solution: Only do the check when executing commands.
Files: src/ex_docmd.c

Patch 6.1.135
Problem: Passing a command to the shell that includes a newline always has
            a backslash before the newline.
Solution: Remove one backslash before the newline. (Servatius Brandt)
Files: src/ex_docmd.c

Patch 6.1.136
Problem: When $TERM is "linux" the default for 'background' is "dark", even
            though the GUI uses a light background. (Hugh Allen)
Solution: Don't mark the option as set when defaulting to "dark" for the
            linux console. Also reset 'background' to "light" when the GUI
            has a light background.
Files: src/option.c

Patch 6.1.137
Problem: Converting to HTML has a clumsy way of dealing with tabs which may
            change the highlighting.
Solution: Replace tabs with spaces after converting a line to HTML. (Preben
            Guldberg)
Files: runtime/syntax/2html.vim

```
Patch 6.1.138 (depends on 6.1.126)
Problem:    Adding extra items to the Syntax menu can't be done when the "Show
            individual choices" menu is used.
Solution:   Use ":runtime!" instead of ":source", so that all synmenu.vim
            files in the runtime path are loaded. (Servatius Brandt)
            Also fix that a translated menu can't be removed.
Files:      runtime/menu.vim

Patch 6.1.139
Problem:    Cygwin: PATH_MAX is not defined.
Solution:   Include limits.h. (Dan Sharp)
Files:      src/main.c

Patch 6.1.140
Problem:    Cygwin: ":args `ls *.c`" does not work if the shell command
            produces CR NL line separators.
Solution:   Remove the CR characters ourselves. (Pavol Juhas)
Files:      src/os_unix.c

Patch 6.1.141
Problem:    ":wincmd gx" may cause problems when mixed with other commands.
            ":wincmd c" doesn't close the window immediately. (Benji Fisher)
Solution:   Pass the extra command character directly instead of using the
            stuff buffer and call ex_close() directly.
Files:      src/ex_docmd.c, src/normal.c, src/proto/normal.pro,
            src/proto/window.pro, src/window.c

Patch 6.1.142
Problem:    Defining paragraphs without a separating blank line isn't
            possible.  Paragraphs can't be formatted automatically.
Solution:   Allow defining paragraphs with lines that end in white space.
            Added the 'w' and 'a' flags in 'formatoptions'.
Files:      runtime/doc/change.txt, src/edit.c, src/misc1.c, src/normal.c,
            src/option.h, src/ops.c, src/proto/edit.pro, src/proto/ops.pro,
            src/vim.h

Patch 6.1.143 (depends on 6.1.142)
Problem:    Auto formatting near the end of the file moves the cursor to a
            wrong position.  In Insert mode some lines are made one char too
            narrow.  When deleting a line undo might not always work properly.
Solution:   Don't always move to the end of the line in the last line.  Don't
            position the cursor past the end of the line in Insert mode.
            After deleting a line save the cursor line for undo.
Files:      src/edit.c, src/ops.c, src/normal.c

Patch 6.1.144
Problem:    Obtaining the size of a line in screen characters can be wrong.
            A pointer may wrap around zero.
Solution:   In win_linetabsize() check for a MAXCOL length argument. (Jim
            Dunleavy)
Files:      src/charset.c

Patch 6.1.145
```

```
Problem:    GTK: Drag&drop with more than 3 files may cause a crash. (Mickael
            Marchand)
Solution:   Rewrite the code that parses the received list of files to be more
            robust.
Files:      src/charset.c, src/gui_gtk_x11.c

Patch 6.1.146
Problem:    MS-Windows: When $HOME is constructed from $HOMEDRIVE and
            $HOMEPATH, it is not used for storing the _viminfo file.  (Normal
            Diamond)
Solution:   Set $HOME with the value obtained from $HOMEDRIVE and $HOMEPATH.
Files:      src/misc1.c

Patch 6.1.147 (extra)
Problem:    MS-Windows: When a dialog has no default button, pressing Enter
            ends it anyway and all buttons are selected.
Solution:   Don't end a dialog when there is no default button.  Don't select
            all button when there is no default. (Vince Negri)
Files:      src/gui_w32.c

Patch 6.1.148 (extra)
Problem:    MS-Windows: ACL is not properly supported.
Solution:   Add an access() replacement that also works for ACL. (Mike
            Williams)
Files:      runtime/doc/editing.txt, src/os_win32.c

Patch 6.1.149 (extra)
Problem:    MS-Windows: Can't use diff mode from the file explorer.
Solution:   Add a "diff with Vim" context menu entry. (Dan Sharp)
Files:      GvimExt/gvimext.cpp, GvimExt/gvimext.h

Patch 6.1.150
Problem:    OS/2, MS-Windows and MS-DOS: When 'shellslash' is set getcwd()
            still uses backslash. (Yegappan Lakshmanan)
Solution:   Adjust slashes in getcwd().
Files:      src/eval.c

Patch 6.1.151 (extra)
Problem:    Win32: The NTFS substream isn't copied.
Solution:   Copy the substream when making a backup copy. (Muraoka Taro)
Files:      src/fileio.c, src/os_win32.c, src/proto/os_win32.pro

Patch 6.1.152
Problem:    When $LANG is iso8859-1 translated menus are not used.
Solution:   Change iso8859 to iso_8859.
Files:      runtime/menu.vim

Patch 6.1.153
Problem:    Searching in included files may search recursively when the path
            starts with "../".  (Sven Berkvens-Matthijsse)
Solution:   Compare full file names, use inode/device when possible.
Files:      src/search.c

Patch 6.1.154 (extra)
```

```
Problem:    DJGPP: "vim -h" leaves the cursor in a wrong position.
Solution:   Don't position the cursor using uninitialized variables. (Jim
            Dunleavy)
Files:      src/os_msdos.c

Patch 6.1.155
Problem:    Win32: Cursor may sometimes disappear in Insert mode.
Solution:   Change "hor10" in 'guicursor' to "hor15". (Walter Briscoe)
Files:      src/option.c

Patch 6.1.156
Problem:    Conversion between DBCS and UCS-2 isn't implemented cleanly.
Solution:   Clean up a few things.
Files:      src/mbyte.c, src/structs.h

Patch 6.1.157
Problem:    'hlsearch' highlights only the second comma in ",,,,," with
            "/,\@<=[^,]*". (Preben Guldberg)
Solution:   Also check for an empty match to start just after a previous
            match.
Files:      src/screen.c

Patch 6.1.158
Problem:    "zs" and "ze" don't work correctly with ":set nowrap siso=1".
            (Preben Guldberg)
Solution:   Take 'siso' into account when computing the horizontal scroll
            position for "zs" and "ze".
Files:      src/normal.c

Patch 6.1.159
Problem:    When expanding an abbreviation that includes a multi-byte
            character too many characters are deleted. (Andrey Urazov)
Solution:   Delete the abbreviation counting characters instead of bytes.
Files:      src/getchar.c

Patch 6.1.160
Problem:    ":$read file.gz" doesn't work. (Preben Guldberg)
Solution:   Don't use the '[ mark after it has become invalid.
Files:      runtime/plugin/gzip.vim

Patch 6.1.161 (depends on 6.1.158)
Problem:    Warning for signed/unsigned compare.  Can set 'siso' to a negative
            value. (Mike Williams)
Solution:   Add a typecast.  Add a check for 'siso' being negative.
Files:      src/normal.c, src/option.c

Patch 6.1.162
Problem:    Python interface: Didn't initialize threads properly.
Solution:   Call PyEval_InitThreads() when starting up.
Files:      src/if_python.c

Patch 6.1.163
Problem:    Win32: Can't compile with Python after 6.1.162.
Solution:   Dynamically load  PyEval_InitThreads(). (Dan Sharp)
```

```
Files:      src/if_python.c

Patch 6.1.164
Problem:    If 'modifiable' is off, converting to xxd fails and 'filetype' is
            changed to "xxd" anyway.
Solution:   Don't change 'filetype' when conversion failed.
Files:      runtime/menu.vim

Patch 6.1.165
Problem:    Making changes in several lines and then a change in one of these
            lines that splits it in two or more lines, undo information was
            corrupted.  May cause a crash. (Dave Fishburn)
Solution:   When skipping to save a line for undo because it was already
            saved, move it to become the last saved line, so that when the
            command changes the line count other saved lines are not involved.
Files:      src/undo.c

Patch 6.1.166
Problem:    When 'autoindent' is set and mswin.vim has been sourced, pasting
            with CTRL-V just after auto-indenting removes the indent. (Shlomi
            Fish)
Solution:   First insert an "x" and delete it again, so that the auto-indent
            remains.
Files:      runtime/mswin.vim

Patch 6.1.167
Problem:    When giving a negative argument to ":retab" strange things start
            happening. (Hans Ginzel)
Solution:   Check for a negative value.
Files:      src/ex_cmds.c

Patch 6.1.168
Problem:    Pressing CTRL-C at the hit-enter prompt doesn't end the prompt.
Solution:   Make CTRL-C stop the hit-enter prompt.
Files:      src/message.c

Patch 6.1.169
Problem:    bufexists() finds a buffer by using the name of a symbolic link to
            it, but bufnr() doesn't. (Yegappan Lakshmanan)
Solution:   When bufnr() can't find a buffer, try using the same method as
            bufexists().
Files:      src/eval.c

Patch 6.1.170
Problem:    Using ":mksession" uses the default session file name, but "vim
            -S" doesn't. (Hans Ginzel)
Solution:   Use the default session file name if "-S" is the last command
            line argument or another option follows.
Files:      runtime/doc/starting.txt, src/main.c

Patch 6.1.171
Problem:    When opening a line just above a closed fold with "O" and the
            comment leader is automatically inserted, the cursor is displayed
            in the first column. (Sung-Hyun Nam)
```

```
Solution:   Update the flag that indicates the cursor is in a closed fold.
Files:      src/misc1.c

Patch 6.1.172
Problem:    Command line completion of ":tag /pat" does not show the same
            results as the tags the command actually finds. (Gilles Roy)
Solution:   Don't modify the pattern to make it a regexp.
Files:      src/ex_getln.c, src/tag.c

Patch 6.1.173
Problem:    When using remote control to edit a position in a file and this
            file is the current buffer and it's modified, the window is split
            and the ":drop" command fails.
Solution:   Don't split the window, keep editing the same buffer.
            Use the ":drop" command in VisVim to avoid the problem there.
Files:      src/ex_cmds.c, src/ex_cmds2.c, src/proto/ex_cmds2.pro,
            VisVim/Commands.cpp

Patch 6.1.174
Problem:    It is difficult to know in a script whether an option not only
            exists but really works.
Solution:   Add "exists('+option')".
Files:      runtime/doc/eval.txt, src/eval.c

Patch 6.1.175
Problem:    When reading commands from a pipe and a CTRL-C is pressed, Vim
            will hang. (Piet Delport)
Solution:   Don't keep reading characters to clear typeahead when an interrupt
            was detected, stop when a single CTRL-C is read.
Files:      src/getchar.c, src/ui.c

Patch 6.1.176
Problem:    When the stack limit is very big a false out-of-stack error may
            be detected.
Solution:   Add a check for overflow of the stack limit computation. (Jim
            Dunleavy)
Files:      src/os_unix.c

Patch 6.1.177 (depends on 6.1.141)
Problem:    ":wincmd" does not allow a following command. (Gary Johnson)
Solution:   Check for a following " | cmd".  Also give an error for trailing
            characters.
Files:      src/ex_docmd.c

Patch 6.1.178
Problem:    When 'expandtab' is set "r<C-V><Tab>" still expands the Tab.
            (Bruce deVisser)
Solution:   Replace with a literal Tab.
Files:      src/normal.c

Patch 6.1.179 (depends on 6.1.091)
Problem:    When using X11R5 XIMPreserveState is undefined. (Albert Chin)
Solution:   Include the missing definitions.
Files:      src/mbyte.c
```

```
Patch 6.1.180
Problem:    Use of the GUI code for forking is inconsistent.
Solution:   Define MAY_FORK and use it for later #ifdefs. (Ben Fowlwer)
Files:      src/gui.c

Patch 6.1.181
Problem:    If the terminal doesn't wrap from the last char in a line to the
            next line, the last column is blanked out. (Peter Karp)
Solution:   Don't output a space to mark the wrap, but the same character
            again.
Files:      src/screen.c

Patch 6.1.182 (depends on 6.1.142)
Problem:    It is not possible to auto-format comments only. (Moshe Kaminsky)
Solution:   When the 'a' and 'c' flags are in 'formatoptions' only auto-format
            comments.
Files:      runtime/doc/change.txt, src/edit.c

Patch 6.1.183
Problem:    When 'fencs' is empty and 'enc' is utf-8, reading a file with
            illegal bytes gives "CONVERSION ERROR" even though no conversion
            is done.  'readonly' is set, even though writing the file results
            in an unmodified file.
Solution:   For this specific error use "ILLEGAL BYTE" and don't set
            'readonly'.
Files:      src/fileio.c

Patch 6.1.184 (extra)
Problem:    The extra mouse buttons found on some mice don't work.
Solution:   Support two extra buttons for MS-Windows. (Michael Geddes)
Files:      runtime/doc/term.txt, src/edit.c, src/ex_getln.c, src/gui.c,
            src/gui_w32.c, src/gui_w48.c, src/keymap.h, src/message.c,
            src/misc1.c, src/misc2.c, src/normal.c, src/vim.h

Patch 6.1.185 (depends on 6.1.182)
Problem:    Can't compile without +comments feature.
Solution:   Add #ifdef FEAT_COMMENTS. (Christian J. Robinson)
Files:      src/edit.c

Patch 6.1.186 (depends on 6.1.177)
Problem:    ":wincmd" does not allow a following comment. (Aric Blumer)
Solution:   Check for a following double quote.
Files:      src/ex_docmd.c

Patch 6.1.187
Problem:    Using ":doarg" with 'hidden' set and the current file is the only
            argument and was modified gives an error message. (Preben
            Guldberg)
Solution:   Don't try re-editing the same file.
Files:      src/ex_cmds2.c

Patch 6.1.188 (depends on 6.1.173)
Problem:    Unused variable in the small version.
```

```
Solution:   Move the declaration for "p" inside #ifdef FEAT_LISTCMDS.
Files:      src/ex_cmds2.c

Patch 6.1.189
Problem:    inputdialog() doesn't work when 'c' is in 'guioptions'. (Aric
            Blumer)
Solution:   Fall back to the input() function in this situation.
Files:      src/eval.c

Patch 6.1.190 (extra)
Problem:    VMS: doesn't build with GTK GUI.  Various other problems.
Solution:   Fix building for GTK.  Improved Perl, Python and TCL support.
            Improved VMS documentation. (Zoltan Arpadffy)
            Added Vimtutor for VMS (T. R. Wyant)
Files:      runtime/doc/os_vms.txt, src/INSTALLvms.txt, src/gui_gtk_f.h,
            src/if_tcl.c, src/main.c, src/gui_gtk_vms.h, src/Make_vms.mms,
            src/os_vms.opt, src/proto/if_tcl.pro, vimtutor.com,
            src/testdir/Make_vms.mms

Patch 6.1.191
Problem:    When using "vim -s script" and redirecting the output, the delay
            for the "Output is not to a terminal" warning slows Vim down too
            much.
Solution:   Don't delay when reading commands from a script.
Files:      src/main.c

Patch 6.1.192
Problem:    ":diffsplit" doesn't add "hor" to 'scrollopt'. (Gary Johnson)
Solution:   Add "hor" to 'scrollopt' each time ":diffsplit" is used.
Files:      src/diff.c, src/main.c

Patch 6.1.193
Problem:    Crash in in_id_list() for an item with a "containedin" list. (Dave
            Fishburn)
Solution:   Check for a negative syntax id, used for keywords.
Files:      src/syntax.c

Patch 6.1.194
Problem:    When "t_ti" is set but it doesn't cause swapping terminal pages,
            "ZZ" may cause the shell prompt to appear on top of the file-write
            message.
Solution:   Scroll the text up in the Vim page before swapping to the terminal
            page. (Michael Schroeder)
Files:      src/os_unix.c

Patch 6.1.195
Problem:    The quickfix and preview windows always keep their height, while
            other windows can't fix their height.
Solution:   Add the 'winfixheight' option, so that a fixed height can be
            specified for any window.  Also fix that the wildmenu may resize a
            one-line window to a two-line window if 'ls' is zero.
Files:      runtime/doc/options.txt, runtime/optwin.vim, src/ex_cmds.c,
            src/ex_getln.c, src/globals.h, src/option.c, src/quickfix.c,
            src/screen.c, src/structs.h, src/window.c
```

```
Patch 6.1.196  (depends on 6.1.084)
Problem:    On Mac OS X 10.2 generating osdef.h fails.
Solution:   Add -no-cpp-precomp to avoid using precompiled header files, which
            disables printing the search path. (Ben Fowler)
Files:      src/auto/configure, src/configure.in

Patch 6.1.197
Problem:    ":help <C-V><C-\><C-V><C-N>" (resulting in <1c><0e>) gives an
            error message. (Servatius Brandt)
Solution:   Double the backslash in "CTRL-\".
Files:      src/ex_cmds.c

Patch 6.1.198 (extra) (depends on 6.1.076)
Problem:    Mac OS X: Dialogues don't work.
Solution:   Fix a crashing problem for some GUI dialogues.  Fix a problem when
            saving to a new file from the GUI. (Peter Cucka)
Files:      src/feature.h, src/gui_mac.c

Patch 6.1.199
Problem:    'guifontwide' doesn't work on Win32.
Solution:   Output each wide character separately. (Michael Geddes)
Files:      src/gui.c

Patch 6.1.200
Problem:    ":syn sync fromstart" is not skipped after ":if 0".  This can make
            syntax highlighting very slow.
Solution:   Check "eap->skip" appropriately. (Rob West)
Files:      src/syntax.c

Patch 6.1.201 (depends on 6.1.192)
Problem:    Warning for illegal pointer combination. (Zoltan Arpadffy)
Solution:   Add a typecast.
Files:      src/diff.c

Patch 6.1.202  (extra)(depends on 6.1.148)
Problem:    Win32: filewritable() doesn't work properly on directories.
Solution:   fix filewritable(). (Mike Williams)
Files:      src/os_win32.c

Patch 6.1.203
Problem:    ":%s/~//" causes a crash after ":%s/x//". (Gary Holloway)
Solution:   Avoid reading past the end of a line when "~" is empty.
Files:      src/regexp.c

Patch 6.1.204 (depends on 6.1.129)
Problem:    Warning for an illegal pointer on Solaris.
Solution:   Add a typecast. (Derek Wyatt)
Files:      src/misc2.c

Patch 6.1.205
Problem:    The gzip plugin changes the alternate file when editing a
            compressed file. (Oliver Fuchs)
Solution:   Temporarily remove the 'a' and 'A' flags from 'cpo'.
```

```
Files:      runtime/plugin/gzip.vim

Patch 6.1.206
Problem:    The script generated with ":mksession" doesn't work properly when
            some commands are mapped.
Solution:   Use ":normal!" instead of ":normal".  And use ":wincmd" where
            possible. (Muraoka Taro)
Files:      src/ex_docmd.c, src/fold.c

Patch 6.1.207
Problem:    Indenting a Java file hangs below a line with a comment after a
            command.
Solution:   Break out of a loop. (Andre Pang)
            Also line up } with matching {.
Files:      runtime/indent/java.vim

Patch 6.1.208
Problem:    Can't use the buffer number from the Python interface.
Solution:   Add buffer.number. (Michal Vitecek)
Files:      src/if_python.c

Patch 6.1.209
Problem:    Printing doesn't work on Mac OS classic.
Solution:   Use a ":" for path separator when opening the resource file. (Axel
            Kielhorn)
Files:      src/ex_cmds2.c

Patch 6.1.210
Problem:    When there is an iconv() conversion error when reading a file
            there can be an error the next time iconv() is used.
Solution:   Reset the state of the iconv() descriptor. (Yasuhiro Matsumoto)
Files:      src/fileio.c

Patch 6.1.211
Problem:    The message "use ! to override" is confusing.
Solution:   Make it "add ! to override".
Files:      src/buffer.c, src/eval.c, src/ex_docmd.c, src/fileio.c,
            src/globals.h

Patch 6.1.212
Problem:    When Vim was started with "-R" ":new" creates a buffer
            'noreadonly' while ":enew" has 'readonly' set. (Preben Guldberg)
Solution:   Don't set 'readonly' in a new empty buffer for ":enew".
Files:      src/ex_docmd.c

Patch 6.1.213
Problem:    Using CTRL-W H may cause a big gap to appear below the last
            window. (Aric Blumer)
Solution:   Don't set the window height when there is a vertical split.
            (Yasuhiro Matsumoto)
Files:      src/window.c

Patch 6.1.214
Problem:    When installing Vim and the runtime files were checked out from
```

            CVS the CVS directories will also be installed.
Solution: Avoid installing the CVS dirs and their contents.
Files: src/Makefile

Patch 6.1.215
Problem: Win32: ":pwd" uses backslashes even when 'shellslash' is set.
            (Xiangjiang Ma)
Solution: Adjust backslashes before printing the message.
Files: src/ex_docmd.c

Patch 6.1.216
Problem: When dynamically loading the iconv library, the error codes may be
            confused.
Solution: Use specific error codes for iconv and redefine them for dynamic
            loading. (Yasuhiro Matsumoto)
Files: src/fileio.c, src/mbyte.c, src/vim.h

Patch 6.1.217
Problem: When sourcing the same Vim script using a different name (symbolic
            link or MS-Windows 8.3 name) it is listed twice with
            ":scriptnames". (Tony Mechelynck)
Solution: Turn the script name into a full path before using it. On Unix
            compare inode/device numbers.
Files: src/ex_cmds2.c

Patch 6.1.218
Problem: No error message for using the function argument "5+". (Servatius
            Brandt)
Solution: Give an error message if a function or variable is expected but is
            not found.
Files: src/eval.c

Patch 6.1.219
Problem: When using ":amenu :b 1<CR>" with a Visual selection and
            'insertmode' is set, Vim does not return to Insert mode. (Mickael
            Marchand)
Solution: Add the command CTRL-\ CTRL-G that goes to Insert mode if
            'insertmode' is set and to Normal mode otherwise. Append this to
            menus defined with ":amenu".
Files: src/edit.c, src/ex_getln.c, src/normal.c

Patch 6.1.220
Problem: When using a BufReadPost autocommand that changes the line count,
            e.g., "$-1join", reloading a file that was changed outside Vim
            does not work properly. (Alan G Isaac)
Solution: Make the buffer empty before reading the new version of the file.
            Save the lines in a dummy buffer, so that they can be put back
            when reading the file fails.
Files: src/buffer.c, src/ex_cmds.c, src/fileio.c, src/globals.h,
            src/proto/buffer.pro

Patch 6.1.221
Problem: Changing case may not work properly, depending on the current
            locale.

```
Solution:   Add the 'casemap' option to let the user chose how changing case
            is to be done.
            Also fix lowering case when an UTF-8 character doesn't keep the
            same byte length.
Files:      runtime/doc/options.txt, src/ascii.h, src/auto/configure,
            src/buffer.c, src/charset.c, src/config.h.in, src/configure.in,
            src/diff.c, src/edit.c, src/eval.c, src/ex_cmds2.c,
            src/ex_docmd.c, src/ex_getln.c, src/fileio.c, src/gui_amiga.c
            src/gui_mac.c, src/gui_photon.c, src/gui_w48.c, src/gui_beos.cc,
            src/macros.h, src/main.c, src/mbyte.c, src/menu.c, src/message.c,
            src/misc1.c, src/misc2.c, src/option.c, src/os_msdos.c,
            src/os_mswin.c, src/proto/charset.pro, src/regexp.c, src/option.h,
            src/syntax.c

Patch 6.1.222 (depends on 6.1.219)
Problem:    Patch 6.1.219 was incomplete.
Solution:   Add the changes for ":amenu".
Files:      src/menu.c

Patch 6.1.223 (extra)
Problem:    Win32: When IME is activated 'iminsert' is set, but it might never
            be reset when IME is disabled. (Muraoka Taro)
            All systems: 'iminsert' is set to 2 when leaving Insert mode, even
            when langmap is being used. (Peter Valach)
Solution:   Don't set "b_p_iminsert" in _OnImeNotify(). (Muraoka Taro)
            Don't store the status of the input method in 'iminsert' when
            'iminsert' is one.  Also for editing the command line and for
            arguments to Normal mode commands.
Files:      src/edit.c, src/ex_getln.c, src/gui_w32.c, src/normal.c

Patch 6.1.224
Problem:    "expand('$VAR')" returns an empty string when the expanded $VAR
            is not an existing file. (Aric Blumer)
Solution:   Included non-existing files, as documented.
Files:      src/eval.c

Patch 6.1.225
Problem:    Using <C-O><C-^> in Insert mode has a delay when starting "vim -u
            NONE" and ":set nocp hidden". (Emmanuel)  do_ecmd() uses
            fileinfo(), the redraw is done after a delay to give the user time
            to read the message.
Solution:   Put the message from fileio() in "keep_msg", so that the redraw is
            done before the delay (still needed to avoid the mode message
            overwrites the fileinfo() message).
Files:      src/buffer.c

Patch 6.1.226
Problem:    Using ":debug" with a ":normal" command may cause a hang.  (Colin
            Keith)
Solution:   Save the typeahead buffer when obtaining a debug command.
Files:      src/ex_cmds2.c, src/getchar.c, src/proto/getchar.pro

Patch 6.1.227
Problem:    It is possible to use a variable name "asdf:asdf" and ":let j:asdf
```

```
            = 5" does not give an error message. (Mikolaj Machowski)
Solution:   Check for a ":" inside the variable name.
Files:      src/eval.c

Patch 6.1.228 (extra)
Problem:    Win32: The special output function for Hangul is used too often,
            causing special handling for other situations to be skipped.
            bInComposition is always FALSE, causing ImeGetTempComposition()
            always to return NULL.
Solution:   Remove HanExtTextOut().  Delete the dead code around
            bInComposition and ImeGetTempComposition().
Files:      src/gui_w16.c, src/gui_w32.c, src/gui_w48.c

Patch 6.1.229
Problem:    Win32: Conversion to/from often used codepages requires the iconv
            library, which is not always available.
Solution:   Use standard MS-Windows functions for the conversion when
            possible. (mostly by Glenn Maynard)
            Also fixes missing declaration for patch 6.1.220.
Files:      src/fileio.c

Patch 6.1.230 (extra)
Problem:    Win16: building doesn't work.
Solution:   Exclude the XBUTTON handling. (Vince Negri)
Files:      src/gui_w48.c

Patch 6.1.231
Problem:    Double clicking with the mouse to select a word does not work for
            multi-byte characters.
Solution:   Use vim_iswordc() instead of vim_isIDc().  This means 'iskeyword'
            is used instead of 'isident'.  Also fix that mixing ASCII with
            multi-byte word characters doesn't work, the mouse class for
            punctuation and word characters was mixed up.
Files:      src/normal.c

Patch 6.1.232 (depends on 6.1.226)
Problem:    Using ex_normal_busy while it might not be available. (Axel
            Kielhorn)
Solution:   Only use ex_normal_busy when FEAT_EX_EXTRA is defined.
Files:      src/ex_cmds2.c

Patch 6.1.233
Problem:    ":help expr-||" does not work.
Solution:   Don't use the '|' as a command separator
Files:      src/ex_cmds.c

Patch 6.1.234 (depends on 6.1.217)
Problem:    Get a warning for using a negative value for st_dev.
Solution:   Don't assign a negative value to st_dev.
Files:      src/ex_cmds2.c

Patch 6.1.235 (depends on 6.1.223)
Problem:    'iminsert' is changed from 1 to 2 when leaving Insert mode. (Peter
            Valach)
```

```
Solution:   Check "State" before resetting it to NORMAL.
Files:      src/edit.c

Patch 6.1.236
Problem:    Memory leaks when appending lines for ":diffget" or ":diffput" and
            when reloading a changed buffer.
Solution:   Free a line after calling ml_append().
Files:      src/diff.c, src/fileio.c

Patch 6.1.237
Problem:    Putting in Visual block mode does not work correctly when "$" was
            used or when the first line is short.  (Christian Michon)
Solution:   First delete the selected text and then put the new text.  Save
            and restore registers as necessary.
Files:      src/globals.h, src/normal.c, src/ops.c, src/proto/ops.pro,
            src/vim.h

Patch 6.1.238 (extra)
Problem:    Win32: The "icon=" argument for the ":menu" command does not
            search for the bitmap file.
Solution:   Expand environment variables and search for the bitmap file.
            (Vince Negri)
            Make it consistent, use the same mechanism for X11 and GTK.
Files:      src/gui.c src/gui_gtk.c, src/gui_w32.c, src/gui_x11.c,
            src/proto/gui.pro

Patch 6.1.239
Problem:    Giving an error for missing :endif or :endwhile when being
            interrupted.
Solution:   Don't give these messages when interrupted.
Files:      src/ex_docmd.c, src/os_unix.c

Patch 6.1.240 (extra)
Problem:    Win32 with BCC 5: CPU may be defined in the environment, which
            causes a wrong argument for the compiler. (Walter Briscoe)
Solution:   Use CPUNR instead of CPU.
Files:      src/Make_bc5.mak

Patch 6.1.241
Problem:    Something goes wrong when drawing or undrawing the cursor.
Solution:   Remember when the cursor invalid in a better way.
Files:      src/gui.c

Patch 6.1.242
Problem:    When pasting a large number of lines on the command line it is not
            possible to interrupt. (Jean Jordaan)
Solution:   Check for an interrupt after each pasted line.
Files:      src/ops.c

Patch 6.1.243 (extra)
Problem:    Win32: When the OLE version is started and wasn't registered, a
            message pops up to suggest registering, even when this isn't
            possible (when the registry is not writable).
Solution:   Check if registering is possible before asking whether it should
```

```
            be done. (Walter Briscoe)
            Also avoid restarting Vim after registering.
Files:      src/if_ole.cpp

Patch 6.1.244
Problem:    Patch 6.1.237 was missing the diff for vim.h. (Igor Goldenberg)
Solution:   Include it here.
Files:      src/vim.h

Patch 6.1.245
Problem:    Comparing with ignored case does not work properly for Unicode
            with a locale where case folding an ASCII character results in a
            multi-byte character. (Glenn Maynard)
Solution:   Handle ignore-case compare for Unicode differently.
Files:      src/mbyte.c

Patch 6.1.246
Problem:    ":blast" goes to the first buffer if the last one is unlisted.
            (Andrew Stryker)
Solution:   From the last buffer search backwards for the first listed buffer
            instead of forwards.
Files:      src/ex_docmd.c

Patch 6.1.247
Problem:    ACL support doesn't always work properly.
Solution:   Add a configure argument to disable ACL "--disable-acl". (Thierry
            Vignaud)
Files:      src/auto/configure, src/configure.in

Patch 6.1.248
Problem:    Typing 'q' at the more-prompt for ":let" does not quit the
            listing. (Hari Krishna Dara)
Solution:   Quit the listing when got_int is set.
Files:      src/eval.c

Patch 6.1.249
Problem:    Can't expand a path on the command line if it includes a "|" as a
            trail byte of a multi-byte character.
Solution:   Check for multi-byte characters. (Yasuhiro Matsumoto)
Files:      src/ex_docmd.c

Patch 6.1.250
Problem:    When changing the value of 'lines' inside the expression set with
            'diffexpr' Vim might crash. (Dave Fishburn)
Solution:   Don't allow changing the screen size while updating the screen.
Files:      src/globals.h, src/option.c, src/screen.c

Patch 6.1.251
Problem:    Can't use completion for ":lcd" and ":lchdir" like ":cd".
Solution:   Expand directory names for these commands. (Servatius Brandt)
Files:      src/ex_docmd.c

Patch 6.1.252
Problem:    "vi}" does not include a line break when the "}" is at the start
```

```
            of a following line. (Kamil Burzynski)
Solution:   Include the line break.
Files:      src/search.c

Patch 6.1.253 (extra)
Problem:    Win32 with Cygwin: Changes the path of arguments in a wrong way.
            (Xiangjiang Ma)
Solution:   Don't use cygwin_conv_to_posix_path() for the Win32 version.
            Update the Cygwin makefile to support more features.  (Dan Sharp)
Files:      src/Make_cyg.mak, src/if_ole.cpp, src/main.c

Patch 6.1.254
Problem:    exists("foo{bar}") does not work.  ':unlet v{"a"}r' does not work.
            ":let v{a}r1 v{a}r2" does not work. ":func F{(1)}" does not work.
            ":delfunc F{" does not give an error message.  ':delfunc F{"F"}'
            does not work.
Solution:   Support magic braces for the exists() argument. (Vince Negri)
            Check for trailing comments explicitly for ":unlet".  Add support
            for magic braces in further arguments of ":let".  Look for a
            parenthesis only after the function name.  (Servatius Brandt)
            Also expand magic braces for "exists('*expr')".  Give an error
            message for an invalid ":delfunc" argument.  Allow quotes in the
            ":delfunc" argument.
Files:      src/eval.c, src/ex_cmds.h, src/ex_docmd.c

Patch 6.1.255 (depends on 6.1.254)
Problem:    Crash when loading menu.vim a second time. (Christian Robinson)
            ":unlet garbage foo" tries unletting "foo" after an error message.
            (Servatius Brandt)
            Very long function arguments cause very long messages when
            'verbose' is 14 or higher.
Solution:   Avoid reading from uninitialized memory.
            Break out of a loop after an invalid argument for ":unlet".
            Truncate long function arguments to 80 characters.
Files:      src/eval.c

Patch 6.1.256 (depends on 6.1.255)
Problem:    Defining a function after ":if 0" could still cause an error
            message for an existing function.
            Leaking memory when there are trailing characters for ":delfunc".
Solution:   Check the "skip" flag.  Free the memory. (Servatius Brandt)
Files:      src/eval.c

Patch 6.1.257
Problem:    ":cwindow" always sets the previous window to the last but one
            window.  (Benji Fisher)
Solution:   Set the previous window properly.
Files:      src/globals.c, src/quickfix.c, src/window.c

Patch 6.1.258
Problem:    Buffers menu doesn't work properly for multibyte buffer names.
Solution:   Use a pattern to get the left and right part of the name.
            (Yasuhiro Matsumoto)
Files:      runtime/menu.vim
```

```
Patch 6.1.259 (extra)
Problem:    Mac: with 'patchmode' is used filenames are truncated.
Solution:   Increase the BASENAMELEN for Mac OS X. (Ed Ralston)
Files:      src/os_mac.h

Patch 6.1.260 (depends on 6.1.104)
Problem:    GCC 3.2 still seems to have an optimizer problem. (Zvi Har'El)
Solution:   Use the same configure check as used for GCC 3.1.
Files:      src/auto/configure, src/configure.in

Patch 6.1.261
Problem:    When deleting a line in a buffer which is not the current buffer,
            using the Perl interface Delete(), the cursor in the current
            window may move. (Chris Houser)
Solution:   Don't adjust the cursor position when changing another buffer.
Files:      src/if_perl.xs

Patch 6.1.262
Problem:    When jumping over folds with "z[", "zj" and "zk" the previous
            position is not remembered. (Hari Krishna Dara)
Solution:   Set the previous context mark before jumping.
Files:      src/fold.c

Patch 6.1.263
Problem:    When typing a multi-byte character that triggers an abbreviation
            it is not inserted properly.
Solution:   Handle adding the typed multi-byte character. (Yasuhiro Matsumoto)
Files:      src/getchar.c

Patch 6.1.264 (depends on patch 6.1.254)
Problem:    exists() does not work for built-in functions. (Steve Wall)
Solution:   Don't check for the function name to start with a capital.
Files:      src/eval.c

Patch 6.1.265
Problem:    libcall() can be used in 'foldexpr' to call any system function.
            rename(), delete() and remote_send() can also be used in
            'foldexpr'.  These are security problems. (Georgi Guninski)
Solution:   Don't allow using libcall(), rename(), delete(), remote_send() and
            similar functions in the sandbox.
Files:      src/eval.c

Patch 6.1.266 (depends on 6.1.265)
Problem:    Win32: compile error in eval.c. (Bill McCarthy)
Solution:   Move a variable declaration.
Files:      src/eval.c

Patch 6.1.267
Problem:    Using "p" to paste into a Visual selected area may cause a crash.
Solution:   Allocate enough memory for saving the register contents. (Muraoka
            Taro)
Files:      src/ops.c
```

```
Patch 6.1.268
Problem:    When triggering an abbreviation with a multi-byte character, this
            character is not correctly inserted after expanding the
            abbreviation. (Taro Muraoka)
Solution:   Add ABBR_OFF to all characters above 0xff.
Files:      src/edit.c, src/ex_getln.c, src/getchar.c

Patch 6.1.269
Problem:    After using input() text written with ":redir" gets extra indent.
            (David Fishburn)
Solution:   Restore msg_col after using input().
Files:      src/ex_getln.c

Patch 6.1.270 (depends on 6.1.260)
Problem:    GCC 3.2.1 still seems to have an optimizer problem.
Solution:   Use the same configure check as used for GCC 3.1.
Files:      src/auto/configure, src/configure.in

Patch 6.1.271
Problem:    When compiling without the +syntax feature there are errors.
Solution:   Don't use some code for syntax highlighting. (Roger Cornelius)
            Make test 45 work without syntax highlighting.
            Also fix an error in a pattern matching: "\%(" was not supported.
Files:      src/ex_cmds2.c, src/regexp.c, src/testdir/test45.in

Patch 6.1.272
Problem:    After using ":set define<" a crash may happen. (Christian Robinson)
Solution:   Make a copy of the option value in allocated memory.
Files:      src/option.c

Patch 6.1.273
Problem:    When the cursor doesn't blink, redrawing an exposed area may hide
            the cursor.
Solution:   Always draw the cursor, also when it didn't move. (Muraoka Taro)
Files:      src/gui.c

Patch 6.1.274 (depends on 6.1.210)
Problem:    Resetting the iconv() state after each error is wrong for an
            incomplete sequence.
Solution:   Don't reset the iconv() state.
Files:      src/fileio.c

Patch 6.1.275
Problem:    When using "v" in a startup script, get warning message that
            terminal cannot highlight. (Charles Campbell)
Solution:   Only give the message after the terminal has been initialized.
Files:      src/normal.c

Patch 6.1.276
Problem:    "gvim --remote file" doesn't prompt for an encryption key.
Solution:   The further characters the client sends to the server are used.
            Added inputsave() and inputrestore() to allow prompting the
            user directly and not using typeahead.
            Also fix possible memory leak for ":normal".
```

```
Files:      src/eval.c, src/ex_cmds2.c, src/ex_docmd.c, src/getchar.c,
            src/main.c, src/proto/getchar.pro, src/proto/ui.pro,
            src/runtime/doc/eval.txt, src/structs.h, src/ui.c, src/vim.h

Patch 6.1.277 (depends on 6.1.276)
Problem:    Compilation error when building with small features.
Solution:   Define trash_input_buf() when needed. (Kelvin Lee)
Files:      src/ui.c

Patch 6.1.278
Problem:    When using signs the line number of a closed fold doesn't line up
            with the other line numbers. (Kamil Burzynski)
Solution:   Insert two spaces for the sign column.
Files:      src/screen.c

Patch 6.1.279
Problem:    The prototype for smsg() and smsg_attr() do not match the function
            definition.  This may cause trouble for some compilers. (Nix)
Solution:   Use va_list for systems that have stdarg.h.  Use "int" instead of
            "void" for the return type.
Files:      src/auto/configure, src/config.h.in, src/configure.in,
            src/proto.h, src/message.c

Patch 6.1.280
Problem:    It's possible to use an argument "firstline" or "lastline" for a
            function but using "a:firstline" or "a:lastline" in the function
            won't work.  (Benji Fisher)
Solution:   Give an error message for these arguments.
            Also avoid that the following function body causes a whole row of
            errors, skip over it after an error in the first line.
Files:      src/eval.c

Patch 6.1.281
Problem:    In Insert mode CTRL-X CTRL-G leaves the cursor after the ruler.
Solution:   Set the cursor position before waiting for the argument of CTRL-G.
            (Yasuhiro Matsumoto)
Files:      src/edit.c

Patch 6.1.282
Problem:    Elvis uses "se" in a modeline, Vim doesn't recognize this.
Solution:   Also accept "se " where "set " is accepted in a modeline.
            (Yasuhiro Matsumoto)
Files:      src/buffer.c

Patch 6.1.283
Problem:    For ":sign" the icon file name cannot contain a space.
Solution:   Handle backslashes in the file name.  (Yasuhiro Matsumoto)
Files:      src/ex_cmds.c

Patch 6.1.284
Problem:    On Solaris there is a warning for "struct utimbuf".
Solution:   Move including "utime.h" to outside the function. (Derek Wyatt)
Files:      src/fileio.c
```

```
Patch 6.1.285
Problem:    Can't wipe out a buffer with 'bufhide' option.
Solution:   Add "wipe" value to 'bufhide'. (Yegappan Lakshmanan)
Files:      runtime/doc/options.txt, src/buffer.c, src/option.c,
            src/quickfix.c

Patch 6.1.286
Problem:    'showbreak' cannot contain multi-byte characters.
Solution:   Allow using all printable characters for 'showbreak'.
Files:      src/charset.c, src/move.c, src/option.c

Patch 6.1.287 (depends on 6.1.285)
Problem:    Effect of "delete" and "wipe" in 'bufhide' were mixed up.
Solution:   Wipe out when wiping out is asked for.
Files:      src/buffer.c

Patch 6.1.288
Problem:    ":silent function F" hangs. (Hari Krishna Dara)
Solution:   Don't use msg_col, it is not incremented when using ":silent".
            Also made the function output look a bit better.  Don't translate
            "function".
Files:      src/eval.c

Patch 6.1.289 (depends on 6.1.278)
Problem:    Compiler warning for pointer. (Axel Kielhorn)
Solution:   Add a typecast for "  ".
Files:      src/screen.c

Patch 6.1.290 (extra)
Problem:    Truncating long text for message box may break multi-byte
            character.
Solution:   Adjust to start of multi-byte character. (Yasuhiro Matsumoto)
Files:      src/os_mswin.c

Patch 6.1.291 (extra)
Problem:    Win32: CTRL-@ doesn't work.  Don't even get a message for it.
Solution:   Recognize the keycode for CTRL-@. (Yasuhiro Matsumoto)
Files:      src/gui_w48.c

Patch 6.1.292 (extra, depends on 6.1.253)
Problem:    Win32: Can't compile with new MingW compiler.
            Borland 5 makefile doesn't generate pathdef.c.
Solution:   Remove -wwide-multiply argument. (Rene de Zwart)
            Various fixes for other problems in Win32 makefiles. (Dan Sharp)
Files:      src/Make_bc5.mak, src/Make_cyg.mak, src/Make_ming.mak,
            src/Make_mvc.mak

Patch 6.1.293
Problem:    byte2line() returns a wrong result for some values.
Solution:   Change ">=" to ">" in ml_find_line_or_offset(). (Bradford C Smith)
            Add one to the line number when at the end of a block.
Files:      src/memline.c

Patch 6.1.294
```

```
Problem:    Can't include a multi-byte character in a string by its hex value.
            (Benji Fisher)
Solution:   Add "\u....": a character specified with up to four hex numbers
            and stored according to the value of 'encoding'.
Files:      src/eval.c

Patch 6.1.295 (extra)
Problem:    Processing the cs.po file generates an error. (Rahul Agrawal)
Solution:   Fix the printf format characters in the translation.
Files:      src/po/cs.po

Patch 6.1.296
Problem:    Win32: When cancelling the font dialog 'guifont' remains set to
            "*".
Solution:   Restore the old value of 'guifont' (Yasuhiro Matsumoto)
Files:      src/option.c

Patch 6.1.297
Problem:    "make test" fails in test6 in an UTF-8 environment. (Benji Fisher)
Solution:   Before executing the BufReadPost autocommands save the current
            fileencoding, so that the file isn't marked changed.
Files:      src/fileio.c

Patch 6.1.298
Problem:    When using signs and the first line of a closed fold has a sign
            it can be redrawn as if the fold was open.  (Kamil Burzynski)
Solution:   Don't redraw a sign inside a closed fold.
Files:      src/screen.c

Patch 6.1.299
Problem:    ":edit +set\ ro file" doesn't work.
Solution:   Halve the number of backslashes in the "+cmd" argument.
Files:      src/ex_docmd.c

Patch 6.1.300 (extra)
Problem:    Handling of ETO_IGNORELANGUAGE is confusing.
Solution:   Clean up the handling of ETO_IGNORELANGUAGE. (Glenn Maynard)
Files:      src/gui_w32.c

Patch 6.1.301 (extra)
Problem:    French translation of file-save dialog doesn't show file name.
Solution:   Insert a star in the printf string. (Francois Terrot)
Files:      src/po/fr.po

Patch 6.1.302
Problem:    Counting lines of the Visual area is incorrect for closed folds.
            (Mikolaj Machowski)
Solution:   Correct the start and end for the closed fold.
Files:      src/normal.c

Patch 6.1.303 (extra)
Problem:    The Top/Bottom/All text does not always fit in the ruler when
            translated to Japanese.  Problem with a character being wider when
            in a bold font.
```

```
Solution:   Use ETO_PDY to specify the width of each character. (Yasuhiro
            Matsumoto)
Files:      src/gui_w32.c

Patch 6.1.304 (extra, depends on 6.1.292)
Problem:    Win32: Postscript is always enabled in the MingW Makefile.
            Pathdef.c isn't generated properly with Make_bc5.mak. (Yasuhiro
            Matsumoto)
Solution:   Change an ifdef to an ifeq. (Madoka Machitani)
            Use the Borland make redirection to generate pathdef.c. (Maurice
            Barnum)
Files:      src/Make_bc5.mak, src/Make_ming.mak

Patch 6.1.305
Problem:    When 'verbose' is 14 or higher, a function call may cause reading
            uninitialized data. (Walter Briscoe)
Solution:   Check for end-of-string in trunc_string().
Files:      src/message.c

Patch 6.1.306
Problem:    The AIX VisualAge cc compiler doesn't define __STDC__.
Solution:   Use __EXTENDED__ like __STDC__. (Jess Thrysoee)
Files:      src/os_unix.h

Patch 6.1.307
Problem:    When a double-byte character has an illegal tail byte the display
            is messed up. (Yasuhiro Matsumoto)
Solution:   Draw "XX" instead of the wrong character.
Files:      src/screen.c

Patch 6.1.308
Problem:    Can't reset the Visual mode returned by visualmode().
Solution:   Use an optional argument to visualmode(). (Charles Campbell)
Files:      runtime/doc/eval.txt, src/eval.c, src/normal.c,
            src/structs.h

Patch 6.1.309
Problem:    The tutor doesn't select German if the locale name is
            "German_Germany.1252". (Joachim Hofmann)
Solution:   Check for "German" in the locale name.  Also check for
            ".ge".  And include the German and Greek tutors.
Files:      runtime/tutor/tutor.de, runtime/tutor/tutor.vim,
            runtime/tutor/tutor.gr, runtime/tutor/tutor.gr.cp737

Patch 6.1.310 (depends on 6.1.307)
Problem:    All double-byte characters are displayed as "XX".
Solution:   Use ">= 32" instead of "< 32".  (Yasuhiro Matsumoto)
Files:      src/screen.c

Patch 6.1.311 (extra)
Problem:    VMS: path in window title doesn't include necessary separator.
            file version doesn't always work properly with Unix.
            Crashes because of memory overwrite in GUI.
            Didn't always handle files with lowercase and correct path.
```

```
Solution:   Fix the problems.  Remove unnecessary file name translations.
            (Zoltan Arpadffy)
Files:      src/buffer.c, src/ex_cmds2.c, src/fileio.c, src/memline.c,
            src/misc1.c, src/misc2.c, src/os_unix.c, src/os_vms.c, src/tag.c

Patch 6.1.312
Problem:    When using ":silent" debugging is also done silently.
Solution:   Disable silence while at the debug prompt.
Files:      src/ex_cmds2.c

Patch 6.1.313
Problem:    When a ":drop fname" command is used and "fname" is open in
            another window, it is also opened in the current window.
Solution:   Change to the window with "fname" instead.
            Don't redefine the argument list when dropping only one file.
Files:      runtime/doc/windows.txt, src/ex_cmds2.c, src/ex_cmds.c,
            src/ex_docmd.c, src/proto/ex_cmds2.pro, src/proto/ex_docmd.pro

Patch 6.1.314 (depends on 6.1.126)
Problem:    Missing backslash in "Generic Config file" syntax menu.
Solution:   Insert the backslash. (Zak Beck)
Files:      runtime/makemenu.vim, runtime/synmenu.vim

Patch 6.1.315 (extra)
Problem:    A very long hostname may lead to an unterminated string.  Failing
            to obtain a hostname may result in garbage.  (Walter Briscoe)
Solution:   Add a NUL at the end of the hostname buffer.
Files:      src/os_mac.c, src/os_msdos.c, src/os_unix.c, src/os_win16.c,
            src/os_win32.c

Patch 6.1.316
Problem:    When exiting with "wq" and there is a hidden buffer, after the
            "file changed" dialog there is a warning for a changed buffer.
            (Ajit Thakkar)
Solution:   Do update the buffer timestamps when exiting.
Files:      src/fileio.c

Patch 6.1.317
Problem:    Closing a window may cause some of the remaining windows to be
            positioned wrong if there is a mix of horizontal and vertical
            splits. (Stefan Ingi Valdimarsson)
Solution:   Update the frame sizes before updating the window positions.
Files:      src/window.c

Patch 6.1.318
Problem:    auto/pathdef.c can include wrong quotes when a compiler flag
            includes quotes.
Solution:   Put a backslash before the quotes in compiler flags. (Shinra Aida)
Files:      src/Makefile

Patch 6.1.319 (depends on 6.1.276)
Problem:    Using "--remote +cmd file" does not execute "cmd".
Solution:   Call inputrestore() in the same command line as inputsave(),
            otherwise it will never get executed.
```

```
Files:      src/main.c

Patch 6.1.320 (depends on 6.1.313)
Problem:    When a ":drop one\ file" command is used the file "one\ file" is
            opened, the backslash is not removed. (Taro Muraoka)
Solution:   Handle backslashes correctly.  Always set the argument list to
            keep it simple.
Files:      runtime/doc/windows.txt, src/ex_cmds.c

Patch 6.1.321
Problem:    When 'mouse' includes 'n' but not 'v', don't allow starting Visual
            mode with the mouse.
Solution:   Don't use MOUSE_MAY_VIS when there is no 'v' in 'mouse'. (Flemming
            Madsen)
Files:      src/normal.c

Patch 6.1.322 (extra, depends on 6.1.315)
Problem:    Win32: The host name is always "PC " plus the real host name.
Solution:   Don't insert "PC " before the host name.
Files:      src/os_win32.c

Patch 6.1.323
Problem:    ":registers" doesn't stop listing for a "q" at the more prompt.
            (Hari Krishna Dara)
Solution:   Check for interrupt and got_int.
Files:      src/ops.c, src/proto/ops.pro

Patch 6.1.324
Problem:    Crash when dragging a vertical separator when <LeftMouse> is
            remapped to jump to another window.
Solution:   Pass the window pointer to the function doing the dragging instead
            of always using the current window. (Daniel Elstner)
            Also fix that starting a drag changes window focus.
Files:      src/normal.c, src/proto/window.pro, src/ui.c, src/vim.h,
            src/window.c

Patch 6.1.325
Problem:    Shift-Tab is not automatically recognized in an xterm.
Solution:   Add <Esc>[Z as the termcap code. (Andrew Pimlott)
Files:      src/term.c

Patch 6.1.326
Problem:    Using a search pattern may read from uninitialized data (Yasuhiro
            Matsumoto)
Solution:   Initialize pointers to NULL.
Files:      src/regexp.c

Patch 6.1.327
Problem:    When opening the "mbyte.txt" help file the utf-8 characters are
            unreadable, because the fileencoding is forced to be latin1.
Solution:   Check for utf-8 encoding first in help files. (Daniel Elstner)
Files:      runtime/doc/mbyte.txt, src/fileio.c

Patch 6.1.328
```

```
Problem:    Prototype for enc_canon_search() is missing.
Solution:   Add the prototype. (Walter Briscoe)
Files:      src/mbyte.c

Patch 6.1.329
Problem:    When editing a file "a b c" replacing "%" in ":Cmd %" or ":next %"
            does not work properly.  (Hari Krishna Dara)
Solution:   Always escape spaces when expanding "%".  Don't split argument for
            <f-args> in a user command when only one argument is used.
Files:      src/ex_docmd.c

Patch 6.1.330
Problem:    GTK, Motif and Athena: Keypad keys produce the same code as
            non-keypad keys, making it impossible to map them separately.
Solution:   Use different termcap codes for the keypad keys. (Neil Bird)
Files:      src/gui_gtk_x11.c, src/gui_x11.c

Patch 6.1.331
Problem:    When translating the help files, "LOCAL ADDITIONS" no longer marks
            the spot where help files from plugins are to be listed.
Solution:   Add a "local-additions" tag and use that to find the right spot.
Files:      runtime/doc/help.txt, src/ex_cmds.c

Patch 6.1.332 (extra)
Problem:    Win32: Loading Perl dynamically doesn't work with Perl 5.8.
            Perl 5.8 also does not work with Cygwin and Ming.
Solution:   Adjust the function calls. (Taro Muraoka)
            Adjust the cyg and ming makefiles. (Dan Sharp)
Files:      src/Make_cyg.mak, src/Make_ming.mak, src/Make_mvc.mak,
            src/if_perl.xs

Patch 6.1.333 (extra)
Problem:    Win32: Can't handle Unicode text on the clipboard.
            Can't pass NUL byte, it becomes a line break.  (Bruce DeVisser)
Solution:   Support Unicode for the clipboard (Ron Aaron and Glenn Maynard)
            Also support copy/paste of NUL bytes.
Files:      src/os_mswin.c, src/os_win16.c src/os_win32.c

Patch 6.1.334 (extra, depends on 6.1.303)
Problem:    Problem with drawing Hebrew characters.
Solution:   Only use ETO_PDY for Windows NT and the like. (Yasuhiro Matsumoto)
Files:      src/gui_w32.c

Patch 6.1.335 (extra)
Problem:    Failure of obtaining the cursor position and window size is
            ignored.
Solution:   Remove a semicolon after an "if". (Walter Briscoe)
Files:      src/gui_w32.c

Patch 6.1.336 (extra)
Problem:    Warning for use of function prototypes of smsg().
Solution:   Define HAVE_STDARG_H. (Walter Briscoe)
Files:      src/os_win32.h
```

```
Patch 6.1.337
Problem:    When using "finish" in debug mode in function B() for ":call
            A(B())" does not stop after B() is finished.
Solution:   Increase debug_level while evaluating a function.
Files:      src/ex_docmd.c

Patch 6.1.338
Problem:    When using a menu that checks out the current file from Insert
            mode, there is no warning for the changed file until exiting
            Insert mode.  (Srikanth Sankaran)
Solution:   Add a check for need_check_timestamps in the Insert mode loop.
Files:      src/edit.c

Patch 6.1.339
Problem:    Completion doesn't allow "g:" in ":let g:did_<Tab>". (Benji
            Fisher)
Solution:   Return "g:var" for global variables when that is what is being
            expanded. (Flemming Madsen)
Files:      src/eval.c

Patch 6.1.340 (extra, depends on 6.1.332)
Problem:    Win32: Can't compile the Perl interface with nmake.
Solution:   Don't compare the version number as a string but as a number.
            (Juergen Kraemer)
Files:      src/Make_mvc.mak

Patch 6.1.341
Problem:    In Insert mode with 'rightleft' set the cursor is drawn halfway a
            double-wide character.  For CTRL-R and CTRL-K in Insert mode the "
            or ? is not displayed.
Solution:   Draw the cursor in the next character cell.  Display the " or ?
            over the right half of the double-wide character. (Yasuhiro
            Matsumoto)  Also fix that cancelling a digraph doesn't redraw
            a double-byte character correctly.
Files:      src/edit.c, src/gui.c, src/mbyte.c

Patch 6.1.342 (depends on 6.1.341)
Problem:    With 'rightleft' set typing "c" on a double-wide character causes
            the cursor to be displayed one cell to the left.
Solution:   Draw the cursor in the next character cell.  (Yasuhiro Matsumoto)
Files:      src/gui.c

Patch 6.1.343 (depends on 6.1.342)
Problem:    Cannot compile with the +multi_byte feature but without +rightleft.
            Cannot compile without the GUI.
Solution:   Fix the #ifdefs.  (partly by Nam SungHyun)
Files:      src/gui.c, src/mbyte.c, src/ui.c

Patch 6.1.344
Problem:    When using ":silent filetype" the output is still put in the
            message history. (Hari Krishna Dara)
Solution:   Don't add messages in the history when ":silent" is used.
Files:      src/message.c
```

Patch 6.1.345 (extra)
Problem: Win32: 'imdisable' doesn't work.
Solution: Make 'imdisable' work. (Yasuhiro Matsumoto)
Files: src/gui_w32.c

Patch 6.1.346
Problem: The scroll wheel can only scroll the current window.
Solution: Make the scroll wheel scroll the window that the mouse points to.
            (Daniel Elstner)
Files: src/edit.c, src/gui.c, src/normal.c, src/term.c

Patch 6.1.347
Problem: When using cscope to list matching tags, the listed number is
            sometimes not equal to what cscope uses. (Vihren Milev)
Solution: For cscope tags use only one table, don't give tags in the current
            file a higher priority.
Files: src/tag.c

Patch 6.1.348
Problem: Wildmode with wildmenu: ":set wildmode=list,full", ":colorscheme
            <tab>" results in "zellner" instead of the first entry. (Anand
            Hariharan)
Solution: Don't call ExpandOne() from globpath(). (Flemming Madsen)
Files: src/ex_getln.c

Patch 6.1.349
Problem: "vim --serverlist" when no server was ever started gives an error
            message without "\n".
            "vim --serverlist" doesn't exit when the X server can't be
            contacted, it starts Vim unexpectedly. (Ricardo Signes)
Solution: Don't give an error when no Vim server was ever started.
            Treat failing of opening the display equal to errors inside the
            remote*() functions. (Flemming Madsen)
Files: src/if_xcmdsrv.c, src/main.c

Patch 6.1.350
Problem: When entering a buffer with ":bnext" for the first time, using an
            autocommand to restore the last used cursor position doesn't work.
            (Paolo Giarusso)
Solution: Don't use the last known cursor position of the current Vim
            invocation if an autocommand changed the position.
Files: src/buffer.c

Patch 6.1.351 (depends on 6.1.349)
Problem: Crash when starting Vim the first time in an X server. (John
            McGowan)
Solution: Don't call xFree() with a fixed string.
Files: src/if_xcmdsrv.c

Patch 6.1.352 (extra, depends on 6.1.345)
Problem: Win32: Crash when setting "imdisable" in _vimrc.
Solution: Don't call IME functions when imm32.dll was not loaded (yet).
            Also add typecasts to avoid Compiler warnings for
            ImmAssociateContext() argument.

```
Files:      src/gui_w32.c

Patch 6.1.353 (extra, depends on 6.1.334)
Problem:    Problem with drawing Arabic characters.
Solution:   Don't use ETO_PDY, do use padding.
Files:      src/gui_w32.c

Patch 6.1.354 (extra, depends on 6.1.333)
Problem:    MS-Windows 98: Notepad can't paste text copied from Vim when
            'encoding' is "utf-8".
Solution:   Also make CF_TEXT available on the clipboard. (Ron Aaron)
Files:      src/os_mswin.c

Patch 6.1.355
Problem:    In a regexp '\n' will never match anything in a string.
Solution:   Make '\n' match a newline character.
Files:      src/buffer.c, src/edit.c, src/eval.c, src/ex_cmds2.c,
            src/ex_docmd.c, src/ex_getln.c, src/fileio.c, src/misc1.c,
            src/option.c, src/os_mac.c, src/os_unix.c, src/quickfix.c,
            src/regexp.c, src/search.c, src/syntax.c, src/tag.c, src/vim.h

Patch 6.1.356 (extra, depends on, well, eh, several others)
Problem:    Compiler warnings for using convert_setup() and a few other
            things.
Solution:   Add typecasts.
Files:      src/mbyte.c, src/os_mswin.c, src/proto/os_win32.pro, src/os_win32.c

Patch 6.1.357
Problem:    CR in the quickfix window jumps to the error under the cursor, but
            this doesn't work in Insert mode. (Srikanth Sankaran)
Solution:   Handle CR in Insert mode in the quickfix window.
Files:      src/edit.c

Patch 6.1.358
Problem:    The tutor doesn't select another locale version properly.
Solution:   Insert the "let" command. (Yasuhiro Matsumoto)
Files:      runtime/tutor/tutor.vim

Patch 6.1.359 (extra)
Problem:    Mac Carbon: Vim doesn't get focus when started from the command
            line.  Crash when using horizontal scroll bar.
Solution:   Set Vim as the frontprocess.  Fix scrolling.  (Peter Cucka)
Files:      src/gui_mac.c

Patch 6.1.360 (depends on 6.1.341)
Problem:    In Insert mode CTRL-K ESC messes up a multi-byte character.
            (Anders Helmersson)
Solution:   Save all bytes of a character when displaying a character
            temporarily.
Files:      src/edit.c, src/proto/screen.pro, src/screen.c

Patch 6.1.361
Problem:    Cannot jump to a file mark with ":'M".
Solution:   Allow jumping to another file for a mark in an Ex address when it
```

```
            is the only thing in the command line.
Files:      src/ex_docmd.c

Patch 6.1.362
Problem:    tgetent() may return zero for success. tgetflag() may return -1
            for an error.
Solution:   Check tgetflag() for returning a positive value.  Add an autoconf
            check for the value that tgetent() returns.
Files:      src/auto/configure, src/config.h.in, src/configure.in, src/term.c

Patch 6.1.363
Problem:    byte2line() can return one more than the number of lines.
Solution:   Return -1 if the offset is one byte past the end.
Files:      src/memline.c

Patch 6.1.364
Problem:    That the FileChangedShell autocommand event never nests makes it
            difficult to reload a file in a normal way.
Solution:   Allow nesting for the FileChangedShell event but do not allow
            triggering itself again.
            Also avoid autocommands for the cmdline window in rare cases.
Files:      src/ex_getln.c, src/fileio.c, src/window.c

Patch 6.1.365 (depends on 6.1.217)
Problem:    Setting a breakpoint in a sourced file with a relative path name
            doesn't work. (Servatius Brandt)
Solution:   Expand the file name to a full path.
Files:      src/ex_cmds2.c

Patch 6.1.366
Problem:    Can't use Vim with Netbeans.
Solution:   Add the Netbeans interface.  Includes support for sign icons and
            "-fg" and "-bg" arguments for GTK.  Add the 'autochdir'
            option.  (Gordon Prieur, George Hernandez, Dave Weatherford)
            Make it possible to display both a sign with a text and one with
            line highlighting in the same line.
            Add support for Agide, interface version 2.1.
            Also fix that when 'iskeyword' includes '?' the "*" command
            doesn't work properly on a word that includes "?" (Bill McCarthy):
            Don't escape "?" to "\?" when searching forward.
Files:      runtime/doc/Makefile, runtime/doc/netbeans.txt,
            runtime/doc/options.txt, runtime/doc/various.txt,
            src/Makefile, src/auto/configure, src/buffer.c, src/config.h.in,
            src/config.mk.in, src/configure.in, src/edit.c, src/ex_cmds.c,
            src/ex_docmd.c, src/feature.h, src/fileio.c, src/globals.h,
            src/gui.c, src/gui_beval.c, src/gui_gtk_x11.c, src/gui_x11.c,
            src/main.c, src/memline.c, src/misc1.c, src/misc2.c, src/move.c,
            src/nbdebug.c, src/nbdebug.h, src/netbeans.c, src/normal.c,
            src/ops.c, src/option.c, src/option.h, src/proto/buffer.pro,
            src/proto/gui_beval.pro, src/proto/gui_gtk_x11.pro,
            src/proto/gui_x11.pro, src/proto/misc2.pro,
            src/proto/netbeans.pro, src/proto/normal.pro, src/proto/ui.pro,
            src/proto.h, src/screen.c, src/structs.h, src/ui.c, src/undo.c,
            src/vim.h, src/window.c, src/workshop.c
```

```
Patch 6.1.367 (depends on 6.1.365)
Problem:    Setting a breakpoint in a function doesn't work.  For a sourced
            file it doesn't work when symbolic links are involved.  (Servatius
            Brandt)
Solution:   Expand the file name in the same way as do_source() does.  Don't
            prepend the path to a function name.
Files:      src/ex_cmds2.c

Patch 6.1.368
Problem:    Completion for ":map" does not include <silent> and <script>.
            ":mkexrc" do not save the <silent> attribute of mappings.
Solution:   Add "<silent>" to the generated map commands when appropriate.
            (David Elstner)
            Add <silent> and <script> to command line completion.
Files:      src/getchar.c

Patch 6.1.369 (extra)
Problem:    VMS: Vim hangs when attempting to edit a read-only file in the
            terminal.  Problem with VMS filenames for quickfix.
Solution:   Rewrite low level input.  Remove version number from file name in
            a couple more places.  Fix crash after patch 6.1.362.  Correct
            return code for system().  (Zoltan Arpadffy, Tomas Stehlik)
Files:      src/misc1.c, src/os_unix.c, src/os_vms.c, src/proto/os_vms.pro,
            src/os_vms_conf.h, src/quickfix.c, src/ui.c

Patch 6.1.370
Problem:    #ifdef nesting is unclear.
Solution:   Insert spaces to indicate the nesting.
Files:      src/os_unix.c

Patch 6.1.371
Problem:    "%V" in 'statusline' doesn't show "0-1" in an empty line.
Solution:   Add one to the column when comparing with virtual column (Andrew
            Pimlott)
Files:      src/buffer.c

Patch 6.1.372
Problem:    With 16 bit ints there are compiler warnings. (Walter Briscoe)
Solution:   Change int into long.
Files:      src/structs.h, src/syntax.c

Patch 6.1.373
Problem:    The default page header for printing is not translated.
Solution:   Add _() around the two places where "Page" is used. (Mike
            Williams)  Translate the default value of the 'titleold' and
            'printheader' options.
Files:      src/ex_cmds2.c, src/option.c

Patch 6.1.374 (extra)
Problem:    MS-Windows: Cannot build GvimExt with MingW or Cygwin.
Solution:   Add makefile and modified resource files. (Rene de Zwart)
            Also support Cygwin. (Alejandro Lopez_Valencia)
Files:      GvimExt/Make_cyg.mak, GvimExt/Make_ming.mak, GvimExt/Makefile,
```

GvimExt/gvimext_ming.def, GvimExt/gvimext_ming.rc

Patch 6.1.375
Problem: MS-Windows: ':!dir "%"' does not work for a file name with spaces.
            (Xiangjiang Ma)
Solution: Don't insert backslashes for spaces in a shell command.
Files: src/ex_docmd.c

Patch 6.1.376
Problem: "vim --version" and "vim --help" have a non-zero exit code.
            That is unusual. (Petesea)
Solution: Use a zero exit code.
Files: src/main.c

Patch 6.1.377
Problem: Can't add words to 'lispwords' option.
Solution: Add P_COMMA and P_NODUP flags. (Haakon Riiser)
Files: src/option.c

Patch 6.1.378
Problem: When two buffer-local user commands are ambiguous, a full match
            with a global user command isn't found. (Hari Krishna Dara)
Solution: Detect this situation and accept the global command.
Files: src/ex_docmd.c

Patch 6.1.379
Problem: Linux with kernel 2.2 can't use the alternate stack in combination
            with threading, causes an infinite loop.
Solution: Don't use the alternate stack in this situation.
Files: src/os_unix.c

Patch 6.1.380
Problem: When 'winminheight' is zero and the quickfix window is zero lines,
            entering the window doesn't make it higher. (Christian J.
            Robinson)
Solution: Make sure the current window is at least one line high.
Files: src/window.c

Patch 6.1.381
Problem: When a BufWriteCmd is used and it leaves the buffer modified, the
            window may still be closed. (Hari Krishna Dara)
Solution: Return FAIL from buf_write() when the buffer is still modified
            after a BufWriteCmd autocommand was used.
Files: src/fileio.c

Patch 6.1.382 (extra)
Problem: Win32 GUI: When using two monitors, the code that checks/fixes the
            window size and position (e.g. when a font changes) doesn't work
            properly. (George Reilly)
Solution: Handle a double monitor situation. (Helmut Stiegler)
Files: src/gui_w32.c

Patch 6.1.383
Problem: The filling of the status line doesn't work properly for

```
            multi-byte characters. (Nam SungHyun)
            There is no check for going past the end of the buffer.
Solution:   Properly distinguish characters and bytes.  Properly check for
            running out of buffer space.
Files:      src/buffer.c, src/ex_cmds2.c, src/proto/buffer.pro, src/screen.c

Patch 6.1.384
Problem:    It is not possible to find if a certain patch has been included.
            (Lubomir Host)
Solution:   Support using has() to check if a patch was included.
Files:      runtime/doc/eval.txt, src/eval.c, src/proto/version.pro,
            src/version.c

Patch 6.1.385 (depends on 6.1.383)
Problem:    Can't compile without the multi-byte feature.
Solution:   Move an #ifdef.  (Christian J. Robinson)
Files:      src/buffer.c

Patch 6.1.386
Problem:    Get duplicate tags when running ":helptags".
Solution:   Do the other halve of moving a section to another help file.
Files:      runtime/tagsrch.txt

Patch 6.1.387 (depends on 6.1.373)
Problem:    Compiler warning for pointer cast.
Solution:   Add (char_u *).
Files:      src/option.c

Patch 6.1.388 (depends on 6.1.384)
Problem:    Compiler warning for pointer cast.
Solution:   Add (char *).  Only include has_patch() when used.
Files:      src/eval.c, src/version.c

Patch 6.1.389 (depends on 6.1.366)
Problem:    Balloon evaluation doesn't work for GTK.
            has("balloon_eval") doesn't work.
Solution:   Add balloon evaluation for GTK.  Also improve displaying of signs.
            (Daniel Elstner)
            Also make ":gui" start the netbeans connection and avoid using
            netbeans functions when the connection is not open.
Files:      src/Makefile, src/feature.h, src/gui.c, src/gui.h,
            src/gui_beval.c, src/gui_beval.h, src/gui_gtk.c,
            src/gui_gtk_x11.c, src/eval.c, src/memline.c, src/menu.c,
            src/netbeans.c, src/proto/gui_beval.pro, src/proto/gui_gtk.pro,
            src/structs.h, src/syntax.c, src/ui.c, src/workshop.c

Patch 6.1.390 (depends on 6.1.389)
Problem:    It's not possible to tell Vim to save and exit through the
            Netbeans interface.  Would still try to send balloon eval text
            after the connection is closed.
            Can't use Unicode characters for sign text.
Solution:   Add functions "saveAndExit" and "getModified".  Check for a
            working connection before sending a balloonText event.
            various other cleanups.
```

```
            Support any character for sign text. (Daniel Elstner)
Files:      runtime/doc/netbeans.txt, runtime/doc/sign.txt, src/ex_cmds.c,
            src/netbeans.c, src/screen.c

Patch 6.1.391
Problem:    ml_get() error when using virtualedit. (Charles Campbell)
Solution:   Get a line from a specific window, not the current one.
Files:      src/charset.c

Patch 6.1.392 (depends on 6.1.383)
Problem:    Highlighting in the 'statusline' is in the wrong position when an
            item is truncated. (Zak Beck)
Solution:   Correct the start of 'statusline' items properly for a truncated
            item.
Files:      src/buffer.c

Patch 6.1.393
Problem:    When compiled with Python and threads, detaching the terminal may
            cause Vim to loop forever.
Solution:   Add -pthread to $CFLAGS when using Python and gcc. (Daniel
            Elstner)
Files:      src/auto/configure,, src/configure.in

Patch 6.1.394 (depends on 6.1.390)
Problem:    The netbeans interface doesn't recognize multibyte glyph names.
Solution:   Check the number of cells rather than bytes to decide
            whether a glyph name is not a filename. (Daniel Elstner)
Files:      src/netbeans.c

Patch 6.1.395 (extra, depends on 6.1.369)
Problem:    VMS: OLD_VMS is never defined.  Missing function prototype.
Solution:   Define OLD_VMS in Make_vms.mms.  Add vms_sys_status() to
            os_vms.pro. (Zoltan Arpadffy)
Files:      src/Make_vms.mms, src/proto/os_vms.pro

Patch 6.1.396 (depends on 6.1.330)
Problem:    Compiler warnings for using enum.
Solution:   Add typecast to char_u.
Files:      src/gui_gtk_x11.c, src/gui_x11.c

Patch 6.1.397 (extra)
Problem:    The install program may use a wrong path for the diff command if
            there is a space in the install directory path.
Solution:   Use double quotes around the path if necessary. (Alejandro
            Lopez-Valencia)  Also use double quotes around the file name
            arguments.
Files:      src/dosinst.c

Patch 6.1.398
Problem:    Saving the typeahead for debug mode causes trouble for a test
            script. (Servatius Brandt)
Solution:   Add the ":debuggreedy" command to avoid saving the typeahead.
Files:      runtime/doc/repeat.txt, src/ex_cmds.h, src/ex_cmds2.c,
            src/ex_docmd.c, src/proto/ex_cmds2.pro
```

```
Patch 6.1.399
Problem:    Warning for unused variable.
Solution:   Remove the variable two_or_more.
Files:      src/ex_cmds.c

Patch 6.1.400 (depends on 6.1.381)
Problem:    When a BufWriteCmd wipes out the buffer it may still be accessed.
Solution:   Don't try accessing a buffer that has been wiped out.
Files:      src/fileio.c

Patch 6.1.401 (extra)
Problem:    Building the Win16 version with Borland 5.01 doesn't work.
            "make test" doesn't work with Make_dos.mak. (Walter Briscoe)
Solution:   Various fixes to the w16 makefile. (Walter Briscoe)
            Don't use deltree.  Use "mkdir \tmp" instead of "mkdir /tmp".
Files:      src/Make_w16.mak, src/testdir/Make_dos.mak

Patch 6.1.402
Problem:    When evaluating a function name with curly braces, an error
            is not handled consistently.
Solution:   Accept the result of a curly braces expression when an
            error was encountered.  Skip evaluating an expression in curly
            braces when skipping.  (Servatius Brandt)
Files:      src/eval.c

Patch 6.1.403 (extra)
Problem:    MS-Windows 16 bit: compiler warnings.
Solution:   Add typecasts. (Walter Briscoe)
Files:      src/ex_cmds2.c, src/gui_w48.c, src/os_mswin.c, src/os_win16.c,
            src/syntax.c

Patch 6.1.404 (extra)
Problem:    Various small problems.
Solution:   Fix comments.  Various small additions, changes in indent, removal
            of unused items and fixes.
Files:      Makefile, README.txt, runtime/menu.vim, runtime/vimrc_example.vim,
            src/INSTALL, src/INSTALLole.txt, src/Make_bc5.mak,
            src/Make_cyg.mak, src/Make_ming.mak, src/Makefile,
            src/config.h.in, src/edit.c, src/eval.c, src/ex_cmds2.c,
            src/ex_docmd.c, src/ex_getln.c, src/fileio.c, src/getchar.c,
            src/gui.c, src/gui_gtk.c, src/gui_photon.c, src/if_cscope.c,
            src/if_python.c, src/keymap.h, src/mark.c, src/mbyte.c,
            src/message.c, src/misc1.c, src/misc2.c, src/normal.c,
            src/option.c, src/os_os2_cfg.h, src/os_win32.c,
            src/proto/getchar.pro, src/proto/message.pro,
            src/proto/regexp.pro, src/screen.c, src/structs.h, src/syntax.c,
            src/term.c, src/testdir/test15.in, src/testdir/test15.ok,
            src/vim.rc, src/xxd/Make_cyg.mak, src/xxd/Makefile

Patch 6.1.405
Problem:    A few files are missing from the toplevel Makefile.
Solution:   Add the missing files.
Files:      Makefile
```

```
Patch 6.1.406 (depends on 6.1.392)
Problem:    When a statusline item doesn't fit arbitrary text appears.
            (Christian J. Robinson)
Solution:   When there is just enough room but not for the "<" truncate the
            statusline item like there is no room.
Files:      src/buffer.c

Patch 6.1.407
Problem:    ":set scrollbind | help" scrollbinds the help window. (Andrew
            Pimlott)
Solution:   Reset 'scrollbind' when opening a help window.
Files:      src/ex_cmds.c

Patch 6.1.408
Problem:    When 'rightleft' is set unprintable character 0x0c is displayed as
            ">c0<".
Solution:   Reverse the text of the hex character.
Files:      src/screen.c

Patch 6.1.409
Problem:    Generating tags for the help doesn't work for some locales.
Solution:   Set LANG=C LC_ALL=C in the environment for "sort". (Daniel
            Elstner)
Files:      runtime/doc/Makefile

Patch 6.1.410 (depends on 6.1.390)
Problem:    Linking error when compiling with Netbeans but without sign icons.
            (Malte Neumann)
Solution:   Don't define buf_signcount() when sign icons are unavailable.
Files:      src/buffer.c

Patch 6.1.411
Problem:    When 'virtualedit' is set, highlighting a Visual block beyond the
            end of a line may be wrong.
Solution:   Correct the virtual column when the end of the line is before the
            displayed part of the line. (Muraoka Taro)
Files:      src/screen.c

Patch 6.1.412
Problem:    When swapping terminal screens and using ":gui" to start the GUI,
            the shell prompt may be after a hit-enter prompt.
Solution:   Output a newline in the terminal when starting the GUI and there
            was a hit-enter prompt..
Files:      src/gui.c

Patch 6.1.413
Problem:    When 'clipboard' contains "unnamed", "p" in Visual mode doesn't
            work correctly.
Solution:   Save the register before overwriting it and put the resulting text
            on the clipboard afterwards.  (Muraoka Taro)
Files:      src/normal.c, src/ops.c

Patch 6.1.414 (extra, depends on 6.1.369)
```

```
Problem:    VMS: Vim busy waits when waiting for input.
Solution:   Delay for a short while before getting another character.  (Zoltan
            Arpadffy)
Files:      src/os_vms.c

Patch 6.1.415
Problem:    When there is a vertical split and a quickfix window, reducing the
            size of the Vim window may result in a wrong window layout and a
            crash.
Solution:   When reducing the window size and there is not enough space for
            'winfixheight' set the frame height to the larger height, so that
            there is a retry while ignoring 'winfixheight'. (Yasuhiro
            Matsumoto)
Files:      src/window.c

Patch 6.1.416 (depends on 6.1.366)
Problem:    When using the Netbeans interface, a line with a sign cannot be
            changed.
Solution:   Respect the GUARDEDOFFSET for sign IDs when checking for a guarded
            area.
Files:      src/netbeans.c

Patch 6.1.417
Problem:    Unprintable multi-byte characters are not handled correctly.
            Multi-byte characters above 0xffff are displayed as another
            character.
Solution:   Handle unprintable multi-byte characters.  Display multi-byte
            characters above 0xffff with a marker.  Recognize UTF-16 words and
            BOM words as unprintable.  (Daniel Elstner)
Files:      src/charset.c, src/mbyte.c, src/screen.c

Patch 6.1.418
Problem:    The result of strftime() is in the current locals.  Need to
            convert it to 'encoding'.
Solution:   Obtain the current locale and convert the argument for strftime()
            to it and the result back to 'encoding'.  (Daniel Elstner)
Files:      src/eval.c, src/ex_cmds.c, src/ex_cmds2.c, src/mbyte.c,
            src/proto/mbyte.pro, src/option.c, src/os_mswin.c

Patch 6.1.419
Problem:    Vim doesn't compile on AIX 5.1.
Solution:   Don't define _NO_PROTO on this system. (Uribarri)
Files:      src/auto/configure, src/configure.in

Patch 6.1.420 (extra)
Problem:    convert_input() has an unnecessary STRLEN().
            Conversion from UCS-2 to a codepage uses word count instead of
            byte count.
Solution:   Remove the STRLEN() call. (Daniel Elstner)
            Always use byte count for string_convert().
Files:      src/gui_w32.c, src/mbyte.c

Patch 6.1.421 (extra, depends on 6.1.354)
Problem:    MS-Windows 9x: When putting text on the clipboard it can be in
```

```
            the wrong encoding.
Solution:   Convert text to the active codepage for CF_TEXT. (Glenn Maynard)
Files:      src/os_mswin.c

Patch 6.1.422
Problem:    Error in .vimrc doesn't cause hit-enter prompt when swapping
            screens. (Neil Bird)
Solution:   Set msg_didany also when sending a message to the terminal
            directly.
Files:      src/message.c

Patch 6.1.423
Problem:    Can't find arbitrary text in help files.
Solution:   Added the ":helpgrep" command.
Files:      runtime/doc/various.txt, src/ex_cmds.h, src/ex_docmd.c,
            src/proto/quickfix.pro, src/quickfix.c

Patch 6.1.424 (extra)
Problem:    Win32: gvim compiled with VC++ 7.0 run on Windows 95 does not show
            menu items.
Solution:   Define $WINVER to avoid an extra item is added to MENUITEMINFO.
            (Muraoka Taro)
Files:      src/Make_mvc.mak

Patch 6.1.425
Problem:    ":helptags $VIMRUNTIME/doc" does not add the "help-tags" tag.
Solution:   Do add the "help-tags" tag for that specific directory.
Files:      src/ex_cmds.c

Patch 6.1.426
Problem:    "--remote-wait +cmd file" waits forever. (Valery Kondakoff)
Solution:   Don't wait for the "+cmd" argument to have been edited.
Files:      src/main.c

Patch 6.1.427
Problem:    Several error messages for regexp patterns are not translated.
Solution:   Use _() properly. (Muraoka Taro)
Files:      src/regexp.c

Patch 6.1.428
Problem:    FreeBSD: wait() may hang when compiled with Python support and
            doing a system() call in a startup script.
Solution:   Use waitpid() instead of wait() and poll every 10 msec, just like
            what is done in the GUI.
Files:      src/os_unix.c

Patch 6.1.429 (depends on 6.1.390)
Problem:    Crash when using showmarks.vim plugin. (Charles Campbell)
Solution:   Check for sign_get_text() returning a NULL pointer.
Files:      src/screen.c

Patch 6.1.430
Problem:    In Lisp code backslashed parens should be ignored for "%". (Dorai)
Solution:   Skip over backslashed parens.
```

```
Files:      src/search.c

Patch 6.1.431
Problem:    Debug commands end up in redirected text.
Solution:   Disable redirection while handling debug commands.
Files:      src/ex_cmds2.c

Patch 6.1.432 (depends on 6.1.375)
Problem:    MS-Windows: ":make %:p" inserts extra backslashes. (David Rennalls)
Solution:   Don't add backslashes, handle it like ":!cmd".
Files:      src/ex_docmd.c

Patch 6.1.433
Problem:    ":popup" only works for Win32.
Solution:   Add ":popup" support for GTK.  (Daniel Elstner)
Files:      runtime/doc/gui.txt, src/ex_docmd.c, src/gui_gtk.c, src/menu.c,
            src/proto/gui_gtk.pro

Patch 6.1.434 (extra)
Problem:    Win32: When there are more than 32767 lines, the scrollbar has a
            roundoff error.
Solution:   Make a click on an arrow move one line.  Also move the code to
            gui_w48.c, there is hardly any difference between the 16 bit and
            32 bit versions. (Walter Briscoe)
Files:      src/gui_w16.c, src/gui_w32.c, src/gui_w48.c

Patch 6.1.435
Problem:    ":winsize x" resizes the Vim window to the minimal size. (Andrew
            Pimlott)
Solution:   Give an error message for wrong arguments of ":winsize" and
            ":winpos".
Files:      src/ex_docmd.c

Patch 6.1.436
Problem:    When a long UTF-8 file contains an illegal byte it's hard to find
            out where it is. (Ron Aaron)
Solution:   Add the line number to the error message.
Files:      src/fileio.c

Patch 6.1.437 (extra, depends on 6.1.421)
Problem:    Using multi-byte functions when they are not available.
Solution:   Put the clipboard conversion inside an #ifdef. (Vince Negri)
            Also fix a pointer type mistake. (Walter Briscoe)
Files:      src/os_mswin.c

Patch 6.1.438
Problem:    When Perl has thread support Vim cannot use the Perl interface.
Solution:   Add a configure check and disable Perl when it will not work.
            (Aron Griffis)
Files:      src/auto/configure, src/configure.in

Patch 6.1.439
Problem:    Netbeans: A "create" function doesn't actually create a buffer,
            following functions may fail.
```

```
Solution:   Create a Vim buffer without a name when "create" is called.
            (Gordon Prieur)
Files:      runtime/doc/netbeans.txt, src/netbeans.c

Patch 6.1.440
Problem:    The "@*" command doesn't obtain the actual contents of the
            clipboard. (Hari Krishna Dara)
Solution:   Obtain the clipboard text before executing the command.
Files:      src/ops.c

Patch 6.1.441
Problem:    "zj" and "zk" cannot be used as a motion command after an
            operator. (Ralf Hetzel)
Solution:   Accept these commands as motion commands.
Files:      src/normal.c

Patch 6.1.442
Problem:    Unicode 3.2 defines more space and punctuation characters.
Solution:   Add the new characters to the Unicode tables. (Raphael Finkel)
Files:      src/mbyte.c

Patch 6.1.443 (extra)
Problem:    Win32: The gvimext.dll build with Borland 5.5 requires another
            DLL.
Solution:   Build a statically linked version by default. (Dan Sharp)
Files:      GvimExt/Make_bc5.mak

Patch 6.1.444 (extra)
Problem:    Win32: Enabling a build with gettext support is not consistent.
Solution:   Use "GETTEXT" for Borland and msvc makefiles. (Dan Sharp)
Files:      src/Make_bc5.mak, src/Make_mvc.mak

Patch 6.1.445 (extra)
Problem:    DJGPP: get warning for argument of putenv()
Solution:   Define HAVE_PUTENV to use DJGPP's putenv(). (Walter Briscoe)
Files:      src/os_msdos.h

Patch 6.1.446 (extra)
Problem:    Win32: The MingW makefile uses a different style of arguments than
            other makefiles.
            Dynamic IME is not supported for Cygwin.
Solution:   Use "no" and "yes" style arguments.  Remove the use of the
            dyn-ming.h include file. (Dan Sharp)
            Do not include the ime.h file and adjust the makefile. (Alejandro
            Lopez-Valencia)
Files:      src/Make_cyg.mak, src/Make_ming.mak, src/gui_w32.c,
            src/if_perl.xs, src/if_python.c, src/if_ruby.c, src/os_win32.c

Patch 6.1.447
Problem:    "make install" uses "make" directly for generating help tags.
Solution:   Use $(MAKE) instead of "make". (Tim Mooney)
Files:      src/Makefile

Patch 6.1.448
```

```
Problem:    'titlestring' has a default maximum width of 50 chars per item.
Solution:   Remove the default maximum (also for 'statusline').
Files:      src/buffer.c

Patch 6.1.449
Problem:    When "1" and "a" are in 'formatoptions', auto-formatting always
            moves a newly added character to the next line. (Servatius Brandt)
Solution:   Don't move a single character to the next line when it was just
            typed.
Files:      src/edit.c

Patch 6.1.450
Problem:    Termcap entry "kB" for back-tab is not recognized.
Solution:   Use back-tab as the shift-tab code.
Files:      src/keymap.h, src/misc2.c, src/term.c

Patch 6.1.451
Problem:    GUI: When text in the find dialog contains a slash, a backslash is
            inserted the next time it is opened. (Mezz)
Solution:   Remove escaped backslashes and question marks. (Daniel Elstner)
Files:      src/gui.c

Patch 6.1.452 (extra, after 6.1.446)
Problem:    Win32: IME support doesn't work for MSVC.
Solution:   Use _MSC_VER instead of __MSVC. (Alejandro Lopez-Valencia)
Files:      src/gui_w32.c

Patch 6.1.453 (after 6.1.429)
Problem:    When compiled without sign icons but with sign support, adding a
            sign may cause a crash.
Solution:   Check for the text sign to exist before using it. (Kamil
            Burzynski)
Files:      src/screen.c

Patch 6.1.454 (extra)
Problem:    Win32: pasting Russian text in Vim with 'enc' set to cp1251
            results in utf-8 bytes.  (Perelyubskiy)
            Conversion from DBCS to UCS2 does not work when 'encoding' is not
            the active codepage.
Solution:   Introduce enc_codepage and use it for conversion to 'encoding'
            (Glenn Maynard)
            Use MultiByteToWideChar() and WideCharToMultiByte() instead of
            iconv().  Should do most needed conversions without iconv.dll.
Files:      src/globals.h, src/gui_w32.c, src/mbyte.c, src/os_mswin.c,
            src/proto/mbyte.pro, src/proto/os_mswin.pro, src/structs.h

Patch 6.1.455
Problem:    Some Unicode characters can be one or two character cells wide.
Solution:   Add the 'ambiwidth' option to tell Vim how to display these
            characters. (Jungshik Shin)
            Also reset the script ID when setting an option to its default
            value, so that ":verbose set" won't give wrong info.
Files:      runtime/doc/options.txt, src/mbyte.c, src/option.c, src/option.h
```

Patch 6.1.456 (extra, after 6.1.454)
Problem: Win32: IME doesn't work.
Solution: ImmGetCompositionStringW() returns the size in bytes, not words.
            (Yasuhiro Matsumoto) Also fix typecast problem.
Files: src/gui_w32.c, src/os_mswin.c

Patch 6.1.457
Problem: An empty register in viminfo causes conversion to fail.
Solution: Don't convert an empty string. (Yasuhiro Matsumoto)
Files: src/ex_cmds.c, src/mbyte.c

Patch 6.1.458
Problem: Compiler warning for pointer.
Solution: Add a typecast.
Files: src/ex_cmds.c

Patch 6.1.459 (extra)
Problem: Win32: libcall() may return an invalid pointer and cause Vim to
            crash.
Solution: Add a strict check for the returned pointer. (Bruce Mellows)
Files: src/os_mswin.c

Patch 6.1.460
Problem: GTK: after scrolling the text one line with a key, clicking the
            arrow of the scrollbar does not always work. (Nam SungHyun)
Solution: Always update the scrollbar thumb when the value changed, even
            when it would not move, like for RISCOS. (Daniel Elstner)
Files: src/gui.c, src/gui.h

Patch 6.1.461
Problem: When a keymap is active, typing a character in Select mode does
            not use it. (Benji Fisher)
Solution: Apply Insert mode mapping to the character typed in Select mode.
Files: src/normal.c

Patch 6.1.462
Problem: When autocommands wipe out a buffer, a crash may happen. (Hari
            Krishna Dara)
Solution: Don't decrement the window count of a buffer before calling the
            autocommands for it. When re-using the current buffer, watch out
            for autocommands changing the current buffer.
Files: src/buffer.c, src/ex_cmds.c, src/proto/buffer.pro

Patch 6.1.463
Problem: When writing a compressed file, the file name that gzip stores in
            the file is the weird temporary file name. (David Rennalls)
Solution: Use the real file name when possible.
Files: runtime/plugin/gzip.vim

Patch 6.1.464
Problem: Crash when using C++ syntax highlighting. (Gerhard Hochholzer)
Solution: Check for a negative index.
Files: src/syntax.c

```
Patch 6.1.465 (after 6.1.454)
Problem:    Compile error when using cygwin.
Solution:   Change #ifdef WIN32 to #ifdef WIN3264. (Alejandro Lopez-Valencia)
            Undefine WIN32 after including windows.h
Files:      src/mbyte.c

Patch 6.1.466
Problem:    The "-f" argument is a bit obscure.
Solution:   Add the "--nofork" argument.  Improve the help text a bit.
Files:      runtime/doc/starting.txt, src/main.c

Patch 6.1.467
Problem:    Setting the window title doesn't work for Chinese.
Solution:   Use an X11 function to convert text to a text property. (Kentaro
            Nakazawa)
Files:      src/os_unix.c

Patch 6.1.468
Problem:    ":mksession" also stores folds for buffers which will not be
            restored.
Solution:   Only store folds for a buffer with 'buftype' empty and help files.
Files:      src/ex_docmd.c

Patch 6.1.469
Problem:    'listchars' cannot contain multi-byte characters.
Solution:   Handle multi-byte UTF-8 list characters. (Matthew Samsonoff)
Files:      src/message.c, src/option.c, src/screen.c

Patch 6.1.470 (lang)
Problem:    Polish messages don't show up correctly on MS-Windows.
Solution:   Convert messages to cp1250. (Mikolaj Machowski)
            Also add English message translations, because it got in the way
            of the patch.
Files:      Makefile, src/po/Makefile, src/po/en_gb.po, src/po/pl.po

Patch 6.1.471
Problem:    ":jumps" output continues after pressing "q" at the more-prompt.
            (Hari Krishna Dara)
Solution:   Check for "got_int" being set.
Files:      src/mark.c

Patch 6.1.472
Problem:    When there is an authentication error when connecting to the X
            server Vim exits.
Solution:   Use XSetIOErrorHandler() to catch the error and longjmp() to avoid
            the exit.  Also do this in the main loop, so that when the X
            server exits a Vim running in a console isn't killed.
Files:      src/globals.h, src/main.c, src/os_unix.c

Patch 6.1.473
Problem:    Referring to $curwin or $curbuf in Perl 5.6 causes a crash.
Solution:   Add "pTHX_" to cur_val(). (Yasuhiro Matsumoto)
Files:      src/if_perl.xs
```

```
Patch 6.1.474
Problem:    When opening the command-line window in Ex mode it's impossible to
            go back. (Pavol Juhas)
Solution:   Reset "exmode_active" and restore it when the command-line window
            is closed.
Files:      src/ex_getln.c

Patch 6.2f.001
Problem:    The configure check for Ruby didn't work properly for Ruby 1.8.0.
Solution:   Change the way the Ruby check is done. (Aron Griffis)
Files:      src/auto/configure, src/configure.in

Patch 6.2f.002
Problem:    The output of ":ls" doesn't show whether a buffer had read errors.
Solution:   Add the "x" flag in the ":ls" output.
Files:      runtime/doc/windows.txt, src/buffer.c

Patch 6.2f.003
Problem:    Test49 doesn't properly test the behavior of ":catch" without an
            argument.
Solution:   Update test49. (Servatius Brandt)
Files:      src/testdir/test49.ok, src/testdir/test49.vim

Patch 6.2f.004
Problem:    "vim --version" always uses CR/LF in the output.
Solution:   Omit the CR.
Files:      src/message.c, src/os_unix.c

Patch 6.2f.005
Problem:    Two error messages without a colon after the number.
Solution:   Add the colon. (Taro Muraoka)
Files:      src/if_cscope.c

Patch 6.2f.006
Problem:    When saving a file takes a while and Vim regains focus this can
            result in a "file changed outside of Vim" warning and ml_get()
            errors. (Mike Williams)
Solution:   Add the "b_saving" flag to avoid checking the timestamp while the
            buffer is being saved. (Michael Schaap)
Files:      src/fileio.c, src/structs.h

Patch 6.2f.007
Problem:    Irix compiler complains about multiple defined symbols.
            vsnprintf() is not available.  (Charles Campbell)
Solution:   Insert EXTERN for variables in globals.h.  Change the configure
            check for vsnprintf() from compiling to linking.
Files:      src/auto/configure, src/configure.in, src/globals.h

Patch 6.2f.008
Problem:    The Aap recipe doesn't work with Aap 0.149.
Solution:   Change targetarg to TARGETARG.  Update the mysign file.
Files:      src/main.aap, src/mysign
```

```
Patch 6.2f.009 (extra)
Problem:    Small problem when building with Borland 5.01.
Solution:   Use mkdir() instead of _mkdir(). (Walter Briscoe)
Files:      src/dosinst.h

Patch 6.2f.010
Problem:    Warning for missing prototypes.
Solution:   Add missing prototypes. (Walter Briscoe)
Files:      src/if_cscope.c

Patch 6.2f.011
Problem:    The configure script doesn't work with autoconf 2.5x.
Solution:   Add square brackets around a header check. (Aron Griffis)
            Note: touch src/auto/configure after applying this patch.
Files:      src/configure.in

Patch 6.2f.012
Problem:    ":echoerr" doesn't work correctly inside try/endtry.
Solution:   Don't reset did_emsg inside a try/endtry. (Servatius Brandt)
Files:      src/eval.c

Patch 6.2f.013 (extra)
Problem:    Macintosh: Compiler warning for a trigraph.
Solution:   Insert a backslash before each question mark. (Peter Cucka)
Files:      src/os_mac.h

Patch 6.2f.014 (extra)
Problem:    Macintosh: ex_eval is not included in the project file.
Solution:   Add ex_eval. (Dany St-Amant)
Files:      src/os_mac.pbproj/project.pbxproj

Patch 6.2f.015 (extra)
Problem:    Win32: When changing header files not all source files involved
            are recompiled.
Solution:   Improve the dependency rules. (Dan Sharp)
Files:      src/Make_cyg.mak, src/Make_ming.mak

Patch 6.2f.016
Problem:    "vim --version > ff" on non-Unix systems results in a file with a
            missing line break at the end. (Bill McCArthy)
Solution:   Add a line break.
Files:      src/main.c

Patch 6.2f.017
Problem:    Unix: starting Vim in the background and then bringing it to the
            foreground may cause the terminal settings to be wrong.
Solution:   Check for tcsetattr() to return an error, retry when it does.
            (Paul Tapper)
Files:      src/os_unix.c

Patch 6.2f.018
Problem:    Mac OS X 10.2: OK is defined to zero in cursus.h while Vim uses
            one.  Redefining it causes a warning message.
Solution:   Undefine OK before defining it to one. (Taro Muraoka)
```

```
Files:      src/vim.h

Patch 6.2f.019
Problem:    Mac OS X 10.2: COLOR_BLACK and COLOR_WHITE are defined in
            curses.h.
Solution:   Rename them to PRCOLOR_BLACK and PRCOLOR_WHITE.
Files:      src/ex_cmds2.c

Patch 6.2f.020
Problem:    Win32: test50 produces beeps and fails with some versions of diff.
Solution:   Remove empty lines and convert the output to dos fileformat.
Files:      src/testdir/test50.in

Patch 6.2f.021
Problem:    Running configure with "--enable-netbeans" disables Netbeans.
            (Gordon Prieur)
Solution:   Fix the tests in configure.in where the default is to enable a
            feature.  Fix that "--enable-acl" reported "yes" confusingly.
Files:      src/auto/configure, src/configure.in, src/mysign

Patch 6.2f.022
Problem:    A bogus value for 'foldmarker' is not rejected, possibly causing a
            hang. (Derek Wyatt)
Solution:   Check for a non-empty string before and after the comma.
Files:      src/option.c

Patch 6.2f.023
Problem:    When the help files are not in $VIMRUNTIME but 'helpfile' is
            correct Vim still can't find the help files.
Solution:   Also look for a tags file in the directory of 'helpfile'.
Files:      src/tag.c

Patch 6.2f.024
Problem:    When 'delcombine' is set and a character has more than two
            composing characters "x" deletes them all.
Solution:   Always delete only the last composing character.
Files:      src/misc1.c

Patch 6.2f.025
Problem:    When reading a file from stdin that has DOS line endings but a
            missing end-of-line for the last line 'fileformat' becomes "unix".
            (Bill McCarthy)
Solution:   Don't add the missing line break when re-reading the text from the
            buffer.
Files:      src/fileio.c

Patch 6.2f.026
Problem:    When typing new text at the command line, old composing characters
            may be displayed.
Solution:   Don't read composing characters from after the end of the
            text to be displayed.
Files:      src/ex_getln.c, src/mbyte.c, src/message.c, src/proto/mbyte.pro,
            src/screen.c
```

```
Patch 6.2f.027
Problem:    Compiler warnings for unsigned char pointers. (Tony Leneis)
Solution:   Add typecasts to char pointer.
Files:      src/quickfix.c

Patch 6.2f.028
Problem:    GTK: When 'imactivatekey' is empty and XIM is inactive it can't be
            made active again.  Cursor isn't updated immediately when changing
            XIM activation.  Japanese XIM may hang when using 'imactivatekey'.
            Can't activate XIM after typing fFtT command or ":sh".
Solution:   Properly set the flag that indicates the IM is active.  Update the
            cursor right away.  Do not send a key-release event.  Handle
            Normal mode and running an external command differently.
            (Yasuhiro Matsumoto)
Files:      src/mbyte.c

Patch 6.2f.029
Problem:    Mixing use of int and enum.
Solution:   Adjust argument type of cs_usage_msg().  Fix wrong typedef.
Files:      src/if_cscope.c, src/if_cscope.h

Patch 6.2f.030 (after 6.2f.028)
Problem:    Cursor moves up when using XIM.
Solution:   Reset im_preedit_cursor.  (Yasuhiro Matsumoto)
Files:      src/mbyte.c

Patch 6.2f.031
Problem:    Crash when listing a function argument in the debugger. (Ron Aaron)
Solution:   Init the name field of an argument to NULL.
Files:      src/eval.c

Patch 6.2f.032
Problem:    When a write fails for a ":silent!" while inside try/endtry the
            BufWritePost autocommands are not triggered.
Solution:   Check the emsg_silent flag in should_abort(). (Servatius Brandt)
Files:      src/ex_eval.c, src/testdir/test49.ok, src/testdir/test49.vim

Patch 6.2f.033
Problem:    Cscope: re-entrance problem for ":cscope" command.  Checking for
            duplicate database didn't work well for Win95.  Didn't check for
            duplicate databases after an empty entry.
Solution:   Don't set postponed_split too early.  Remember first empty
            database entry. (Sergey Khorev)
Files:      src/if_cscope.c

Patch 6.2f.034
Problem:    The netbeans interface cannot be used on systems without
            vsnprintf(). (Tony Leneis)
Solution:   Use EMSG(), EMSGN() and EMSG2() instead.
Files:      src/auto/configure, src/configure.in, src/netbeans.c

Patch 6.2f.035
Problem:    The configure check for the netbeans interface doesn't work if the
            socket and nsl libraries are required.
```

Solution: Check for the socket and nsl libraries before the netbeans check.
Files: src/auto/configure, src/configure.in

Patch 6.2f.036
Problem: Moving leftwards over text with an illegal UTF-8 byte moves one
            byte instead of one character.
Solution: Ignore an illegal byte after the cursor position.
Files: src/mbyte.c

Patch 6.2f.037
Problem: When receiving a Netbeans command at the hit-enter or more prompt
            the screen is redrawn but Vim is still waiting at the prompt.
Solution: Quit the prompt like a CTRL-C was typed.
Files: src/netbeans.c

Patch 6.2f.038
Problem: The dependency to run autoconf causes a patch for configure.in
            to run autoconf, even though the configure script was updated as
            well.
Solution: Only run autoconf with "make autoconf".
Files: src/Makefile

Patch 6.2f.039
Problem: CTRL-W K makes the new top window very high.
Solution: When 'equalalways' is set equalize the window heights.
Files: src/window.c

==
VERSION 6.3   version-6.3

This section is about improvements made between version 6.2 and 6.3.

This is mainly a bug-fix release. There are also a few new features.
The major number of new items is in the runtime files and translations.

Changed   changed-6.3

The intro message also displays a note about sponsoring Vim, mixed randomly
with the message about helping children in Uganda.

Included the translated menus, keymaps and tutors with the normal runtime
files. The separate "lang" archive now only contains translated messages.

Made the translated menu file names a bit more consistent. Use "latin1" for
"iso_8859-1" and "iso_8859-15".

Removed the "file_select.vim" script from the distribution. It's not more
useful than other scripts that can be downloaded from www.vim.org.

The "runtime/doc/tags" file is now always in unix fileformat. On MS-Windows
it used to be dos fileformat, but ":helptags" generates a unix format file.

```
Added                                                   added-6.3
-----

New commands:
        :cNfile         go to last error in previous file
        :cpfile         idem
        :changes        print the change list
        :keepmarks      following command keeps marks where they are
        :keepjumps      following command keeps jumplist and marks
        :lockmarks      following command keeps marks where they are
        :redrawstatus   force a redraw of the status line(s)

New options:
        'antialias'     Mac OS X: use smooth, antialiased fonts
        'helplang'      preferred help languages

Syntax files:
        Arch inventory (Nikolai Weibull)
        Calendar (Nikolai Weibull)
        Ch (Wayne Cheng)
        Controllable Regex Mutilator (Nikolai Weibull)
        D (Jason Mills)
        Desktop (Mikolaj Machowski)
        Dircolors (Nikolai Weibull)
        Elinks configuration (Nikolai Weibull)
        FASM (Ron Aaron)
        GrADS scripts (Stefan Fronzek)
        Icewm menu (James Mahler)
        LDIF (Zak Johnson)
        Locale input, fdcc. (Dwayne Bailey)
        Pinfo config (Nikolai Weibull)
        Pyrex (Marco Barisione)
        Relax NG Compact (Nikolai Weibull)
        Slice (Morel Bodin)
        VAX Macro Assembly (Tom Uijldert)
        grads (Stefan Fronzek)
        libao (Nikolai Weibull)
        mplayer (Nikolai Weibull)
        rst (Nikolai Weibull)
        tcsh (Gautam Iyer)
        yaml (Nikolai Weibull)

Compiler plugins:
        ATT dot (Marcos Macedo)
        Apple Project Builder (Alexander von Below)
        Intel (David Harrison)
        bdf (Nikolai Weibull)
        icc (Peter Puck)
        javac (Doug Kearns)
        neato (Marcos Macedo)
        onsgmls (Robert B. Rowsome)
        perl (Christian J. Robinson)
```

```
        rst (Nikolai Weibull)
        se (SmartEiffel) (Doug Kearns)
        tcl (Doug Kearns)
        xmlwf (Robert B. Rowsome)

Filetype plugins:
        Aap (Bram Moolenaar)
        Ch (Wayne Cheng)
        Css (Nikolai Weibull)
        Pyrex (Marco Barisione)
        Rst (Nikolai Weibull)

Indent scripts:
        Aap (Bram Moolenaar)
        Ch (Wayne Cheng)
        DocBook (Nikolai Weibull)
        MetaPost (Eugene Minkovskii)
        Objective-C (Kazunobu Kuriyama)
        Pyrex (Marco Barisione)
        Rst (Nikolai Weibull)
        Tcsh (Gautam Iyer)
        XFree86 configuration file (Nikolai Weibull)
        Zsh (Nikolai Weibull)

Keymaps:
        Greek for cp1253 (Panagiotis Louridas)
        Hungarian (Magyar) (Laszlo Zavaleta)
        Persian-Iranian (Behnam Esfahbod)

Message translations:
        Catalan (Ernest Adrogue)
        Russian (Vassily Ragosin)
        Swedish (Johan Svedberg)

Menu translations:
        Catalan (Ernest Adrogue)
        Russian (Tim Alexeevsky)
        Swedish (Johan Svedberg)

Tutor translations:
        Catalan (Ernest Adrogue)
        Russian in cp1251 (Alexey Froloff)
        Slovak in cp1250 and iso8859-2 (Lubos Celko)
        Swedish (Johan Svedberg)
        Korean (Kee-Won Seo)
        UTF-8 version of the Japanese tutor (Yasuhiro Matsumoto) Use this as
                the original, create the other Japanese tutor by conversion.

Included "russian.txt" help file. (Vassily Ragosin)

Include Encapsulated PostScript and PDF versions of the Vim logo in the extra
archive.

The help highlighting finds the highlight groups and shows them in the color
```

that is actually being used. (idea from Yakov Lerner)

The big Win32 version is now compiled with Ruby interface, version 1.8. For
Python version 2.3 is used. For Perl version 5.8 is used.

The "ftdetect" directory is mentioned in the documentation. The DOS install
program creates it.

Fixed   fixed-6.3

Test 42 failed on MS-Windows. Set and reset 'fileformat' and 'binary' options
here and there. (Walter Briscoe)

The explorer plugin didn't work for double-byte 'encoding's.

Use "copy /y" in Make_bc5.mak to avoid a prompt for overwriting.

Patch 6.2.001
Problem: The ":stopinsert" command doesn't have a help tag.
Solution: Add the tag. (Antoine J. Mechelynck)
Files: runtime/doc/insert.txt, runtime/doc/tags

Patch 6.2.002
Problem: When compiled with the +multi_byte feature but without +eval,
            displaying UTF-8 characters may cause a crash. (Karsten Hopp)
Solution: Also set the default for 'ambiwidth' when compiled without the
            +eval feature.
Files: src/option.c

Patch 6.2.003
Problem: GTK 2: double-wide characters below 256 are not displayed
            correctly.
Solution: Check the cell width for characters above 127. (Yasuhiro
            Matsumoto)
Files: src/gui_gtk_x11.c

Patch 6.2.004
Problem: With a line-Visual selection at the end of the file a "p" command
            puts the text one line upwards.
Solution: Detect that the last line was deleted and put forward. (Taro
            Muraoka)
Files: src/normal.c

Patch 6.2.005
Problem: GTK: the "Find" and "Find and Replace" tools don't work. (Aschwin
            Marsman)
Solution: Show the dialog after creating it. (David Necas)
Files: src/gui_gtk.c

Patch 6.2.006
Problem: The Netbeans code contains an obsolete function that uses "vim61"
            and sets the fall-back value for $VIMRUNTIME.

```
Solution:   Delete the obsolete function.
Files:      src/main.c, src/netbeans.c, src/proto/netbeans.pro

Patch 6.2.007
Problem:    Listing tags for Cscope doesn't always work.
Solution:   Avoid using smgs_attr(). (Sergey Khorev)
Files:      src/if_cscope.c

Patch 6.2.008
Problem:    XIM with GTK 2: After backspacing preedit characters are wrong.
Solution:   Reset the cursor position. (Yasuhiro Matsumoto)
Files:      src/mbyte.c

Patch 6.2.009
Problem:    Win32: The self-installing executable "Full" selection only
            selects some of the items to install. (Salman Mohsin)
Solution:   Change commas to spaces in between section numbers.
Files:      nsis/gvim.nsi

Patch 6.2.010
Problem:    When 'virtualedit' is effective and a line starts with a
            multi-byte character, moving the cursor right doesn't work.
Solution:   Obtain the right character to compute the column offset. (Taro
            Muraoka)
Files:      src/charset.c

Patch 6.2.011
Problem:    Alpha OSF1: stat() is a macro and doesn't allow an #ifdef halfway.
            (Moshe Kaminsky)
Solution:   Move the #ifdef outside of stat().
Files:      src/os_unix.c

Patch 6.2.012
Problem:    May hang when polling for a character.
Solution:   Break the wait loop when not waiting for a character.
Files:      src/os_unix.c

Patch 6.2.013 (extra)
Problem:    Win32: The registry key for uninstalling GvimExt still uses "6.1".
Solution:   Change the version number to "6.2". (Ajit Thakkar)
Files:      src/GvimExt/GvimExt.reg

Patch 6.2.014 (after 6.2.012)
Problem:    XSMP doesn't work when using poll().
Solution:   Use xsmp_idx instead of gpm_idx. (Neil Bird)
Files:      src/os_unix.c

Patch 6.2.015
Problem:    The +xsmp feature is never enabled.
Solution:   Move the #define for USE_XSMP to below where WANT_X11 is defined.
            (Alexey Froloff)
Files:      src/feature.h

Patch 6.2.016
```

```
Problem:    Using ":scscope find" with 'cscopequickfix' does not always split
            the window. (Gary Johnson)
            Win32: ":cscope add" could make the script that contains it
            read-only until the corresponding ":cscope kill".
            Errors during ":cscope add" may not be handled properly.
Solution:   When using the quickfix window may need to split the window.
            Avoid file handle inheritance for the script.
            Check for a failed connection and/or process.  (Sergey Khorev)
Files:      src/ex_cmds2.c, src/if_cscope.c

Patch 6.2.017
Problem:    Test11 sometimes prompts the user, because a file would have been
            changed outside of Vim. (Antonio Colombo)
Solution:   Add a FileChangedShell autocommand to avoid the prompt.
Files:      src/testdir/test11.in

Patch 6.2.018
Problem:    When using the XSMP protocol and reading from stdin Vim may wait
            for a key to be pressed.
Solution:   Avoid that RealWaitForChar() is used recursively.
Files:      src/os_unix.c

Patch 6.2.019 (lang)
Problem:    Loading the Portuguese menu causes an error message.
Solution:   Join two lines.  (Jose Pedro Oliveira, José de Paula)
Files:      runtime/lang/menu_pt_br.vim

Patch 6.2.020
Problem:    The "Syntax/Set syntax only" menu item causes an error message.
            (Oyvind Holm)
Solution:   Set the script-local variable in a function. (Benji Fisher)
Files:      runtime/synmenu.vim

Patch 6.2.021
Problem:    The user manual section on exceptions contains small mistakes.
Solution:   Give a good example of an error that could be missed and other
            improvements. (Servatius Brandt)
Files:      runtime/doc/usr_41.txt

Patch 6.2.022 (extra)
Problem:    Win32: After deleting a menu item it still appears in a tear-off
            window.
Solution:   Set the mode to zero for the deleted item. (Yasuhiro Matsumoto)
Files:      src/gui_w32.c

Patch 6.2.023 (extra)
Problem:    Win32: Make_ivc.mak does not clean everything.
Solution:   Delete more files in the clean rule. (Walter Briscoe)
Files:      src/Make_ivc.mak

Patch 6.2.024 (extra)
Problem:    Win32: Compiler warnings for typecasts.
Solution:   Use DWORD instead of WORD. (Walter Briscoe)
Files:      src/gui_w32.c
```

```
Patch 6.2.025
Problem:    Missing prototype for sigaltstack().
Solution:   Add the prototype when it is not found in a header file.
Files:      src/os_unix.c

Patch 6.2.026
Problem:    Warning for utimes() argument.
Solution:   Add a typecast.
Files:      src/fileio.c

Patch 6.2.027
Problem:    Warning for uninitialized variable.
Solution:   Set mb_l to one when not using multi-byte characters.
Files:      src/message.c

Patch 6.2.028
Problem:    Cscope connection may kill Vim process and others.
Solution:   Check for pid being larger than one. (Khorev Sergey)
Files:      src/if_cscope.c

Patch 6.2.029
Problem:    When using the remote server functionality Vim may leak memory.
            (Srikanth Sankaran)
Solution:   Free the result of XListProperties().
Files:      src/if_xcmdsrv.c

Patch 6.2.030
Problem:    Mac: Warning for not being able to use precompiled header files.
Solution:   Don't redefine select.  Use -no-cpp-precomp for compiling, so that
            function prototypes are still found.
Files:      src/os_unix.c, src/osdef.sh

Patch 6.2.031
Problem:    The langmenu entry in the options window doesn't work. (Rodolfo
            Lima)
            With GTK 1 the ":options" command causes an error message.
            (Michael Naumann)
Solution:   Change "lmenu" to "langmenu".  Only display the 'tbis' option for
            GTK 2.
Files:      runtime/optwin.vim

Patch 6.2.032
Problem:    The lpc filetype is never recognized. (Shizhu Pan)
Solution:   Check for g:lpc_syntax_for_c instead of the local variable
            lpc_syntax_for_c. (Benji Fisher)
Files:      runtime/filetype.vim

Patch 6.2.033 (extra)
Problem:    Mac: Various compiler warnings.
Solution:   Don't include Classic-only headers in Unix version.
            Remove references to several unused variables. (Ben Fowler)
            Fix double definition of DEFAULT_TERM.
            Use int instead of unsigned short for pixel values, so that the
```

```
            negative error values are recognized.
Files:      src/gui_mac.c, src/term.c

Patch 6.2.034
Problem:    Mac: Compiler warning for redefining DEFAULT_TERM.
Solution:   Fix double definition of DEFAULT_TERM.
Files:      src/term.c

Patch 6.2.035
Problem:    Mac: Compiler warnings in Python interface.
Solution:   Make a difference between pure Mac and Unix-Mac. (Peter Cucka)
Files:      src/if_python.c

Patch 6.2.036 (extra)
Problem:    Mac Unix version: If foo is a directory, then ":e f<Tab>" should
            expand to ":e foo/" instead of ":e foo" .  (Vadim Zeitlin)
Solution:   Define DONT_ADD_PATHSEP_TO_DIR only for pure Mac. (Benji Fisher)
Files:      src/os_mac.h

Patch 6.2.037
Problem:    Win32: converting an encoding name to a codepage could result in
            an arbitrary number.
Solution:   make encname2codepage() return zero if the encoding name doesn't
            contain a codepage number.
Files:      src/mbyte.c

Patch 6.2.038 (extra)
Problem:    Warning messages when using the MingW compiler. (Bill McCarthy)
            Can't compile console version without +mouse feature.
Solution:   Initialize variables, add parenthesis.
            Add an #ifdef around g_nMouseClick. (Ajit Thakkar)
Files:      src/eval.c, src/os_win32.c, src/gui_w32.c, src/dosinst.c

Patch 6.2.039 (extra)
Problem:    More warning messages when using the MingW compiler.
Solution:   Initialize variables. (Bill McCarthy)
Files:      src/os_mswin.c

Patch 6.2.040
Problem:    FreeBSD: Crash while starting up when compiled with +xsmp feature.
Solution:   Pass a non-NULL argument to IceAddConnectionWatch().
Files:      src/os_unix.c

Patch 6.2.041 (extra, after 6.2.033)
Problem:    Mac: Compiler warnings for conversion types, missing prototype,
            missing return type.
Solution:   Change sscanf "%hd" to "%d", the argument is an int now.  Add
            gui_mch_init_check() prototype.  Add "int" to termlib functions.
Files:      src/gui_mac.c, src/proto/gui_mac.pro, src/termlib.c.

Patch 6.2.042 (extra)
Problem:    Cygwin: gcc 3.2 has an optimizer problem, sometimes causing a
            crash.
Solution:   Add -fno-strength-reduce to the compiler arguments. (Dan Sharp)
```

```
Files:      src/Make_cyg.mak

Patch 6.2.043
Problem:    Compiling with both netbeans and workshop doesn't work.
Solution:   Move the shellRectangle() function to gui_x11.c. (Gordon Prieur)
Files:      src/gui_x11.c, src/integration.c, src/netbeans.c,
            src/proto/netbeans.pro

Patch 6.2.044
Problem:    ":au filetypedetect" gives an error for a non-existing event name,
            but it's actually a non-existing group name. (Antoine Mechelynck)
Solution:   Make the error message clearer.
Files:      src/fileio.c

Patch 6.2.045
Problem:    Obtaining the '( mark changes the '' mark. (Gary Holloway)
Solution:   Don't set the '' mark when searching for the start/end of the
            current sentence/paragraph.
Files:      src/mark.c

Patch 6.2.046
Problem:    When evaluating an argument of a function throws an exception the
            function is still called. (Hari Krishna Dara)
Solution:   Don't call the function when an exception was thrown.
Files:      src/eval.c

Patch 6.2.047 (extra)
Problem:    Compiler warnings when using MingW. (Bill McCarthy)
Solution:   Give the s_dwLastClickTime variable a type.  Initialize dwEndTime.
Files:      src/os_win32.c

Patch 6.2.048
Problem:    The Python interface doesn't compile with Python 2.3 when
            dynamically loaded.
Solution:   Use dll_PyObject_Malloc and dll_PyObject_Free. (Paul Moore)
Files:      src/if_python.c

Patch 6.2.049
Problem:    Using a "-range=" argument with ":command" doesn't work and
            doesn't generate an error message.
Solution:   Generate an error message.
Files:      src/ex_docmd.c

Patch 6.2.050
Problem:    Test 32 didn't work on MS-Windows.
Solution:   Write the temp file in Unix fileformat. (Walter Briscoe)
Files:      src/testdir/test32.in

Patch 6.2.051
Problem:    When using "\=submatch(0)" in a ":s" command, line breaks become
            NUL characters.
Solution:   Change NL to CR characters, so that they become line breaks.
Files:      src/regexp.c
```

```
Patch 6.2.052
Problem:    A few messages are not translated.
Solution:   Add _() to the messages. (Muraoka Taro)
Files:      src/ex_cmds.c

Patch 6.2.053
Problem:    Prototype for bzero() doesn't match most systems.
Solution:   Use "void *" instead of "char *" and "size_t" instead of "int".
Files:      src/osdef1.h.in

Patch 6.2.054
Problem:    A double-byte character with a second byte that is a backslash
            causes problems inside a string.
Solution:   Skip over multi-byte characters in a string properly. (Yasuhiro
            Matsumoto)
Files:      src/eval.c

Patch 6.2.055
Problem:    Using col('.') from CTRL-O in Insert mode does not return the
            correct value for multi-byte characters.
Solution:   Correct the cursor position when it is necessary, move to the
            first byte of a multi-byte character. (Yasuhiro Matsumoto)
Files:      src/edit.c

Patch 6.2.056 (extra)
Problem:    Building with Sniff++ doesn't work.
Solution:   Use the multi-threaded libc when needed. (Holger Ditting)
Files:      src/Make_mvc.mak

Patch 6.2.057 (extra)
Problem:    Mac: With -DMACOS_X putenv() is defined twice, it is in a system
            library.  Get a warning for redefining OK.  Unused variables in
            os_mac.c
Solution:   Define HAVE_PUTENV.  Undefine OK after including curses.h.
            Remove declarations for unused variables.
Files:      src/os_mac.c, src/os_mac.h, src/vim.h

Patch 6.2.058
Problem:    When 'autochdir' is set ":bnext" to a buffer without a name causes
            a crash.
Solution:   Don't call vim_chdirfile() when the file name is NULL. (Taro
            Muraoka)
Files:      src/buffer.c

Patch 6.2.059
Problem:    When 'scrolloff' is a large number and listing completion results
            on the command line, then executing a command that jumps close to
            where the cursor was before, part of the screen is not updated.
            (Yakov Lerner)
Solution:   Don't skip redrawing part of the window when it was scrolled.
Files:      src/screen.c

Patch 6.2.060 (extra)
Problem:    Win32: When 'encoding' is set to "iso-8859-7" copy/paste to/from
```

```
            the clipboard gives a lalloc(0) error. (Kriton Kyrimis)
Solution:   When the string length is zero allocate one byte.  Also fix that
            when the length of the Unicode text is zero (conversion from
            'encoding' to UCS-2 was not possible) the normal text is used.
Files:      src/os_mswin.c

Patch 6.2.061
Problem:    GUI: Using the left mouse button with the shift key should work
            like "*" but it scrolls instead. (Martin Beller)
Solution:   Don't recognize an rxvt scroll wheel event when using the GUI.
Files:      src/term.c

Patch 6.2.062
Problem:    When one buffer uses a syntax with "containedin" and another
            buffer does not, redrawing depends on what the current buffer is.
            (Brett Pershing Stahlman)
Solution:   Use "syn_buf" instead of "curbuf" to get the b_syn_containedin
            flag.
Files:      src/syntax.c

Patch 6.2.063
Problem:    When using custom completion end up with no matches.
Solution:   Make cmd_numfiles and cmd_files local to completion to avoid that
            they are overwritten when ExpandOne() is called recursively by
            f_glob().
Files:      src/eval.c, src/ex_docmd.c, src/ex_getln.c, src/proto/ex_getln.pro,
            src/misc1.c, src/structs.h, src/tag.c

Patch 6.2.064
Problem:    resolve() only handles one symbolic link, need to repeat it to
            resolve all of them.  Then need to simplify the file name.
Solution:   Make resolve() resolve all symbolic links and simplify the result.
            Add simplify() to just simplify a file name.  Fix that test49
            doesn't work if /tmp is a symbolic link.  (Servatius Brandt)
Files:      runtime/doc/eval.txt, src/eval.c, src/tag.c,
            src/testdir/test49.vim

Patch 6.2.065
Problem:    ":windo 123" only updates other windows when entering them.
            (Walter Briscoe)
Solution:   Update the topline before going to the next window.
Files:      src/ex_cmds2.c

Patch 6.2.066 (extra)
Problem:    Ruby interface doesn't work with Ruby 1.8.0.
Solution:   Change "defout" to "stdout". (Aron Griffis)
            Change dynamic loading. (Taro Muraoka)
Files:      src/if_ruby.c, src/Make_mvc.mak

Patch 6.2.067
Problem:    When searching for a string that starts with a composing character
            the command line isn't drawn properly.
Solution:   Don't count the space to draw the composing character on and
            adjust the cursor column after drawing the string.
```

```
Files:      src/message.c

Patch 6.2.068
Problem:    Events for the netbeans interface that include a file name with
            special characters don't work properly.
Solution:   Use nb_quote() on the file name. (Sergey Khorev)
Files:      src/netbeans.c

Patch 6.2.069 (after 6.2.064)
Problem:    Unused variables "limit" and "new_st" and unused label "fail" in
            some situation. (Bill McCarthy)
Solution:   Put the declarations inside an #ifdef. (Servatius Brandt)
Files:      src/eval.c, src/tag.c

Patch 6.2.070 (after 6.2.069)
Problem:    Still unused variable "new_st". (Bill McCarthy)
Solution:   Move the declaration to the right block this time.
Files:      src/tag.c

Patch 6.2.071
Problem:    'statusline' can only contain 50 % items. (Antony Scriven)
Solution:   Allow 80 items and mention it in the docs.
Files:      runtime/doc/option.txt, src/vim.h

Patch 6.2.072
Problem:    When using expression folding, foldexpr() mostly returns -1 for
            the previous line, which makes it difficult to write a fold
            expression.
Solution:   Make the level of the previous line available while still looking
            for the end of a fold.
Files:      src/fold.c

Patch 6.2.073
Problem:    When adding detection of a specific filetype for a plugin you need
            to edit "filetype.vim".
Solution:   Source files from the "ftdetect" directory, so that a filetype
            detection plugin only needs to be dropped in a directory.
Files:      runtime/doc/filetype.txt, runtime/doc/usr_05.txt,
            runtime/doc/usr_41.txt, runtime/filetype.vim

Patch 6.2.074
Problem:    Warnings when compiling the Python interface. (Ajit Thakkar)
Solution:   Use ANSI function declarations.
Files:      src/if_python.c

Patch 6.2.075
Problem:    When the temp file for writing viminfo can't be used "NULL"
            appears in the error message. (Ben Lavender)
Solution:   Print the original file name when there is no temp file name.
Files:      src/ex_cmds.c

Patch 6.2.076
Problem:    The tags listed for cscope are in the wrong order. (Johannes
            Stezenbach)
```

```
Solution:   Remove the reordering of tags for the current file. (Sergey
            Khorev)
Files:      src/if_cscope.c

Patch 6.2.077
Problem:    When a user function specifies custom completion, the function
            gets a zero argument instead of an empty string when there is no
            word before the cursor. (Preben Guldberg)
Solution:   Don't convert an empty string to a zero.
Files:      src/eval.c

Patch 6.2.078
Problem:    "make test" doesn't work if Vim wasn't compiled yet. (Ed Avis)
Solution:   Build Vim before running the tests.
Files:      src/Makefile

Patch 6.2.079
Problem:    ":w ++enc=utf-8 !cmd" doesn't work.
Solution:   Check for the "++" argument before the "!".
Files:      src/ex_docmd.c

Patch 6.2.080
Problem:    When 't_ti' is not empty but doesn't swap screens, using "ZZ" in
            an unmodified file doesn't clear the last line.
Solution:   Call msg_clr_eos() when needed. (Michael Schroeder)
Files:      src/os_unix.c

Patch 6.2.081
Problem:    Problem when using a long multibyte string for the statusline.
Solution:   Use the right pointer to get the cell size. (Taro Muraoka)
Files:      src/buffer.c

Patch 6.2.082
Problem:    Can't compile with Perl 5.8.1.
Solution:   Rename "e_number" to "e_number_exp". (Sascha Blank)
Files:      src/digraph.c, src/globals.h

Patch 6.2.083
Problem:    When a compiler uses ^^^^ to mark a word the information is not
            visible in the quickfix window. (Srikanth Sankaran)
Solution:   Don't remove the indent for a line that is not recognized as an
            error message.
Files:      src/quickfix.c

Patch 6.2.084
Problem:    "g_" in Visual mode always goes to the character after the line.
            (Jean-Rene David)
Solution:   Ignore the NUL at the end of the line.
Files:      src/normal.c

Patch 6.2.085
Problem:    ":verbose set ts" doesn't say an option was set with a "-c" or
            "--cmd" argument.
Solution:   Remember the option was set from a Vim argument.
```

```
Files:      src/main.c, src/ex_cmds2.c, src/vim.h

Patch 6.2.086
Problem:    "{" and "}" stop inside a closed fold.
Solution:   Only stop once inside a closed fold. (Stephen Riehm)
Files:      src/search.c

Patch 6.2.087
Problem:    CTRL-^ doesn't use the 'confirm' option.  Same problem with
            ":bnext". (Yakov Lerner)
Solution:   Put up a dialog for a changed file when 'confirm' is set in more
            situations.
Files:      src/buffer.c, src/ex_cmds.c

Patch 6.2.088
Problem:    When 'sidescrolloff' is set 'showmatch' doesn't work correctly if
            the match is less than 'sidescrolloff' off from the side of the
            window.  (Roland Stahn)
Solution:   Set 'sidescrolloff' to zero while displaying the match.
Files:      src/search.c

Patch 6.2.089
Problem:    ":set isk+=" adds a comma. (Mark Waggoner)
Solution:   Don't add a comma when the added value is empty.
Files:      src/option.c

Patch 6.2.090 (extra)
Problem:    Win32: MingW compiler complains about #pragmas. (Bill McCarthy)
Solution:   Put an #ifdef around the #pragmas.
Files:      src/os_win32.c

Patch 6.2.091
Problem:    When an autocommand is triggered when a file is dropped on Vim and
            it produces output, messages from a following command may be
            scrolled unexpectedly. (David Rennalls)
Solution:   Save and restore msg_scroll in handle_drop().
Files:      src/ex_docmd.c

Patch 6.2.092
Problem:    Invalid items appear in the help file tags. (Antonio Colombo)
Solution:   Only accept tags with white space before the first "*".
Files:      runtime/doc/doctags.c, src/ex_cmds.c

Patch 6.2.093
Problem:    ":nnoremenu" also defines menu for Visual mode. (Klaus Bosau)
Solution:   Check the second command character for an "o", not the third.
Files:      src/menu.c

Patch 6.2.094
Problem:    Can't compile with GTK and tiny features.
Solution:   Include handle_drop() and vim_chdirfile() when FEAT_DND is defined.
            Do not try to split the window.
Files:      src/ex_docmd.c, src/misc2.c
```

```
Patch 6.2.095
Problem:    The message "Cannot go to buffer x" is confusing for ":buf 6".
            (Frans Englich)
Solution:   Make it "Buffer x does not exist".
Files:      src/buffer.c

Patch 6.2.096
Problem:    Win32: ":let @* = ''" put a newline on the clipboard. (Klaus
            Bosau)
Solution:   Put zero bytes on the clipboard for an empty string.
Files:      src/ops.c

Patch 6.2.097
Problem:    Setting or resetting 'insertmode' in a BufEnter autocommand
            doesn't always have immediate effect. (Nagger)
Solution:   When 'insertmode' is set, set need_start_insertmode, when it's
            reset set stop_insert_mode.
Files:      src/option.c

Patch 6.2.098 (after 6.2.097)
Problem:    Can't build Vim with tiny features. (Christian J. Robinson)
Solution:   Declare stop_insert_mode always.
Files:      src/edit.c, src/globals.h

Patch 6.2.099 (extra)
Problem:    Test 49 fails. (Mikolaj Machowski)
Solution:   The Polish translation must not change "E116" to "R116".
Files:      src/po/pl.po

Patch 6.2.100
Problem:    "make proto" fails when compiled with the Perl interface.
Solution:   Remove "-fno.*" from PERL_CFLAGS, cproto sees it as its option.
Files:      src/auto/configure, src/configure.in

Patch 6.2.101
Problem:    When using syntax folding, opening a file slows down a lot when
            it's size increases by only 20%. (Gary Johnson)
Solution:   The array with cached syntax states is leaking entries.  After
            cleaning up the list obtain the current entry again.
Files:      src/syntax.c

Patch 6.2.102
Problem:    The macros equal() and CR conflict with a Carbon header file.
Solution:   Rename equal() to equalpos().  Rename CR to CAR.
            Do this in the non-extra files only.
Files:      src/ascii.h, src/buffer.c, src/charset.c, src/edit.c, src/eval.c,
            src/ex_cmds.c, src/ex_cmds2.c, src/ex_getln.c, src/fileio.c,
            src/getchar.c, src/gui.c, src/gui_athena.c, src/gui_gtk_x11.c,
            src/gui_motif.c, src/macros.h, src/mark.c, src/message.c,
            src/misc1.c, src/misc2.c, src/normal.c, src/ops.c, src/os_unix.c,
            src/regexp.c, src/search.c, src/ui.c, src/workshop.c

Patch 6.2.103 (extra)
Problem:    The macros equal() and CR conflict with a Carbon header file.
```

```
Solution:   Rename equal() to equalpos().  Rename CR to CAR.
            Do this in the extra files only.
Files:      src/gui_photon.c, src/gui_w48.c

Patch 6.2.104
Problem:    Unmatched braces in the table with options.
Solution:   Move the "}," outside of the #ifdef. (Yakov Lerner)
Files:      src/option.c

Patch 6.2.105
Problem:    When the cursor is past the end of the line when calling
            get_c_indent() a crash might occur.
Solution:   Don't look past the end of the line. (NJ Verenini)
Files:      src/misc1.c

Patch 6.2.106
Problem:    Tag searching gets stuck on a very long line in the tags file.
Solution:   When skipping back to search the first matching tag remember the
            offset where searching started looking for a line break.
Files:      src/tag.c

Patch 6.2.107 (extra)
Problem:    The NetBeans interface cannot be used on Win32.
Solution:   Add support for the NetBeans for Win32.  Add support for reading
            XPM files on Win32.  Also fixes that a sign icon with a space in
            the file name did not work through the NetBeans interface.
            (Sergey Khorev)
            Also: avoid repeating error messages when the connection is lost.
Files:      Makefile, runtime/doc/netbeans.txt, src/Make_bc5.mak,
            src/Make_cyg.mak, src/Make_ming.mak, src/Make_mvc.mak,
            src/bigvim.bat, src/feature.h, src/gui_beval.c, src/gui_beval.h,
            src/gui_w32.c, src/gui_w48.c, src/menu.c, src/nbdebug.c,
            src/nbdebug.h, src/netbeans.c, src/os_mswin.c, src/os_win32.h,
            src/proto/gui_beval.pro, src/proto/gui_w32.pro,
            src/proto/netbeans.pro, src/proto.h, src/version.c, src/vim.h,
            src/xpm_w32.c, src/xpm_w32.h

Patch 6.2.108
Problem:    Crash when giving a message about ignoring case in a tag. (Manfred
            Kuehn)
Solution:   Use a longer buffer for the message.
Files:      src/tag.c

Patch 6.2.109
Problem:    Compiler warnings with various Amiga compilers.
Solution:   Add typecast, prototypes, et al. that are also useful for other
            systems.  (Flavio Stanchina)
Files:      src/eval.c, src/ops.c

Patch 6.2.110
Problem:    When $LANG includes the encoding, a menu without an encoding name
            is not found.
Solution:   Also look for a menu file without any encoding.
Files:      runtime/menu.vim
```

```
Patch 6.2.111
Problem:    Encoding "cp1251" is not recognized.
Solution:   Add "cp1251" to the table of encodings. (Alexey Froloff)
Files:      src/mbyte.c

Patch 6.2.112
Problem:    After applying patches test32 fails. (Antonio Colombo)
Solution:   Have "make clean" in the testdir delete *.rej and *.orig files.
            Use this when doing "make clean" in the src directory.
Files:      src/Makefile, src/testdir/Makefile

Patch 6.2.113
Problem:    Using ":startinsert" after "$" works like "a" instead of "i".
            (Ajit Thakkar)
Solution:   Reset "w_curswant" for ":startinsert" and reset o_eol in edit().
Files:      src/edit.c, src/ex_docmd.c

Patch 6.2.114
Problem:    When stdout is piped through "tee", the size of the screen may not
            be correct.
Solution:   Use stdin instead of stdout for ioctl() when stdin is a tty and
            stdout isn't.
Files:      src/os_unix.c

Patch 6.2.115 (extra)
Problem:    Compiler warnings with various Amiga compilers.
Solution:   Add typecast, prototypes, et al.  Those changes that are
            Amiga-specific. (Flavio Stanchina)
Files:      src/fileio.c, src/memfile.c, src/os_amiga.c, src/os_amiga.h,
            src/vim.h

Patch 6.2.116 (extra)
Problem:    German keyboard with Numlock set different from system startup
            causes problems.
Solution:   Ignore keys with code 0xff. (Helmut Stiegler)
Files:      src/gui_w48.c

Patch 6.2.117
Problem:    Breakpoints in loops of sourced files and functions are not
            detected. (Hari Krishna Dara)
Solution:   Check for breakpoints when using lines that were previously read.
            (Servatius Brandt)
Files:      src/eval.c, src/ex_cmds2.c, src/ex_docmd.c, src/proto/eval.pro,
            src/proto/ex_cmds2.pro

Patch 6.2.118 (extra)
Problem:    Mac: Compiling is done in a non-standard way.
Solution:   Use the Unix method for Mac OS X, with autoconf.  Add "CARBONGUI"
            to Makefile and configure. (Eric Kow)
            Move a few prototypes from os_mac.pro to gui_mac.pro.
Files:      src/Makefile, src/auto/configure, src/configure.in,
            src/config.mk.in, src/gui_mac.c, src/os_mac.h, src/os_macosx.c,
            src/proto/gui_mac.pro, src/proto/os_mac.pro,
```

```
            src/infplist.xml, src/vim.h

Patch 6.2.119 (after 6.2.107)
Problem:    When packing the MS-Windows archives a few files are missing.
            (Guopeng Wen)
Solution:   Add gui_beval.* to the list of generic source files.
Files:      Makefile

Patch 6.2.120
Problem:    Win32 GUI: The console dialogs are not supported on MS-Windows,
            disabling the 'c' flag of 'guioptions'. (Servatius Brandt)
Solution:   Define FEAT_CON_DIALOG also for GUI-only builds.
Files:      src/feature.h

Patch 6.2.121 (after 6.2.118)
Problem:    Not all make programs support "+=". (Charles Campbell)
Solution:   Use a normal assignment.
Files:      src/Makefile

Patch 6.2.122 (after 6.2.119)
Problem:    Not all shells can expand [^~].  File missing.  (Guopeng Wen)
Solution:   Use a simpler pattern.  Add the Aap recipe for the maze program
            and a clean version of the source code.
Files:      Makefile, runtime/macros/maze/Makefile,
            runtime/macros/maze/README.txt, runtime/macros/maze/main.aap,
            runtime/macros/maze/mazeclean.c

Patch 6.2.123 (after 6.2.118)
Problem:    Running configure fails. (Tony Leneis)
Solution:   Change "==" to "=" for a test.
Files:      src/auto/configure, src/configure.in

Patch 6.2.124 (after 6.2.121)(extra)
Problem:    Mac: Recursive use of M4FLAGS causes problems.  When running Vim
            directly it can't find the runtime files.  (Emily Jackson)
            Using GNU constructs causes warnings with other make programs.
            (Ronald Schild)
Solution:   Use another name for the M4FLAGS variable.
            Don't remove "Vim.app" from the path.
            Update the explanation for compiling on the Mac. (Eric Kow)
            Don't use $(shell ) and $(addprefix ).
Files:      src/INSTALLmac.txt, src/Makefile, src/misc1.c

Patch 6.2.125 (after 6.2.107)
Problem:    The "winsock2.h" file isn't always available.
Solution:   Don't include this header file.
Files:      src/netbeans.c

Patch 6.2.126
Problem:    Typing CTRL-C at a confirm() prompt doesn't throw an exception.
Solution:   Reset "mapped_ctrl_c" in get_keystroke(), so that "got_int" is set
            in _OnChar().
Files:      src/misc1.c
```

```
Patch 6.2.127 (extra)
Problem:    Win32 console: Typing CTRL-C doesn't throw an exception.
Solution:   Set got_int immediately when CTRL-C is typed, don't wait for
            mch_breakcheck() being called.
Files:      src/os_win32.c

Patch 6.2.128 (after 6.2.118)
Problem:    src/auto/configure is not consistent with src/configure.in.
Solution:   Use the newly generated configure script.
Files:      src/auto/configure

Patch 6.2.129
Problem:    When 'number' is set 'wrapmargin' does not work Vi-compatible.
            (Yasuhiro Matsumoto)
Solution:   Reduce the textwidth when 'number' is set.  Also for 'foldcolumn'
            and similar things.
Files:      src/edit.c

Patch 6.2.130 (extra)
Problem:    Win32 console: When 'restorescreen' is not set exiting Vim causes
            the screen to be cleared. (Michael A. Mangino)
Solution:   Don't clear the screen when exiting and 'restorescreen' isn't set.
Files:      src/os_win32.c

Patch 6.2.131 (extra)
Problem:    Win32: Font handles are leaked.
Solution:   Free italic, bold and bold-italic handles before overwriting them.
            (Michael Wookey)
Files:      src/gui_w48.c

Patch 6.2.132 (extra)
Problem:    Win32: console version doesn't work on latest Windows Server 2003.
Solution:   Copy 12000 instead of 15000 cells at a time to avoid running out
            of memory.
Files:      src/os_win32.c

Patch 6.2.133
Problem:    When starting the GUI a bogus error message about 'imactivatekey'
            may be given.
Solution:   Only check the value of 'imactivatekey' when the GUI is running.
Files:      src/gui.c, src/option.c

Patch 6.2.134 (extra)
Problem:    Win32: When scrolling parts of the window are redrawn when this
            isn't necessary.
Solution:   Only invalidate parts of the window when they are obscured by
            other windows. (Michael Wookey)
Files:      src/gui_w48.c

Patch 6.2.135
Problem:    An item <> in the ":command" argument is interpreted as <args>.
Solution:   Avoid that <> is recognized as <args>.
Files:      src/ex_docmd.c
```

Patch 6.2.136
Problem: ":e ++enc=latin1 newfile" doesn't set 'fenc' when the file doesn't
            exist. (Miroslaw Dobrzanski-Neumann)
Solution: Set 'fileencoding' to the specified encoding when editing a file
            that does not exist.
Files: src/fileio.c

Patch 6.2.137
Problem: "d:cmd<CR>" cannot be repeated with ".". Breaks repeating "d%"
            when using the matchit plugin.
Solution: Store the command to be repeated. This is restricted to
            single-line commands.
Files: src/ex_docmd.c, src/globals.h, src/normal.c, src/vim.h

Patch 6.2.138 (extra)
Problem: Compilation problem on VMS with dynamic buffer on the stack.
Solution: Read one byte less than the size of the buffer, so that we can
            check for the string length without an extra buffer.
Files: src/os_vms.c

Patch 6.2.139
Problem: Code is repeated in the two Perl files.
Solution: Move common code from if_perl.xs and if_perlsfio.c to vim.h.
            Also fix a problem with generating prototypes.
Files: src/if_perl.xs, src/if_perlsfio.c, src/vim.h

Patch 6.2.140 (after 6.2.121)
Problem: Mac: Compiling with Python and Perl doesn't work.
Solution: Adjust the configure check for Python to use "-framework Python"
            for Python 2.3 on Mac OS/X.
            Move "-ldl" after "DynaLoader.a" in the link command.
            Change "perllibs" to "PERL_LIBS".
Files: src/auto/configure, src/configure.in, src/config.mk.in

Patch 6.2.141 (extra)
Problem: Mac: The b_FSSpec field is sometimes unused.
Solution: Change the #ifdef to FEAT_CW_EDITOR and defined it in feature.h
Files: src/fileio.c, src/gui_mac.c, src/structs.h, src/feature.h

Patch 6.2.142 (after 6.2.124)
Problem: Mac: building without GUI through configure doesn't work.
            When the system is slow, unpacking the resource file takes too
            long.
Solution: Don't always define FEAT_GUI_MAC when MACOS is defined, define it
            in the Makefile.
            Add a configure option to skip Darwin detection.
            Use a Python script to unpack the resources to avoid a race
            condition. (Taro Muraoka)
Files: Makefile, src/Makefile, src/auto/configure, src/configure.in,
            src/dehqx.py, src/vim.h

Patch 6.2.143
Problem: Using "K" on Visually selected text doesn't work if it ends in
            a multi-byte character.

```
Solution:   Include all the bytes of the last character. (Taro Muraoka)
Files:      src/normal.c

Patch 6.2.144
Problem:    When "g:html_use_css" is set the HTML header generated by the
            2html script is wrong.
Solution:   Add the header after adding HREF for links.
            Also use ":normal!" instead of ":normal" to avoid mappings
            getting in the way.
Files:      runtime/syntax/2html.vim

Patch 6.2.145 (after 6.2.139)
Problem:    Undefining "bool" doesn't work for older systems. (Wojtek Pilorz)
Solution:   Only undefine "bool" on Mac OS.
Files:      src/vim.h

Patch 6.2.146
Problem:    On some systems the prototype for iconv() is wrong, causing a
            warning message.
Solution:   Use a cast (void *) to avoid the warning. (Charles Campbell)
Files:      src/fileio.c, src/mbyte.c

Patch 6.2.147
Problem:    ":s/pat/\=col('.')" always replaces with "1".
Solution:   Set the cursor to the start of the match before substituting.
            (Helmut Stiegler)
Files:      src/ex_cmds.c

Patch 6.2.148
Problem:    Can't break an Insert into several undoable parts.
Solution:   Add the CTRL-G u command.
Files:      runtime/doc/insert.txt, src/edit.c

Patch 6.2.149
Problem:    When the cursor is on a line past 21,474,748 the indicated
            percentage of the position is invalid.  With that many lines
            "100%" causes a negative cursor line number, resulting in a crash.
            (Daniel Goujot)
Solution:   Divide by 100 instead of multiplying.  Avoid overflow when
            computing the line number for "100%".
Files:      src/buffer.c, src/ex_cmds2.c, src/normal.c

Patch 6.2.150
Problem:    When doing "vim - < file" lines are broken at NUL chars.
            (Daniel Goujot)
Solution:   Change NL characters back to NUL when reading from the temp
            buffer.
Files:      src/fileio.c

Patch 6.2.151
Problem:    When doing "vim --remote +startinsert file" some commands are
            inserted as text. (Klaus Bosau)
Solution:   Put all the init commands in one Ex line, not using a <CR>, so
            that Insert mode isn't started too early.
```

```
Files:      src/main.c

Patch 6.2.152
Problem:    The cursor() function doesn't reset the column offset for
            'virtualedit'.
Solution:   Reset the offset to zero. (Helmut Stiegler)
Files:      src/eval.c

Patch 6.2.153
Problem:    Win32: ":lang german" doesn't use German messages.
Solution:   Add a table to translate the Win32 language names to two-letter
            language codes.
Files:      src/ex_cmds2.c

Patch 6.2.154
Problem:    Python bails out when giving a warning message. (Eugene
            Minkovskii)
Solution:   Set sys.argv[] to an empty string.
Files:      src/if_python.c

Patch 6.2.155
Problem:    Win32: Using ":tjump www" in a help file gives two results.
            (Dave Roberts)
Solution:   Ignore differences between slashes and backslashes when checking
            for identical tag matches.
Files:      src/tag.c

Patch 6.2.156 (after 6.2.125)
Problem:    Win32: Netbeans fails to build, EINTR is not defined.
Solution:   Redefine EINTR to WSAEINTR. (Mike Williams)
Files:      src/netbeans.c

Patch 6.2.157
Problem:    Using "%p" in 'errorformat' gives a column number that is too
            high.
Solution:   Set the flag to use the number as a virtual column.  (Lefteris
            Koutsoloukas)
Files:      src/quickfix.c

Patch 6.2.158
Problem:    The sed command on Solaris and HPUX doesn't work for a line that
            doesn't end in a newline.
Solution:   Add a newline when feeding text to sed. (Mark Waggoner)
Files:      src/configure.in, src/auto/configure

Patch 6.2.159
Problem:    When using expression folding and 'foldopen' is "undo" an undo
            command doesn't always open the fold.
Solution:   Save and restore the KeyTyped variable when evaluating 'foldexpr'.
            (Taro Muraoka)
Files:      src/fold.c

Patch 6.2.160
Problem:    When 'virtualedit' is "all" and 'selection' is "exclusive",
```

```
            selecting a double-width character below a single-width character
            may cause a crash.
Solution:   Avoid overflow on unsigned integer decrement. (Taro Muraoka)
Files:      src/normal.c

Patch 6.2.161 (extra)
Problem:    VMS: Missing header file.  Reading input busy loops.
Solution:   Include termdef.h.  Avoid the use of a wait function in
            vms_read().  (Frank Ries)
Files:      src/os_unix.h, src/os_vms.c

Patch 6.2.162
Problem:    ":redraw" doesn't always display the text that includes the cursor
            position, e.g. after ":call cursor(1, 0)". (Eugene Minkovskii)
Solution:   Call update_topline() before redrawing.
Files:      src/ex_docmd.c

Patch 6.2.163
Problem:    "make install" may also copy AAPDIR directories.
Solution:   Delete AAPDIR directories, just like CVS directories.
Files:      src/Makefile

Patch 6.2.164 (after 6.2.144)
Problem:    When "g:html_use_css" is set the HTML header generated by the
            2html script is still wrong.
Solution:   Search for a string instead of jumping to a fixed line number.
            Go to the start of the line before inserting the header.
            (Jess Thrysoee)
Files:      runtime/syntax/2html.vim

Patch 6.2.165
Problem:    The configure checks hang when using autoconf 2.57.
Solution:   Invoke AC_PROGRAM_EGREP to set $EGREP. (Aron Griffis)
Files:      src/auto/configure, src/configure.in

Patch 6.2.166
Problem:    When $GZIP contains "-N" editing compressed files doesn't work
            properly.
Solution:   Add "-n" to "gzip -d" to avoid restoring the file name. (Oyvind
            Holm)
Files:      runtime/plugin/gzip.vim

Patch 6.2.167
Problem:    The Python interface leaks memory when assigning lines to a
            buffer. (Sergey Khorev)
Solution:   Do not copy the line when calling ml_replace().
Files:      src/if_python.c

Patch 6.2.168
Problem:    Python interface: There is no way to get the indices from a range
            object.
Solution:   Add the "start" and "end" attributes. (Maurice S. Barnum)
Files:      src/if_python.c, runtime/doc/if_pyth.txt
```

```
Patch 6.2.169
Problem:    The prototype for _Xmblen() appears in a recent XFree86 header
            file, causing a warning for our prototype. (Hisashi T Fujinaka)
Solution:   Move the prototype to an osdef file, so that it's filtered out.
Files:      src/mbyte.c, src/osdef2.h.in

Patch 6.2.170
Problem:    When using Sun WorkShop the current directory isn't changed to
            where the file is.
Solution:   Set the 'autochdir' option when using WorkShop.  And avoid using
            the basename when 'autochdir' is not set.
Files:      src/gui_x11.c, src/ex_cmds.c

Patch 6.2.171 (after 6.2.163)
Problem:    The "-or" argument of "find" doesn't work for SysV systems.
Solution:   Use "-o" instead. (Gordon Prieur)
Files:      src/Makefile

Patch 6.2.172 (after 6.2.169)
Problem:    The prototype for _Xmblen() still causes trouble.
Solution:   Include the X11 header file that defines the prototype.
Files:      src/osdef2.h.in, src/osdef.sh

Patch 6.2.173 (extra)
Problem:    Win32: Ruby interface doesn't work with Ruby 1.8.0 for other
            compilers than MSVC.
Solution:   Fix the BC5, Cygwin and Mingw makefiles. (Dan Sharp)
Files:      src/Make_bc5.mak, src/Make_cyg.mak, src/Make_ming.mak

Patch 6.2.174
Problem:    After the ":intro" message only a mouse click in the last line
            gets past the hit-return prompt.
Solution:   Accept a click at or below the hit-return prompt.
Files:      src/gui.c, src/message.c

Patch 6.2.175
Problem:    Changing 'backupext' in a *WritePre autocommand doesn't work.
            (William Natter)
Solution:   Move the use of p_bex to after executing the *WritePre
            autocommands.  Also avoids reading allocated memory after freeing.
Files:      src/fileio.c

Patch 6.2.176
Problem:    Accented characters in translated help files are not handled
            correctly. (Fabien Vayssiere)
Solution:   Include "192-255" in 'iskeyword' for the help window.
Files:      src/ex_cmds.c

Patch 6.2.177 (extra)
Problem:    VisVim: Opening a file with a space in the name doesn't work. (Rob
            Retter)  Arbitrary commands are being executed. (Neil Bird)
Solution:   Put a backslash in front of every space in the file name.
            (Gerard Blais)  Terminate the CTRL-\ CTRL-N command with a NUL.
Files:      src/VisVim/Commands.cpp, src/VisVim/VisVim.rc
```

```
Patch 6.2.178
Problem:    People who don't know how to exit Vim try pressing CTRL-C.
Solution:   Give a message how to exit Vim when CTRL-C is pressed and it
            doesn't cancel anything.
Files:      src/normal.c

Patch 6.2.179 (extra)
Problem:    The en_gb messages file isn't found on case sensitive systems.
Solution:   Rename en_gb to en_GB. (Mike Williams)
Files:      src/po/en_gb.po, src/po/en_GB.po, src/po/Make_ming.mak,
            src/po/Make_mvc.mak, src/po/Makefile, src/po/README_mvc.txt

Patch 6.2.180
Problem:    Compiling with GTK2 on Win32 doesn't work.
Solution:   Include gdkwin32.h instead of gdkx.h. (Srinath Avadhanula)
Files:      src/gui_gtk.c, src/gui_gtk_f.c, src/gui_gtk_x11.c, src/mbyte.c

Patch 6.2.181 (after 6.2.171)
Problem:    The "-o" argument of "find" has lower priority than the implied
            "and" with "-print".
Solution:   Add parenthesis around the "-o" expression. (Gordon Prieur)
Files:      src/Makefile

Patch 6.2.182 (after 6.2.094)
Problem:    Compilation with tiny features fails because of missing
            get_past_head() function.
Solution:   Adjust the #ifdef for get_past_head().
Files:      src/misc1.c

Patch 6.2.183 (after 6.2.178)
Problem:    Warning for char/unsigned char mixup.
Solution:   Use MSG() instead of msg(). (Tony Leneis)
Files:      src/normal.c

Patch 6.2.184
Problem:    With 'formatoptions' set to "1aw" inserting text may cause the
            paragraph to be ended. (Alan Schmitt)
Solution:   Temporarily add an extra space to make the paragraph continue
            after moving the word after the cursor to the next line.
            Also format when pressing Esc.
Files:      src/edit.c, src/normal.c, src/proto/edit.pro

Patch 6.2.185
Problem:    Restoring a session with zero-height windows does not work
            properly. (Charles Campbell)
Solution:   Accept a zero argument to ":resize" as intended.  Add a window
            number argument to ":resize" to be able to set the size of other
            windows, because the current window cannot be zero-height.
            Fix the explorer plugin to avoid changing the window sizes.  Add
            the winrestcmd() function for this.
Files:      runtime/doc/eval.txt, runtime/plugin/explorer.vim, src/eval.c,
            src/ex_cmds.h, src/ex_docmd.c, src/proto/window.pro, src/window.c
```

```
Patch 6.2.186 (after 6.2.185)
Problem:    Documentation file eval.txt contains examples without indent.
Solution:   Insert the indent.  Also fix other mistakes.
Files:      runtime/doc/eval.txt

Patch 6.2.187
Problem:    Using Insure++ reveals a number of bugs.  (Dominique Pelle)
Solution:   Initialize variables where needed.  Free allocated memory to avoid
            leaks.  Fix comparing tags to avoid reading past allocated memory.
Files:      src/buffer.c, src/diff.c, src/fileio.c, src/mark.c, src/misc1.c,
            src/misc2.c, src/ops.c, src/option.c, src/tag.c, src/ui.c

Patch 6.2.188 (extra)
Problem:    MS-Windows: Multi-byte characters in a filename cause trouble for
            the window title.
Solution:   Return when the wide function for setting the title did its work.
Files:      src/gui_w48.c

Patch 6.2.189
Problem:    When setting 'viminfo' after editing a new buffer its marks are
            not stored. (Keith Roberts)
Solution:   Set the "b_marks_read" flag when skipping to read marks from the
            viminfo file.
Files:      src/fileio.c

Patch 6.2.190
Problem:    When editing a compressed files, marks are lost.
Solution:   Add the ":lockmarks" modifier and use it in the gzip plugin.
            Make exists() also check for command modifiers, so that the
            existence of ":lockmarks" can be checked for.
            Also add ":keepmarks" to avoid that marks are deleted when
            filtering text.
            When deleting lines put marks 'A - 'Z and '0 - '9 at the first
            deleted line instead of clearing the mark.  They were kept in the
            viminfo file anyway.
            Avoid that the gzip plugin puts deleted text in registers.
Files:      runtime/doc/motion.txt, runtime/plugin/gzip.vim, src/ex_cmds.c,
            src/ex_docmd.c, src/mark.c, src/structs.h

Patch 6.2.191
Problem:    The intro message is outdated.  Information about sponsoring and
            registering is missing.
Solution:   Show info about sponsoring and registering Vim in the intro
            message now and then.  Add help file about sponsoring.
Files:      runtime/doc/help.txt, runtime/doc/sponsor.txt, runtime/doc/tags,
            runtime/menu.vim, src/version.c

Patch 6.2.192
Problem:    Using CTRL-T and CTRL-D with "gR" messes up the text.  (Jonathan
            Hankins)
Solution:   Avoid calling change_indent() recursively.
Files:      src/edit.c

Patch 6.2.193
```

```
Problem:    When recalling a search pattern from the history from a ":s,a/c,"
            command the '/' ends the search string. (JC van Winkel)
Solution:   Store the separator character with the history entries.  Escape
            characters when needed, replace the old separator with the new one.
            Also fixes that recalling a "/" search for a "?" command messes up
            trailing flags.
Files:      src/eval.c, src/ex_getln.c, src/normal.c, src/proto/ex_getln.pro,
            src/search.c, src/tag.c

Patch 6.2.194 (after 6.2.068)
Problem:    For NetBeans, instead of writing the file and sending an event
            about it, tell NetBeans to write the file.
Solution:   Add the "save" command, "netbeansBuffer" command and
            "buttonRelease" event to the netbeans protocol.  Updated the
            interface to version 2.2.  (Gordon Prieur)
            Also: open a fold when the cursor has been positioned.
            Also: fix memory leak, free result of nb_quote().
Files:      runtime/doc/netbeans.txt, src/fileio.c, src/netbeans.c,
            src/normal.c, src/proto/netbeans.pro, src/structs.h

Patch 6.2.195 (after 6.2.190)
Problem:    Compiling fails for missing CPO_REMMARK symbol.
Solution:   Add the patch I forgot to include...
Files:      src/option.h

Patch 6.2.196 (after 6.2.191)
Problem:    Rebuilding the documentation doesn't use the sponsor.txt file.
Solution:   Add sponsor.txt to the Makefile. (Christian J. Robinson)
Files:      runtime/doc/Makefile

Patch 6.2.197
Problem:    It is not possible to force a redraw of status lines. (Gary
            Johnson)
Solution:   Add the ":redrawstatus" command.
Files:      runtime/doc/various.txt, src/ex_cmds.h, src/ex_docmd.c,
            src/screen.c

Patch 6.2.198
Problem:    A few messages are not translated. (Ernest Adrogue)
Solution:   Mark the messages to be translated.
Files:      src/ex_cmds.c

Patch 6.2.199 (after 6.2.194)
Problem:    Vim doesn't work perfectly well with NetBeans.
Solution:   When NetBeans saves the file, reset the timestamp to avoid "file
            changed" warnings.  Close a buffer in a proper way.  Don't try
            giving a debug message with an invalid pointer.  Send a
            newDotAndMark message when needed.  Report a change by the "r"
            command to NetBeans.  (Gordon Prieur)
Files:      src/netbeans.c, src/normal.c

Patch 6.2.200
Problem:    When recovering a file, 'fileformat' is always the default, thus
            writing the file may result in differences. (Penelope Fudd)
```

```
Solution:   Before recovering the file try reading the original file to obtain
            the values of 'fileformat', 'fileencoding', etc.
Files:      src/memline.c

Patch 6.2.201
Problem:    When 'autowriteall' is set ":qall" still refuses to exit if there
            is a modified buffer. (Antoine Mechelynck)
Solution:   Attempt writing modified buffers as intended.
Files:      src/ex_cmds2.c

Patch 6.2.202
Problem:    Filetype names of CHILL and ch script are confusing.
Solution:   Rename "ch" to "chill" and "chscript" to "ch".
Files:      runtime/filetype.vim, runtime/makemenu.vim, runtime/synmenu.vim
            runtime/syntax/ch.vim, runtime/syntax/chill.vim

Patch 6.2.203
Problem:    With characterwise text that has more than one line, "3P" works
            wrong.  "3p" has the same problem.  There also is a display
            problem. (Daniel Goujot)
Solution:   Perform characterwise puts with a count in the right position.
Files:      src/ops.c

Patch 6.2.204 (after 6.2.086)
Problem:    "]]" in a file with closed folds moves to the end of the file.
            (Nam SungHyun)
Solution:   Find one position in each closed fold, then move to after the fold.
Files:      src/search.c

Patch 6.2.205 (extra)
Problem:    MS-Windows: When the taskbar is at the left or top of the screen,
            the Vim window placement is wrong.
Solution:   Compute the size and position of the window correctly. (Taro
            Muraoka)
Files:      src/gui_w32.c, src/gui_w48.c

Patch 6.2.206
Problem:    Multi-byte characters cannot be used as hotkeys in a console
            dialog.  (Mattias Erkisson)
Solution:   Handle multi-byte characters properly.  Also put () or [] around
            default hotkeys.
Files:      src/message.c, src/macros.h

Patch 6.2.207
Problem:    When 'encoding' is a multi-byte encoding, expanding an
            abbreviation that starts where insertion started results in
            characters before the insertion to be deleted.  (Xiangjiang Ma)
Solution:   Stop searching leftwards for the start of the word at the position
            where insertion started.
Files:      src/getchar.c

Patch 6.2.208
Problem:    When using fold markers, three lines in a row have the start
            marker and deleting the first one with "dd", a nested fold is not
```

```
            deleted.  (Kamil Burzynski)
            Using marker folding, a level 1 fold doesn't stop when it is
            followed by "{{{2", starting a level 2 fold.
Solution:   Don't stop updating folds at the end of a change when the nesting
            level of folds is larger than the fold level.
            Correctly compute the number of folds that start at "{{{2".
            Also avoid a crash for a NULL pointer.
Files:      src/fold.c

Patch 6.2.209
Problem:    A bogus fold is created when using "P" while the cursor is in the
            middle of a closed fold. (Kamil Burzynski)
Solution:   Correct the line number where marks are modified for closed folds.
Files:      src/ops.c

Patch 6.2.210 (extra)
Problem:    Mac OSX: antialiased fonts are not supported.
Solution:   Add the 'antialias' option to switch on antialiasing on Mac OSX
            10.2 and later. (Peter Cucka)
Files:      runtime/doc/options.txt, src/gui_mac.c, src/option.h, src/option.c

Patch 6.2.211 (extra)
Problem:    Code for handling file dropped on Vim is duplicated.
Solution:   Move the common code to gui_handle_drop().
            Add code to drop the files in the window under the cursor.
            Support drag&drop on the Macintosh.  (Taro Muraoka)
            When dropping a directory name edit that directory (using the
            explorer plugin)
            Fix that changing directory with Shift pressed didn't work for
            relative path names.
Files:      src/fileio.c, src/gui.c, src/gui_gtk_x11.c, src/gui_mac.c,
            src/gui_w48.c, src/proto/fileio.pro, src/proto/gui.pro

Patch 6.2.212 (after 6.2.199)
Problem:    NetBeans: Replacing with a count is not handled correctly.
Solution:   Move reporting the change outside of the loop for the count.
            (Gordon Prieur)
Files:      src/normal.c

Patch 6.2.213 (after 6.2.208)
Problem:    Using marker folding, "{{{1" doesn't start a new fold when already
            at fold level 1. (Servatius Brandt)
Solution:   Correctly compute the number of folds that start at "{{{1".
Files:      src/fold.c

Patch 6.2.214 (after 6.2.211) (extra)
Problem:    Warning for an unused variable.
Solution:   Delete the declaration. (Bill McCarthy)
Files:      src/gui_w48.c

Patch 6.2.215
Problem:    NetBeans: problems saving an unmodified file.
Solution:   Add isNetbeansModified() function.  Disable netbeans_unmodified().
            (Gordon Prieur)
```

```
Files:      src/fileio.c, src/netbeans.c, src/proto/netbeans.pro,
            runtime/doc/netbeans.txt, runtime/doc/tags

Patch 6.2.216 (after 6.2.206)
Problem:    Multi-byte characters still cannot be used as hotkeys in a console
            dialog.  (Mattias Erkisson)
Solution:   Make get_keystroke() handle multi-byte characters.
Files:      src/misc1.c

Patch 6.2.217
Problem:    GTK: setting the title doesn't always work correctly.
Solution:   Invoke gui_mch_settitle(). (Tomas Stehlik)
Files:      src/os_unix.c

Patch 6.2.218
Problem:    Warning for function without prototype.
Solution:   Add argument types to the msgCB field of the BalloonEval struct.
Files:      src/gui_beval.h

Patch 6.2.219
Problem:    Syntax highlighting hangs on an empty match of an item with a
            nextgroup.  (Charles Campbell)
Solution:   Remember that the item has already matched and don't match it
            again at the same position.
Files:      src/syntax.c

Patch 6.2.220
Problem:    When a Vim server runs in a console a remote command isn't handled
            before a key is typed.  (Joshua Neuheisel)
Solution:   Don't try reading more input when a client-server command has been
            received.
Files:      src/os_unix.c

Patch 6.2.221
Problem:    No file name completion for ":cscope add".
Solution:   Add the XFILE flag to ":cscope". (Gary Johnson)
Files:      src/ex_cmds.h

Patch 6.2.222
Problem:    Using "--remote" several times on a row only opens some of the
            files. (Dany St-Amant)
Solution:   Don't delete all typeahead when the server receives a command from
            a client, only delete typed characters.
Files:      src/main.c

Patch 6.2.223
Problem:    Cscope: Avoid a hang when cscope waits for a response while Vim
            waits for a prompt.
            Error messages from Cscope mess up the display.
Solution:   Detect the hit-enter message and respond by sending a return
            character to cscope. (Gary Johnson)
            Use EMSG() and strerror() when possible.  Replace perror() with
            PERROR() everywhere, add emsg3().
Files:      src/diff.c, src/if_cscope.c, src/integration.c, src/message.c,
```

```
            src/proto/message.pro, src/misc2.c, src/netbeans.c, src/vim.h

Patch 6.2.224
Problem:    Mac: Can't compile with small features. (Axel Kielhorn)
Solution:   Also include vim_chdirfile() when compiling for the Mac.
Files:      src/misc2.c

Patch 6.2.225
Problem:    NetBeans: Reported modified state isn't exactly right.
Solution:   Report a file being modified in the NetBeans way.
Files:      src/netbeans.c

Patch 6.2.226 (after 6.2.107) (extra)
Problem:    The "ws2-32.lib" file isn't always available.
Solution:   Use "WSock32.lib" instead. (Taro Muraoka, Dan Sharp)
Files:      src/Make_cyg.mak, src/Make_ming.mak, src/Make_mvc.mak

Patch 6.2.227 (extra)
Problem:    The "PC" symbol is defined but not used anywhere.
Solution:   Remove "-DPC" from the makefiles.
Files:      src/Make_bc3.mak, src/Make_bc5.mak, src/Make_cyg.mak,
            src/Make_ming.mak

Patch 6.2.228
Problem:    Receiving CTRL-\ CTRL-N after typing "f" or "m" doesn't switch Vim
            back to Normal mode.  Same for CTRL-\ CTRL-G.
Solution:   Check if the character typed after a command is CTRL-\ and obtain
            another character to check for CTRL-N or CTRL-G, waiting up to
            'ttimeoutlen' msec.
Files:      src/normal.c

Patch 6.2.229
Problem:    ":function" with a name that uses magic curlies does not work
            inside a function.  (Servatius Brandt)
Solution:   Skip over the function name properly.
Files:      src/eval.c

Patch 6.2.230 (extra)
Problem:    Win32: a complex pattern may cause a crash.
Solution:   Use __try and __except to catch the exception and handle it
            gracefully, when possible.  Add myresetstkoflw() to reset the
            stack overflow. (Benjamin Peterson)
Files:      src/Make_bc5.mak, src/os_mswin.c src/os_win32.c, src/os_win32.h,
            src/proto/os_win32.pro, src/regexp.c

Patch 6.2.231 (after 6.2.046)
Problem:    Various problems when an error exception is raised from within a
            builtin function.  When it is invoked while evaluating arguments
            to a function following arguments are still evaluated.  When
            invoked with a line range it will be called for remaining lines.
Solution:   Update "force_abort" also after calling a builtin function, so
            that aborting() always returns the correct value. (Servatius
            Brandt)
Files:      src/eval.c, src/ex_eval.c, src/proto/ex_eval.pro,
```

```
            src/testdir/test49.ok, src/testdir/test49.vim

Patch 6.2.232
Problem:    ":python vim.command('python print 2*2')" crashes Vim.  (Eugene
            Minkovskii)
Solution:   Disallow executing a Python command recursively and give an error
            message.
Files:      src/if_python.c

Patch 6.2.233
Problem:    On Mac OSX adding -pthread for Python only generates a warning.
            The test for Perl threads rejects Perl while it's OK.
            Tcl doesn't work at all.
            The test for Ruby fails if ruby exists but there are no header
            files.  The Ruby library isn't detected properly
Solution:   Avoid adding -pthread on Mac OSX.  Accept Perl threads when it's
            not the 5.5 threads.
            Use the Tcl framework for header files.  For Ruby rename cWindow
            to cVimWindow to avoid a name clash. (Ken Scott)
            Only enable Ruby when the header files can be found.  Use "-lruby"
            instead of "libruby.a" when it can't be found.
Files:      src/auto/configure, src/configure.in, src/if_ruby.c

Patch 6.2.234
Problem:    GTK 2 GUI: ":sp" and the ":q" leaves the cursor on the command
            line.
Solution:   Flush output before removing scrollbars.  Also do this in other
            places where gui_mch_*() functions are invoked.
Files:      src/ex_cmds.c, src/option.c, src/window.c

Patch 6.2.235 (extra)
Problem:    Win32: Cursor isn't removed with a 25x80 window and doing:
            "1830ia<Esc>400a-<Esc>0w0". (Yasuhiro Matsumoto)
Solution:   Remove the call to gui_undraw_cursor() from gui_mch_insert_lines().
Files:      src/gui_w48.c

Patch 6.2.236
Problem:    Using gvim with Agide gives "connection lost" error messages.
Solution:   Only give the "connection lost" message when the buffer was once
            owned by NetBeans.
Files:      src/netbeans.c, src/structs.h

Patch 6.2.237
Problem:    GTK 2: Thai text is drawn wrong.  It changes when moving the
            cursor over it.
Solution:   Disable the shaping engine, it moves combining characters to a
            wrong position and combines characters, while drawing the cursor
            doesn't combine characters.
Files:      src/gui_gtk_x11.c

Patch 6.2.238 (after 6.2.231)
Problem:    ":function" does not work inside a while loop. (Servatius Brandt)
Solution:   Add get_while_line() and pass it to do_one_cmd() when in a while
            loop, so that all lines are stored and can be used again when
```

```
            repeating the loop.
            Adjust test 49 so that it checks for the fixed problems.
            (Servatius Brandt)
Files:      src/digraph.c, src/ex_cmds2.c, src/ex_docmd.c, src/ex_eval.c,
            src/proto/ex_cmds2.pro, src/proto/ex_docmd.pro,
            src/testdir/test49.in, src/testdir/test49.ok,
            src/testdir/test49.vim

Patch 6.2.239
Problem:    GTK 2: With closed folds the arrow buttons of a vertical scrollbar
            often doesn't scroll. (Moshe Kaminsky)
Solution:   Hackish solution: Detect that the button was pressed from the
            mouse pointer position.
Files:      src/gui_gtk.c, src/gui.c

Patch 6.2.240
Problem:    GTK 2: Searching for bitmaps for the toolbar doesn't work as with
            other systems.  Need to explicitly use "icon=name".  (Ned Konz,
            Christian J.  Robinson)
Solution:   Search for icons like done for Motif.
Files:      src/gui_gtk.c

Patch 6.2.241
Problem:    GTK 2: Search and Search/Replace dialogs are synced, that makes no
            sense.  Buttons are sometimes greyed-out. (Jeremy Messenger)
Solution:   Remove the code to sync the two dialogs.  Adjust the code to react
            to an empty search string to also work for GTK2. (David Necas)
Files:      src/gui_gtk.c

Patch 6.2.242
Problem:    Gnome: "vim --help" only shows the Gnome arguments, not the Vim
            arguments.
Solution:   Don't let the Gnome code remove the "--help" argument and don't
            exit at the end of usage().
Files:      src/gui_gtk_x11.c, src/main.c

Patch 6.2.243 (extra)
Problem:    Mac: Dropping a file on a Vim icon causes a hit-enter prompt.
Solution:   Move the dropped files to the global argument list, instead of the
            usual drop handling. (Eckehard Berns)
Files:      src/main.c, src/gui_mac.c

Patch 6.2.244
Problem:    ':echo "\xf7"' displays the illegal byte as if it was a character
            and leaves "cho" after it.
Solution:   When checking the length of a UTF-8 byte sequence and it's shorter
            than the number of bytes available, assume it's an illegal byte.
Files:      src/mbyte.c

Patch 6.2.245
Problem:    Completion doesn't work for ":keepmarks" and ":lockmarks".
Solution:   Add the command modifiers to the table of commands. (Madoka
            Machitani)
Files:      src/ex_cmds.h, src/ex_docmd.c
```

```
Patch 6.2.246
Problem:    Mac: Starting Vim from Finder doesn't show error messages.
Solution:   Recognize that output is being displayed by stderr being
            "/dev/console".  (Eckehard Berns)
Files:      src/main.c, src/message.c

Patch 6.2.247 (after 6.2.193)
Problem:    When using a search pattern from the viminfo file the last
            character is replaced with a '/'.
Solution:   Store the separator character in the right place. (Kelvin Lee)
Files:      src/ex_getln.c

Patch 6.2.248
Problem:    GTK: When XIM is enabled normal "2" and keypad "2" cannot be
            distinguished.
Solution:   Detect that XIM changes the keypad key to the expected ASCII
            character and fall back to the non-XIM code. (Neil Bird)
Files:      src/gui_gtk_x11.c, src/mbyte.c, src/proto/mbyte.pro

Patch 6.2.249
Problem:    ":cnext" moves to the error in the next file, but there is no
            method to go back.
Solution:   Add ":cpfile" and ":cNfile".
Files:      src/ex_cmds.h, src/quickfix.c, src/vim.h, runtime/doc/quickfix.txt

Patch 6.2.250
Problem:    Memory leaks when using signs. (Xavier de Gaye)
Solution:   Delete the list of signs when unloading a buffer.
Files:      src/buffer.c

Patch 6.2.251
Problem:    GTK: The 'v' flag in 'guioptions' doesn't work. (Steve Hall)
            Order of buttons is reversed for GTK 2.2.4.  Don't always get
            focus back after handling a dialog.
Solution:   Make buttons appear vertically when desired.  Reverse the order in
            which buttons are added to a dialog.  Move mouse pointer around
            when the dialog is done and we don't have focus.
Files:      src/gui_gtk.c

Patch 6.2.252 (extra, after 6.2.243)
Problem:    Mac: Dropping a file on a Vim icon causes a hit-enter prompt for
            Mac OS classic.
Solution:   Remove the #ifdef from the code that fixes it for Mac OSX.
Files:      src/gui_mac.c

Patch 6.2.253
Problem:    When 'tagstack' is not set a ":tag id" command does not work after
            a ":tjump" command.
Solution:   Set "new_tag" when 'tagstack' isn't set. (G. Narendran)
Files:      src/tag.c

Patch 6.2.254
Problem:    May run out of space for error messages.
```

```
Solution:   Keep room for two more bytes.
Files:      src/quickfix.c

Patch 6.2.255
Problem:    GTK: A new item in the popup menu is put just after instead of
            just before the right item. (Gabriel Zachmann)
Solution:   Don't increment the menu item index.
Files:      src/gui_gtk.c

Patch 6.2.256
Problem:    Mac: "macroman" encoding isn't recognized, need to use
            "8bit-macroman".
Solution:   Recognize "macroman" with an alias "mac". (Eckehard Berns)
Files:      src/mbyte.c

Patch 6.2.257 (after 6.2.250)
Problem:    Signs are deleted for ":bdel", but they could still be useful.
Solution:   Delete signs only for ":bwipe".
Files:      src/buffer.c

Patch 6.2.258
Problem:    GUI: can't disable (grey-out) a popup menu item.  (Ajit Thakkar)
Solution:   Loop over the popup menus for all modes.
Files:      src/menu.c

Patch 6.2.259
Problem:    If there are messages when exiting, on the console there is a
            hit-enter prompt while the message can be read; in the GUI the
            message may not be visible.
Solution:   Use the hit-enter prompt when there is an error message from
            writing the viminfo file or autocommands, or when there is any
            output in the GUI and 'verbose' is set.  Don't use a hit-enter
            prompt for the non-GUI version unless there is an error message.
Files:      src/main.c

Patch 6.2.260
Problem:    GTK 2: Can't quit a dialog with <Esc>.
            GTK 1 and 2: <Enter> always gives a result, even when the default
            button has been disabled.
Solution:   Handle these keys explicitly.  When no default button is specified
            use the first one (works mostly like it was before).
Files:      src/gui_gtk.c

Patch 6.2.261
Problem:    When 'autoindent' and 'cindent' are set and a line is recognized
            as a comment, starting a new line won't do 'cindent' formatting.
Solution:   Also use 'cindent' formatting for lines that are used as a
            comment. (Servatius Brandt)
Files:      src/misc1.c

Patch 6.2.262
Problem:    1 CTRL-W w beeps, even though going to the first window is
            possible. (Charles Campbell)
Solution:   Don't beep.
```

```
Files:      src/window.c

Patch 6.2.263
Problem:    Lint warnings: Duplicate function prototypes, duplicate macros,
            use of a zero character instead of a zero pointer, unused
            variable.  Clearing allocated memory in a complicated way.
Solution:   Remove the function prototypes from farsi.h.  Remove the
            duplicated lines in keymap.h.  Change getvcol() argument from NUL
            to NULL.  Remove the "col" variable in regmatch().  Use
            lalloc_clear() instead of lalloc(). (Walter Briscoe)
Files:      src/farsi.h, src/keymap.h, src/ops.c, src/regexp.c, src/search.c

Patch 6.2.264 (after 6.2.247)
Problem:    Writing past allocated memory when using a command line from the
            viminfo file.
Solution:   Store the NUL in the right place.
Files:      src/ex_getln.c

Patch 6.2.265
Problem:    Although ":set" is not allowed in the sandbox, ":let &opt = val"
            works.
Solution:   Do allow changing options in the sandbox, but not the ones that
            can't be changed from a modeline.
Files:      src/ex_cmds.h, src/options.c

Patch 6.2.266
Problem:    When redirecting output and using ":silent", line breaks are
            missing from output of ":map" and ":tselect".  Alignment of
            columns is wrong.
Solution:   Insert a line break where "msg_didout" was tested.  Update msg_col
            when redirecting and using ":silent".
Files:      src/getchar.c, src/message.c

Patch 6.2.267 (extra)
Problem:    Win32: "&&" in a tearoff menu is not shown. (Luc Hermitte)
Solution:   Use the "name" item from the menu instead of the "dname" item.
Files:      src/gui_w32.c, src/menu.c

Patch 6.2.268
Problem:    GUI: When changing 'guioptions' part of the window may be off
            screen. (Randall Morris)
Solution:   Adjust the size of the window when changing 'guioptions', but only
            when adding something.
Files:      src/gui.c

Patch 6.2.269
Problem:    Diff mode does not highlight a change in a combining character.
            (Raphael Finkel)
Solution:   Make diff_find_change() multi-byte aware: find the start byte of
            a character that contains a change.
Files:      src/diff.c

Patch 6.2.270
Problem:    Completion in Insert mode, then repeating with ".", doesn't handle
```

```
            composing characters in the completed text. (Raphael Finkel)
Solution:   Don't skip over composing chars when adding completed text to the
            redo buffer.
Files:      src/getchar.c

Patch 6.2.271
Problem:    NetBeans: Can't do "tail -f" on the log.  Passing socket info with
            an argument or environment variable is not secure.
Solution:   Wait after initializing the log.  Allow passing the socket info
            through a file. (Gordon Prieur)
Files:      runtime/doc/netbeans.txt, src/main.c, src/netbeans.c

Patch 6.2.272
Problem:    When the "po" directory exists, but "po/Makefile" doesn't,
            building fails.  Make loops when the "po" directory has been
            deleted after running configure.
Solution:   Check for the "po/Makefile" instead of just the "po" directory.
            Check this again before trying to run make with that Makefile.
Files:      src/auto/configure, src/configure.in, src/Makefile

Patch 6.2.273
Problem:    Changing the sort order in an explorer window for an empty
            directory produces error messages. (Doug Kearns)
Solution:   When an invalid range is used for a function that is not going to
            be executed, skip over the arguments anyway.
Files:      src/eval.c

Patch 6.2.274
Problem:    ":print" skips empty lines when 'list' is set and there is no
            "eol" in 'listchars'. (Yakov Lerner)
Solution:   Skip outputting a space for an empty line only when 'list' is set
            and the end-of-line character is not empty.
Files:      src/message.c

Patch 6.2.275 (extra, after 6.2.267)
Problem:    Warning for uninitialized variable when using gcc.
Solution:   Initialize "acLen" to zero. (Bill McCarthy)
Files:      src/gui_w32.c

Patch 6.2.276
Problem:    ":echo X()" does not put a line break between the message that X()
            displays and the text that X() returns. (Yakov Lerner)
Solution:   Invoke msg_start() after evaluating the argument.
Files:      src/eval.c

Patch 6.2.277
Problem:    Vim crashes when a ":runtime ftplugin/ada.vim" causes a recursive
            loop. (Robert Nowotniak)
Solution:   Restore "msg_list" before returning from do_cmdline().
Files:      src/ex_docmd.c

Patch 6.2.278
Problem:    Using "much" instead of "many".
Solution:   Correct the error message.
```

```
Files:      src/eval.c

Patch 6.2.279
Problem:    There is no default choice for a confirm() dialog, now that it is
            possible not to have a default choice.
Solution:   Make the first choice the default choice.
Files:      runtime/doc/eval.txt, src/eval.c

Patch 6.2.280
Problem:    "do" and ":diffget" don't work in the first line and the last line
            of a buffer. (Aron Griffis)
Solution:   Find a difference above the first line and below the last line.
            Also fix a few display updating bugs.
Files:      src/diff.c, src/fold.c, src/move.c

Patch 6.2.281
Problem:    PostScript printing doesn't work on Mac OS X 10.3.2.
Solution:   Adjust the header file. (Mike Williams)
Files:      runtime/print/prolog.ps

Patch 6.2.282
Problem:    When using CTRL-O to go back to a help file, it becomes listed.
            (Andrew Nesbit)
            Using ":tag" or ":tjump" in a help file doesn't keep the help file
            settings (e.g. for 'iskeyword').
Solution:   Don't mark a buffer as listed when its help flag is set.  Put all
            the option settings for a help buffer together in do_ecmd().
Files:      src/ex_cmds.c

Patch 6.2.283
Problem:    The "local additions" in help.txt are used without conversion,
            causing latin1 characters showing up wrong when 'enc' is utf-8.
            (Antoine J. Mechelynck)
Solution:   Convert the text to 'encoding'.
Files:      src/ex_cmds.c

Patch 6.2.284
Problem:    Listing a function puts "endfunction" in the message history.
            Typing "q" at the more prompt isn't handled correctly when listing
            variables and functions.  (Hara Krishna Dara)
Solution:   Don't use msg() for "endfunction".  Check "got_int" regularly.
Files:      src/eval.c

Patch 6.2.285
Problem:    GUI: In a single wrapped line that fills the window, "gj" in the
            last screen line leaves the cursor behind. (Ivan Tarasov)
Solution:   Undraw the cursor before scrolling the text up.
Files:      src/gui.c

Patch 6.2.286
Problem:    When trying to rename a file and it doesn't exist, the destination
            file is deleted anyway. (Luc Deux)
Solution:   Don't delete the destination when the source doesn't exist. (Taro
            Muraoka)
```

```
Files:      src/fileio.c

Patch 6.2.287 (after 6.2.264)
Problem:    Duplicate lines are added to the viminfo file.
Solution:   Compare with existing entries without an offset.  Also fixes
            reading very long history lines from viminfo.
Files:      src/ex_getln.c

Patch 6.2.288 (extra)
Problem:    Mac: An external program can't be interrupted.
Solution:   Don't use the 'c' key for backspace. (Eckehard Berns)
Files:      src/gui_mac.c

Patch 6.2.289
Problem:    Compiling the Tcl interface with thread support causes ":make" to
            fail.  (Juergen Salk)
Solution:   Use $TCL_DEFS from the Tcl config script to obtain the required
            compile flags for using the thread library.
Files:      src/auto/configure, src/configure.in

Patch 6.2.290 (extra)
Problem:    Mac: The mousewheel doesn't work.
Solution:   Add mousewheel support.  Also fix updating the thumb after a drag
            and then using another way to scroll.  (Eckehard Berns)
Files:      src/gui_mac.c

Patch 6.2.291 (extra)
Problem:    Mac: the plus button and close button don't do anything.
Solution:   Make the plus button maximize the window and the close button
            close Vim. (Eckehard Berns)
Files:      src/gui.c, src/gui_mac.c

Patch 6.2.292
Problem:    Motif: When removing GUI arguments from argv[] a "ps -ef" shows
            the last argument repeated.
Solution:   Set argv[argc] to NULL. (Michael Jarvis)
Files:      src/gui_x11.c

Patch 6.2.293 (after 6.2.255)
Problem:    GTK: A new item in a menu is put before the tearoff item.
Solution:   Do increment the menu item index for non-popup menu items.
Files:      src/gui_gtk.c

Patch 6.2.294 (extra)
Problem:    Mac: Cannot use modifiers with Space, Tab, Enter and Escape.
Solution:   Handle all modifiers for these keys.  (Eckehard Berns)
Files:      src/gui_mac.c

Patch 6.2.295
Problem:    When in debug mode, receiving a message from a remote client
            causes a crash.  Evaluating an expression causes Vim to wait for
            "cont" to be typed, without a prompt.  (Hari Krishna Dara)
Solution:   Disable debugging when evaluating an expression for a client.
            (Michael Geddes)  Don't try reading into the typeahead buffer when
```

```
            it may have been filled in another way.
Files:      src/ex_getln.c, src/getchar.c, src/if_xcmdsrv.c, src/main.c,
            src/misc1.c, src/proto/getchar.pro, src/proto/main.pro,
            src/proto/os_unix.pro, src/proto/ui.pro, src/structs.h,
            src/os_unix.c, src/ui.c

Patch 6.2.296 (extra)
Problem:    Same as 6.2.295.
Solution:   Extra files for patch 6.2.295.
Files:      src/os_amiga.c, src/os_msdos.c, src/os_riscos.c, src/os_win32.c,
            src/proto/os_amiga.pro, src/proto/os_msdos.pro,
            src/proto/os_riscos.pro, src/proto/os_win32.pro

Patch 6.2.297 (after 6.2.232)
Problem:    Cannot invoke Python commands recursively.
Solution:   With Python 2.3 and later use the available mechanisms to invoke
            Python recursively. (Matthew Mueller)
Files:      src/if_python.c

Patch 6.2.298
Problem:    A change always sets the '. mark and an insert always sets the '^
            mark, even when this is not wanted.
            Cannot go back to the position of older changes without undoing
            those changes.
Solution:   Add the ":keepjumps" command modifier.
            Add the "g," and "g;" commands.
Files:      runtime/doc/motion.txt, src/ex_cmds.h, src/ex_docmd.c, src/edit.c,
            src/mark.c, src/misc1.c, src/normal.c, src/proto/mark.pro,
            src/structs.h, src/undo.c

Patch 6.2.299
Problem:    Can only use one language for help files.
Solution:   Add the 'helplang' option to select the preferred language(s).
            Make ":helptags" generate tags files for all languages.
Files:      runtime/doc/options.txt, runtime/doc/various.txt, src/Makefile,
            src/ex_cmds.c, src/ex_cmds2.c, src/ex_cmds.h, src/ex_getln.c,
            src/normal.c, src/option.c, src/option.h, src/proto/ex_cmds.pro,
            src/proto/ex_cmds2.pro, src/proto/option.pro, src/structs.h,
            src/tag.c, src/vim.h

Patch 6.2.300 (after 6.2.297)
Problem:    Cannot build Python interface with Python 2.2 or earlier.
Solution:   Add a semicolon.
Files:      src/if_python.c

Patch 6.2.301
Problem:    The "select all" item from the popup menu doesn't work for Select
            mode.
Solution:   Use the same commands as for the "Edit.select all" menu.
            (Benji Fisher)
Files:      runtime/menu.vim

Patch 6.2.302
Problem:    Using "CTRL-O ." in Insert mode doesn't work properly. (Benji
```

```
            Fisher)
Solution:   Restore "restart_edit" after an insert command that was not typed.
            Avoid waiting with displaying the mode when there is no text to be
            overwritten.
            Fix that "CTRL-O ." sometimes doesn't put the cursor back after
            the end-of-line.  Only reset the flag that CTRL-O was used past
            the end of the line when restarting editing.  Update "o_lnum"
            number when inserting text and "o_eol" is set.
Files:      src/edit.c, src/normal.c

Patch 6.2.303
Problem:    Cannot use Unicode digraphs while 'encoding' is not Unicode.
Solution:   Convert the character from Unicode to 'encoding' when needed.
            Use the Unicode digraphs for the Macintosh. (Eckehard Berns)
Files:      src/digraph.c

Patch 6.2.304 (extra, after 6.2.256)
Problem:    Mac: No proper support for 'encoding'.  Conversion without iconv()
            is not possible.
Solution:   Convert input from 'termencoding' to 'encoding'.  Add
            mac_string_convert().  Convert text for the clipboard when needed.
            (Eckehard Berns)
Files:      src/gui_mac.c, src/mbyte.c, src/structs.h, src/vim.h

Patch 6.2.305 (after 6.2.300)
Problem:    Win32: Cannot build Python interface with Python 2.3. (Ajit
            Thakkar)
Solution:   Add two functions to the dynamic loading feature.
Files:      src/if_python.c

Patch 6.2.306 (extra)
Problem:    Win32: Building console version with BCC 5.5 gives a warning for
            get_cmd_args() prototype missing.  (Ajit Thakkar)
Solution:   Don't build os_w32exe.c for the console version.
Files:      src/Make_bc5.mak

Patch 6.2.307 (after 6.2.299)
Problem:    Installing help files fails.
Solution:   Expand wildcards for translated help files separately.
Files:      src/Makefile

Patch 6.2.308
Problem:    Not all systems have "whoami", resulting in an empty user name.
Solution:   Use "logname" when possible, "whoami" otherwise.  (David Boyce)
Files:      src/Makefile

Patch 6.2.309
Problem:    "3grx" waits for two ESC to be typed.  (Jens Paulus)
Solution:   Append the ESC to the stuff buffer when redoing the "gr" insert.
Files:      src/edit.c

Patch 6.2.310
Problem:    When setting 'undolevels' to -1, making a change and setting
            'undolevels' to a positive value an "undo list corrupt" error
```

```
            occurs. (Madoka Machitani)
Solution:   Sync undo before changing 'undolevels'.
Files:      src/option.c

Patch 6.2.311 (after 6.2.298)
Problem:    When making several changes in one line the changelist grows
            quickly.  There is no error message for reaching the end of the
            changelist.  Reading changelist marks from viminfo doesn't work
            properly.
Solution:   Only make a new entry in the changelist when making a change in
            another line or 'textwidth' columns away.  Add E662, E663 and E664
            error messages.  Put a changelist mark from viminfo one position
            before the end.
Files:      runtime/doc/motion.txt, src/mark.c, src/misc1.c, src/normal.c

Patch 6.2.312 (after 6.2.299)
Problem:    "make install" clears the screen when installing the docs.
Solution:   Execute ":helptags" in silent mode.
Files:      runtime/doc/Makefile

Patch 6.2.313
Problem:    When opening folds in a diff window, other diff windows no longer
            show the same text.
Solution:   Sync the folds in diff windows.
Files:      src/diff.c, src/fold.c, src/move.c, src/proto/diff.pro,
            src/proto/move.pro

Patch 6.2.314
Problem:    When 'virtualedit' is set "rx" may cause a crash with a blockwise
            selection and using "$". (Moritz Orbach)
Solution:   Don't try replacing chars in a line that has no characters in the
            block.
Files:      src/ops.c

Patch 6.2.315
Problem:    Using CTRL-C in a Visual mode mapping while 'insertmode' is set
            stops Vim from returning to Insert mode.
Solution:   Don't reset "restart_edit" when a CTRL-C is found and 'insertmode'
            is set.
Files:      src/normal.c

Patch 6.2.316 (after 6.2.312)
Problem:    "make install" tries connecting to the X server when installing
            the docs. (Stephen Thomas)
Solution:   Add the "-X" argument.
Files:      runtime/doc/Makefile

Patch 6.2.317 (after 6.2.313)
Problem:    When using "zi" in a diff window, other diff windows are not
            adjusted. (Richard Curnow)
Solution:   Distribute a change in 'foldenable' to other diff windows.
Files:      src/normal.c

Patch 6.2.318
```

```
Problem:    When compiling with _THREAD_SAFE external commands don't echo
            typed characters.
Solution:   Don't set the terminal mode to TMODE_SLEEP when it's already at
            TMODE_COOK.
Files:      src/os_unix.c

Patch 6.2.319 (extra)
Problem:    Building gvimext.dll with Mingw doesn't work properly.
Solution:   Use gcc instead of dllwrap.  Use long option names. (Alejandro
            Lopez-Valencia)
Files:      src/GvimExt/Make_ming.mak

Patch 6.2.320
Problem:    Win32: Adding and removing the menubar resizes the Vim window.
            (Jonathon Merz)
Solution:   Don't let a resize event change 'lines' unexpectedly.
Files:      src/gui.c

Patch 6.2.321
Problem:    When using modeless selection, wrapping lines are not recognized,
            a line break is always inserted.
Solution:   Add LineWraps[] to remember whether a line wrapped or not.
Files:      src/globals.h, src/screen.c, src/ui.c

Patch 6.2.322
Problem:    With 'showcmd' set, after typing "dd" the next "d" may not be
            displayed. (Jens Paulus)
Solution:   Redraw the command line after updating the screen, scrolling may
            have set "clear_cmdline".
Files:      src/screen.c

Patch 6.2.323
Problem:    Win32: expanding "~/file" in an autocommand pattern results in
            backslashes, while this pattern should only have forward slashes.
Solution:   Make expanding environment variables respect 'shellslash' and set
            p_ssl when expanding the autocommand pattern.
Files:      src/fileio.c, src/misc1.c, src/proto/fileio.pro

Patch 6.2.324 (extra)
Problem:    Win32: when "vimrun.exe" has a path with white space, such as
            "Program Files", executing external commands may fail.
Solution:   Put double quotes around the path to "vimrun".
Files:      src/os_win32.c

Patch 6.2.325
Problem:    When $HOME includes a space, doing ":set tags=~/tags" doesn't
            work, the space is used to separate file names.  (Brett Stahlman)
Solution:   Escape the space with a backslash.
Files:      src/option.c

Patch 6.2.326
Problem:    ":windo set syntax=foo" doesn't work.  (Tim Chase)
Solution:   Don't change 'eventignore' for ":windo".
Files:      src/ex_cmds2.c
```

Patch 6.2.327
Problem: When formatting text all marks in the formatted lines are lost.
            A word is not joined to a previous line when this would be
            possible. (Mikolaj Machowski)
Solution: Try to keep marks in the same position as much as possible.
            Also keep mark positions when joining lines.
            Start auto-formatting in the previous line when appropriate.
            Add the "gw" operator: Like "gq" but keep the cursor where it is.
Files: runtime/doc/change.txt, src/edit.c, src/globals.h, src/mark.c,
            src/misc1.c, src/normal.c, src/ops.c, src/proto/edit.pro,
            src/proto/mark.pro, src/proto/ops.pro, src/structs.h, src/vim.h

Patch 6.2.328
Problem: XIM with GTK: It is hard to understand what XIM is doing.
Solution: Add xim_log() to log XIM events and help with debugging.
Files: src/mbyte.c

Patch 6.2.329
Problem: ":=" does not work Vi compatible. (Antony Scriven)
Solution: Print the last line number instead of the current line. Don't
            print "line".
Files: src/ex_cmds.h, src/ex_docmd.c

Patch 6.2.330 (extra, after 6.2.267)
Problem: Win32: Crash when tearing off a menu.
Solution: Terminate a string with a NUL. (Yasuhiro Matsumoto)
Files: src/gui_w32.c

Patch 6.2.331 (after 6.2.327)
Problem: "gwap" leaves cursor in the wrong line.
Solution: Remember the cursor position before finding the ends of the
            paragraph.
Files: src/normal.c, src/ops.c, src/structs.h

Patch 6.2.332 (extra)
Problem: Amiga: Compile error for string array. Compiling the Amiga GUI
            doesn't work.
Solution: Use a char pointer instead. Move including "gui_amiga.h" to after
            including "vim.h". Add a semicolon. (Ali Akcaagac)
Files: src/gui_amiga.c, src/os_amiga.c

Patch 6.2.333 (extra)
Problem: Win32: printing doesn't work with specified font charset.
Solution: Use the specified font charset. (Mike Williams)
Files: src/os_mswin.c

Patch 6.2.334 (extra, after 6.2.296)
Problem: Win32: evaluating client expression in debug mode requires typing
            "cont".
Solution: Use eval_client_expr_to_string().
Files: src/os_mswin.c

Patch 6.2.335

```
Problem:    The ":sign" command cannot be followed by another command.
Solution:   Add TRLBAR to the command flags.
Files:      src/ex_cmds.h

Patch 6.2.336 (after 6.2.327)
Problem:    Mixup of items in an expression.
Solution:   Move "== NUL" to the right spot.
Files:      src/edit.c

Patch 6.2.337 (extra, after 6.2.319)
Problem:    Building gvimext.dll with Mingw doesn't work properly.
Solution:   Fix white space and other details. (Alejandro Lopez-Valencia)
Files:      src/GvimExt/Make_ming.mak

Patch 6.2.338 (after 6.2.331)
Problem:    When undoing "gwap" the cursor is always put at the start of the
            paragraph.  When undoing auto-formatting the cursor may be above
            the change.
Solution:   Try to move the cursor back to where it was or to the first line
            that actually changed.
Files:      src/normal.c, src/ops.c, src/undo.c

Patch 6.2.339
Problem:    Crash when using many different highlight groups and a User
            highlight group.  (Juergen Kraemer)
Solution:   Do not use the sg_name_u pointer when it is NULL.  Also simplify
            use of the highlight group table.
Files:      src/syntax.c

Patch 6.2.340
Problem:    ":reg" doesn't show the actual contents of the clipboard if it was
            filled outside of Vim. (Stuart MacDonald)
Solution:   Obtain the clipboard contents before displaying it.
Files:      src/ops.c

Patch 6.2.341 (extra)
Problem:    Win32: When the path to diff.exe contains a space and using the
            vimrc generated by the install program, diff mode does not work.
Solution:   Put the first double quote just before the space instead of before
            the path.
Files:      src/dosinst.c

Patch 6.2.342 (extra)
Problem:    Win32: macros are not always used as expected.
Solution:   Define WINVER to 0x0400 instead of 0x400. (Alejandro
            Lopez-Valencia)
Files:      src/Make_bc5.mak, src/Make_cyg.mak, src/Make_mvc.mak

Patch 6.2.343
Problem:    Title doesn't work with some window managers.  X11: Setting the
            text property for the window title is hard coded.
Solution:   Use STRING format when possible.  Use the UTF-8 function when
            it's available and 'encoding' is utf-8. Use
            XStringListToTextProperty().  Do the same for the icon name.
```

            (David Harrison)
Files: src/os_unix.c

Patch 6.2.344 (extra, after 6.2.337)
Problem: Cannot build gvimext.dll with MingW on Linux.
Solution: Add support for cross compiling. (Ronald Hoellwarth)
Files: src/GvimExt/Make_ming.mak

Patch 6.2.345 (extra)
Problem: Win32: Copy/paste between two Vims fails if 'encoding' is not set
            properly or there are illegal bytes.
Solution: Use a raw byte format. Always set it when copying. When pasting
            use the raw format if 'encoding' is the same.
Files: src/os_mswin.c, src/os_win16.c, src/os_win32.c, src/vim.h

Patch 6.2.346
Problem: Win32 console: After using "chcp" Vim does not detect the
            different codepage.
Solution: Use GetConsoleCP() and when it is different from GetACP() set
            'termencoding'.
Files: src/option.c

Patch 6.2.347 (extra)
Problem: Win32: XP theme support is missing.
Solution: Add a manifest and refer to it from the resource file. (Michael
            Wookey)
Files: Makefile, src/gvim.exe.mnf, src/vim.rc

Patch 6.2.348
Problem: Win32: "vim c:\dir\(test)" doesn't work, because the 'isfname'
            default value doesn't contain parenthesis.
Solution: Temporarily add '(' and ')' to 'isfname' when expanding file name
            arguments.
Files: src/main.c

Patch 6.2.349
Problem: Finding a match using 'matchpairs' may cause a crash.
            'matchpairs' is not used for 'showmatch'.
Solution: Don't look past the NUL in 'matchpairs'. Use 'matchpairs' for
            'showmatch'. (Dave Olszewkski)
Files: src/misc1.c, src/normal.c, src/proto/search.pro, src/search.c

Patch 6.2.350
Problem: Not enough info about startup timing.
Solution: Add a few more TIME_MSG() calls.
Files: src/main.c

Patch 6.2.351
Problem: Win32: $HOME may be set to %USERPROFILE%.
Solution: Expand %VAR% at the start of $HOME.
Files: src/misc1.c

Patch 6.2.352 (after 6.2.335)
Problem: ":sign texthl=||" does not work.

```
Solution:   Remove the check for a following command.  Give an error for extra
            arguments after "buff=1".
Files:      src/ex_cmds.c, src/ex_cmds.h

Patch 6.2.353 (extra)
Problem:    Win32: Supported server name length is limited. (Paul Bossi)
Solution:   Use MAX_PATH instead of 25.
Files:      src/os_mswin.c

Patch 6.2.354 (extra)
Problem:    Win32: When the mouse pointer is on a tear-off menu it is hidden
            when typing but is not redisplayed when moved. (Markx Hackmann)
Solution:   Handle the pointer move event for the tear-off menu window.
Files:      src/gui_w32.c

Patch 6.2.355 (after 6.2.303)
Problem:    When 'encoding' is a double-byte encoding different from the
            current locale, the width of characters is not correct.
            Possible failure and memory leak when using iconv, Unicode
            digraphs and 'encoding' is not "utf-8".
Solution:   Use iconv() to discover the actual width of characters.
            Add the "vc_fail" field to vimconv_T.
            When converting a digraph, init the conversion type to NONE and
            cleanup afterwards.
Files:      src/digraph.c, src/mbyte.c, src/structs.h

Patch 6.2.356
Problem:    When using a double-byte 'encoding' and 'selection' is
            "exclusive", "vy" only yanks the first byte of a double-byte
            character.  (Xiangjiang Ma)
Solution:   Correct the column in unadjust_for_sel() to position on the first
            byte, always include the trailing byte of the selected text.
Files:      src/normal.c

Patch 6.2.357 (after 6.2.321)
Problem:    Memory leak when resizing the Vim window.
Solution:   Free the LineWraps array.
Files:      src/screen.c

Patch 6.2.358 (after 6.2.299)
Problem:    Memory leak when using ":help" and the language doesn't match.
Solution:   Free the array with matching tags.
Files:      src/ex_cmds.c

Patch 6.2.359 (after 6.2.352)
Problem:    Compiler warning for long to int type cast.
Solution:   Add explicit type cast.
Files:      src/ex_cmds.c

Patch 6.2.360
Problem:    "100|" in an empty line results in a ruler "1,0-100". (Pavol
            Juhas)
Solution:   Recompute w_virtcol if the target column was not reached.
Files:      src/misc2.c
```

Patch 6.2.361 (extra)
Problem: Win32: Run gvim, ":set go-=m", use Alt-Tab, keep Alt pressed while
            pressing Esc, then release Alt: Cursor disappears and typing a key
            causes a beep. (Hari Krishna Dara)
Solution: Don't ignore the WM_SYSKEYUP event when the menu is disabled.
Files: src/gui_w32.c

Patch 6.2.362 (extra, after 6.2.347)
Problem: Win32: The manifest causes gvim not to work. (Dave Roberts)
Solution: Change "x86" to "X86". (Serge Pirotte)
Files: src/gvim.exe.mnf

Patch 6.2.363
Problem: In an empty file with 'showmode' off, "i" doesn't change the ruler
            from "0-1" to "1". Typing "x<BS>" does show "1", but then <Esc>
            doesn't make it "0-1" again. Same problem for ruler in
            statusline. (Andrew Pimlott)
Solution: Remember the "empty line" flag with Insert mode and'ed to it.
Files: src/screen.c

Patch 6.2.364
Problem: HTML version of the documentation doesn't mention the encoding,
            which is a problem for mbyte.txt.
Solution: Adjust the awk script. (Ilya Sher)
Files: runtime/doc/makehtml.awk

Patch 6.2.365
Problem: The configure checks for Perl and Python may add compile and link
            arguments that break building Vim.
Solution: Do a sanity check: try building with the arguments.
Files: src/auto/configure, src/configure.in

Patch 6.2.366
Problem: When the GUI can't start because no valid font is found, there is
            no error message. (Ugen)
Solution: Add an error message.
Files: src/gui.c

Patch 6.2.367
Problem: Building the help tags file while installing may fail if there is
            another Vim in $PATH.
Solution: Specify the just installed Vim executable. (Gordon Prieur)
Files: src/Makefile

Patch 6.2.368
Problem: When 'autochdir' is set, closing a window doesn't change to the
            directory of the new current window. (Salman Halim)
Solution: Handle 'autochdir' always when a window becomes the current one.
Files: src/window.c

Patch 6.2.369
Problem: Various memory leaks: when using globpath(), when searching for
            help tags files, when defining a function inside a function, when

```
            giving an error message through an exception, for the final "."
            line in ":append", in expression "cond ? a : b" that fails and for
            missing ")" in an expression.  Using NULL pointer when adding
            first user command and for pointer computations with regexp.
            (tests by Dominique Pelle)
Solution:   Fix the leaks by freeing the allocated memory.  Don't use the
            array of user commands when there are no entries.  Use a macro
            instead of a function call for saving and restoring regexp states.
Files:      src/eval.c, src/ex_cmds.c, src/ex_docmd.c, src/ex_getln.c,
            src/misc2.c, src/regexp.c, src/screen.c, src/tag.c

Patch 6.2.370 (extra, after6.2.341)
Problem:    Win32: When the path to diff.exe contains a space and using the
            vimrc generated by the install program, diff mode may not work.
            (Alejandro Lopez-Valencia)
Solution:   Do not use double quotes for arguments that do not have a space.
Files:      src/dosinst.c

Patch 6.2.371
Problem:    When 'virtualedit' is set and there is a Tab before the next "x",
            "dtx" does not delete the whole Tab. (Ken Hashishi)
Solution:   Move the cursor to the last position of the Tab.  Also for
            "df<Tab>".
Files:      src/normal.c

Patch 6.2.372
Problem:    When using balloon evaluation, no value is displayed for members
            of structures and items of an array.
Solution:   Include "->", "." and "[*]" in the expression.
Files:      src/gui_beval.c, src/normal.c, src/vim.h

Patch 6.2.373
Problem:    When 'winminheight' is zero and a window is reduced to zero
            height, the ruler always says "Top" instead of the cursor
            position. (Antoine J. Mechelynck)
Solution:   Don't recompute w_topline for a zero-height window.
Files:      src/window.c

Patch 6.2.374
Problem:    ":echo "hello" | silent normal n" removes the "hello" message.
            (Servatius Brandt)
Solution:   Don't echo the search string when ":silent" was used.  Also don't
            show the mode.  In general: don't clear to the end of the screen.
Files:      src/gui.c, src/message.c, src/os_unix.c, src/proto/message.pro,
            src/screen.c, src/search.c, src/window.c

Patch 6.2.375
Problem:    When changing 'guioptions' the hit-enter prompt may be below the
            end of the Vim window.
Solution:   Call screen_alloc() before showing the prompt.
Files:      src/message.c

Patch 6.2.376
Problem:    Win32: Ruby interface cannot be dynamically linked with Ruby 1.6.
```

```
Solution:   Add #ifdefs around use of rb_w32_snprintf().  (Benoît Cerrina)
Files:      src/if_ruby.c

Patch 6.2.377 (after 6.2.372)
Problem:    Compiler warnings for signed/unsigned compare. (Michael Wookey)
Solution:   Add type cast.
Files:      src/normal.c

Patch 6.2.378 (extra, after 6.2.118)
Problem:    Mac: cannot build with Project Builder.
Solution:   Add remove_tail_with_ext() to locate and remove the "build"
            directory from the runtime path.  Include os_unix.c when needed.
            (Dany St Amant)
Files:      src/misc1.c, src/os_macosx.c, src/vim.h

Patch 6.2.379
Problem:    Using ":mkvimrc" in the ":options" window sets 'bufhidden' to
            "delete". (Michael Naumann)
Solution:   Do not add buffer-specific option values to a global vimrc file.
Files:      src/option.c

Patch 6.2.380 (extra)
Problem:    DOS: "make test" fails when running it again.  Can't "make test"
            with Borland C.
Solution:   Make sure ".out" files are deleted when they get in the way.  Add
            a "test" target to the Borland C Makefile.
Files:      src/Make_bc5.mak, src/testdir/Make_dos.mak

Patch 6.2.381
Problem:    Setting 'fileencoding' to a comma separated list (confusing it
            with 'fileencodings') does not result in an error message.
            Setting 'fileencoding' in an empty file marks it as modified.
            There is no "+" in the title after setting 'fileencoding'.
Solution:   Check for a comma in 'fileencoding'.  Only consider a non-empty
            file modified by changing 'fileencoding'.  Update the title after
            changing 'fileencoding'.
Files:      src/option.c

Patch 6.2.382
Problem:    Running "make test" puts marks from test files in viminfo.
Solution:   Specify a different viminfo file to use.
Files:      src/testdir/test15.in, src/testdir/test49.in

Patch 6.2.383
Problem:    ":hi foo term='bla" crashes Vim. (Antony Scriven)
Solution:   Check that the closing ' is there.
Files:      src/syntax.c

Patch 6.2.384
Problem:    ":menu a.&b" ":unmenu a.b" only works if "&b" isn't translated.
Solution:   Also compare the names without '&' characters.
Files:      src/menu.c

Patch 6.2.385  (extra)
```

```
Problem:    Win32: forward_slash() and trash_input_buf() are undefined when
            compiling with small features. (Ajit Thakkar)
Solution:   Change the #ifdefs for forward_slash().  Don't call
            trash_input_buf() if the input buffer isn't used.
Files:      src/fileio.c, src/os_win32.c

Patch 6.2.386
Problem:    Wasting time trying to read marks from the viminfo file for a
            buffer without a name.
Solution:   Skip reading marks when the buffer has no name.
Files:      src/fileio.c

Patch 6.2.387
Problem:    There is no highlighting of translated items in help files.
Solution:   Search for a "help_ab.vim" syntax file when the help file is
            called "*.abx".  Also improve the help highlighting a bit.
Files:      runtime/syntax/help.vim

Patch 6.2.388
Problem:    GTK: When displaying some double-width characters they are drawn
            as single-width, because of conversion to UTF-8.
Solution:   Check the width that GTK uses and add a space if it's one instead
            of two.
Files:      src/gui_gtk_x11.c

Patch 6.2.389
Problem:    When working over a slow connection, it's very annoying that the
            last line is partly drawn and then cleared for every change.
Solution:   Don't redraw the bottom line if no rows were inserted or deleted.
            Don't draw the line if we know "@" lines will be used.
Files:      src/screen.c

Patch 6.2.390
Problem:    Using "r*" in Visual mode on multi-byte characters only replaces
            every other character. (Tyson Roberts)
Solution:   Correct the cursor position after replacing each character.
Files:      src/ops.c

Patch 6.2.391 (extra)
Problem:    The ":highlight" command is not tested.
Solution:   Add a test script for ":highlight".
Files:      src/testdir/Makefile, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/test51.in,
            src/testdir/test51.ok

Patch 6.2.392 (after 6.2.384)
Problem:    Unused variable.
Solution:   Remove "dlen".
Files:      src/menu.c

Patch 6.2.393
Problem:    When using very long lines the viminfo file can become very big.
Solution:   Add the "s" flag to 'viminfo': skip registers with more than the
```

```
            specified Kbyte of text.
Files:      runtime/doc/options.txt, src/ops.c, src/option.c

Patch 6.2.394  (after 6.2.391)
Problem:    Test 51 fails on a terminal with 8 colors. (Tony Leneis)
Solution:   Use "DarkBlue" instead of "Blue" to avoid the "bold" attribute.
Files:      src/testdir/test51.in

Patch 6.2.395
Problem:    When using ":tag" or ":pop" the previous matching tag is used.
            But since the current file is different, the ordering of the tags
            may change.
Solution:   Remember what the current buffer was for when re-using cur_match.
Files:      src/edit.c, src/ex_cmds.c, src/proto/tag.pro, src/structs.h,
            src/tag.c

Patch 6.2.396
Problem:    When CTRL-T jumps to another file and an autocommand moves the
            cursor to the '" mark, don't end up on the right line.  (Michal
            Malecki)
Solution:   Set the line number after loading the file.
Files:      src/tag.c

Patch 6.2.397
Problem:    When using a double-byte 'encoding' mapping <M-x> doesn't work.
            (Yasuhiro Matsumoto)
Solution:   Do not set the 8th bit of the character but use a modifier.
Files:      src/gui_gtk_x11.c, src/gui_x11.c, src/misc2.c

Patch 6.2.398 (extra)
Problem:    Win32 console: no extra key modifiers are supported.
Solution:   Encode the modifiers into the input stream.  Also fix that special
            keys are converted and stop working when 'tenc' is set.  Also fix
            that when 'tenc' is initialized the input and output conversion is
            not setup properly until 'enc' or 'tenc' is set.
Files:      src/getchar.c, src/option.c, src/os_win32.c

Patch 6.2.399
Problem:    A ":set" command that fails still writes a message when it is
            inside a try/catch block.
Solution:   Include all the text of the message in the error message.
Files:      src/charset.c, src/option.c

Patch 6.2.400
Problem:    Can't compile if_xcmdsrv.c on HP-UX 11.0.
Solution:   Include header file poll.h. (Malte Neumann)
Files:      src/if_xcmdsrv.c

Patch 6.2.401
Problem:    When opening a buffer that was previously opened, Vim does not
            restore the cursor position if the first line starts with white
            space.  (Gregory Margo)
Solution:   Don't skip restoring the cursor position if it is past the blanks
            in the first line.
```

```
Files:      src/buffer.c

Patch 6.2.402
Problem:    Mac: "make install" doesn't generate help tags. (Benji Fisher)
Solution:   Generate help tags before copying the runtime files.
Files:      src/Makefile

Patch 6.2.403
Problem:    ":@y" checks stdin if there are more commands to execute.  This
            fails if stdin is not connected, e.g., when starting the GUI from
            KDE. (Ned Konz)
Solution:   Only check for a next command if there still is typeahead.
Files:      src/ex_docmd.c

Patch 6.2.404
Problem:    Our own function to determine width of Unicode characters may get
            outdated. (Markus Kuhn)
Solution:   Use wcwidth() when it is available.  Also use iswprint().
Files:      src/auto/configure, src/configure.in, src/config.h.in, src/mbyte.c

Patch 6.2.405
Problem:    Cannot map zero without breaking the count before a command.
            (Benji Fisher)
Solution:   Disable mapping zero when entering a count.
Files:      src/getchar.c, src/globals.h, src/normal.c

Patch 6.2.406
Problem:    ":help \zs", ":help \@=" and similar don't find useful help.
Solution:   Prepend "/\" to the arguments to find the desired help tag.
Files:      src/ex_cmds.c

Patch 6.2.407 (after 6.2.299)
Problem:    ":help \@<=" doesn't find help.
Solution:   Avoid that ":help \@<=" searches for the "<=" language.
Files:      src/tag.c

Patch 6.2.408
Problem:    ":compiler" is not consistent: Sets local options and a global
            variable. (Douglas Potts)  There is no error message when a
            compiler is not supported.
Solution:   Use ":compiler!" to set a compiler globally, otherwise it's local
            to the buffer and "b:current_compiler" is used.  Give an error
            when no compiler script could be found.
            Note: updated compiler plugins can be found at
            ftp://ftp.vim.org/pub/vim/runtime/compiler/
Files:      runtime/compiler/msvc.vim, runtime/doc/quickfix.txt, src/eval.c,
            src/ex_cmds2.c

Patch 6.2.409
Problem:    The cursor ends up in the last column instead of after the line
            when doing "i//<Esc>o" with 'indentexpr' set to "cindent(v:lnum)".
            (Toby Allsopp)
Solution:   Adjust the cursor as if in Insert mode.
Files:      src/misc1.c
```

```
Patch 6.2.410 (after 6.2.389)
Problem:    In diff mode, when there are more filler lines than fit in the
            window, they are not drawn.
Solution:   Check for filler lines when skipping to draw a line that doesn't
            fit.
Files:      src/screen.c

Patch 6.2.411
Problem:    A "\n" inside a string is not seen as a line break by the regular
            expression matching. (Hari Krishna Dara)
Solution:   Add the vim_regexec_nl() function for strings where "\n" is to be
            matched with a line break.
Files:      src/eval.c, src/ex_eval.c, src/proto/regexp.c, src/regexp.c

Patch 6.2.412
Problem:    Ruby: "ruby << EOF" inside a function doesn't always work.  Also
            for ":python", ":tcl" and ":perl".
Solution:   Check for "<< marker" and skip until "marker" before checking for
            "endfunction".
Files:      src/eval.c

Patch 6.2.413 (after 6.2.411)
Problem:    Missing prototype for vim_regexec_nl(). (Marcel Svitalsky)
Solution:   Now really include the prototype.
Files:      src/proto/regexp.pro

Patch 6.2.414
Problem:    The function used for custom completion of user commands cannot
            have <SID> to make it local. (Hari Krishna Dara)
Solution:   Pass the SID of the script where the user command was defined on
            to the completion.  Also clean up #ifdefs.
Files:      src/ex_docmd.c, src/eval.c, src/ex_getln.c, src/structs.h

Patch 6.2.415
Problem:    Vim may crash after a sequence of events that change the window
            size.  The window layout assumes a larger window than is actually
            available. (Servatius Brandt)
Solution:   Invoke win_new_shellsize() from screenalloc() instead of from
            set_shellsize().
Files:      src/screen.c, src/term.c

Patch 6.2.416
Problem:    Compiler warning for incompatible pointer.
Solution:   Remove the "&" in the call to poll(). (Xavier de Gaye)
Files:      src/os_unix.c

Patch 6.2.417 (after 6.2.393)
Problem:    Many people forget that the '"' item in 'viminfo' needs to be
            preceded with a backslash,
Solution:   Add '<' as an alias for the '"' item.
Files:      runtime/doc/options.txt, src/ops.c, src/option.c

Patch 6.2.418
```

```
Problem:    Using ":nnoremap <F12> :echo "cheese" and ":cabbr cheese xxx":
            when pressing <F12> still uses the abbreviation. (Hari Krishna)
Solution:   Also apply "noremap" to abbreviations.
Files:      src/getchar.c

Patch 6.2.419 (extra)
Problem:    Win32: Cannot open the Vim window inside another application.
Solution:   Add the "-P" argument to specify the window title of the
            application to run inside. (Zibo Zhao)
Files:      runtime/doc/starting.txt, src/main.c, src/gui_w32.c,
            src/gui_w48.c, src/if_ole.cpp, src/os_mswin.c,
            src/proto/gui_w32.pro

Patch 6.2.420
Problem:    Cannot specify a file to be edited in binary mode without setting
            the global value of the 'binary' option.
Solution:   Support ":edit ++bin file".
Files:      runtime/doc/editing.txt, src/buffer.c, src/eval.c, src/ex_cmds.h,
            src/ex_docmd.c, src/fileio.c, src/misc2.c

Patch 6.2.421
Problem:    Cannot set the '[ and '] mark, which may be necessary when an
            autocommand simulates reading a file.
Solution:   Allow using "m[" and "m]".
Files:      runtime/doc/motion.txt, src/mark.c

Patch 6.2.422
Problem:    In CTRL-X completion messages the "/" makes them less readable.
Solution:   Remove the slashes. (Antony Scriven)
Files:      src/edit.c

Patch 6.2.423
Problem:    ":vertical wincmd ]" does not split vertically.
Solution:   Add "postponed_split_flags".
Files:      src/ex_docmd.c, src/globals.h, src/if_cscope.c, src/tag.c

Patch 6.2.424
Problem:    A BufEnter autocommand that sets an option stops 'mousefocus' from
            working in Insert mode (Normal mode is OK). (Gregory Seidman)
Solution:   In the Insert mode loop invoke gui_mouse_correct() when needed.
Files:      src/edit.c

Patch 6.2.425
Problem:    Vertical split and command line window: can only drag status line
            above the cmdline window on the righthand side, not lefthand side.
Solution:   Check the status line row instead of the window pointer.
Files:      src/ui.c

Patch 6.2.426
Problem:    A syntax region end match with a matchgroup that includes a line
            break only highlights the last line with matchgroup. (Gary
            Holloway)
Solution:   Also use the line number of the position where the region
            highlighting ends.
```

```
Files:      src/syntax.c

Patch 6.2.427 (extra)
Problem:    When pasting a lot of text in a multi-byte encoding, conversion
            from 'termencoding' to 'encoding' may fail for some characters.
            (Kuang-che Wu)
Solution:   When there is an incomplete byte sequence at the end of the read
            text keep it for the next time.
Files:      src/mbyte.c, src/os_amiga.c, src/os_mswin.c, src/proto/mbyte.pro,
            src/proto/os_mswin.pro, src/ui.c

Patch 6.2.428
Problem:    The X11 clipboard supports the Vim selection for char/line/block
            mode, but since the encoding is not included  can't copy/paste
            between two Vims with a different 'encoding'.
Solution:   Add a new selection format that includes the 'encoding'.  Perform
            conversion when necessary.
Files:      src/gui_gtk_x11.c, src/ui.c, src/vim.h

Patch 6.2.429
Problem:    Unix: glob() doesn't work for a directory with a single quote in
            the name. (Nazri Ramliy)
Solution:   When using the shell to expand, only put double quotes around
            spaces and single quotes, not the whole thing.
Files:      src/os_unix.c

Patch 6.2.430
Problem:    BOM at start of a vim script file is not recognized and causes an
            error message.
Solution:   Detect the BOM and skip over it.  Also fix that after using
            ":scriptencoding" the iconv() file descriptor was not closed
            (memory leak).
Files:      src/ex_cmds2.c

Patch 6.2.431
Problem:    When using the horizontal scrollbar, the scrolling is limited to
            the length of the cursor line.
Solution:   Make the scroll limit depend on the longest visible line.  The
            cursor is moved when necessary.  Including the 'h' flag in
            'guioptions' disables this.
Files:      runtime/doc/gui.txt, runtime/doc/options.txt, src/gui.c,
            src/misc2.c, src/option.h

Patch 6.2.432 (after 6.2.430 and 6.2.431)
Problem:    Lint warnings.
Solution:   Add type casts.
Files:      src/ex_cmds2.c, src/gui.c

Patch 6.2.433
Problem:    Translating "VISUAL" and "BLOCK" separately doesn't give a good
            result. (Alejandro Lopez Valencia)
Solution:   Use a string for each combination.
Files:      src/screen.c
```

```
Patch 6.2.434 (after 6.2.431)
Problem:    Compiler warning. (Salman Halim)
Solution:   Add type casts.
Files:      src/gui.c

Patch 6.2.435
Problem:    When there are vertically split windows the minimal Vim window
            height is computed wrong.
Solution:   Use frame_minheight() to correctly compute the minimal height.
Files:      src/window.c

Patch 6.2.436
Problem:    Running the tests changes the user's viminfo file.
Solution:   In test 49 tell the extra Vim to use the test viminfo file.
Files:      src/testdir/test49.vim

Patch 6.2.437
Problem:    ":mksession" always puts "set nocompatible" in the session file.
            This changes option settings. (Ron Aaron)
Solution:   Add an "if" to only change 'compatible' when needed.
Files:      src/ex_docmd.c

Patch 6.2.438
Problem:    When the 'v' flag is present in 'cpoptions', backspacing and then
            typing text again: one character too much is overtyped before
            inserting is done again.
Solution:   Set "dollar_vcol" to the right column.
Files:      src/edit.c

Patch 6.2.439
Problem:    GTK 2: Changing 'lines' may cause a mismatch between the window
            layout and the size of the window.
Solution:   Disable the hack with force_shell_resize_idle().
Files:      src/gui_gtk_x11.c

Patch 6.2.440
Problem:    When 'lazyredraw' is set the window title is still updated.
            The size of the Visual area and the ruler are displayed too often.
Solution:   Postpone redrawing the window title.  Only show the Visual area
            size when waiting for a character.  Don't draw the ruler
            unnecessary.
Files:      src/buffer.c, src/normal.c, src/screen.c

Patch 6.2.441
Problem:    ":unabbreviate foo " doesn't work, because of the trailing space,
            while an abbreviation with a trailing space is not possible. (Paul
            Jolly)
Solution:   Accept a match with the lhs of an abbreviation without the
            trailing space.
Files:      src/getchar.c

Patch 6.2.442
Problem:    Cannot manipulate the command line from a function.
Solution:   Add getcmdline(), getcmdpos() and setcmdpos() functions and the
```

```
            CTRL-\ e command.
Files:      runtime/doc/cmdline.txt, runtime/doc/eval.txt, src/eval.c
            src/ex_getln.c, src/ops.c, src/proto/ex_getln.pro,
            src/proto/ops.pro

Patch 6.2.443
Problem:    With ":silent! echoerr something" you don't get the position of
            the error.  emsg() only writes the message itself and returns.
Solution:   Also redirect the position of the error.
Files:      src/message.c

Patch 6.2.444
Problem:    When adding the 'c' flag to a ":substitute" command it may replace
            more times than without the 'c' flag.  Happens for a  match that
            starts with "\ze" (Marcel Svitalsk) and when using "\@<=" (Klaus
            Bosau).
Solution:   Correct "prev_matchcol" when replacing the line.  Don't replace
            the line when the pattern uses look-behind matching.
Files:      src/ex_cmds.c, src/proto/regexp.pro, src/regexp.c

Patch 6.2.445
Problem:    Copying vimtutor to /tmp/something is not secure, a symlink may
            cause trouble.
Solution:   Create a directory and create the file in it.  Use "umask" to
            create the directory with mode 700.  (Stefan Nordhausen)
Files:      src/vimtutor

Patch 6.2.446 (after 6.2.404)
Problem:    Using library functions wcwidth() and iswprint() results in
            display problems for Hebrew characters. (Ron Aaron)
Solution:   Disable the code to use the library functions, use our own.
Files:      src/mbyte.c

Patch 6.2.447 (after 6.2.440)
Problem:    Now that the title is only updated when redrawing, it is no longer
            possible to show it while executing a function. (Madoka Machitani)
Solution:   Make ":redraw" also update the title.
Files:      src/ex_docmd.c

Patch 6.2.448 (after 6.2.427)
Problem:    Mac: conversion done when 'termencoding' differs from 'encoding'
            fails when pasting a longer text.
Solution:   Check for an incomplete sequence at the end of the chunk to be
            converted. (Eckehard Berns)
Files:      src/mbyte.c

Patch 6.2.449 (after 6.2.431)
Problem:    Get error messages when switching files.
Solution:   Check for a valid line number when calculating the width of the
            horizontal scrollbar. (Helmut Stiegler)
Files:      src/gui.c

Patch 6.2.450
Problem:    "  #include" and "  #define" are not recognized with the default
```

```
            option values for 'include' and 'defined'. (RG Kiran)
Solution:   Adjust the default values to allow white space before the #.
Files:      runtime/doc/options.txt, src/option.c

Patch 6.2.451
Problem:    GTK: when using XIM there are various problems, including setting
            'modified' and breaking undo at the wrong moment.
Solution:   Add "xim_changed_while_preediting", "preedit_end_col" and
            im_is_preediting(). (Yasuhiro Matsumoto)
Files:      src/ex_getln.c, src/globals.h, src/gui_gtk.c, src/gui_gtk_x11.c,
            src/mbyte.c, src/misc1.c, src/proto/mbyte.pro, src/screen.c,
            src/undo.c

Patch 6.2.452
Problem:    In diff mode, when DiffAdd and DiffText highlight settings are
            equal, an added line is highlighted with DiffChange. (Tom Schumm)
Solution:   Remember the diff highlight type instead of the attributes.
Files:      src/screen.c

Patch 6.2.453
Problem:    ":s/foo\|\nbar/x/g" does not replace two times in "foo\nbar".
            (Pavel Papushev)
Solution:   When the pattern can match a line break also try matching at the
            NUL at the end of a line.
Files:      src/ex_cmds.c, src/regexp.c

Patch 6.2.454
Problem:    ":let b:changedtick" doesn't work. (Alan Schmitt)  ":let
            b:changedtick = 99" does not give an error message.
Solution:   Add code to recognize ":let b:changedtick".
Files:      src/eval.c

Patch 6.2.455 (after 6.2.297)
Problem:    In Python commands the current locale changes how certain Python
            functions work. (Eugene M. Minkovskii)
Solution:   Set the LC_NUMERIC locale to "C" while executing a Python command.
Files:      src/if_python.c

Patch 6.2.456 (extra)
Problem:    Win32: Editing a file by its Unicode name (dropping it on Vim or
            using the file selection dialog) doesn't work. (Yakov Lerner, Alex
            Jakushev)
Solution:   Use wide character functions when file names are involved and
            convert from/to 'encoding' where needed.
Files:      src/gui_w48.c, src/macros.h, src/memfile.c, src/memline.c,
            src/os_mswin.c, src/os_win32.c

Patch 6.2.457 (after 6.2.244)
Problem:    When 'encoding' is "utf-8" and writing text with chars above 0x80
            in latin1, conversion is wrong every 8200 bytes. (Oyvind Holm)
Solution:   Correct the utf_ptr2len_check_len() function and fix the problem
            of displaying 0xf7 in utfc_ptr2len_check_len().
Files:      src/mbyte.c
```

```
Patch 6.2.458
Problem:    When 'virtualedit' is set "$" doesn't move to the end of an
            unprintable character, causing "y$" not to include that character.
            (Fred Ma)
Solution:   Set "coladd" to move the cursor to the end of the character.
Files:      src/misc2.c

Patch 6.2.459 (after 6.2.454)
Problem:    Variable "b" cannot be written. (Salman Halim)
Solution:   Compare strings properly.
Files:      src/eval.c

Patch 6.2.460 (extra, after 6.2.456)
Problem:    Compiler warnings for missing prototypes.
Solution:   Include the missing prototypes.
Files:      src/proto/os_win32.pro

Patch 6.2.461
Problem:    After using a search command "x" starts putting single characters
            in the numbered registers.
Solution:   Reset "use_reg_one" at the right moment.
Files:      src/normal.c

Patch 6.2.462
Problem:    Finding a matching parenthesis does not correctly handle a
            backslash in a trailing byte.
Solution:   Handle multi-byte characters correctly. (Taro Muraoka)
Files:      src/search.c

Patch 6.2.463 (extra)
Problem:    Win32: An NTFS file system may contain files with extra info
            streams.  The current method to copy them creates one and then
            deletes it again.  (Peter Toennies)  Also, only three streams with
            hard coded names are copied.
Solution:   Use BackupRead() to check which info streams the original file
            contains and only copy these streams.
Files:      src/os_win32.c

Patch 6.2.464 (extra, after 6.2.427)
Problem:    Amiga: Compilation error with gcc. (Ali Akcaagac)
Solution:   Move the #ifdef outside of Read().
Files:      src/os_amiga.c

Patch 6.2.465
Problem:    When resizing the GUI window the window manager sometimes moves it
            left of or above the screen. (Michael McCarty)
Solution:   Check the window position after resizing it and move it onto the
            screen when it isn't.
Files:      src/gui.c

Patch 6.2.466 (extra, after 6.2.456)
Problem:    Win32: Compiling with Borland C fails, and an un/signed warning.
Solution:   Redefine wcsicmp() to wcscmpi() and add type casts. (Yasuhiro
            Matsumoto)
```

```
Files:      src/os_win32.c

Patch 6.2.467 (extra, after 6.2.463)
Problem:    Win32: can't compile without multi-byte feature. (Ajit Thakkar)
Solution:   Add #ifdefs around the info stream code.
Files:      src/os_win32.c

Patch 6.2.468
Problem:    Compiler warnings for shadowed variables. (Matthias Mohr)
Solution:   Delete superfluous variables and rename others.
Files:      src/eval.c, src/ex_docmd.c, src/ex_eval.c, src/if_cscope.c,
            src/fold.c, src/option.c, src/os_unix.c, src/quickfix.c,
            src/regexp.c

Patch 6.2.469 (extra, after 6.2.456)
Problem:    Win32: Can't create swap file when 'encoding' differs from the
            active code page. (Kriton Kyrimis)
Solution:   In enc_to_ucs2() terminate the converted string with a NUL
Files:      src/os_mswin.c

Patch 6.2.470
Problem:    The name returned by tempname() may be equal to the file used for
            shell output when ignoring case.
Solution:   Skip 'O' and 'I' in tempname().
Files:      src/eval.c

Patch 6.2.471
Problem:    "-L/usr/lib" is used in the link command, even though it's
            supposed to be filtered out. "-lw" and "-ldl" are not
            automatically added when needed for "-lXmu". (Antonio Colombo)
Solution:   Check for a space after the argument instead of before.  Also
            remove "-R/usr/lib" if it's there.  Check for "-lw" and "-ldl"
            before trying "-lXmu".
Files:      src/auto/configure, src/configure.in, src/link.sh

Patch 6.2.472
Problem:    When using a FileChangedShell autocommand that changes the current
            buffer, a buffer exists that can't be wiped out.
            Also, Vim sometimes crashes when executing an external command
            that changes the buffer and a FileChangedShell autocommand is
            used.  (Hari Krishna Dara)
            Users are confused by the warning for a file being changed outside
            of Vim.
Solution:   Avoid that the window counter for a buffer is incremented twice.
            Avoid that buf_check_timestamp() is used recursively.
            Add a hint to look in the help for more info.
Files:      src/ex_cmds.c, src/fileio.c

Patch 6.2.473
Problem:    Using CTRL-] in a help buffer without a name causes a crash.
Solution:   Check for name to be present before using it. (Taro Muraoka)
Files:      src/tag.c

Patch 6.2.474 (extra, after 6.2.456)
```

```
Problem:    When Vim is starting up conversion is done unnecessarily.  Failure
            to find the runtime files on Windows 98. (Randall W. Morris)
Solution:   Init enc_codepage negative, only use it when not negative.
            Don't use GetFileAttributesW() on Windows 98 or earlier.
Files:      src/globals.h, src/gui_w32.c, src/gui_w48.c, src/os_mswin.c,
            src/os_win32.c

Patch 6.2.475
Problem:    Commands after "perl <<EOF" are parsed as Vim commands when they
            are not executed.
Solution:   Properly skip over the perl commands.
Files:      src/ex_docmd.c, src/ex_getln.c, src/if_perl.xs, src/if_python.c,
            src/if_ruby.c, src/if_tcl.c, src/misc2.c

Patch 6.2.476
Problem:    When reloading a hidden buffer changed outside of Vim and the
            current buffer is read-only, the reloaded buffer becomes
            read-only.  (Hari Krishna Dara)
Solution:   Save the 'readonly' flag of the reloaded buffer instead of the
            current buffer.
Files:      src/fileio.c

Patch 6.2.477
Problem:    Using remote_send(v:servername, "\<C-V>") causes Vim to hang.
            (Yakov Lerner)
Solution:   When the resulting string is empty don't set received_from_client.
Files:      src/main.c

Patch 6.2.478
Problem:    Win32: "--remote file" fails changing directory if the current
            directory name starts with a single quote.  (Iestyn Walters)
Solution:   Add a backslash where it will be removed later.
Files:      src/main.c, src/misc2.c, src/proto/misc2.pro

Patch 6.2.479
Problem:    The error message for errors during recovery goes unnoticed.
Solution:   Avoid that the hit-enter prompt overwrites the message.  Add a few
            lines to make the error stand out.
Files:      src/main.c, src/message.c, src/memline.c

Patch 6.2.480
Problem:    NetBeans: Using negative index in array.  backslash at end of
            message may cause Vim to crash. (Xavier de Gaye)
Solution:   Initialize buf_list_used to zero. Check for trailing backslash.
Files:      src/netbeans.c

Patch 6.2.481
Problem:    When writing a file it is not possible to specify that hard and/or
            symlinks are to be broken instead of preserved.
Solution:   Add the "breaksymlink" and "breakhardlink" values to 'backupcopy'.
            (Simon Ekstrand)
Files:      runtime/doc/options.txt, src/fileio.c, src/option.c, src/option.h

Patch 6.2.482
```

```
Problem:    Repeating insert of CTRL-K 1 S doesn't work.  The superscript 1 is
            considered to be a digit. (Juergen Kraemer)
Solution:   In vim_isdigit() only accept '0' to '9'.  Use VIM_ISDIGIT() for
            speed where possible.  Also add vim_isxdigit().
Files:      src/buffer.c, src/charset.c, src/diff.c, src/digraph.c,
            src/edit.c, src/eval.c,, src/ex_cmds.c, src/ex_cmds2.c,
            src/ex_docmd.c, src/ex_eval.c, src/ex_getln.c,
            src/if_xcmdsrv.c, src/farsi.c, src/fileio.c, src/fold.c,
            src/getchar.c, src/gui.c, src/if_cscope.c, src/macros.h,
            src/main.c, src/mark.c, src/mbyte.c, src/menu.c, src/misc1.c,
            src/misc2.c, src/normal.c, src/ops.c, src/option.c,
            src/proto/charset.pro, src/regexp.c, src/screen.c, src/search.c,
            src/syntax.c, src/tag.c, src/term.c, src/termlib.c

Patch 6.2.483 (extra, after 6.2.482)
Problem:    See 6.2.482.
Solution:   Extra part of patch 6.2.482.
Files:      src/gui_photon.c, src/gui_w48.c, src/os_msdos.c, src/os_mswin.c

Patch 6.2.484
Problem:    MS-Windows: With the included diff.exe, differences after a CTRL-Z
            are not recognized.  (Peter Keresztes)
Solution:   Write the files with unix fileformat and invoke diff with --binary
            if possible.
Files:      src/diff.c

Patch 6.2.485
Problem:    A BufWriteCmd autocommand cannot know if "!" was used or not.
            (Hari Krishna Dara)
Solution:   Add the v:cmdbang variable.
Files:      runtime/doc/eval.txt, src/eval.c, src/proto/eval.pro,
            src/fileio.c, src/vim.h

Patch 6.2.486 (6.2.482)
Problem:    Diff for eval.c is missing.
Solution:   Addition to patch 6.2.482.
Files:      src/eval.c

Patch 6.2.487 (extra, after 6.2.456)
Problem:    Compiler warnings for wrong prototype. (Alejandro Lopez Valencia)
Solution:   Delete the prototype for Handle_WM_Notify().
Files:      src/proto/gui_w32.pro

Patch 6.2.488
Problem:    Missing ")" in *.ch filetype detection.
Solution:   Add the ")".  (Ciaran McCreesh)
Files:      runtime/filetype.vim

Patch 6.2.489
Problem:    When accidentally opening a session in Vim which has already been
            opened in another Vim there is a long row of ATTENTION prompts.
            Need to quit each of them to get out. (Robert Webb)
Solution:   Add the "Abort" alternative to the dialog.
Files:      src/memline.c
```

Patch 6.2.490
Problem: With 'paragraph' it is not possible to use a single dot as a
            paragraph boundary. (Dorai Sitaram)
Solution: Allow using " " (two spaces) in 'paragraph' to match ".$" or
            ". $"
Files: src/search.c

Patch 6.2.491
Problem: Decrementing a position doesn't take care of multi-byte chars.
Solution: Adjust the column for multi-byte characters. Remove mb_dec().
            (Yasuhiro Matsumoto)
Files: src/mbyte.c, src/misc2.c, src/proto/mbyte.pro

Patch 6.2.492
Problem: When using ":redraw" while there is a message, the next ":echo"
            still causes text to scroll. (Yasuhiro Matsumoto)
Solution: Reset msg_didout and msg_col, so that after ":redraw" the next
            message overwrites an existing one.
Files: src/ex_docmd.c

Patch 6.2.493
Problem: "@x" doesn't work when 'insertmode' is set. (Benji Fisher)
Solution: Put "restart_edit" in the typeahead buffer, so that it's used
            after executing the register contents.
Files: src/ops.c

Patch 6.2.494
Problem: Using diff mode with two windows, when moving horizontally in
            inserted lines, a fold in the other window may open.
Solution: Compute the line number in the other window correctly.
Files: src/diff.c

Patch 6.2.495 (extra, after 6.2.456)
Problem: Win32: The file dialog doesn't work on Windows 95.
Solution: Put the wide code of gui_mch_browse() in gui_mch_browseW() and use
            it only on Windows NT/2000/XP.
Files: src/gui_w32.c, src/gui_w48.c

Patch 6.2.496
Problem: FreeBSD 4.x: When compiled with the pthread library (Python) a
            complicated pattern may cause Vim to crash. Catching the signal
            doesn't work.
Solution: When compiled with threads, instead of using the normal stacksize
            limit, use the size of the initial stack.
Files: src/auto/configure, src/config.h.in, src/configure.in,
            src/os_unix.c

Patch 6.2.497 (extra)
Problem: Russian messages are only available in one encoding.
Solution: Convert the messages to MS-Windows codepages. (Vassily Ragosin)
Files: src/po/Makefile

Patch 6.2.498

```
Problem:    Non-latin1 help files are not properly supported.
Solution:   Support utf-8 help files and convert them to 'encoding' when
            needed.
Files:      src/fileio.c

Patch 6.2.499
Problem:    When writing a file and halting the system, the file might be lost
            when using a journaling file system.
Solution:   Use fsync() to flush the file data to disk after writing a file.
            (Radim Kolar)
Files:      src/fileio.c

Patch 6.2.500 (extra)
Problem:    The DOS/MS-Windows the installer doesn't use the --binary flag for
            diff.
Solution:   Add --binary to the diff argument in MyDiff(). (Alejandro Lopez-
            Valencia)
Files:      src/dosinst.c

Patch 6.2.501
Problem:    Vim does not compile with MorphOS.
Solution:   Add a Makefile and a few changes to make Vim work with MorphOS.
            (Ali Akcaagac)
Files:      runtime/doc/os_amiga.txt, src/INSTALLami.txt,
            src/Make_morphos.mak, src/memfile.c, src/term.c

Patch 6.2.502
Problem:    Building fails for generating message files.
Solution:   Add dummy message files.
Files:      src/po/ca.po, src/po/ru.po, src/po/sv.po

Patch 6.2.503
Problem:    Mac: Can't compile MacRoman conversions without the GUI.
Solution:   Also link with the Carbon framework for the terminal version, for
            the MacRoman conversion functions. (Eckehard Berns)
            Remove -ltermcap from the GUI link command, it is not needed.
Files:      src/auto/configure, src/Makefile, src/configure.in

Patch 6.2.504
Problem:    Various problems with 'cindent', among which that a
            list of variable declarations is not indented properly.
Solution:   Fix the wrong indenting.  Improve indenting of C++ methods.
            Add the 'i', 'b' and 'W' options to 'cinoptions'. (mostly by
            Helmut Stiegler)
            Improve indenting of preprocessor-continuation lines.
Files:      runtime/doc/indent.txt, src/misc1.c, src/testdir/test3.in,
            src/testdir/test3.ok

Patch 6.2.505
Problem:    Help for -P argument is missing. (Ronald Hoellwarth)
Solution:   Add the patch that was missing in 6.2.419.
Files:      runtime/doc/starting.txt

Patch 6.2.506 (extra)
```

Problem: Win32: When 'encoding' is a codepage then reading a utf-8 file
            only works when iconv is available. Writing a file in another
            codepage uses the wrong kind of conversion.
Solution: Use internal conversion functions. Enable reading and writing
            files with 'fileencoding' different from 'encoding' for all valid
            codepages and utf-8 without the need for iconv.
Files: src/fileio.c, src/testdir/Make_dos.mak, src/testdir/test52.in,
            src/testdir/test52.ok

Patch 6.2.507
Problem: The ownership of the file with the password for the NetBeans
            connection is not checked. "-nb={file}" doesn't work for GTK.
Solution: Only accept the file when owned by the user and not accessible by
            others. Detect "-nb=" for GTK.
Files: src/netbeans.c, src/gui_gtk_x11.c

Patch 6.2.508
Problem: Win32: "v:lang" does not show the current language for messages if
            it differs from the other locale settings.
Solution: Use the value of the $LC_MESSAGES environment variable.
Files: src/ex_cmds2.c

Patch 6.2.509 (after 6.2.508)
Problem: Crash when $LANG is not set.
Solution: Add check for NULL pointer. (Ron Aaron)
Files: src/ex_cmds2.c

Patch 6.2.510 (after 6.2.507)
Problem: Warning for pointer conversion.
Solution: Add a type cast.
Files: src/gui_gtk_x11.c

Patch 6.2.511
Problem: Tags in Russian help files are in utf-8 encoding, which may be
            different from 'encoding'.
Solution: Use the "TAG_FILE_ENCODING" field in the tags file to specify the
            encoding of the tags. Convert help tags from 'encoding' to the
            tag file encoding when searching for matches, do the reverse when
            listing help tags.
Files: runtime/doc/tagsrch.txt, src/ex_cmds.c, src/tag.c

Patch 6.2.512
Problem: Translating "\"\n" is useless. (Gerfried Fuchs)
Solution: Remove the _() around it.
Files: src/main.c, src/memline.c

Patch 6.2.513 (after 6.2.507)
Problem: NetBeans: the check for owning the connection info file can be
            simplified. (Nikolay Molchanov)
Solution: Only check if the access mode is right.
Files: src/netbeans.c

Patch 6.2.514
Problem: When a highlight/syntax group name contains invalid characters

```
            there is no warning.
Solution:   Add an error for unprintable characters and a warning for other
            invalid characters.
Files:      src/syntax.c

Patch 6.2.515
Problem:    When using the options window 'swapfile' is reset.
Solution:   Use ":setlocal" instead of ":set".
Files:      runtime/optwin.vim

Patch 6.2.516
Problem:    The sign column cannot be seen, looks like there are two spaces
            before the text. (Rob Retter)
Solution:   Add the SignColumn highlight group.
Files:      runtime/doc/options.txt, runtime/doc/sign.txt, src/option.c,
            src/screen.c, src/syntax.c, src/vim.h

Patch 6.2.517
Problem:    Using "r*" in Visual mode on multi-byte characters replaces
            too many characters.  In Visual Block mode replacing with a
            multi-byte character doesn't work.
Solution:   Adjust the operator end for the difference in byte length of the
            original and the replaced character.  Insert all bytes of a
            multi-byte character, take care of double-wide characters.
Files:      src/ops.c

Patch 6.2.518
Problem:    Last line of a window is not updated after using "J" and then "D".
            (Adri Verhoef)
Solution:   When no line is found below a change that doesn't need updating,
            update all lines below the change.
Files:      src/screen.c

Patch 6.2.519
Problem:    Mac: cannot read/write files in MacRoman format.
Solution:   Do internal conversion from/to MacRoman to/from utf-8 and latin1.
            (Eckehard Berns)
Files:      src/fileio.c

Patch 6.2.520 (extra)
Problem:    The NSIS installer is outdated.
Solution:   Make it work with NSIS 2.0.  Also include console executables for
            Win 95/98/ME and Win NT/2000/XP.  Use LZWA compression.  Use
            "/oname" to avoid having to rename files before running NSIS.
Files:      Makefile, nsis/gvim.nsi

Patch 6.2.521
Problem:    When using silent Ex mode the "changing a readonly file" warning
            is omitted but the one second wait isn't. (Yakov Lerner)
Solution:   Skip the delay when "silent_mode" is set.
Files:      src/misc1.c

Patch 6.2.522
Problem:    GUI: when changing 'cmdheight' in the gvimrc file the window
```

```
            layout is messed up. (Keith Dart)
Solution:   Skip updating the window layout when changing 'cmdheight' while
            still starting up.
Files:      src/option.c

Patch 6.2.523
Problem:    When loading a session and aborting when a swap file already
            exists, the user is left with useless windows. (Robert Webb)
Solution:   Load one file before creating the windows.
Files:      src/ex_docmd.c

Patch 6.2.524 (extra, after 6.2.520)
Problem:    Win32: (un)installing gvimext.dll may fail if it was used.
            The desktop and start menu links are created for the current user
            instead of all users.
            Using the home directory as working directory for the links is a
            bad idea for multi-user systems.
            Cannot use Vim from the "Open With..." menu.
Solution:   Force a reboot if necessary. (Alejandro Lopez-Valencia)  Also use
            macros for the directory of the source and runtime files.  Use
            "CSIDL_COMMON_*" instead of "CSIDL_*" when possible.
            Do not specify a working directory in the links.
            Add Vim to the "Open With..." menu. (Giuseppe Bilotta)
Files:      nsis/gvim.nsi, src/dosinst.c, src/dosinst.h, src/uninstal.c

Patch 6.2.525
Problem:    When the history contains a very long line ":history" causes a
            crash. (Volker Kiefel)
Solution:   Shorten the history entry to fit it in one line.
Files:      src/ex_getln.c

Patch 6.2.526
Problem:    When s:lang is "ja" the Japanese menus are not used.
Solution:   Add 'encoding' to the language when there is no charset.
Files:      runtime/menu.vim

Patch 6.2.527
Problem:    The 2html script uses ":wincmd p", which breaks when using some
            autocommands.
Solution:   Remember the window numbers and jump to them with ":wincmd w".
            Also add XHTML support. (Panagiotis Issaris)
Files:      runtime/syntax/2html.vim

Patch 6.2.528
Problem:    NetBeans: Changes of the "~" command are not reported.
Solution:   Call netbeans_inserted() after performing "~". (Gordon Prieur)
            Also change NetBeans debugging to append to the log file.
            Also fix that "~" in Visual block mode changes too much if there
            are multi-byte characters.
Files:      src/nbdebug.c, src/normal.c, src/ops.c

Patch 6.2.529 (extra)
Problem:    VisVim only works for Admin.  Doing it for one user doesn't work.
            (Alexandre Gouraud)
```

```
Solution:   When registering the module fails, simply continue.
Files:      src/VisVim/VisVim.cpp

Patch 6.2.530
Problem:    Warning for missing prototype on the Amiga.
Solution:   Include time.h
Files:      src/version.c

Patch 6.2.531
Problem:    In silent ex mode no messages are given, which makes debugging
            very difficult.
Solution:   Do output messages when 'verbose' is set.
Files:      src/message.c, src/ui.c

Patch 6.2.532 (extra)
Problem:    Compiling for Win32s with VC 4.1 doesn't work.
Solution:   Don't use CP_UTF8 if it's not defined.  Don't use CSIDL_COMMON*
            when not defined.
Files:      src/dosinst.h, src/fileio.c

Win32 console: After patch 6.2.398 Ex mode did not work. (Yasuhiro Matsumoto)

Patch 6.3a.001
Problem:    Win32: if testing for the "--binary" option fails, diff isn't used
            at all.
Solution:   Handle the "ok" flag properly. (Yasuhiro Matsumoto)
Files:      src/diff.c

Patch 6.3a.002
Problem:    NetBeans: An insert command from NetBeans beyond the end of a
            buffer crashes Vim. (Xavier de Gaye)
Solution:   Use a local pos_T structure for the position.
Files:      src/netbeans.c

Patch 6.3a.003
Problem:    E315 error with auto-formatting comments. (Henry Van Roessel)
Solution:   Pass the line number to same_leader().
Files:      src/ops.c

Patch 6.3a.004
Problem:    Test32 fails on Windows XP for the DJGPP version.  Renaming
            test11.out fails.
Solution:   Don't try renaming, create new files to use for the test.
Files:      src/testdir/test32.in, src/testdir/test32.ok

Patch 6.3a.005
Problem:    ":checkpath!" does not use 'includeexpr'.
Solution:   Use a file name that was found directly.  When a file was not
            found and the located name is empty, use the rest of the line.
Files:      src/search.c

Patch 6.3a.006
Problem:    "yip" moves the cursor to the first yanked line, but not to the
            first column.  Looks like not all text was yanked. (Jens Paulus)
```

```
Solution:   Move the cursor to the first column.
Files:      src/search.c

Patch 6.3a.007
Problem:    'cindent' recognizes "enum" but not "typedef enum".
Solution:   Skip over "typedef" before checking for "enum". (Helmut Stiegler)
            Also avoid that searching for this item goes too far back.
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 6.3a.008 (extra)
Problem:    Windows 98: Some of the wide functions are not implemented,
            resulting in file I/O to fail.  This depends on what Unicode
            support is installed.
Solution:   Handle the failure and fall back to non-wide functions.
Files:      src/os_win32.c

Patch 6.3a.009
Problem:    Win32: Completion of filenames does not work properly when
            'encoding' differs from the active code page.
Solution:   Use wide functions for expanding wildcards when appropriate.
Files:      src/misc1.c

Patch 6.3a.010 (extra)
Problem:    Win32: Characters in the window title that do not appear in the
            active codepage are replaced by a question mark.
Solution:   Use DefWindowProcW() instead of DefWindowProc() when possible.
Files:      src/glbl_ime.cpp, src/globals.h, src/proto/gui_w16.pro,
            src/proto/gui_w32.pro, src/gui_w16.c, src/gui_w32.c, src/gui_w48.c

Patch 6.3a.011
Problem:    Using the explorer plugin changes a local directory to the global
            directory.
Solution:   Don't use ":chdir" to restore the current directory.  Make
            "expand('%:p')" remove "/../" and "/./" items from the path.
Files:      runtime/plugin/explorer.vim, src/eval.c, src/os_unix.c

Patch 6.3a.012 (extra)
Problem:    On Windows 98 the installer doesn't work, don't even get the "I
            agree" button.  The check for the path ending in "vim" makes the
            browse dialog hard to use.  The default path when no previous Vim
            is installed is "c:\vim" instead of "c:\Program Files\Vim".
Solution:   Remove the background gradient command.  Change the
            .onVerifyInstDir function to a leave function for the directory
            page.  Don't let the install program default to c:\vim when no
            path could be found.
Files:      nsis/gvim.nsi, src/dosinst.c

Patch 6.3a.013 (extra)
Problem:    Win32: Characters in the menu that are not in the active codepage
            are garbled.
Solution:   Convert menu strings from 'encoding' to the active codepage.
Files:      src/gui_w32.c, src/gui_w48.c

Patch 6.3a.014
```

```
Problem:    Using multi-byte text and highlighting in a statusline causes gaps
            to appear. (Helmut Stiegler)
Solution:   Advance the column by text width instead of number of bytes.  Add
            the vim_strnsize() function.
Files:      src/charset.c, src/proto/charset.pro, src/screen.c

Patch 6.3a.015
Problem:    Using the "select all" menu item when 'insertmode' is set and
            clicking the mouse button doesn't return to Insert mode.  The
            Buffers/Delete menu doesn't offer a choice to abandon a changed
            buffer.  (Jens Paulus)
Solution:   Don't use CTRL-\ CTRL-N.  Add ":confirm" for the Buffers menu
            items.
Files:      runtime/menu.vim

Patch 6.3a.016
Problem:    After cancelling the ":confirm" dialog the error message and
            hit-enter prompt may not be displayed properly.
Solution:   Flush output after showing the dialog.
Files:      src/message.c

Patch 6.3a.017
Problem:    servername() doesn't work when Vim was started with the "-X"
            argument or when the "exclude" in 'clipboard' matches the terminal
            name.  (Robert Nowotniak)
Solution:   Force connecting to the X server when using client-server
            commands.
Files:      src/eval.c, src/globals.h, src/os_unix.c

Patch 6.3a.018 (after 6.3a.017)
Problem:    Compiler warning for return value of make_connection().
Solution:   Use void return type.
Files:      src/eval.c

Patch 6.3a.019 (extra)
Problem:    Win32: typing non-latin1 characters doesn't work.
Solution:   Invoke _OnChar() directly to avoid that the argument is truncated
            to a byte.  Convert the UTF-16 character to bytes according to
            'encoding' and ignore 'termencoding'.  Same for _OnSysChar().
Files:      src/gui_w32.c, src/gui_w48.c

Patch 6.3a.020 (extra)
Problem:    Missing support for AROS (AmigaOS reimplementation).  Amiga GUI
            doesn't work.
Solution:   Add AROS support.  (Adam Chodorowski)
            Fix Amiga GUI problems. (Georg Steger, Ali Akcaagac)
Files:      Makefile, src/Make_aros.mak, src/gui_amiga.c, src/gui_amiga.h,
            src/memfile.c, src/os_amiga.c, src/term.c

Patch 6.3a.021 (after 6.3a.017)
Problem:    Can't compile with X11 but without GUI.
Solution:   Put use of "gui.in_use" inside an #ifdef.
Files:      src/eval.c
```

Patch 6.3a.022
Problem: When typing Tabs when 'softtabstop' is used and 'list' is set a
            tab is counted for two spaces.
Solution: Use the "L" flag in 'cpoptions' to tell whether a tab is counted
            as two spaces or as 'tabstop'. (Antony Scriven)
Files: runtime/doc/options.txt, src/edit.c

Patch 6.3a.023
Problem: Completion on the command line doesn't handle backslashes
            properly. Only the tail of matches is shown, even when not
            completing filenames.
Solution: When turning the string into a pattern double backslashes. Don't
            omit the path when not expanding files or directories.
Files: src/ex_getln.c

Patch 6.3a.024
Problem: The "save all" toolbar item fails for buffers that don't have a
            name. When using ":wa" or closing the Vim window and there are
            nameless buffers, browsing for a name may cause the name being
            given to the wrong buffer or not stored properly. ":browse" only
            worked for one file.
Solution: Use ":confirm browse" for "save all".
            Pass buffer argument to setfname(). Restore "browse" flag and
            "forceit" after doing the work for one file.
Files: runtime/menu.vim, src/buffer.c, src/ex_cmds.c, src/ex_cmds2.c,
            src/ex_docmd.c, src/ex_getln.c, src/fileio.c, src/memline.c,
            src/message.c, src/window.c, src/proto/buffer.pro,
            src/proto/ex_cmds2.pro, src/proto/memline.pro

Patch 6.3a.025
Problem: Setting 'virtualedit' moves the cursor. (Benji Fisher)
Solution: Update the virtual column before using it.
Files: src/option.c

Patch 6.3a.026 (extra, after 6.3a.008)
Problem: Editing files on Windows 98 doesn't work when 'encoding' is
            "utf-8" (Antoine Mechelynck)
            Warning for missing function prototype.
Solution: For all wide functions check if it failed because it is not
            implemented. Use ANSI function declaration for char_to_string().
Files: src/gui_w48.c, src/os_mswin.c, src/os_win32.c

Patch 6.3a.027 (extra, after 6.3a.026)
Problem: Compiler warning for function argument.
Solution: Declare both char and WCHAR arrays.
Files: src/gui_w48.c

Patch 6.3a.028
Problem: ":normal ." doesn't work inside a function, because redo is saved
            and restored. (Benji Fisher)
Solution: Make a copy of the redo buffer when executing a function.
Files: src/getchar.c

Patch 6.3b.001 (extra)

```
Problem:    Bcc 5: The generated auto/pathdef can't be compiled.
Solution:   Fix the way quotes and backslashes are escaped.
Files:      src/Make_bc5.mak

Patch 6.3b.002
Problem:    Win32: conversion during file write fails when a double-byte
            character is split over two writes.
Solution:   Fix the conversion retry without a trailing byte. (Taro Muraoka)
Files:      src/fileio.c

Patch 6.3b.003 (extra)
Problem:    Win32: When compiling with Borland C 5.5 and 'encoding' is "utf-8"
            then Vim can't open files under MS-Windows 98. (Antoine J.
            Mechelynck)
Solution:   Don't use _wstat(), _wopen() and _wfopen() in this situation.
Files:      src/os_mswin.c, src/os_win32.c

Patch 6.3b.004
Problem:    ":helpgrep" includes a trailing CR in the text line.
Solution:   Remove the CR.
Files:      src/quickfix.c

Patch 6.3b.005
Problem:    ":echo &g:ai" results in the local option value. (Salman Halim)
Solution:   Pass the flags from find_option_end() to get_option_value().
Files:      src/eval.c

Patch 6.3b.006
Problem:    When using "mswin.vim", CTRL-V in Insert mode leaves cursor before
            last pasted character.  (Mathew Davis)
Solution:   Use the same Paste() function as in menu.vim.
Files:      runtime/mswin.vim

Patch 6.3b.007
Problem:    Session file doesn't restore view on windows properly. (Robert
            Webb)
Solution:   Restore window sizes both before and after restoring the view, so
            that the view, cursor position and size are restored properly.
Files:      src/ex_docmd.c

Patch 6.3b.008
Problem:    Using ":finally" in a user command doesn't always work. (Hari
            Krishna Dara)
Solution:   Don't assume that using getexline() means the command was typed.
Files:      src/ex_docmd.c

Patch 6.3b.009 (extra)
Problem:    Win32: When the -P argument is not found in a window title, there
            is no error message.
Solution:   When the window can't be found give an error message and exit.
            Also use try/except to catch failing to open the MDI window.
            (Michael Wookey)
Files:      src/gui_w32.c
```

```
Patch 6.3b.010
Problem:    Win32: Using the "-D" argument and expanding arguments may cause a
            hang, because the terminal isn't initialized yet. (Vince Negri)
Solution:   Don't go into debug mode before the terminal is initialized.
Files:      src/main.c

Patch 6.3b.011
Problem:    Using CTRL-\ e while obtaining an expression aborts the command
            line. (Hari Krishna Dara)
Solution:   Insert the CTRL-\ e as typed.
Files:      src/ex_getln.c

Patch 6.3b.012 (after 6.3b.010)
Problem:    Can't compile with tiny features. (Norbert Tretkowski)
Solution:   Add #ifdefs.
Files:      src/main.c

Patch 6.3b.013
Problem:    Loading a session file results in editing the wrong file in the
            first window when this is not the file at the current position in
            the argument list. (Robert Webb)
Solution:   Check w_arg_idx_invalid to decide whether to edit a file.
Files:      src/ex_docmd.c

Patch 6.3b.014
Problem:    ":runtime! foo*.vim" may using freed memory when a sourced script
            changes the value of 'runtimepath'.
Solution:   Make a copy of 'runtimepath' when looping over the matches.
Files:      src/ex_cmds2.c

Patch 6.3b.015
Problem:    Get lalloc(0) error when using "p" in Visual mode while
            'clipboard' contains "autoselect,unnamed". (Mark Wagonner)
Solution:   Avoid allocating zero bytes.  Obtain the clipboard when necessary.
Files:      src/ops.c

Patch 6.3b.016
Problem:    When 'virtualedit' is used "x" doesn't delete the last character
            of a line that has as many characters as 'columns'. (Yakov Lerner)
Solution:   When the cursor isn't moved let oneright() return FAIL.
Files:      src/edit.c

Patch 6.3b.017
Problem:    Win32: "vim --remote-wait" doesn't exit when the server finished
            editing the file. (David Fishburn)
Solution:   In the rrhelper plugin change backslashes to forward slashes and
            escape special characters.
Files:      runtime/plugin/rrhelper.vim

Patch 6.3b.018
Problem:    The list of help files in the "local additions" table doesn't
            recognize utf-8 encoding. (Yasuhiro Matsumoto)
Solution:   Recognize utf-8 characters.
Files:      src/ex_cmds.c
```

```
Patch 6.3b.019
Problem:    When $VIMRUNTIME is not a full path name the "local additions"
            table lists all the help files.
Solution:   Use fullpathcmp() instead of fnamecmp() to compare the directory
            names.
Files:      src/ex_cmds.c

Patch 6.3b.020
Problem:    When using CTRL-^ when entering a search string, the item in the
            statusline that indicates the keymap is not updated. (Ilya
            Dogolazky)
Solution:   Mark the statuslines for updating.
Files:      src/ex_getln.c

Patch 6.3b.021
Problem:    The swapfile is not readable for others, the ATTENTION prompt does
            not show all info when someone else is editing the same file.
            (Marcel Svitalsky)
Solution:   Use the protection of original file for the swapfile and set it
            after creating the swapfile.
Files:      src/fileio.c

Patch 6.3b.022
Problem:    Using "4v" to select four times the old Visual area may put the
            cursor beyond the end of the line. (Jens Paulus)
Solution:   Correct the cursor column.
Files:      src/normal.c

Patch 6.3b.023
Problem:    When "3dip" starts in an empty line, white lines after the
            non-white lines are not deleted. (Jens Paulus)
Solution:   Include the white lines.
Files:      src/search.c

Patch 6.3b.024
Problem:    "2daw" does not delete leading white space like "daw" does.  (Jens
            Paulus)
Solution:   Include the white space when a count is used.
Files:      src/search.c

Patch 6.3b.025
Problem:    Percentage in ruler isn't updated when a line is deleted. (Jens
            Paulus)
Solution:   Check for a change in line count when deciding to update the ruler.
Files:      src/screen.c, src/structs.h

Patch 6.3b.026
Problem:    When selecting "abort" at the ATTENTION prompt for a file that is
            already being edited Vim crashes.
Solution:   Don't abort creating a new buffer when we really need it.
Files:      src/buffer.c, src/vim.h

Patch 6.3b.027
```

```
Problem:    Win32: When enabling the menu in a maximized window, Vim uses more
            lines than what is room for. (Shizhu Pan)
Solution:   When deciding to call shell_resized(), also compare the text area
            size with Rows and Columns, not just with screen_Rows and
            screen_Columns.
Files:      src/gui.c

Patch 6.3b.028
Problem:    When in diff mode, setting 'rightleft' causes a crash. (Eddine)
Solution:   Check for last column differently when 'rightleft' is set.
Files:      src/screen.c

Patch 6.3b.029
Problem:    Win32: warning for uninitialized variable.
Solution:   Initialize to zero.
Files:      src/misc1.c

Patch 6.3b.030
Problem:    After Visually selecting four characters, changing it to other
            text, Visually selecting and yanking two characters: "." changes
            four characters, another "." changes two characters. (Robert Webb)
Solution:   Don't store the size of the Visual area when redo is active.
Files:      src/normal.c

==============================================================================
VERSION 6.4                                                  version-6.4

This section is about improvements made between version 6.3 and 6.4.

This is a bug-fix release.  There are also a few new features.  The major
number of new items is in the runtime files and translations.

The big MS-Windows version now uses:
        Ruby version 1.8.3
        Perl version 5.8.7
        Python version 2.4.2

Changed                                                      changed-6.4
-------

Removed runtime/tools/tcltags, Exuberant ctags does it better.

Added                                                        added-6.4
-----

Alsaconf syntax file (Nikolai Weibull)
Eruby syntax, indent, compiler and ftplugin file (Doug Kearns)
Esterel syntax file (Maurizio Tranchero)
Mathematica indent file (Steve Layland)
Netrc syntax file (Nikolai Weibull)
PHP compiler file (Doug Kearns)
Pascal indent file (Neil Carter)
```

Prescribe syntax file (Klaus Muth)
Rubyunit compiler file (Doug Kearns)
SMTPrc syntax file (Kornel Kielczewski)
Sudoers syntax file (Nikolai Weibull)
TPP syntax file (Gerfried Fuchs)
VHDL ftplugin file (R. Shankar)
Verilog-AMS syntax file (S. Myles Prather)

Bulgarian keymap (Alberto Mardegan)
Canadian keymap (Eric Joanis)

Hungarian menu translations in UTF-8 (Kantra Gergely)
Ukrainian menu translations (Bohdan Vlasyuk)

Irish message translations (Kevin Patrick Scannell)

Configure also checks for tclsh8.4.

Fixed fixed-6.4

"dFxd;" deleted the character under the cursor, "d;" didn't remember the
exclusiveness of the motion.

When using "set laststatus=2 cmdheight=2" in the .gvimrc you may only get one
line for the cmdline. (Christian Robinson) Invoke command_height() after the
GUI has started up.

Gcc would warn "dereferencing type-punned pointer will break strict -aliasing
rules". Avoid using typecasts for variable pointers.

Gcc 3.x interprets the -MM argument differently. Change "-I /path" to
"-isystem /path" for "make depend".

Patch 6.3.001
Problem: ":browse split" gives the file selection dialog twice. (Gordon
            Bazeley) Same problem for ":browse diffpatch".
Solution: Reset cmdmod.browse before calling do_ecmd().
Files: src/diff.c, src/ex_docmd.c

Patch 6.3.002
Problem: When using translated help files with non-ASCII latin1 characters
            in the first line the utf-8 detection is wrong.
Solution: Properly detect utf-8 characters. When a mix of encodings is
            detected continue with the next language and avoid a "no matches"
            error because of "got_int" being set. Add the directory name to
            the error message for a duplicate tag.
Files: src/ex_cmds.c

Patch 6.3.003
Problem: Crash when using a console dialog and the first choice does not
            have a default button. (Darin Ohashi)

```
Solution:   Allocate two more characters for the [] around the character for
            the default choice.
Files:      src/message.c

Patch 6.3.004
Problem:    When searching for a long string (140 chars in a 80 column
            terminal) get three hit-enter prompts. (Robert Webb)
Solution:   Avoid the hit-enter prompt when giving the message for wrapping
            around the end of the buffer.  Don't give that message again when
            the string was not found.
Files:      src/message.c, src/search.c

Patch 6.3.005
Problem:    Crash when searching for a pattern with a character offset and
            starting in a closed fold. (Frank Butler)
Solution:   Check for the column to be past the end of the line.  Also fix
            that a pattern with a character offset relative to the end isn't
            read back from the viminfo properly.
Files:      src/search.c

Patch 6.3.006
Problem:    ":breakadd file *foo" prepends the current directory to the file
            pattern. (Hari Krishna Dara)
Solution:   Keep the pattern as-is.
Files:      src/ex_cmds2.c

Patch 6.3.007
Problem:    When there is a buffer with 'buftype' set to "nofile" and using a
            ":cd" command, the swap file is not deleted when exiting.
Solution:   Use the full path of the swap file also for "nofile" buffers.
Files:      src/fileio.c

Patch 6.3.008
Problem:    Compiling fails under OS/2.
Solution:   Include "e_screenmode" also for OS/2. (David Sanders)
Files:      src/globals.h

Patch 6.3.009 (after 6.3.006)
Problem:    ":breakadd file /path/foo.vim" does not match when a symbolic link
            is involved.  (Servatius Brandt)
Solution:   Do expand the pattern when it does not start with "*".
Files:      runtime/doc/repeat.txt, src/ex_cmds2.c

Patch 6.3.010
Problem:    When writing to a named pipe there is an error for fsync()
            failing.
Solution:   Ignore the fsync() error for devices.
Files:      src/fileio.c

Patch 6.3.011
Problem:    Crash when the completion function of a user-command uses a
            "normal :cmd" command.  (Hari Krishna Dara)
Solution:   Save the command line when invoking the completion function.
Files:      src/ex_getln.c
```

```
Patch 6.3.012
Problem:    Internal lalloc(0) error when using a complicated multi-line
            pattern in a substitute command. (Luc Hermitte)
Solution:   Avoid going past the end of a line.
Files:      src/ex_cmds.c

Patch 6.3.013
Problem:    Crash when editing a command line and typing CTRL-R = to evaluate
            a function that uses "normal :cmd". (Hari Krishna Dara)
Solution:   Save and restore the command line when evaluating an expression
            for CTRL-R =.
Files:      src/ex_getln.c, src/ops.c, src/proto/ex_getln.pro,
            src/proto/ops.pro

Patch 6.3.014
Problem:    When using Chinese or Taiwanese the default for 'helplang' is
            wrong. (Simon Liang)
Solution:   Use the part of the locale name after "zh_".
Files:      src/option.c

Patch 6.3.015
Problem:    The string that winrestcmd() returns may end in garbage.
Solution:   NUL-terminate the string. (Walter Briscoe)
Files:      src/eval.c

Patch 6.3.016
Problem:    The default value for 'define' has "\s" before '#'.
Solution:   Add a star after "\s". (Herculano de Lima Einloft Neto)
Files:      src/option.c

Patch 6.3.017
Problem:    "8zz" may leave the cursor beyond the end of the line. (Niko
            Maatjes)
Solution:   Correct the cursor column after moving to another line.
Files:      src/normal.c

Patch 6.3.018
Problem:    ":0argadd zero" added the argument after the first one, instead of
            before it. (Adri Verhoef)
Solution:   Accept a zero range for ":argadd".
Files:      src/ex_cmds.h

Patch 6.3.019
Problem:    Crash in startup for debug version. (David Rennals)
Solution:   Move the call to nbdebug_wait() to after allocating NameBuff.
Files:      src/main.c

Patch 6.3.020
Problem:    When 'encoding' is "utf-8" and 'delcombine' is set, "dw" does not
            delete a word but only a combining character of the first
            character, if there is one. (Raphael Finkel)
Solution:   Correctly check that one character is being deleted.
Files:      src/misc1.c
```

Patch 6.3.021
Problem: When the last character of a file name is a multi-byte character
            and the last byte is a path separator, the file cannot be edited.
Solution: Check for the last byte to be part of a multi-byte character.
            (Taro Muraoka)
Files: src/fileio.c

Patch 6.3.022 (extra)
Problem: Win32: When the last character of a file name is a multi-byte
            character and the last byte is a path separator, the file cannot
            be written. A trail byte that is a space makes that a file cannot
            be opened from the command line.
Solution: Recognize double-byte characters when parsing the command line.
            In mch_stat() check for the last byte to be part of a multi-byte
            character. (Taro Muraoka)
Files: src/gui_w48.c, src/os_mswin.c

Patch 6.3.023
Problem: When the "to" part of a mapping starts with its "from" part,
            abbreviations for the same characters is not possible. For
            example, when <Space> is mapped to something that starts with a
            space, typing <Space> does not expand abbreviations.
Solution: Only disable expanding abbreviations when a mapping is not
            remapped, don't disable it when the RHS of a mapping starts with
            the LHS.
Files: src/getchar.c, src/vim.h

Patch 6.3.024
Problem: In a few places a string in allocated memory is not terminated
            with a NUL.
Solution: Add ga_append(NUL) in script_get(), gui_do_findrepl() and
            serverGetVimNames().
Files: src/ex_getln.c, src/gui.c, src/if_xcmdsrv.c, src/os_mswin.c

Patch 6.3.025 (extra)
Problem: Missing NUL for list of server names.
Solution: Add ga_append(NUL) in serverGetVimNames().
Files: src/os_mswin.c

Patch 6.3.026
Problem: When ~/.vim/after/syntax/syncolor.vim contains a command that
            reloads the colors an endless loop and/or a crash may occur.
Solution: Only free the old value of an option when it was originally
            allocated. Limit recursiveness of init_highlight() to 5 levels.
Files: src/option.c, src/syntax.c

Patch 6.3.027
Problem: VMS: Writing a file may insert extra CR characters. Not all
            terminals are recognized correctly. Vt320 doesn't support colors.
            Environment variables are not expanded correctly.
Solution: Use another method to write files. Add vt320 termcap codes for
            colors. (Zoltan Arpadffy)
Files: src/fileio.c, src/misc1.c, src/os_unix.c, src/structs.h,

```
            src/term.c

Patch 6.3.028
Problem:    When appending to a file the BOM marker may be written.  (Alex
            Jakushev)
Solution:   Do not write the BOM marker when appending.
Files:      src/fileio.c

Patch 6.3.029
Problem:    Crash when inserting a line break. (Walter Briscoe)
Solution:   In the syntax highlighting code, don't use an old state after a
            change was made, current_col may be past the end of the line.
Files:      src/syntax.c

Patch 6.3.030
Problem:    GTK 2: Crash when sourcing a script that deletes the menus, sets
            'encoding' to "utf-8" and loads the menus again.  GTK error
            message when tooltip text is in a wrong encoding.
Solution:   Don't copy characters from the old screen to the new screen when
            switching 'encoding' to utf-8, they may be invalid.  Only set the
            tooltip when it is valid utf-8.
Files:      src/gui_gtk.c, src/mbyte.c, src/proto/mbyte.pro, src/screen.c

Patch 6.3.031
Problem:    When entering a mapping and pressing Tab halfway the command line
            isn't redrawn properly. (Adri Verhoef)
Solution:   Reposition the cursor after drawing over the "..." of the
            completion attempt.
Files:      src/ex_getln.c

Patch 6.3.032
Problem:    Using Python 2.3 with threads doesn't work properly.
Solution:   Release the lock after initialization.
Files:      src/if_python.c

Patch 6.3.033
Problem:    When a mapping ends in a Normal mode command of more than one
            character Vim doesn't return to Insert mode.
Solution:   Check that the mapping has ended after obtaining all characters of
            the Normal mode command.
Files:      src/normal.c

Patch 6.3.034
Problem:    VMS: crash when using ":help".
Solution:   Avoid using "tags-??", some Open VMS systems can't handle the "?"
            wildcard.  (Zoltan Arpadffy)
Files:      src/tag.c

Patch 6.3.035 (extra)
Problem:    RISC OS: Compile errors.
Solution:   Change e_screnmode to e_screenmode.  Change the way
            __riscosify_control is set.  Improve the makefile.  (Andy Wingate)
Files:      src/os_riscos.c, src/search.c, src/Make_ro.mak
```

```
Patch 6.3.036
Problem:    ml_get errors when the whole file is a fold, switching
            'foldmethod' and doing "zj". (Christian J. Robinson) Was not
            deleting the fold but creating a fold with zero lines.
Solution:   Delete the fold properly.
Files:      src/fold.c

Patch 6.3.037 (after 6.3.032)
Problem:    Warning for unused variable.
Solution:   Change the #ifdefs for the saved thread stuff.
Files:      src/if_python.c

Patch 6.3.038 (extra)
Problem:    Win32: When the "file changed" dialog pops up after a click that
            gives gvim focus and not moving the mouse after that, the effect
            of the click may occur when moving the mouse later. (Ken Clark)
            Happened because the release event was missed.
Solution:   Clear the s_button_pending variable when any input is received.
Files:      src/gui_w48.c

Patch 6.3.039
Problem:    When 'number' is set and inserting lines just above the first
            displayed line (in another window on the same buffer), the line
            numbers are not updated.  (Hitier Sylvain)
Solution:   When 'number' is set and lines are inserted/deleted redraw all
            lines below the change.
Files:      src/screen.c

Patch 6.3.040
Problem:    Error handling does not always work properly and may cause a
            buffer to be marked as if it's viewed in a window while it isn't.
            Also when selecting "Abort" at the attention prompt.
Solution:   Add enter_cleanup() and leave_cleanup() functions to move
            saving/restoring things for error handling to one place.
            Clear a buffer read error when it's unloaded.
Files:      src/buffer.c, src/ex_docmd.c, src/ex_eval.c,
            src/proto/ex_eval.pro, src/structs.h, src/vim.h

Patch 6.3.041 (extra)
Problem:    Win32: When the path to a file has Russian characters, ":cd %:p:h"
            doesn't work. (Valery Kondakoff)
Solution:   Use a wide function to change directory.
Files:      src/os_mswin.c

Patch 6.3.042
Problem:    When there is a closed fold at the top of the window, CTRL-X
            CTRL-E in Insert mode reduces the size of the fold instead of
            scrolling the text up. (Gautam)
Solution:   Scroll over the closed fold.
Files:      src/move.c

Patch 6.3.043
Problem:    'hlsearch' highlighting sometimes disappears when inserting text
            in PHP code with syntax highlighting. (Marcel Svitalsky)
```

```
Solution:   Don't use pointers to remember where a match was found, use an
            index.  The pointers may become invalid when searching in other
            lines.
Files:      src/screen.c

Patch 6.3.044 (extra)
Problem:    Mac: When 'linespace' is non-zero the Insert mode cursor leaves
            pixels behind. (Richard Sandilands)
Solution:   Erase the character cell before drawing the text when needed.
Files:      src/gui_mac.c

Patch 6.3.045
Problem:    Unusual characters in an option value may cause unexpected
            behavior, especially for a modeline. (Ciaran McCreesh)
Solution:   Don't allow setting termcap options or 'printdevice' in a
            modeline.  Don't list options for "termcap" and "all" in a
            modeline.  Don't allow unusual characters in 'filetype', 'syntax',
            'backupext', 'keymap', 'patchmode' and 'langmenu'.
Files:      src/option.c, runtime/doc/options.txt

Patch 6.3.046
Problem:    ":registers" doesn't show multi-byte characters properly.
            (Valery Kondakoff)
Solution:   Get the length of each character before displaying it.
Files:      src/ops.c

Patch 6.3.047 (extra)
Problem:    Win32 with Borland C 5.5 on Windows XP: A new file is created with
            read-only attributes. (Tony Mechelynck)
Solution:   Don't use the _wopen() function for Borland.
Files:      src/os_win32.c

Patch 6.3.048 (extra)
Problem:    Build problems with VMS on IA64.
Solution:   Add dependencies to the build file. (Zoltan Arpadffy)
Files:      src/Make_vms.mms

Patch 6.3.049 (after 6.3.045)
Problem:    Compiler warning for "char" vs "char_u" mixup. (Zoltan Arpadffy)
Solution:   Add a typecast.
Files:      src/option.c

Patch 6.3.050
Problem:    When SIGHUP is received while busy exiting, non-reentrant
            functions such as free() may cause a crash.
Solution:   Ignore SIGHUP when exiting because of an error. (Scott Anderson)
Files:      src/misc1.c, src/main.c

Patch 6.3.051
Problem:    When 'wildmenu' is set and completed file names contain multi-byte
            characters Vim may crash.
Solution:   Reserve room for multi-byte characters. (Yasuhiro Matsumoto)
Files:      src/screen.c
```

```
Patch 6.3.052 (extra)
Problem:    Windows 98: typed keys that are not ASCII may not work properly.
            For example with a Russian input method. (Jiri Jezdinsky)
Solution:   Assume that the characters arrive in the current codepage instead
            of UCS-2.  Perform conversion based on that.
Files:      src/gui_w48.c

Patch 6.3.053
Problem:    Win32: ":loadview" cannot find a file with non-ASCII characters.
            (Valerie Kondakoff)
Solution:   Use mch_open() instead of open() to open the file.
Files:      src/ex_cmds2.c

Patch 6.3.054
Problem:    When 'insertmode' is set <C-L>4ixxx<C-L> hangs Vim. (Jens Paulus)
            Vim is actually still working but redraw is disabled.
Solution:   When stopping Insert mode with CTRL-L don't put an Esc in the redo
            buffer but a CTRL-L.
Files:      src/edit.c

Patch 6.3.055 (after 6.3.013)
Problem:    Can't use getcmdline(), getcmdpos() or setcmdpos() with <C-R>=
            when editing a command line.  Using <C-\>e may crash Vim. (Peter
            Winters)
Solution:   When moving ccline out of the way for recursive use, make it
            available to the functions that need it.  Also save and restore
            ccline when calling get_expr_line().  Make ccline.cmdbuf NULL at
            the end of getcmdline().
Files:      src/ex_getln.c

Patch 6.3.056
Problem:    The last characters of a multi-byte file name may not be displayed
            in the window title.
Solution:   Avoid to remove a multi-byte character where the last byte looks
            like a path separator character. (Yasuhiro Matsumoto)
Files:      src/buffer.c, src/ex_getln.c

Patch 6.3.057
Problem:    When filtering lines folds are not updated. (Carl Osterwisch)
Solution:   Update folds for filtered lines.
Files:      src/ex_cmds.c

Patch 6.3.058
Problem:    When 'foldcolumn' is equal to the window width and 'wrap' is on
            Vim may crash.  Disabling the vertical split feature breaks
            compiling.  (Peter Winters)
Solution:   Check for zero room for wrapped text.  Make compiling without
            vertical splits possible.
Files:      src/move.c, src/quickfix.c, src/screen.c, src/netbeans.c

Patch 6.3.059
Problem:    Crash when expanding an ":edit" command containing several spaces
            with the shell. (Brian Hirt)
```

```
Solution:   Allocate enough space for the quotes.
Files:      src/os_unix.c

Patch 6.3.060
Problem:    Using CTRL-R CTRL-O in Insert mode with an invalid register name
            still causes something to be inserted.
Solution:   Check the register name for being valid.
Files:      src/edit.c

Patch 6.3.061
Problem:    When editing a utf-8 file in an utf-8 xterm and there is a
            multi-byte character in the last column, displaying is messed up.
            (Joël Rio)
Solution:   Check for a multi-byte character, not a multi-column character.
Files:      src/screen.c

Patch 6.3.062
Problem:    ":normal! gQ" hangs.
Solution:   Quit getcmdline() and do_exmode() when out of typeahead.
Files:      src/ex_getln.c, src/ex_docmd.c

Patch 6.3.063
Problem:    When a CursorHold autocommand changes to another window
            (temporarily) 'mousefocus' stops working.
Solution:   Call gui_mouse_correct() after triggering CursorHold.
Files:      src/gui.c

Patch 6.3.064
Problem:    line2byte(line("$") + 1) sometimes returns the wrong number.
            (Charles Campbell)
Solution:   Flush the cached line before counting the bytes.
Files:      src/memline.c

Patch 6.3.065
Problem:    The euro digraph doesn't always work.
Solution:   Add an "e=" digraph for Unicode euro character and adjust the
            help files.
Files:      src/digraph.c, runtime/doc/digraph.txt

Patch 6.3.066
Problem:    Backup file may get wrong permissions.
Solution:   Use permissions of original file for backup file in more places.
Files:      src/fileio.c

Patch 6.3.067 (after 6.3.066)
Problem:    Newly created file gets execute permission.
Solution:   Check for "perm" to be negative before using it.
Files:      src/fileio.c

Patch 6.3.068
Problem:    When editing a compressed file xxx.gz which is a symbolic link to
            the actual file a ":write" renames the link.
Solution:   Resolve the link, so that the actual file is renamed and
            compressed.
```

```
Files:      runtime/plugin/gzip.vim

Patch 6.3.069
Problem:    When converting text with illegal characters Vim may crash.
Solution:   Avoid that too much is subtracted from the length. (Da Woon Jung)
Files:      src/mbyte.c

Patch 6.3.070
Problem:    After ":set number linebreak wrap" and a vertical split, moving
            the vertical separator far left will crash Vim. (Georg Dahn)
Solution:   Avoid dividing by zero.
Files:      src/charset.c

Patch 6.3.071
Problem:    The message for CTRL-X mode is still displayed after an error for
            'thesaurus' or 'dictionary' being empty.
Solution:   Clear "edit_submode".
Files:      src/edit.c

Patch 6.3.072
Problem:    Crash in giving substitute message when language is Chinese and
            encoding is utf-8. (Yongwei)
Solution:   Make the msg_buf size larger when using multi-byte.
Files:      src/vim.h

Patch 6.3.073
Problem:    Win32 GUI: When the Vim window is partly above or below the
            screen, scrolling causes display errors when the taskbar is not on
            that side.
Solution:   Use the SW_INVALIDATE flag when the Vim window is partly below or
            above the screen.
Files:      src/gui_w48.c

Patch 6.3.074
Problem:    When mswin.vim is used and 'insertmode' is set, typing text in
            Select mode and then using CTRL-V results in <SNR>99_Pastegi.
            (Georg Dahn)
Solution:   When restart_edit is set use "d" instead of "c" to remove the
            selected text to avoid calling edit() twice.
Files:      src/normal.c

Patch 6.3.075
Problem:    After unloading another buffer, syntax highlighting in the current
            buffer may be wrong when it uses "containedin". (Eric Arnold)
Solution:   Use "buf" instead of "curbuf" in syntax_clear().
Files:      src/syntax.c

Patch 6.3.076
Problem:    Crash when using cscope and there is a parse error (e.g., line too
            long). (Alexey I. Froloff)
Solution:   Pass the actual number of matches to cs_manage_matches() and
            correctly handle the error situation.
Files:      src/if_cscope.c
```

```
Patch 6.3.077 (extra)
Problem:    VMS: First character input after ESC was not recognized.
Solution:   Added TRM$M_TM_TIMED in vms_read().  (Zoltan Arpadffy)
Files:      src/os_vms.c

Patch 6.3.078 (extra, after 6.3.077)
Problem:    VMS: Performance issue after patch 6.3.077
Solution:   Add a timeout in the itemlist.  (Zoltan Arpadffy)
Files:      src/os_vms.c

Patch 6.3.079
Problem:    Crash when executing a command in the command line window while
            syntax highlighting is enabled. (Pero Brbora)
Solution:   Don't use a pointer to a buffer that has been deleted.
Files:      src/syntax.c

Patch 6.3.080 (extra)
Problem:    Win32: With 'encoding' set to utf-8 while the current codepage is
            Chinese editing a file with some specific characters in the name
            fails.
Solution:   Use _wfullpath() instead of _fullpath() when necessary.
Files:      src/os_mswin.c

Patch 6.3.081
Problem:    Unix: glob() may execute a shell command when it's not wanted.
            (Georgi Guninski)
Solution:   Verify the sandbox flag is not set.
Files:      src/os_unix.c

Patch 6.3.082 (after 6.3.081)
Problem:    Unix: expand() may execute a shell command when it's not wanted.
            (Georgi Guninski)
Solution:   A more generic solution than 6.3.081.
Files:      src/os_unix.c

Patch 6.3.083
Problem:    VMS: The vt320 termcap entry is incomplete.
Solution:   Add missing function keys.  (Zoltan Arpadffy)
Files:      src/term.c

Patch 6.3.084 (extra)
Problem:    Cygwin: compiling with DEBUG doesn't work.  Perl path was ignored.
            Failure when $(OUTDIR) already exists.  "po" makefile is missing.
Solution:   Use changes tested in Vim 7. (Tony Mechelynck)
Files:      src/Make_cyg.mak, src/po/Make_cyg.mak

Patch 6.3.085
Problem:    Crash in syntax highlighting code. (Marc Espie)
Solution:   Prevent current_col going past the end of the line.
Files:      src/syntax.c

Patch 6.3.086 (extra)
Problem:    Can't produce message translation file with msgfmt that checks
            printf strings.
```

```
Solution:   Fix the Russian translation.
Files:      src/po/ru.po, src/po/ru.cp1251.po

Patch 6.3.087
Problem:    MS-DOS: Crash. (Jason Hood)
Solution:   Don't call fname_case() with a NULL pointer.
Files:      src/ex_cmds.c

Patch 6.3.088
Problem:    Editing ".in" causes error E218. (Stefan Karlsson)
Solution:   Require some characters before ".in".  Same for ".orig" and others.
Files:      runtime/filetype.vim

Patch 6.3.089
Problem:    A session file doesn't work when created while the current
            directory contains a space or the directory of the session files
            contains a space. (Paolo Giarrusso)
Solution:   Escape spaces with a backslash.
Files:      src/ex_docmd.c

Patch 6.3.090
Problem:    A very big value for 'columns' or 'lines' may cause a crash.
Solution:   Limit the values to 10000 and 1000.
Files:      src/option.c

Patch 6.4a.001
Problem:    The Unix Makefile contained too many dependencies and a few
            uncommented lines.
Solution:   Run "make depend" with manual changes to avoid a gcc
            incompatibility.  Comment a few lines.
Files:      src/Makefile

Patch 6.4b.001
Problem:    Vim reports "Vim 6.4a" in the ":version" output.
Solution:   Change "a" to "b". (Tony Mechelynck)
Files:      src/version.h

Patch 6.4b.002
Problem:    In Insert mode, pasting a multi-byte character after the end of
            the line leaves the cursor just before that character.
Solution:   Make sure "gP" leaves the cursor in the right place when
            'virtualedit' is set.
Files:      src/ops.c

Patch 6.4b.003 (after 6.4b.002)
Problem:    The problem still exists when 'encoding' is set to "cp936".
Solution:   Fix the problem in getvvcol(), compute the coladd field correctly.
Files:      src/charset.c, src/ops.c

Patch 6.4b.004
Problem:    Selecting a {} block with "viB" includes the '}' when there is an
            empty line before it.
Solution:   Don't advance the cursor to include a line break when it's already
            at the line break.
```

```

```

version7.txt For Vim version 8.1. Last change: 2016 Jul 17

VIM REFERENCE MANUAL by Bram Moolenaar

vim7 version-7.0 version7.0

Welcome to Vim 7! A large number of features has been added. This file mentions all the new items, changes to existing features and bug fixes since Vim 6.x. Use this command to see the version you are using:

```
:version
```

See vi_diff.txt for an overview of differences between Vi and Vim 7.0.
See version4.txt for differences between Vim 3.x and Vim 4.x.
See version5.txt for differences between Vim 4.x and Vim 5.x.
See version6.txt for differences between Vim 5.x and Vim 6.x.

Changed   changed-7.2
Added   added-7.2
Fixed   fixed-7.2

VERSION 7.3   version-7.3

Persistent undo   new-persistent-undo
More encryption   new-more-encryption
Conceal text   new-conceal
Lua interface   new-lua
Python3 interface   new-python3

Changed   changed-7.3
Added   added-7.3
Fixed   fixed-7.3

VERSION 7.4   version-7.4
New regexp engine   new-regexp-engine
Better Python interface   better-python-interface
Changed   changed-7.4
Added   added-7.4
Fixed   fixed-7.4

==
INCOMPATIBLE CHANGES   incompatible-7

These changes are incompatible with previous releases. Check this list if you
run into a problem when upgrading from Vim 6.x to 7.0.

A ":write file" command no longer resets the 'modified' flag of the buffer,
unless the '+' flag is in 'cpoptions' cpo-+ . This was illogical, since the
buffer is still modified compared to the original file. And when undoing
all changes the file would actually be marked modified. It does mean that
":quit" fails now.

":helpgrep" now uses a help window to display a match.

In an argument list double quotes could be used to include spaces in a file
name. This caused a difference between ":edit" and ":next" for escaping
double quotes and it is incompatible with some versions of Vi.
        Command   Vim 6.x file name   Vim 7.x file name
        :edit foo\"888   foo"888   foo"888
        :next foo\"888   foo888   foo"888
        :next a\"b c\"d   ab cd   a"b and c"d

In a literal-string a single quote can be doubled to get one.
":echo 'a''b'" would result in "a b", but now that two quotes stand for one it
results in "a'b".

When overwriting a file with ":w! fname" there was no warning for when "fname"
was being edited by another Vim. Vim now gives an error message E768 .

The support for Mac OS 9 has been removed.

Files ending in .tex now have 'filetype' set to "context", "plaintex", or "tex". ft-tex-plugin

Minor incompatibilities:

For filetype detection: For many types, use */.dir/filename instead of ~/.dir/filename, so that it also works for other user's files.

For quite a few filetypes the indent settings have been moved from the filetype plugin to the indent plugin. If you used:
	:filetype plugin on
Then some indent settings may be missing. You need to use:
	:filetype plugin indent on

":0verbose" now sets 'verbose' to zero instead of one.

Removed the old and incomplete "VimBuddy" code.

Buffers without a name report "No Name" instead of "No File". It was confusing for buffers with a name and 'buftype' set to "nofile".

When ":file xxx" is used in a buffer without a name, the alternate file name isn't set. This avoids creating buffers without a name, they are not useful.

The "2html.vim" script now converts closed folds to HTML. This means the HTML looks like it's displayed, with the same folds open and closed. Use "zR", or "let html_ignore_folding=1", if no folds should appear in the HTML. (partly by Carl Osterwisch)
Diff mode is now also converted to HTML as it is displayed.

Win32: The effect of the <F10> key depended on 'winaltkeys'. Now it depends on whether <F10> has been mapped or not. This allows mapping <F10> without changing 'winaltkeys'.

When 'octal' is in 'nrformats' and using CTRL-A on "08" it became "018", which is illogical. Now it becomes "9". The leading zero(s) is(are) removed to avoid the number becoming octal after incrementing "009" to "010".

When 'encoding' is set to a Unicode encoding, the value for 'fileencodings' now includes "default" before "latin1". This means that for files with 8-bit encodings the default is to use the encoding specified by the environment, if possible. Previously latin1 would always be used, which is wrong in a non-latin1 environment, such as Russian.

Previously Vim would exit when there are two windows, both of them displaying a help file, and using ":quit". Now only the window is closed.

"-w {scriptout}" only works when {scriptout} doesn't start with a digit. Otherwise it's used to set the 'window' option.

Previously <Home> and <xHome> could be mapped separately. This had the disadvantage that all mappings (with modifiers) had to be duplicated, since

you can't be sure what the keyboard generates. Now all <xHome> are internally translated to <Home>, both for the keys and for mappings. Also for <xEnd>, <xF1>, etc.

":put" now leaves the cursor on the last inserted line.

When a .gvimrc file exists then 'compatible' is off, just like when a ".vimrc" file exists.

When making a string upper-case with "vlllU" or similar then the German sharp s is replaced with "SS". This does not happen with "~" to avoid backwards compatibility problems and because "SS" can't be changed back to a sharp s.

"gd" previously found the very first occurrence of a variable in a function, that could be the function argument without type. Now it finds the position where the type is given.

The line continuation in functions was not taken into account, line numbers in errors were logical lines, not lines in the sourced file. That made it difficult to locate errors. Now the line number in the sourced file is reported, relative to the function start. This also means that line numbers for ":breakadd func" are different.

When defining a user command with :command the special items could be abbreviated. This caused unexpected behavior, such as <li> being recognized as <line1>. The items can no longer be abbreviated.

When executing a FileChangedRO autocommand it is no longer allowed to switch to another buffer or edit another file. This is to prevent crashes (the event is triggered deep down in the code where changing buffers is not anticipated). It is still possible to reload the buffer.

At the more-prompt and the hit-enter-prompt , when the 'more' option is set, the 'k', 'u', 'g' and 'b' keys are now used to scroll back to previous messages. Thus they are no longer used as typeahead.

==
NEW FEATURES   new-7

Vim script enhancements   new-vim-script

In Vim scripts the following types have been added:

```
        List            ordered list of items
        Dictionary      associative array of items
        Funcref         reference to a function
```

Many functions and commands have been added to support the new types.

The string() function can be used to get a string representation of a variable. Works for Numbers, Strings and composites of them. Then eval() can be used to turn the string back into the variable value.

The :let command can now use "+=", "-=" and ".=":
```
:let var += expr        " works like :let var = var + expr
:let var -= expr        " works like :let var = var - expr
:let var .= string      " works like :let var = var . string
```

With the :profile command you can find out where your function or script is wasting time.

In the Python interface vim.eval() also handles Dictionaries and Lists.
python-eval (G. Sumner Hayes)

The getscript plugin was added as a convenient way to update scripts from www.vim.org automatically. (Charles Campbell)

The vimball plugin was added as a convenient way to distribute a set of files for a plugin (plugin file, autoload script, documentation). (Charles Campbell)

Spell checking new-spell

Spell checking has been integrated in Vim. There were a few implementations with scripts, but they were slow and/or required an external program.

The 'spell' option is used to switch spell checking on or off
The 'spelllang' option is used to specify the accepted language(s)
The 'spellfile' option specifies where new words are added
The 'spellsuggest' option specifies the methods used for making suggestions

The]s and [s commands can be used to move to the next or previous error
The zg and zw commands can be used to add good and wrong words
The z= command can be used to list suggestions and correct the word
The :mkspell command is used to generate a Vim spell file from word lists

The "undercurl" highlighting attribute was added to nicely point out spelling mistakes in the GUI (based on patch from Marcin Dalecki).
The "guisp" color can be used to give it a color different from foreground and background.
The number of possible different highlight attributes was raised from about 220 to over 30000. This allows for the attributes of spelling to be combined with syntax highlighting attributes. This is also used for syntax highlighting and marking the Visual area.

Much more info here: spell .

Omni completion new-omni-completion

This could also be called "intellisense", but that is a trademark. It is a smart kind of completion. The text in front of the cursor is inspected to figure out what could be following. This may suggest struct and class members, system functions, etc.

Use CTRL-X CTRL-O in Insert mode to start the completion. i_CTRL-X_CTRL-O

The 'omnifunc' option is set by filetype plugins to define the function that
figures out the completion.

Currently supported languages:

C	ft-c-omni
(X)HTML with CSS	ft-html-omni
JavaScript	ft-javascript-omni
PHP	ft-php-omni
Python	
Ruby	ft-ruby-omni
SQL	ft-sql-omni
XML	ft-xml-omni
any language with syntax highlighting	ft-syntax-omni

You can add your own omni completion scripts.

When the 'completeopt' option contains "menu" then matches for Insert mode
completion are displayed in a (rather primitive) popup menu.

MzScheme interface new-MzScheme

The MzScheme interpreter is supported. MzScheme

The :mzscheme command can be used to execute MzScheme commands
The :mzfile command can be used to execute an MzScheme script file

This depends on Vim being compiled with the +mzscheme feature.

Printing multi-byte text new-print-multi-byte

The :hardcopy command now supports printing multi-byte characters when using
PostScript.

The 'printmbcharset' and 'printmbfont' options are used for this.
Also see postscript-cjk-printing . (Mike Williams)

Tab pages new-tab-pages

A tab page is a page with one or more windows with a label (aka tab) at the top.
By clicking on the label you can quickly switch between the tab pages. And
with the keyboard, using the gt (Goto Tab) command. This is a convenient
way to work with many windows.

To start Vim with each file argument in a separate tab page use the -p
argument. The maximum number of pages can be set with 'tabpagemax'.

The line with tab labels is either made with plain text and highlighting or with a GUI mechanism. The GUI labels look better but are only available on a few systems. The line can be customized with 'tabline', 'guitablabel' and 'guitabtooltip'. Whether it is displayed is set with 'showtabline'. Whether to use the GUI labels is set with the "e" flag in 'guioptions'.

The :tab command modifier can be used to have most commands that open a new window open a new tab page instead.

The --remote-tab argument can be used to edit a file in a new tab page in an already running Vim server.

Variables starting with "t:" are local to a tab page.

More info here: tabpage
Most of the GUI stuff was implemented by Yegappan Lakshmanan.

Undo branches new-undo-branches

Previously there was only one line of undo-redo. If, after undoing a number of changes, a new change was made all the undone changes were lost. This could lead to accidentally losing work.

Vim now makes an undo branch in this situation. Thus you can go back to the text after any change, even if they were undone. So long as you do not run into 'undolevels', when undo information is freed up to limit the memory used.

To be able to navigate the undo branches each change is numbered sequentially. The commands g- and :earlier go back in time, to older changes. The commands g+ and :later go forward in time, to newer changes.

The changes are also timestamped. Use ":earlier 10m" to go to the text as it was about ten minutes earlier.

The :undolist command can be used to get an idea of which undo branches exist. The :undo command now takes an argument to directly jump to a specific position in this list. The changenr() function can be used to obtain the change number.

There is no graphical display of the tree with changes, navigation can be quite confusing.

Extended Unicode support new-more-unicode

Previously only two combining characters were displayed. The limit is now raised to 6. This can be set with the 'maxcombine' option. The default is still 2.

ga now shows all combining characters, not just the first two.

Previously only 16 bit Unicode characters were supported for displaying. Now the full 32 bit character set can be used. Unless manually disabled at compile time to save a bit of memory.

For pattern matching it is now possible to search for individual composing characters. patterns-composing

The 8g8 command searches for an illegal UTF-8 byte sequence.

More highlighting new-more-highlighting

Highlighting matching parens:

When moving the cursor through the text and it is on a paren, then the matching paren can be highlighted. This uses the new CursorMoved autocommand event.

This means some commands are executed every time you move the cursor. If this slows you down too much switch it off with:

```
:NoMatchParen
```

See matchparen for more information.

The plugin uses the :match command. It now supports three match patterns. The plugin uses the third one. The first one is for the user and the second one can be used by another plugin.

Highlighting the cursor line and column:

The 'cursorline' and 'cursorcolumn' options have been added. These highlight the screen line and screen column of the cursor. This makes the cursor position easier to spot. 'cursorcolumn' is also useful to align text. This may make screen updating quite slow. The CursorColumn and CursorLine highlight groups allow changing the colors used. hl-CursorColumn hl-CursorLine

The number of possible different highlight attributes was raised from about 220 to over 30000. This allows for the attributes of spelling to be combined with syntax highlighting attributes. This is also used for syntax highlighting, marking the Visual area, CursorColumn, etc.

Translated manual pages new-manpage-trans

The manual page of Vim and associated programs is now also available in several other languages.

French - translated by David Blanchet
Italian - translated by Antonio Colombo
Russian - translated by Vassily Ragosin

Polish - translated by Mikolaj Machowski

The Unix Makefile installs the Italian manual pages in .../man/it/man1/,
.../man/it.ISO8859-1/man1/ and .../man/it.UTF-8/man1/. There appears to be no
standard for what encoding goes in the "it" directory, the 8-bit encoded file
is used there as a best guess.
Other languages are installed in similar places.
The translated pages are not automatically installed when Vim was configured
with "--disable-nls", but "make install-languages install-tool-languages" will
do it anyway.

Internal grep new-vimgrep

The ":vimgrep" command can be used to search for a pattern in a list of files.
This is like the ":grep" command, but no external program is used. Besides
better portability, handling of different file encodings and using multi-line
patterns, this also allows grepping in compressed and remote files.
 :vimgrep .

If you want to use the search results in a script you can use the
 getqflist() function.

To grep files in various directories the "**" pattern can be used. It expands
into an arbitrary depth of directories. "**" can be used in all places where
file names are expanded, thus also with :next and :args .

Scroll back in messages new-scroll-back

When displaying messages, at the more-prompt and the hit-enter-prompt , The
'k', 'u', 'g' and 'b' keys can be used to scroll back to previous messages.
This is especially useful for commands such as ":syntax", ":autocommand" and
":highlight". This is implemented in a generic way thus it works for all
commands and highlighting is kept. Only works when the 'more' option is set.
Previously it only partly worked for ":clist".

The g< command can be used to see the last page of messages after you have
hit <Enter> at the hit-enter-prompt . Then you can scroll further back.

Cursor past end of the line new-onemore

When the 'virtualedit' option contains "onemore" the cursor can move just past
the end of the line. As if it's on top of the line break.

This makes some commands more consistent. Previously the cursor was always
past the end of the line if the line was empty. But it is far from Vi
compatible. It may also break some plugins or Vim scripts. Use with care!

The patch was provided by Mattias Flodin.

POSIX compatibility new-posix

The POSIX test suite was used to verify POSIX compatibility. A number of problems have been fixed to make Vim more POSIX compatible. Some of them conflict with traditional Vi or expected behavior. The $VIM_POSIX environment variable can be set to get POSIX compatibility. See posix .

Items that were fixed for both Vi and POSIX compatibility:
- repeating "R" with a count only overwrites text once; added the 'X' flag to 'cpoptions' cpo-X
- a vertical movement command that moves to a non-existing line fails; added the '-' flag to 'cpoptions' cpo--
- when preserving a file and doing ":q!" the file can be recovered; added the '&' flag to 'cpoptions' cpo-&
- The 'window' option is partly implemented. It specifies how much CTRL-F and CTRL-B scroll when there is one window. The "-w {number}" argument is now accepted. "-w {scriptout}" only works when {scriptout} doesn't start with a digit.
- Allow "-c{command}" argument, no space between "-c" and {command}.
- When writing a file with ":w!" don't reset 'readonly' when 'Z' is present in 'cpoptions'.
- Allow 'l' and '#' flags for ":list", ":print" and ":number".
- Added the '.' flag to 'cpoptions': ":cd" fails when the buffer is modified.
- In Ex mode with an empty buffer ":read file" doesn't keep an empty line above or below the new lines.
- Remove a backslash before a NL for the ":global" command.
- When ":append", ":insert" or ":change" is used with ":global", get the inserted lines from the command. Can use backslash-NL to separate lines.
- Can use ":global /pat/ visual" to execute Normal mode commands at each matched line. Use "Q" to continue and go to the next line.
- The :open command has been partially implemented. It stops Ex mode, but redraws the whole screen, not just one line as open mode is supposed to do.
- Support using a pipe to read the output from and write input to an external command. Added the 'shelltemp' option and has("filterpipe").
- In ex silent mode the ":set" command output is displayed.
- The ":@@" and ":**" give an error message when no register was used before.
- The search pattern "[]-`]" matches ']', '^', '_' and '`'.
- Autoindent for ":insert" is using the line below the insert.
- Autoindent for ":change" is using the first changed line.
- Editing Ex command lines is not done in cooked mode, because CTRL-D and CTRL-T cannot be handled then.
- In Ex mode, "1,3" prints three lines. "%" prints all lines.
- In Ex mode "undo" would undo all changes since Ex mode was started.
- Implemented the 'prompt' option.

Debugger support new-debug-support

The 'balloonexpr' option has been added. This is a generic way to implement balloon functionality. You can use it to show info for the word under the

mouse pointer.

Remote file explorer new-netrw-explore

The netrw plugin now also supports viewing a directory, when "scp://" is used.
Deleting and renaming files is possible.

To avoid duplicating a lot of code, the previous file explorer plugin has been
integrated in the netrw plugin. This means browsing local and remote files
works the same way.

":browse edit" and ":browse split" use the netrw plugin when it's available
and a GUI dialog is not possible.

The netrw plugin is maintained by Charles Campbell.

Define an operator new-define-operator

Previously it was not possible to define your own operator; a command that is
followed by a {motion}. Vim 7 introduces the 'operatorfunc' option and the
g@ operator. This makes it possible to define a mapping that works like an
operator. The actual work is then done by a function, which is invoked
through the g@ operator.

See :map-operator for the explanation and an example.

Mapping to an expression new-map-expression

The {rhs} argument of a mapping can be an expression. That means the
resulting characters can depend on the context. Example:

```
:inoremap <expr> . InsertDot()
```

Here the dot will be mapped to whatever InsertDot() returns.

This also works for abbreviations. See :map-<expr> for the details.

Visual and Select mode mappings new-map-select

Previously Visual mode mappings applied both to Visual and Select mode. With
a trick to have the mappings work in Select mode like they would in Visual
mode.

Commands have been added to define mappings for Visual and Select mode
separately: :xmap and :smap . With the associated "noremap" and "unmap"
commands.

The same is done for menus: :xmenu , :smenu , etc.

Location list new-location-list

The support for a per-window quickfix list (location list) is added. The location list can be displayed in a location window (similar to the quickfix window). You can open more than one location list window. A set of commands similar to the quickfix commands are added to browse the location list. (Yegappan Lakshmanan)

Various new items new-items-7

Normal mode commands:

a", a' and a`
i", i' and i` New text objects to select quoted strings. a' (Taro Muraoka)

CTRL-W <Enter> In the quickfix window: opens a new window to show the location of the error under the cursor.

at and it text objects select a block of text between HTML or XML tags.

<A-LeftMouse> ('mousemodel' "popup" or "popup-setpos")
<A-RightMouse> ('mousemodel' "extend")
Make a blockwise selection. <A-LeftMouse>

gF Start editing the filename under the cursor and jump to the line number following the file name. (Yegappan Lakshmanan)

CTRL-W F Start editing the filename under the cursor in a new window and jump to the line number following the file name. (Yegappan Lakshmanan)

Insert mode commands:

CTRL-\ CTRL-O Execute a Normal mode command. Like CTRL-O but without moving the cursor. i_CTRL-_CTRL-O

Options:

'balloonexpr' expression for text to show in evaluation balloon
'completefunc' The name of the function used for user-specified Insert mode completion. CTRL-X CTRL-U can be used in Insert mode to do any kind of completion. (Taro Muraoka)
'completeopt' Enable popup menu and other settings for Insert mode completion.
'cursorcolumn' highlight column of the cursor
'cursorline' highlight line of the cursor
'formatexpr' expression for formatting text with gq and when text

goes over 'textwidth' in Insert mode.
'formatlistpat' pattern to recognize a numbered list for formatting. (idea by Hugo Haas)
'fsync' Whether fsync() is called after writing a file. (Ciaran McCreesh)
'guitablabel' expression for text to display in GUI tab page label
'guitabtooltip' expression for text to display in GUI tab page tooltip
'macatsui' Mac: use ATSUI text display functions
'maxcombine' maximum number of combining characters displayed
'maxmempattern' maximum amount of memory to use for pattern matching
'mkspellmem' parameters for :mkspell memory use
'mzquantum' Time in msec to schedule MzScheme threads.
'numberwidth' Minimal width of the space used for the 'number' and 'relativenumber' option. (Emmanuel Renieris)
'omnifunc' The name of the function used for omni completion.
'operatorfunc' function to be called for g@ operator
'printmbcharset' CJK character set to be used for :hardcopy
'printmbfont' font names to be used for CJK output of :hardcopy
'pumheight' maximum number of items to show in the popup menu
'quoteescape' Characters used to escape quotes inside a string. Used for the a", a' and a` text objects. a'
'shelltemp' whether to use a temp file or pipes for shell commands
'showtabline' whether to show the tab pages line
'spell' switch spell checking on/off
'spellcapcheck' pattern to locate the end of a sentence
'spellfile' file where good and wrong words are added
'spelllang' languages to check spelling for
'spellsuggest' methods for spell suggestions
'synmaxcol' maximum column to look for syntax items; avoids very slow redrawing when there are very long lines
'tabline' expression for text to display in the tab pages line
'tabpagemax' maximum number of tab pages to open for -p
'verbosefile' Log messages in a file.
'wildoptions' "tagfile" value enables listing the file name of matching tags for CTRL-D command line completion. (based on an idea from Yegappan Lakshmanan)
'winfixwidth' window with fixed width, similar to 'winfixheight'

Ex commands:

Win32: The ":winpos" command now also works in the console. (Vipin Aravind)

:startreplace Start Replace mode. (Charles Campbell)
:startgreplace Start Virtual Replace mode.

:0file Removes the name of the buffer. (Charles Campbell)

:diffoff Switch off diff mode in the current window or in all windows.

:delmarks Delete marks.

:exusage Help for Ex commands (Nvi command).

:viusage	Help for Vi commands (Nvi command).
:sort	Sort lines in the buffer without depending on an external command. (partly by Bryce Wagner)
:vimgrep	Internal grep command, search for a pattern in files.
:vimgrepadd	Like :vimgrep but don't make a new list.
:caddfile	Add error messages to an existing quickfix list (Yegappan Lakshmanan).
:cbuffer	Read error lines from a buffer. (partly by Yegappan Lakshmanan)
:cgetbuffer	Create a quickfix list from a buffer but don't jump to the first error.
:caddbuffer	Add errors from the current buffer to the quickfix list.
:cexpr	Read error messages from a Vim expression (Yegappan Lakshmanan).
:caddexpr	Add error messages from a Vim expression to an existing quickfix list. (Yegappan Lakshmanan).
:cgetexpr	Create a quickfix list from a Vim expression, but don't jump to the first error. (Yegappan Lakshmanan).
:lfile	Like :cfile but use the location list.
:lgetfile	Like :cgetfile but use the location list.
:laddfile	Like :caddfile but use the location list.
:lbuffer	Like :cbuffer but use the location list.
:lgetbuffer	Like :cgetbuffer but use the location list.
:laddbuffer	Like :caddbuffer but use the location list.
:lexpr	Like :cexpr but use the location list.
:lgetexpr	Like :cgetexpr but use the location list.
:laddexpr	Like :caddexpr but use the location list.
:ll	Like :cc but use the location list.
:llist	Like :clist but use the location list.
:lnext	Like :cnext but use the location list.
:lprevious	Like :cprevious but use the location list.
:lNext	Like :cNext but use the location list.
:lfirst	Like :cfirst but use the location list.
:lrewind	Like :crewind but use the location list.
:llast	Like :clast but use the location list.
:lnfile	Like :cnfile but use the location list.
:lpfile	Like :cpfile but use the location list.
:lNfile	Like :cNfile but use the location list.
:lolder	Like :colder but use the location list.
:lnewer	Like :cnewer but use the location list.
:lwindow	Like :cwindow but use the location list.
:lopen	Like :copen but use the location list.
:lclose	Like :cclose but use the location list.
:lmake	Like :make but use the location list.
:lgrep	Like :grep but use the location list.
:lgrepadd	Like :grepadd but use the location list.
:lvimgrep	Like :vimgrep but use the location list.
:lvimgrepadd	Like :vimgrepadd but use the location list.
:lhelpgrep	Like :helpgrep but use the location list.

:lcscope Like :cscope but use the location list.
:ltag Jump to a tag and add matching tags to a location list.

:undojoin Join a change with the previous undo block.
:undolist List the leafs of the undo tree.

:earlier Go back in time for changes in the text.
:later Go forward in time for changes in the text.

:for Loop over a List .
:endfor

:lockvar Lock a variable, prevents it from being changed.
:unlockvar Unlock a locked variable.

:mkspell Create a Vim spell file.
:spellgood Add a word to the list of good words.
:spellwrong Add a word to the list of bad words
:spelldump Dump list of good words.
:spellinfo Show information about the spell files used.
:spellrepall Repeat a spelling correction for the whole buffer.
:spellundo Remove a word from list of good and bad words.

:mzscheme Execute MzScheme commands.
:mzfile Execute an MzScheme script file.

:nbkey Pass a key to NetBeans for processing.

:profile Commands for Vim script profiling.
:profdel Stop profiling for specified items.

:smap Select mode mapping.
:smapclear
:snoremap
:sunmap

:xmap Visual mode mapping, not used for Select mode.
:xmapclear
:xnoremap
:xunmap

:smenu Select mode menu.
:snoremenu
:sunmenu

:xmenu Visual mode menu, not used for Select mode.
:xnoremenu
:xunmenu

:tabclose Close the current tab page.
:tabdo Perform a command in every tab page.
:tabedit Edit a file in a new tab page.
:tabnew Open a new tab page.
:tabfind Search for a file and open it in a new tab page.

:tabnext	Go to the next tab page.
:tabprevious	Go to the previous tab page.
:tabNext	Go to the previous tab page.
:tabfirst	Go to the first tab page.
:tabrewind	Go to the first tab page.
:tablast	Go to the last tab page.
:tabmove	Move the current tab page elsewhere.
:tabonly	Close all other tab pages.
:tabs	List the tab pages and the windows they contain.

Ex command modifiers:

:keepalt	Do not change the alternate file.
:noautocmd	Do not trigger autocommand events.
:sandbox	Execute a command in the sandbox.
:tab	When opening a new window create a new tab page.

Ex command arguments:

++bad	Specify what happens with characters that can't be converted and illegal bytes. (code example by Yasuhiro Matsumoto) Also, when a conversion error occurs or illegal bytes are found include the line number in the error message.

New and extended functions:

add()	append an item to a List
append()	append List of lines to the buffer
argv()	without an argument return the whole argument list
browsedir()	dialog to select a directory
bufnr()	takes an extra argument: create buffer
byteidx()	index of a character (Ilya Sher)
call()	call a function with List as arguments
changenr()	number of current change
complete()	set matches for Insert mode completion
complete_add()	add match for 'completefunc'
complete_check()	check for key pressed, for 'completefunc'
copy()	make a shallow copy of a List or Dictionary
count()	count nr of times a value is in a List or Dictionary
cursor()	also accepts an offset for 'virtualedit', and the first argument can be a list: [lnum, col, off]
deepcopy()	make a full copy of a List or Dictionary
diff_filler()	returns number of filler lines above line {lnum}.
diff_hlID()	returns the highlight ID for diff mode
empty()	check if List or Dictionary is empty
eval()	evaluate {string} and return the result
extend()	append one List to another or add items from one

	Dictionary to another
feedkeys()	put characters in the typeahead buffer
filter()	remove selected items from a List or Dictionary
finddir()	find a directory in 'path'
findfile()	find a file in 'path' (Johannes Zellner)
foldtextresult()	the text displayed for a closed fold at line "lnum"
function()	make a Funcref out of a function name
garbagecollect()	cleanup unused Lists and Dictionaries with circular references
get()	get an item from a List or Dictionary
getbufline()	get a list of lines from a specified buffer (Yegappan Lakshmanan)
getcmdtype()	return the current command-line type (Yegappan Lakshmanan)
getfontname()	get actual font name being used
getfperm()	get file permission string (Nikolai Weibull)
getftype()	get type of file (Nikolai Weibull)
getline()	with second argument: get List with buffer lines
getloclist()	list of location list items (Yegappan Lakshmanan)
getpos()	return a list with the position of cursor, mark, etc.
getqflist()	list of quickfix errors (Yegappan Lakshmanan)
getreg()	get contents of a register
gettabwinvar()	get variable from window in specified tab page.
has_key()	check whether a key appears in a Dictionary
haslocaldir()	check if current window used :lcd
hasmapto()	check for a mapping to a string
index()	index of item in List
inputlist()	prompt the user to make a selection from a list
insert()	insert an item somewhere in a List
islocked()	check if a variable is locked
items()	get List of Dictionary key-value pairs
join()	join List items into a String
keys()	get List of Dictionary keys
len()	number of items in a List or Dictionary
map()	change each List or Dictionary item
maparg()	extra argument: use abbreviation
mapcheck()	extra argument: use abbreviation
match()	extra argument: count
matcharg()	return arguments of :match command
matchend()	extra argument: count
matchlist()	list with match and submatches of a pattern in a string
matchstr()	extra argument: count
max()	maximum value in a List or Dictionary
min()	minimum value in a List or Dictionary
mkdir()	create a directory
pathshorten()	reduce directory names to a single character
printf()	format text
pumvisible()	check whether the popup menu is displayed
range()	generate a List with numbers
readfile()	read a file into a list of lines
reltime()	get time value, possibly relative
reltimestr()	turn a time value into a string
remove()	remove one or more items from a List or Dictionary
repeat()	repeat "expr" "count" times (Christophe Poucet)

reverse()	reverse the order of a List
search()	extra argument:
searchdecl()	search for declaration of variable
searchpair()	extra argument: line to stop searching
searchpairpos()	return a List with the position of the match
searchpos()	return a List with the position of the match
setloclist()	modify a location list (Yegappan Lakshmanan)
setpos()	set cursor or mark to a position
setqflist()	modify a quickfix list (Yegappan Lakshmanan)
settabwinvar()	set variable in window of specified tab page
sort()	sort a List
soundfold()	get the sound-a-like equivalent of a word
spellbadword()	get a badly spelled word
spellsuggest()	get suggestions for correct spelling
split()	split a String into a List
str2nr()	convert a string to a number, base 2, 8, 10 or 16
stridx()	extra argument: start position
strridx()	extra argument: start position
string()	string representation of a List or Dictionary
system()	extra argument: filters {input} through a shell command
tabpagebuflist()	List of buffers in a tab page
tabpagenr()	number of current or last tab page
tabpagewinnr()	window number in a tab page
tagfiles()	List with tags file names
taglist()	get list of matching tags (Yegappan Lakshmanan)
tr()	translate characters (Ron Aaron)
uniq()	remove copies of repeated adjacent list items
values()	get List of Dictionary values
winnr()	takes an argument: what window to use
winrestview()	restore the view of the current window
winsaveview()	save the view of the current window
writefile()	write a list of lines into a file

User defined functions can now be loaded automatically from the "autoload" directory in 'runtimepath'. See autoload-functions .

New Vim variables:

v:insertmode	used for InsertEnter and InsertChange autocommands
v:val	item value in a map() or filter() function
v:key	item key in a map() or filter() function
v:profiling	non-zero after a ":profile start" command
v:fcs_reason	the reason why FileChangedShell was triggered
v:fcs_choice	what should happen after FileChangedShell
v:beval_bufnr	buffer number for 'balloonexpr'
v:beval_winnr	window number for 'balloonexpr'
v:beval_lnum	line number for 'balloonexpr'
v:beval_col	column number for 'balloonexpr'
v:beval_text	text under the mouse pointer for 'balloonexpr'
v:scrollstart	what caused the screen to be scrolled up
v:swapname	name of the swap file for the SwapExists event
v:swapchoice	what to do for an existing swap file
v:swapcommand	command to be executed after handling SwapExists

v:char	argument for evaluating 'formatexpr'

New autocommand events:

ColorScheme	after loading a color scheme
CursorHoldI	the user doesn't press a key for a while in Insert mode
CursorMoved	the cursor was moved in Normal mode
CursorMovedI	the cursor was moved in Insert mode
FileChangedShellPost	after handling a file changed outside of Vim
InsertEnter	starting Insert or Replace mode
InsertChange	going from Insert to Replace mode or back
InsertLeave	leaving Insert or Replace mode
MenuPopup	just before showing popup menu
QuickFixCmdPre	before :make, :grep et al. (Ciaran McCreesh)
QuickFixCmdPost	after :make, :grep et al. (Ciaran McCreesh)
SessionLoadPost	after loading a session file. (Yegappan Lakshmanan)
ShellCmdPost	after executing a shell command
ShellFilterPost	after filtering with a shell command
SourcePre	before sourcing a Vim script
SpellFileMissing	when a spell file can't be found
SwapExists	found existing swap file when editing a file
TabEnter	just after entering a tab page
TabLeave	just before leaving a tab page
VimResized	after the Vim window size changed (Yakov Lerner)

New highlight groups:

Pmenu	Popup menu: normal item hl-Pmenu
PmenuSel	Popup menu: selected item hl-PmenuSel
PmenuThumb	Popup menu: scrollbar hl-PmenuThumb
PmenuSbar	Popup menu: Thumb of the scrollbar hl-PmenuSbar
TabLine	tab pages line, inactive label hl-TabLine
TabLineSel	tab pages line, selected label hl-TabLineSel
TabLineFill	tab pages line, filler hl-TabLineFill
SpellBad	badly spelled word hl-SpellBad
SpellCap	word with wrong caps hl-SpellCap
SpellRare	rare word hl-SpellRare
SpellLocal	word only exists in other region hl-SpellLocal

```
CursorColumn            'cursorcolumn'  hl-CursorColumn
CursorLine              'cursorline'  hl-CursorLine

MatchParen              matching parens  pi_paren.txt   hl-MatchParen
```

New items in search patterns:

```
 /\%d  \%d123           search for character with decimal number
 /\]   [\d123]          idem, in a collection
 /\%o  \%o103           search for character with octal number
 /\]   [\o1o3]          idem, in a collection
 /\%x  \%x1a            search for character with 2 pos. hex number
 /\]   [\x1a]           idem, in a collection
 /\%u  \%u12ab          search for character with 4 pos. hex number
 /\]   [\u12ab]         idem, in a collection
 /\%U  \%U1234abcd      search for character with 8 pos. hex number
 /\]   [\U1234abcd]     idem, in a collection
                            (The above partly by Ciaran McCreesh)

 /[[=  [[=a=]]          an equivalence class (only for latin1 characters)
 /[[.  [[.a.]]          a collation element (only works with single char)

 /\%'m   \%'m           match at mark m
 /\%<'m  \%<'m          match before mark m
 /\%>'m  \%>'m          match after mark m
 /\%V    \%V            match in Visual area
```

Nesting /multi items no longer is an error when an empty match is possible.

It is now possible to use \{0}, it matches the preceding atom zero times. Not useful, just for compatibility.

New Syntax/Indent/FTplugin files:

Moved all the indent settings from the filetype plugin to the indent file.
Implemented b:undo_indent to undo indent settings when setting 'filetype' to a different value.

a2ps syntax and ftplugin file. (Nikolai Weibull)
ABAB/4 syntax file. (Marius van Wyk)
alsaconf ftplugin file. (Nikolai Weibull)
AppendMatchGroup ftplugin file. (Dave Silvia)
arch ftplugin file. (Nikolai Weibull)
asterisk and asteriskvm syntax file. (Tilghman Lesher)
BDF ftplugin file. (Nikolai Weibull)
BibTeX indent file. (Dorai Sitaram)
BibTeX Bibliography Style syntax file. (Tim Pope)
BTM ftplugin file. (Bram Moolenaar)
calendar ftplugin file. (Nikolai Weibull)
Changelog indent file. (Nikolai Weibull)
ChordPro syntax file. (Niels Bo Andersen)
Cmake indent and syntax file. (Andy Cedilnik)

conf ftplugin file. (Nikolai Weibull)
context syntax and ftplugin file. (Nikolai Weibull)
CRM114 ftplugin file. (Nikolai Weibull)
cvs RC ftplugin file. (Nikolai Weibull)
D indent file. (Jason Mills)
Debian Sources.list syntax file. (Matthijs Mohlmann)
dictconf and dictdconf syntax, indent and ftplugin files. (Nikolai Weibull)
diff ftplugin file. (Bram Moolenaar)
dircolors ftplugin file. (Nikolai Weibull)
django and htmldjango syntax file. (Dave Hodder)
doxygen syntax file. (Michael Geddes)
elinks ftplugin file. (Nikolai Weibull)
eterm ftplugin file. (Nikolai Weibull)
eviews syntax file. (Vaidotas Zemlys)
fetchmail RC ftplugin file. (Nikolai Weibull)
FlexWiki syntax and ftplugin file. (George Reilly)
Generic indent file. (Dave Silvia)
gpg ftplugin file. (Nikolai Weibull)
gretl syntax file. (Vaidotas Zemlys)
groovy syntax file. (Alessio Pace)
group syntax and ftplugin file. (Nikolai Weibull)
grub ftplugin file. (Nikolai Weibull)
Haskell ftplugin file. (Nikolai Weibull)
help ftplugin file. (Nikolai Weibull)
indent ftplugin file. (Nikolai Weibull)
Javascript ftplugin file. (Bram Moolenaar)
Kconfig ftplugin and syntax file. (Nikolai Weibull)
ld syntax, indent and ftplugin file. (Nikolai Weibull)
lftp ftplugin file. (Nikolai Weibull)
libao config ftplugin file. (Nikolai Weibull)
limits syntax and ftplugin file. (Nikolai Weibull)
Lisp indent file. (Sergey Khorev)
loginaccess and logindefs syntax and ftplugin file. (Nikolai Weibull)
m4 ftplugin file. (Nikolai Weibull)
mailaliases syntax file. (Nikolai Weibull)
mailcap ftplugin file. (Nikolai Weibull)
manconf syntax and ftplugin file. (Nikolai Weibull)
matlab ftplugin file. (Jake Wasserman)
Maxima syntax file. (Robert Dodier)
MGL syntax file. (Gero Kuhlmann)
modconf ftplugin file. (Nikolai Weibull)
mplayer config ftplugin file. (Nikolai Weibull)
Mrxvtrc syntax and ftplugin file. (Gautam Iyer)
MuPAD source syntax, indent and ftplugin. (Dave Silvia)
mutt RC ftplugin file. (Nikolai Weibull)
nanorc syntax and ftplugin file. (Nikolai Weibull)
netrc ftplugin file. (Nikolai Weibull)
pamconf syntax and ftplugin file. (Nikolai Weibull)
Pascal indent file. (Neil Carter)
passwd syntax and ftplugin file. (Nikolai Weibull)
PHP compiler plugin. (Doug Kearns)
pinfo ftplugin file. (Nikolai Weibull)
plaintex syntax and ftplugin files. (Nikolai Weibull, Benji Fisher)
procmail ftplugin file. (Nikolai Weibull)

prolog ftplugin file. (Nikolai Weibull)
protocols syntax and ftplugin file. (Nikolai Weibull)
quake ftplugin file. (Nikolai Weibull)
racc syntax and ftplugin file. (Nikolai Weibull)
readline ftplugin file. (Nikolai Weibull)
rhelp syntax file. (Johannes Ranke)
rnoweb syntax file. (Johannes Ranke)
Relax NG compact ftplugin file. (Nikolai Weibull)
Scheme indent file. (Sergey Khorev)
screen ftplugin file. (Nikolai Weibull)
sensors syntax and ftplugin file. (Nikolai Weibull)
services syntax and ftplugin file. (Nikolai Weibull)
setserial syntax and ftplugin file. (Nikolai Weibull)
sieve syntax and ftplugin file. (Nikolai Weibull)
SiSU syntax file (Ralph Amissah)
Sive syntax file. (Nikolai Weibull)
slp config, reg and spi syntax and ftplugin files. (Nikolai Weibull)
SML indent file. (Saikat Guha)
SQL anywhere syntax and indent file. (David Fishburn)
SQL indent file.
SQL-Informix syntax file. (Dean L Hill)
SQL: Handling of various variants. (David Fishburn)
sshconfig ftplugin file. (Nikolai Weibull)
Stata and SMCL syntax files. (Jeff Pitblado)
sudoers ftplugin file. (Nikolai Weibull)
sysctl syntax and ftplugin file. (Nikolai Weibull)
terminfo ftplugin file. (Nikolai Weibull)
trustees syntax file. (Nima Talebi)
Vera syntax file. (David Eggum)
udev config, permissions and rules syntax and ftplugin files. (Nikolai Weibull)
updatedb syntax and ftplugin file. (Nikolai Weibull)
VHDL indent file (Gerald Lai)
WSML syntax file. (Thomas Haselwanter)
Xdefaults ftplugin file. (Nikolai Weibull)
XFree86 config ftplugin file. (Nikolai Weibull)
xinetd syntax, indent and ftplugin file. (Nikolai Weibull)
xmodmap ftplugin file. (Nikolai Weibull)
Xquery syntax file. (Jean-Marc Vanel)
xsd (XML schema) indent file.
YAML ftplugin file. (Nikolai Weibull)
Zsh ftplugin file. (Nikolai Weibull)

New Keymaps:

Sinhala (Sri Lanka) (Harshula Jayasuriya)
Tamil in TSCII encoding (Yegappan Lakshmanan)
Greek in cp737 (Panagiotis Louridas)
Polish-slash (HS6_06)
Ukrainian-jcuken (Anatoli Sakhnik)
Kana (Edward L. Fox)

New message translations:

The Ukrainian messages are now also available in cp1251.
Vietnamese message translations and menu. (Phan Vinh Thinh)

Others:

The :read command has the ++edit argument. This means it will use the detected 'fileformat', 'fileencoding' and other options for the buffer. This also fixes the problem that editing a compressed file didn't set these options.

The Netbeans interface was updated for Sun Studio 10. The protocol number goes from 2.2 to 2.3. (Gordon Prieur)

Mac: When starting up Vim will load the $VIMRUNTIME/macmap.vim script to define default command-key mappings. (mostly by Benji Fisher)

Mac: Add the selection type to the clipboard, so that Block, line and character selections can be used between two Vims. (Eckehard Berns)
Also fixes the problem that setting 'clipboard' to "unnamed" breaks using "yyp".

Mac: GUI font selector. (Peter Cucka)

Mac: support for multi-byte characters. (Da Woon Jung)
This doesn't always work properly. If you see text drawing problems try switching the 'macatsui' option off.

Mac: Support the xterm mouse in the non-GUI version.

Mac: better integration with Xcode. Post a fake mouse-up event after the odoc event and the drag receive handler to work around a stall after Vim loads a file. Fixed an off-by-one line number error. (Da Woon Jung)

Mac: When started from Finder change directory to the file being edited or the user home directory.

Added the t_SI and t_EI escape sequences for starting and ending Insert mode. To be used to set the cursor shape to a bar or a block. No default values, they are not supported by termcap/terminfo.

GUI font selector for Motif. (Marcin Dalecki)

Nicer toolbar buttons for Motif. (Marcin Dalecki)

Mnemonics for the Motif find/replace dialog. (Marcin Dalecki)

Included a few improvements for Motif from Marcin Dalecki. Draw label contents ourselves to make them handle fonts in a way configurable by Vim and a bit less dependent on the X11 font management.

Autocommands can be defined local to a buffer. This means they will also work when the buffer does not have a name or no specific name. See

autocmd-buflocal . (Yakov Lerner)

For xterm most combinations of modifiers with function keys are recognized.
xterm-modifier-keys

When 'verbose' is set the output of ":highlight" will show where a highlight item was last set.
When 'verbose' is set the output of the ":map", ":abbreviate", ":command", ":function" and ":autocmd" commands will show where it was last defined. (Yegappan Lakshmanan)

":function /pattern" lists functions matching the pattern.

"1gd" can be used like "gd" but ignores matches in a {} block that ends before the cursor position. Likewise for "1gD" and "gD".

'scrolljump' can be set to a negative number to scroll a percentage of the window height.

The v:scrollstart variable has been added to help find the location in your script that causes the hit-enter prompt.

To make it possible to handle the situation that a file is being edited that is already being edited by another Vim instance, the SwapExists event has been added. The v:swapname , v:swapchoice and v:swapcommand variables can be used, for example to use the client-server functionality to bring the other Vim to the foreground.
When starting Vim with a "-t tag" argument, there is an existing swapfile and the user selects "quit" or "abort" then exit Vim.

Undo now also restores the '< and '> marks. "gv" selects the same area as before the change and undo.

When editing a search pattern for a "/" or "?" command and 'incsearch' is set CTRL-L can be used to add a character from the current match. CTRL-R CTRL-W will add a word, but exclude the part of the word that was already typed.

Ruby interface: add line number methods. (Ryan Paul)

The $MYVIMRC environment variable is set to the first found vimrc file.
The $MYGVIMRC environment variable is set to the first found gvimrc file.

==
IMPROVEMENTS improvements-7

":helpgrep" accepts a language specifier after the pattern: "pat@it".

Moved the help for printing to a separate help file. It's quite a lot now.

When doing completion for ":!cmd", ":r !cmd" or ":w !cmd" executable files are found in $PATH instead of looking for ordinary files in the current directory.

When ":silent" is used and a backwards range is given for an Ex command the range is swapped automatically instead of asking if that is OK.

The pattern matching code was changed from a recursive function to an iterative mechanism. This avoids out-of-stack errors. State is stored in allocated memory, running out of memory can always be detected. Allows matching more complex things, but Vim may seem to hang while doing that.

Previously some options were always evaluated in the sandbox. Now that only happens when the option was set from a modeline or in secure mode. Applies to 'balloonexpr', 'foldexpr', 'foldtext' and 'includeexpr'. (Sumner Hayes)

Some commands and expressions could have nasty side effects, such as using CTRL-R = while editing a search pattern and the expression invokes a function that jumps to another window. The textlock has been added to prevent this from happening.

":breakadd here" and ":breakdel here" can be used to set or delete a breakpoint at the cursor.

It is now possible to define a function with:
```
:exe "func Test()\n ...\n endfunc"
```

The tutor was updated to make it simpler to use and text was added to explain a few more important commands. Used ideas from Gabriel Zachmann.

Unix: When libcall() fails obtain an error message with dlerror() and display it. (Johannes Zellner)

Mac and Cygwin: When editing an existing file make the file name the same case of the edited file. Thus when typing ":e os_UNIX.c" the file name becomes "os_unix.c".

Added "nbsp" in 'listchars'. (David Blanchet)

Added the "acwrite" value for the 'buftype' option. This is for a buffer that does not have a name that refers to a file and is written with BufWriteCmd autocommands.

For lisp indenting and matching parenthesis: (Sergey Khorev)
- square brackets are recognized properly
- #\(, #\), #\[and #\] are recognized as character literals
- Lisp line comments (delimited by semicolon) are recognized

Added the "count" argument to match(), matchend() and matchstr(). (Ilya Sher)

winnr() takes an optional "$" or "#" argument. (Nikolai Weibull, Yegappan Lakshmanan)

Added 's' flag to search(): set ' mark if cursor moved. (Yegappan Lakshmanan)
Added 'n' flag to search(): don't move the cursor. (Nikolai Weibull)
Added 'c' flag to search(): accept match at the cursor.
Added 'e' flag to search(): move to end of the match. (Benji Fisher)
Added 'p' flag to search(): return number of sub-pattern. (Benji Fisher)
These also apply to searchpos(), searchpair() and searchpairpos().

The search() and searchpair() functions have an extra argument to specify where to stop searching. Speeds up searches that should not continue too far.

When uncompressing fails in the gzip plugin, give an error message but don't delete the raw text. Helps if the file has a .gz extension but is not actually compressed. (Andrew Pimlott)

When C, C++ or IDL syntax is used, may additionally load doxygen syntax. (Michael Geddes)

Support setting 'filetype' and 'syntax' to "aaa.bbb" for "aaa" plus "bbb" filetype or syntax.

The ":registers" command now displays multi-byte characters properly.

VMS: In the usage message mention that a slash can be used to make a flag upper case. Add color support to the builtin vt320 terminal codes. (Zoltan Arpadffy)

For the '%' item in 'viminfo', allow a number to set a maximum for the number of buffers.

For recognizing the file type: When a file looks like a shell script, check for an "exec" command that starts the tcl interpreter. (suggested by Alexios Zavras)

Support conversion between utf-8 and latin9 (iso-8859-15) internally, so that digraphs still work when iconv is not available.

When a session file is loaded while editing an unnamed, empty buffer that buffer is wiped out. Avoids that there is an unused buffer in the buffer list.

Win32: When libintl.dll supports bind_textdomain_codeset(), use it. (NAKADAIRA Yukihiro)

Win32: Vim was not aware of hard links on NTFS file systems. These are detected now for when 'backupcopy' is "auto". Also fixed a bogus "file has been changed since reading it" error for links.

When foldtext() finds no text after removing the comment leader, use the second line of the fold. Helps for C-style /* */ comments where the first line is just "/*".

When editing the same file from two systems (e.g., Unix and MS-Windows) there mostly was no warning for an existing swap file, because the name of the edited file differs (e.g., y:\dir\file vs /home/me/dir/file). Added a flag to the swap file to indicate it is in the same directory as the edited file. The used path then doesn't matter and the check for editing the same file is much more reliable.

Unix: When editing a file through a symlink the swap file would use the name of the symlink. Now use the name of the actual file, so that editing the same file twice is detected. (suggestions by Stefano Zacchiroli and James Vega)

Client-server communication now supports 'encoding'. When setting 'encoding'
in a Vim server to "utf-8", and using "vim --remote fname" in a console,
"fname" is converted from the console encoding to utf-8. Also allows Vims
with different 'encoding' settings to exchange messages.

Internal: Changed ga_room into ga_maxlen, so that it doesn't need to be
incremented/decremented each time.

When a register is empty it is not stored in the viminfo file.

Removed the tcltags script, it's obsolete.

":redir @*>>" and ":redir @+>>" append to the clipboard. Better check for
invalid characters after the register name. :redir

":redir => variable" and ":redir =>> variable" write or append to a variable.
(Yegappan Lakshmanan) :redir

":redir @{a-z}>>" appends to register a to z. (Yegappan Lakshmanan)

The 'verbosefile' option can be used to log messages in a file. Verbose
messages are not displayed then. The "-V{filename}" argument can be used to
log startup messages.

":let g:" lists global variables.
":let b:" lists buffer-local variables.
":let w:" lists window-local variables.
":let v:" lists Vim variables.

The stridx() and strridx() functions take a third argument, where to start
searching. (Yegappan Lakshmanan)

The getreg() function takes an extra argument to be able to get the expression
for the '=' register instead of the result of evaluating it.

The setline() function can take a List argument to set multiple lines. When
the line number is just below the last line the line is appended.

g CTRL-G also shows the number of characters if it differs from the number of
bytes.

Completion for ":debug" and entering an expression for the '=' register. Skip
":" between range and command name. (Peter Winters)

CTRL-Q in Insert mode now works like CTRL-V by default. Previously it was
ignored.

When "beep" is included in 'debug' a function or script that causes a beep
will result in a message with the source of the error.

When completing buffer names, match with "\(^\|[\/]\)" instead of "^", so that
":buf stor<Tab>" finds both "include/storage.h" and "storage/main.c".

To count items (pattern matches) without changing the buffer the 'n' flag has
been added to :substitute . See count-items .

In a :substitute command the \u, \U, \l and \L items now also work for
multi-byte characters.

The "screen.linux" $TERM name is recognized to set the default for
'background' to "dark". (Ciaran McCreesh) Also for "cygwin" and "putty".

The FileChangedShell autocommand event can now use the v:fcs_reason
variable that specifies what triggered the event. v:fcs_choice can be used
to reload the buffer or ask the user what to do.

Not all modifiers were recognized for xterm function keys. Added the
possibility in term codes to end in ";*X" or "O*X", where X is any character
and the * stands for the modifier code.
Added the <xUp>, <xDown>, <xLeft> and <xRight> keys, to be able to recognize
the two forms that xterm can send their codes in and still handle all possible
modifiers.

getwinvar() now also works to obtain a buffer-local option from the specified
window.

Added the "%s" item to 'errorformat'. (Yegappan Lakshmanan)
Added the "%>" item to 'errorformat'.

For 'errorformat' it was not possible to have a file name that contains the
character that follows after "%f". For example, in "%f:%l:%m" the file name
could not contain ":". Now include the first ":" where the rest of the
pattern matches. In the example a ":" not followed by a line number is
included in the file name. (suggested by Emanuele Giaquinta)

GTK GUI: use the GTK file dialog when it's available. Mix from patches by
Grahame Bowland and Evan Webb.

Added ":scriptnames" to bugreport.vim, so that we can see what plugins were
used.

Win32: If the user changes the setting for the number of lines a scroll wheel
click scrolls it is now used immediately. Previously Vim would need to be
restarted.

When using @= in an expression the value is expression @= contains. ":let @=
= value" can be used to set the register contents.

A ! can be added to ":popup" to have the popup menu appear at the mouse
pointer position instead of the text cursor.

The table with encodings has been expanded with many MS-Windows codepages,
such as cp1250 and cp737, so that these can also be used on Unix without
prepending "8bit-".
When an encoding name starts with "microsoft-cp" ignore the "microsoft-" part.

Added the "customlist" completion argument to a user-defined command. The

user-defined completion function should return the completion candidates as a Vim List and the returned results are not filtered by Vim. (Yegappan Lakshmanan)

Win32: Balloons can have multiple lines if common controls supports it. (Sergey Khorev)

For command-line completion the matches for various types of arguments are now sorted: user commands, variables, syntax names, etc.

When no locale is set, thus using the "C" locale, Vim will work with latin1 characters, using its own isupper()/toupper()/etc. functions.

When using an rxvt terminal emulator guess the value of 'background' using the COLORFGBG environment variable. (Ciaran McCreesh)

Also support t_SI and t_EI on Unix with normal features. (Ciaran McCreesh)

When 'foldcolumn' is one then put as much info in it as possible. This allows closing a fold with the mouse by clicking on the '-'.

input() takes an optional completion argument to specify the type of completion supported for the input. (Yegappan Lakshmanan)

"dp" works with more than two buffers in diff mode if there is only one where 'modifiable' is set.

The 'diffopt' option has three new values: "horizontal", "vertical" and "foldcolumn".

When the 'include' option contains \zs the file name found is what is being matched from \zs to the end or \ze. Useful to pass more to 'includeexpr'.

Loading plugins on startup now supports subdirectories in the plugin directory. load-plugins

In the foldcolumn always show the '+' for a closed fold, so that it can be opened easily. It may overwrite another character, esp. if 'foldcolumn' is 1.

It is now possible to get the W10 message again by setting 'readonly'. Useful in the FileChangedRO autocommand when checking out the file fails.

Unix: When open() returns EFBIG give an appropriate message.

":mksession" sets the SessionLoad variable to notify plugins. A modeline is added to the session file to set 'filetype' to "vim".

In the ATTENTION prompt put the "Delete it" choice before "Quit" to make it more logical. (Robert Webb)

When appending to a file while the buffer has no name the name of the appended file would be used for the current buffer. But the buffer contents is actually different from the file content. Don't set the file name, unless the 'P' flag is present in 'cpoptions'.

When starting to edit a new file and the directory for the file doesn't exist
then Vim will report "[New DIRECTORY]" instead of "[New File] to give the user
a hint that something might be wrong.

Win32: Preserve the hidden attribute of the viminfo file.

In Insert mode CTRL-A didn't keep the last inserted text when using CTRL-O and
then a cursor key. Now keep the previously inserted text if nothing is
inserted after the CTRL-O. Allows using CTRL-O commands to move the cursor
without losing the last inserted text.

The exists() function now supports checking for autocmd group definition
and for supported autocommand events. (Yegappan Lakshmanan)

Allow using ":global" in the sandbox, it doesn't do anything harmful by
itself.

":saveas asdf.c" will set 'filetype' to c when it's empty. Also for ":w
asdf.c" when it sets the filename for the buffer.

Insert mode completion for whole lines now also searches unloaded buffers.

The colortest.vim script can now be invoked directly with ":source" or
":runtime syntax/colortest.vim".

The 'statusline' option can be local to the window, so that each window can
have a different value. (partly by Yegappan Lakshmanan)

The 'statusline' option and other options that support the same format can now
use these new features:
- When it starts with "%!" the value is first evaluated as an expression
  before parsing the value.
- "%#HLname#" can be used to start highlighting with HLname.

When 'statusline' is set to something that causes an error message then it is
made empty to avoid an endless redraw loop. Also for other options, such at
'tabline' and 'titlestring'. ":verbose set statusline" will mention that it
was set in an error handler.

When there are several matching tags, the ":tag <name>" and CTRL-] commands
jump to the [count] matching tag. (Yegappan Lakshmanan)

Win32: In the batch files generated by the install program, use $VIMRUNTIME or
$VIM if it's set. Example provided by Mathias Michaelis.
Also create a vimtutor.bat batch file.

The 'balloonexpr' option is now global-local .

The system() function now runs in cooked mode, thus can be interrupted by
CTRL-C.

==
COMPILE TIME CHANGES   compile-changes-7

Dropped the support for the BeOS and Amiga GUI. They were not maintained and
probably didn't work. If you want to work on this: get the Vim 6.x version
and merge it back in.

When running the tests and one of them fails to produce "test.out" the
following tests are still executed. This helps when running out of memory.

When compiling with EXITFREE defined and the ccmalloc library, it is possible
to detect memory leaks. Some memory will always be reported as leaked, such
as allocated by X11 library functions and the memory allocated in
alloc_cmdbuff() to store the ":quit" command.

Moved the code for printing to src/hardcopy.c.

Moved some code from main() to separate functions to make it easier to see
what is being done. Using a structure to avoid a lot of arguments to the
functions.

Moved unix_expandpath() to misc1.c, so that it can also be used by os_mac.c
without copying the code.

--- Mac ---

"make" now creates the Vim.app directory and "make install" copies it to its
final destination. (Raf)

Put the runtime directory not directly in Vim.app but in
Vim.app/Contents/Resources/vim, so that it's according to Mac specs.

Made it possible to compile with Motif, Athena or GTK without tricks and still
being able to use the MacRoman conversion. Added the os_mac_conv.c file.

When running "make install" the runtime files are installed as for Unix.
Avoids that too many files are copied. When running "make" a link to the
runtime files is created to avoid a recursive copy that takes much time.

Configure will attempt to build Vim for both Intel and PowerPC. The
--with-mac-arch configure argument can change it.

--- Win32 ---

The Make_mvc.mak file was adjusted to work with the latest MS compilers,
including the free version of Visual Studio 2005. (George Reilly)

INSTALLpc.txt was updated for the recent changes. (George Reilly)

The distributed executable is now produced with the free Visual C++ Toolkit
2003 and other free SDK chunks. msvcsetup.bat was added to support this.

Also generate the .pdb file that can be used to generate a useful crash report
on MS-Windows. (George Reilly)

==

When using PostScript printing on MS-DOS the default 'printexpr' used "lpr" instead of "copy". When 'printdevice' was empty the copy command did not work. Use "LPT1" then.

The GTK font dialog uses a font size zero when the font name doesn't include a size. Use a default size of 10.

This example in the documentation didn't work:
```
    :e `=foo . ".c"`
```
Skip over the expression in `=expr` when looking for comments, |, % and #.

When ":helpgrep" doesn't find anything there is no error message.

"L" and "H" did not take closed folds into account.

Win32: The "-P title" argument stopped at the first title that matched, even when it doesn't support MDI.

Mac GUI: CTRL-^ and CTRL-@ did not work.

"2daw" on "word." at the end of a line didn't include the preceding white space.

Win32: Using FindExecutable() doesn't work to find a program. Use SearchPath() instead. For executable() use $PATHEXT when the program searched for doesn't have an extension.

When 'virtualedit' is set, moving the cursor up after appending a character may move it to a different column. Was caused by auto-formatting moving the cursor and not putting it back where it was.

When indent was added automatically and then moving the cursor, the indent was not deleted (like when pressing ESC). The "I" flag in 'cpoptions' can be used to make it work the old way.

When opening a command-line window, 'textwidth' gets set to 78 by the Vim filetype plugin. Reset 'textwidth' to 0 to avoid lines are broken.

After using cursor(line, col) moving up/down doesn't keep the same column.

Win32: Borland C before 5.5 requires using ".u." for LowPart and HighPart fields. (Walter Briscoe)

On Sinix SYS_NMLN isn't always defined. Define it ourselves. (Cristiano De Michele)

Printing with PostScript may keep the printer waiting for more. Append a CTRL-D to the printer output. (Mike Williams)

When converting a string with a hex or octal number the leading '-' was ignored. ":echo '-05' + 0" resulted in 5 instead of -5.

Using "@:" to repeat a command line didn't work when it contains control characters. Also remove "'<,'>" when in Visual mode to avoid that it appears twice.

When using file completion for a user command, it would not expand environment variables like for a regular command with a file argument.

'cindent': When the argument of a #define looks like a C++ class the next line is indented too much.

When 'comments' includes multi-byte characters inserting the middle part and alignment may go wrong. 'cindent' also suffers from this for right-aligned items.

Win32: when 'encoding' is set to "utf-8" getenv() still returns strings in the active codepage. Convert to utf-8. Also for $HOME.

The default for 'helplang' was "zh" for both "zh_cn" and "zh_tw". Now use "cn" or "tw" as intended.

When 'bin' is set and 'eol' is not set then line2byte() added the line break after the last line while it's not there.

Using foldlevel() in a WinEnter autocommand may not work. Noticed when resizing the GUI shell upon startup.

Python: Using buffer.append(f.readlines()) didn't work. Allow appending a string with a trailing newline. The newline is ignored.

When using the ":saveas f2" command for buffer "f1", the Buffers menu would contain "f2" twice, one of them leading to "f1". Also trigger the BufFilePre and BufFilePost events for the alternate buffer that gets the old name.

strridx() did not work well when the needle is empty. (Ciaran McCreesh)

GTK: Avoid a potential hang in gui_mch_wait_for_chars() when input arrives just before it is invoked

VMS: Occasionally CR characters were inserted in the file. Expansion of environment variables was not correct. (Zoltan Arpadffy)

UTF-8: When 'delcombine' is set "dw" only deleted the last combining character from the first character of the word.

When using ":sball" in an autocommand only the filetype in one buffer was detected. Reset did_filetype in enter_buffer().

When using ":argdo" and the window already was at the first argument index, but not actually editing it, the current buffer would be used instead.

When ":next dir/*" includes many matches, adding the names to the argument list may take an awful lot of time and can't be interrupted. Allow interrupting this.

When editing a file that was already loaded in a buffer, modelines were not used. Now window-local options in the modeline are set. Buffer-local options and global options remain unmodified.

Win32: When 'encoding' is set to "utf-8" in the vimrc file, files from the command line with non-ASCII characters are not used correctly. Recode the file names when 'encoding' is set, using the Unicode command line.

Win32 console: When the default for 'encoding' ends up to be "latin1", the default value of 'isprint' was wrong.

When an error message is given while waiting for a character (e.g., when an xterm reports the number of colors), the hit-enter prompt overwrote the last line. Don't reset msg_didout in normal_cmd() for K_IGNORE.

Mac GUI: Shift-Tab didn't work.

When defining tooltip text, don't translate terminal codes, since it's not going to be used like a command.

GTK 2: Check the tooltip text for valid utf-8 characters to avoid getting a GTK error. Invalid characters may appear when 'encoding' is changed.

GTK 2: Add a safety check for invalid utf-8 sequences, they can crash pango.

Win32: When 'encoding' is changed while starting up, use the Unicode command line to convert the file arguments to 'encoding'. Both for the GUI and the console version.

Win32 GUI: latin9 text (iso-8859-15) was not displayed correctly, because there is no codepage for latin9. Do our own conversion from latin9 to UCS2.

When two versions of GTK+ 2 are installed it was possible to use the header files from one and the library from the other. Use GTK_LIBDIR to put the directory for the library early in the link flags.

With the GUI find/replace dialog a replace only worked if the pattern was literal text. Now it works for any pattern.

When 'equalalways' is set and 'eadirection' is "hor", ":quit" would still cause equalizing window heights in the vertical direction.

When ":emenu" is used in a startup script the command was put in the typeahead buffer, causing a prompt for the crypt key to be messed up.

Mac OS/X: The default for 'isprint' included characters 128-160, causes problems for Terminal.app.

When a syntax item with "containedin" is used, it may match in the start or end of a region with a matchgroup, while this doesn't happen for a "contains" argument.

When a transparent syntax items matches in another item where the highlighting has already stopped (because of a he= argument), the highlighting would come

back.

When cscope is used to set the quickfix error list, it didn't get set if there was only one match. (Sergey Khorev)

When 'confirm' is set and using ":bdel" in a modified buffer, then selecting "cancel", would still give an error message.

The PopUp menu items that started Visual mode didn't work when not in Normal mode. Switching between selecting a word and a line was not possible.

Win32: The keypad decimal point always resulted in a '.', while on some keyboards it's a ','. Use MapVirtualKey(VK_DECIMAL, 2).

Removed unused function DisplayCompStringOpaque() from gui_w32.c

In Visual mode there is not always an indication whether the line break is selected or not. Highlight the character after the line when the line break is included, e.g., after "v$o".

GTK: The <F10> key can't be mapped, it selects the menu. Disable that with a GTK setting and do select the menu when <F10> isn't mapped. (David Necas)

After "Y" '[and '] were not at start/end of the yanked text.

When a telnet connection is dropped Vim preserves files and exits. While doing that a SIGHUP may arrive and disturb us, thus ignore it. (Scott Anderson) Also postpone SIGHUP, SIGQUIT and SIGTERM until it's safe to handle. Added handle_signal().

When completing a file name on the command line backslashes are required for white space. Was only done for a space, not for a Tab.

When configure could not find a terminal library, compiling continued for a long time before reporting the problem. Added a configure check for tgetent() being found in a library.

When the cursor is on the first char of the last line a ":g/pat/s///" command may cause the cursor to be displayed below the text.

Win32: Editing a file with non-ASCII characters doesn't work when 'encoding' is "utf-8". use _wfullpath() instead of _fullpath(). (Yu-sung Moon)

When recovering the 'fileformat' and 'fileencoding' were taken from the original file instead of from the swapfile. When the file didn't exist, was empty or the option was changed (e.g., with ":e ++fenc=cp123 file") it could be wrong. Now store 'fileformat' and 'fileencoding' in the swapfile and use the values when recovering.

":bufdo g/something/p" overwrites each last printed text line with the file message for the next buffer. Temporarily clear 'shortmess' to avoid that.

Win32: Cannot edit a file starting with # with --remote. Do escape % and # when building the ":drop" command.

A comment or | just after an expression-backtick argument was not recognized.
E.g. in :e `="foo"`"comment.

"(" does not stop at an empty sentence (single dot and white space) while ")"
does. Also breaks "das" on that dot.

When doing "yy" with the cursor on a TAB the ruler could be wrong and "k"
moved the cursor to another column.

When 'commentstring' is '"%s' and there is a double quote in the line a double
quote before the fold marker isn't removed in the text displayed for a closed
fold.

In Visual mode, when 'bin' and 'eol' set, g CTRL-G counted the last line
break, resulting in "selected 202 of 201 bytes".

Motif: fonts were not used for dialog components. (Marcin Dalecki)

Motif: After using a toolbar button the keyboard focus would be on the toolbar
(Lesstif problem). (Marcin Dalecki)

When using "y<C-V>`x" where mark x is in the first column, the last line was
not included.

Not all test scripts work properly on MS-Windows when checked out from CVS.
Use a Vim command to fix all fileformats to dos before executing the tests.

When using ":new" and the file fits in the window, lines could still be above
the window. Now remove empty lines instead of keeping the relative position.

Cmdline completion didn't work after ":let var1 var<Tab>".

When using ":startinsert" or ":startreplace" when already in Insert mode
(possible when using CTRL-R =), pressing Esc would directly restart Insert
mode. (Peter Winters)

"2daw" didn't work at end of file if the last word is a single character.

Completion for ":next a'<Tab>" put a backslash before single quote, but it was
not removed when editing a file. Now halve backslashes in save_patterns().
Also fix expanding a file name with the shell that contains "\'".

When doing "1,6d|put" only "fewer lines" was reported. Now a following "more
lines" overwrites the message.

Configure could not handle "-Dfoo=long\ long" in the TCL config output.

When searching backwards, using a pattern that matches a newline and uses \zs
after that, didn't find a match. Could also get a hang or end up in the right
column in the wrong line.

When $LANG is "sl" for slovenian, the slovak menu was used, since "slovak"
starts with "sl".

When 'paste' is set in the GUI the Paste toolbar button doesn't work. Clear 'paste' when starting the GUI.

A message about a wrong viminfo line included the trailing NL.

When 'paste' is set in the GUI the toolbar button doesn't work in Insert mode. Use ":exe" in menu.vim to avoid duplicating the commands, instead of using a mapping.

Treat "mlterm" as an xterm-like terminal. (Seiichi Sato)

":z.4" and ":z=4" didn't work Vi compatible.

When sourcing a file, editing it and sourcing it again, it could appear twice in ":scriptnames" and get a new <SID>, because the inode has changed.

When $SHELL is set but empty the 'shell' option would be empty. Don't use an empty $SHELL value.

A command "w! file" in .vimrc or $EXINIT didn't work. Now it writes an empty file.

When a CTRL-F command at the end of the file failed, the cursor was still moved to the start of the line. Now it remains where it is.

When using ":s" or "&" to repeat the last substitute and "$" was used to put the cursor in the last column, put the cursor in the last column again. This is Vi compatible.

Vim is not fully POSIX compliant but sticks with traditional Vi behavior. Added a few flags in 'cpoptions' to behave the POSIX way when wanted. The $VIM_POSIX environment variable is checked to set the default.

Appending to a register didn't insert a line break like Vi. Added the '>' flag to 'cpoptions' for this.

Using "I" in a line with only blanks appended to the line. This is not Vi compatible. Added the 'H' flag in 'cpoptions' for this.

When joining multiple lines the cursor would be at the last joint, but Vi leaves it at the position where "J" would put it. Added the 'q' flag in 'cpoptions' for this.

Autoindent didn't work for ":insert" and ":append".

Using ":append" in an empty buffer kept the dummy line. Now it's deleted to be Vi compatible.

When reading commands from a file and stdout goes to a terminal, would still request the xterm version. Vim can't read it, thus the output went to the shell and caused trouble there.

When redirecting to a register with an invalid name the redirection would

still be done (after an error message). Now reset "redir_reg". (Yegappan Lakshmanan)

It was not possible to use a NL after a backslash in Ex mode. This is sometimes used to feed multiple lines to a shell command.

When 'cmdheight' is set to 2 in .vimrc and the GUI uses the number of lines from the terminal we actually get 3 lines for the cmdline in gvim.

When setting $HOME allocated memory would leak.

Win32: bold characters may sometimes write in another character cell. Use unicodepdy[] as for UTF-8. (Taro Muraoka)

":w fname" didn't work for files with 'buftype' set to "nofile".

The method used to locate user commands for completion differed from when they are executed. Ambiguous command names were not completed properly.

Incremental search may cause a crash when there is a custom statusline that indirectly invokes ":normal".

Diff mode failed when $DIFF_OPTIONS was set in the environment. Unset it before invoking "diff".

Completion didn't work after ":argdo", ":windo" and ":bufdo". Also for ":set &l:opt" and ":set &g:opt". (Peter Winters)

When setting 'ttymouse' to "dec" in an xterm that supports the DEC mouse locator it doesn't work. Now switch off the mouse before selecting another mouse model.

When the CursorHold event is triggered and the commands peek for typed characters the typeahead buffer may be messed up, e.g., when a mouse-up event is received. Avoid invoking the autocommands from the function waiting for a character, let it put K_CURSORHOLD in the input buffer.

Removed the "COUNT" flag from ":argadd", to avoid ":argadd 1*" to be used like ":1argadd *". Same for ":argdelete" and ":argedit".

Avoid that $LANG is used for the menus when LC_MESSAGES is "en_US".

Added backslashes before dashes in the vim.1 manual page to make them appear as real dashes. (Pierre Habouzit)

Where "gq" left the cursor depended on the value of 'formatprg'. Now "gq" always leaves the cursor at the last line of the formatted text.

When editing a compressed file, such as "changelog.Debian.gz" file, filetype detection may try to check the contents of the file while it's still compressed. Skip setting 'filetype' for compressed files until they have been decompressed. Required for patterns that end in a "*".

Starting with an argument "+cmd" or "-S script" causes the cursor to be moved

to the first line. That breaks a BufReadPost autocommand that uses g`".
Don't move the cursor if it's somewhere past the first line.

"gg=G" while 'modifiable' is off was uninterruptible.

When 'encoding' is "sjis" inserting CTRL-V u d800 a few times causes a crash.
Don't insert a DBCS character with a NUL second byte.

In Insert mode CTRL-O <Home> didn't move the cursor. Made "ins_at_eol" global
and reset it in nv_home().

Wildcard expansion failed: ":w /tmp/$$.`echo test`". Don't put quotes around
spaces inside backticks.

After this sequence of commands: Y V p gv: the wrong line is selected. Now
let "gv" select the text that was put, since the original text is deleted.
This should be the most useful thing to do.

":sleep 100u" sleeps for 100 seconds, not 100 usec as one might expect. Give
an error message when the argument isn't recognized.

In gui_mch_draw_string() in gui_w32.c "unibuflen" wasn't static, resulting in
reallocating the buffer every time. (Alexei Alexandrov)

When using a Python "atexit" function it was not invoked when Vim exits. Now
call Py_Finalize() for that. (Ugo Di Girolamo)
This breaks the thread stuff though, fixed by Ugo.

GTK GUI: using a .vimrc with "set cmdheight=2 lines=43" and ":split" right
after startup, the window layout is messed up. (Michael Schaap) Added
win_new_shellsize() call in gui_init() to fix the topframe size.

Trick to get ...MOUSE_NM not used when there are vertical splits. Now pass
column -1 for the left most window and add MOUSE_COLOFF for others. Limits
mouse column to 10000.

searchpair() may hang when the end pattern has "\zs" at the end. Check that
we find the same position again and advance one character.

When in diff mode and making a change that causes the "changed" highlighting
to disappear or reappear, it was still highlighted in another window.

When a ":next" command fails because the user selects "Abort" at the ATTENTION
prompt the argument index was advanced anyway.

When "~" is in 'iskeyword' the "gd" doesn't work, it's used for the previous
substitute pattern. Put "\V" in the pattern to avoid that.

Use of sprintf() sometimes didn't check properly for buffer overflow. Also
when using smsg(). Included code for snprintf() to avoid having to do size
checks where invoking them

":help \=<Tab>" didn't find "sub-replace-\=". Wild menu for help tags didn't
show backslashes. ":he :s\=" didn't work.

When reading an errorfile "~/" in a file name was not expanded.

GTK GUI: When adding a scrollbar (e.g. when using ":vsplit") in a script or removing it the window size may change. GTK sends us resize events when we change the window size ourselves, but they may come at an unexpected moment. Peek for a character to get any window resize events and fix 'columns' and 'lines' to undo this.

When using the GTK plug mechanism, resizing and focus was not working properly. (Neil Bird)

After deleting files from the argument list a session file generated with ":mksession" may contain invalid ":next" commands.

When 'shortmess' is empty and 'keymap' set to accents, in Insert mode CTRL-N may cause the hit-enter prompt. Typing 'a then didn't result in the accented character. Put the character typed at the prompt back in the typeahead buffer so that mapping is done in the right mode.

setbufvar() and setwinvar() did not give error messages.

It was possible to set a variable with an illegal name, e.g. with setbufvar(). It was possible to define a function with illegal name, e.t. ":func F{-1}()"

CTRL-W F and "gf" didn't use the same method to get the file name.

When reporting a conversion error the line number of the last error could be given. Now report the first encountered error.

When using ":e ++enc=name file" and iconv() was used for conversion an error caused a fall-back to no conversion. Now replace a character with '?' and continue.

When opening a new buffer the local value of 'bomb' was not initialized from the global value.

Win32: When using the "Edit with Vim" entry the file name was limited to about 200 characters.

When using command line completion for ":e *foo" and the file "+foo" exists the resulting command ":e +foo" doesn't work. Now insert a backslash: ":e \+foo".

When the translation of "-- More --" was not 10 characters long the following message would be in the wrong position.

At the more-prompt the last character in the last line wasn't drawn.

When deleting non-existing text while 'virtualedit' is set the '[and '] marks were not set.

Win32: Could not use "**/" in 'path', it had to be "**\".

The search pattern "\n" did not match at the end of the last line.

Searching for a pattern backwards, starting on the NUL at the end of the line and 'encoding' is "utf-8" would match the pattern just before it incorrectly. Affected searchpair('/*', '', '*/').

For the Find/Replace dialog it was possible that not finding the text resulted in an error message while redrawing, which cleared the syntax highlighting while it was being used, resulting in a crash. Now don't clear syntax highlighting, disable it with b_syn_error.

Win32: Combining UTF-8 characters were drawn on the previous character. Could be noticed with a Thai font.

Output of ":function" could leave some of the typed text behind. (Yegappan Lakshmanan)

When the command line history has only a few lines the command line window would be opened with these lines above the first window line.

When using a command line window for search strings ":qa" would result in searching for "qa" instead of quitting all windows.

GUI: When scrolling with the scrollbar and there is a line that doesn't fit redrawing may fail. Make sure w_skipcol is valid before redrawing.

Limit the values of 'columns' and 'lines' to avoid an overflow in Rows * Columns. Fixed bad effects when running out of memory (command line would be reversed, ":qa!" resulted in ":!aq").

Motif: "gvim -iconic" opened the window anyway. (David Harrison)

There is a tiny chance that a symlink gets created between checking for an existing file and creating a file. Use the O_NOFOLLOW for open() if it's available.

In an empty line "ix<CTRL-O>0" moved the cursor to after the line instead of sticking to the first column.

When using ":wq" and a BufWriteCmd autocmd uses inputsecret() the text was echoed anyway. Set terminal to raw mode in getcmdline().

Unix: ":w a;b~c" caused an error in expanding wildcards.

When appending to a file with ":w >>fname" in a buffer without a name, causing the buffer to use "fname", the modified flag was reset.

When appending to the current file the "not edited" flag would be reset. ":w" would overwrite the file accidentally.

Unix: When filtering text with an external command Vim would still read input, causing text typed for the command (e.g., a password) to be eaten and echoed. Don't read input when the terminal is in cooked mode.

The Cygwin version of xxd used CR/LF line separators. (Corinna Vinschen)

Unix: When filtering text through a shell command some resulting text may be dropped. Now after detecting that the child has exited try reading some more of its output.

When inside input(), using "CTRL-R =" and the expression throws an exception the command line was not abandoned but it wasn't used either. Now abandon typing the command line.

'delcombine' was also used in Visual and Select mode and for commands like "cl". That was illogical and has been disabled.

When recording while a CursorHold autocommand was defined special keys would appear in the register. Now the CursorHold event is not triggered while recording.

Unix: the src/configure script used ${srcdir-.}, not all shells understand that. Use ${srcdir:-.} instead.

When editing file "a" which is a symlink to file "b" that doesn't exist, writing file "a" to create "b" and then ":split b" resulted in two buffers on the same file with two different swapfile names. Now set the inode in the buffer when creating a new file.

When 'esckeys' is not set don't send the xterm code to request the version string, because it may cause trouble in Insert mode.

When evaluating an expression for CTRL-R = on the command line it was possible to call a function that opens a new window, resulting in errors for incremental search, and many other nasty things were possible. Now use the textlock to disallow changing the buffer or jumping to another window to protect from unexpected behavior. Same for CTRL-\ e.

"d(" deleted the character under the cursor, while the documentation specified an exclusive motion. Vi also doesn't delete the character under the cursor.

Shift-Insert in Insert mode could put the cursor before the last character when it just fits in the window. In coladvance() don't stop at the window edge when filling with spaces and when in Insert mode. In mswin.vim avoid getting a beep from the "l" command.

Win32 GUI: When Alt-F4 is used to close the window and Cancel is selected in the dialog then Vim would insert <M-F4> in the text. Now it's ignored.

When ":silent! {cmd}" caused the swap file dialog, which isn't displayed, there would still be a hit-enter prompt.

Requesting the termresponse (t_RV) early may cause problems with "-c" arguments that invoke an external command or even "-c quit". Postpone it until after executing "-c" arguments.

When typing in Insert mode so that a new line is started, using CTRL-G u to break undo and start a new change, then joining the lines with <BS> caused

undo info to be missing. Now reset the insertion start point.

Syntax HL: When a region start match has a matchgroup and an offset that
happens to be after the end of the line then it continued in the next line and
stopped at the region end match, making the region continue after that.
Now check for the column being past the end of the line in syn_add_end_off().

When changing a file, setting 'swapfile' off and then on again, making another
change and killing Vim, then some blocks may be missing from the swapfile.
When 'swapfile' is switched back on mark all blocks in the swapfile as dirty.
Added mf_set_dirty().

Expanding wildcards in a command like ":e aap;<>!" didn't work. Put
backslashes before characters that are special to the shell. (Adri Verhoef)

A CursorHold autocommand would cause a message to be cleared. Don't show the
special key for the event for 'showcmd'.

When expanding a file name for a shell command, as in "!cmd foo<Tab>" or ":r
!cmd foo<Tab>" also escape characters that are special for the shell:
"!;&()<>".

When the name of the buffer was set by a ":r fname" command cpo-f no
autocommands were triggered to notify about the change in the buffer list.

In the quickfix buffer 'bufhidden' was set to "delete", which caused closing
the quickfix window to leave an unlisted "No Name" buffer behind every time.

Win32: when using two screens of different size, setting 'lines' to a large
value didn't fill the whole screen. (SungHyun Nam)

Win32 installer: The generated _vimrc contained an absolute path to diff.exe.
After upgrading it becomes invalid. Now use $VIMRUNTIME instead.

The command line was cleared to often when 'showmode' was set and ":silent
normal vy" was used. Don't clear the command line unless the mode was
actually displayed. Added the "mode_displayed" variable.

The "load session" toolbar item could not handle a space or other special
characters in v:this_session.

":set sta ts=8 sw=4 sts=2" deleted 4 spaces halfway a line instead of 2.

In a multi-byte file the foldmarker could be recognized in the trail byte.
(Taro Muraoka)

Pasting with CTRL-V and menu didn't work properly when some commands are
mapped. Use ":normal!" instead of ":normal". (Tony Apuzzo)

Crashed when expanding a file name argument in backticks.

In some situations the menu and scrollbar didn't work, when the value contains
a CSI byte. (Yukihiro Nakadaira)

GTK GUI: When drawing the balloon focus changes and we might get a key release event that removed the balloon again. Ignore the key release event.

'titleold' was included in ":mkexrc" and ":mksession" files.

":set background&" didn't use the same logic as was used when starting up.

When "umask" is set such that nothing is writable then the viminfo file would be written without write permission. (Julian Bridle)

Motif: In diff mode dragging one scrollbar didn't update the scrollbar of the other diff'ed window.

When editing in an xterm with a different number of colors than expected the screen would be cleared and redrawn, causing the message about the edited file to be cleared. Now set "keep_msg" to redraw the last message.

For a color terminal: When the Normal HL uses bold, possibly to make the color lighter, and another HL group specifies a color it might become light as well. Now reset bold if a HL group doesn't specify bold itself.

When using 256 color xterm the color 255 would show up as color 0. Use a short instead of a char to store the color number.

ml_get errors when searching for "\n\zs" in an empty file.

When selecting a block and using "$" to select until the end of every line and not highlighting the character under the cursor the first character of the block could be unhighlighted.

When counting words for the Visual block area and using "$" to select until the end of every line only up to the length of the last line was counted.

"dip" in trailing empty lines left one empty line behind.

The script ID was only remembered globally for each option. When a buffer- or window-local option was set the same "last set" location was changed for all buffers and windows. Now remember the script ID for each local option separately.

GUI: The "Replace All" button didn't handle backslashes in the replacement in the same way as "Replace". Escape backslashes so that they are taken literally.

When using Select mode from Insert mode and typing a key, causing lines to be deleted and a message displayed, delayed the effect of inserting the key. Now overwrite the message without delay.

When 'whichwrap' includes "l" then "dl" and "yl" on a single letter line worked differently. Now recognize all operators when using "l" at the end of a line.

GTK GUI: when the font selector returned a font name with a comma in it then it would be handled like two font names. Now put a backslash before the

comma.

MS-DOS, Win32: When 'encoding' defaults to "latin1" then the value for
'iskeyword' was still for CPxxx. And when 'nocompatible' was set 'isprint'
would also be the wrong value.

When a command was defined not to take arguments and no '|' no warning message
would be given for using a '|'. Also with ":loadkeymap".

Motif: When using a fontset and 'encoding' is "utf-8" and sizeof(wchar_t) !=
sizeof(XChar2b) then display was wrong. (Yukihiro Nakadaira)

":all" always set the current window to the first window, even when it
contains a buffer that is not in the argument list (can't be closed because it
is modified). Now go to the window that has the first item of the argument
list.

GUI: To avoid left-over pixels from bold text all characters after a character
with special attributes were redrawn. Now only do this for characters that
actually are bold. Speeds up displaying considerably.

When only highlighting changes and the text is scrolled at the same time
everything is redrawn instead of using a scroll and updating the changed text.
E.g., when using ":match" to highlight a paren that the cursor landed on.
Added SOME_VALID: Redraw the whole window but also try to scroll to minimize
redrawing.

Win32: When using Korean IME making it active didn't work properly. (Moon,
Yu-sung, 2005 March 21)

Ruby interface: when inserting/deleting lines display wasn't updated. (Ryan
Paul)

--- fixes since Vim 7.0b ---

Getting the GCC version in configure didn't work with Solaris sed. First
strip any "darwin." and then get the version number.

The "autoload" directory was missing from the self-installing executable for
MS-Windows.

The MS-Windows install program would find "vimtutor.bat" in the install
directory. After changing to "c:" also change to "\" to avoid looking in the
install directory.

To make the 16 bit DOS version compile exclude not used highlight
initializations and build a tiny instead of small version.

finddir() and findfile() accept a negative count and return a List then.

The Python indent file contained a few debugging statements, removed.

Expanding {} for a function name, resulting in a name starting with "s:" was
not handled correctly.

Spelling: renamed COMPOUNDMAX to COMPOUNDWORDMAX. Added several items to be able to handle the new Hungarian dictionary.

Mac: Default to building for the current platform only, that is much faster than building a universal binary. Also, using Perl/Python/etc. only works for the current platform.

The time on undo messages disappeared for someone. Using %T for strftime() apparently doesn't work everywhere. Use %H:%M:%S instead.

Typing BS at the "z=" prompt removed the prompt.

--- fixes and changes since Vim 7.0c ---

When jumping to another tab page the Vim window size was always set, even when nothing in the layout changed.

Win32 GUI tab pages line wasn't always enabled. Do a proper check for the compiler version.

Win32: When switching between tab pages the Vim window was moved when part of it was outside of the screen. Now only do that in the direction of a size change.

Win32: added menu to GUI tab pages line. (Yegappan Lakshmanan)

Mac: Added document icons. (Benji Fisher)

Insert mode completion: Using Enter to accept the current match causes confusion. Use CTRL-Y instead. Also, use CTRL-E to go back to the typed text.

GUI: When there are left and right scrollbars, ":tabedit" kept them instead of using the one that isn't needed.

Using "gP" to replace al the text could leave the cursor below the last line, causing ml_get errors.

When 'cursorline' is set don't use the highlighting when Visual mode is active, otherwise it's difficult to see the selected area.

The matchparen plugin restricts the search to 100 lines, to avoid a long delay when there are closed folds.

Sometimes using CTRL-X s to list spelling suggestions used text from another line.

Win32: Set the default for 'isprint' back to the wrong default "@,~-255", because many people use Windows-1252 while 'encoding' is "latin1".

GTK: Added a workaround for gvim crashing when used over an untrusted ssh link, caused by GTK doing something nasty. (Ed Catmur)

Win32: The font used for the tab page labels is too big. Use the system menu font. (George Reilly)

Win32: Adjusting the window position and size to keep it on the screen didn't work properly when the taskbar is on the left or top of the screen.

The installman.sh and installml.sh scripts use ${10}, that didn't work with old shells. And use "test -f" instead of "test -e".

Win32: When 'encoding' was set in the vimrc then a directory argument for diff mode didn't work.

GUI: at the inputlist() prompt the cursorshape was adjusted as if the windows were still at their old position.

The parenmatch plugin didn't remember the highlighting per window.

Using ":bd" for a buffer that's the current window in another tab page caused a crash.

For a new tab page the 'scroll' option wasn't set to a good default.

Using an end offset for a search "/pat/e" didn't work properly for multi-byte text. (Yukihiro Nakadaira)

":s/\n/,/" doubled the text when used on the last line.

When "search" is in 'foldopen' "[s" and "]s" now open folds.

When using a numbered function "dict" can be omitted, but "self" didn't work then. Always add FC_DICT to the function flags when it's part of a dictionary.

When "--remote-tab" executes locally it left an empty tab page.

"gvim -u NONE", ":set cursorcolumn", "C" in the second line didn't update text. Do update further lines even though the "$" is displayed.

VMS: Support GTK better, also enable +clientserver. (Zoltan Arpadffy)

When highlighting of statusline or tabline is changed there was no redraw to show the effect.

Mac: Added "CFBundleIdentifier" to infplist.xml.

Added tabpage-local variables t:var.

Win32: Added double-click in tab pages line creates new tab. (Yegappan Lakshmanan)

Motif: Added GUI tab pages line. (Yegappan Lakshmanan)

Fixed crash when 'lines' was set to 1000 in a modeline.

When init_spellfile() finds a writable directory in 'runtimepath' but it doesn't contain a "spell" directory, create one.

Win32: executable() also finds "xxd" in the directory where Vim was started, but "!xxd" doesn't work. Append the Vim starting directory to $PATH.

The tab page labels are shortened, directory names are reduced to a single letter by default. Added the pathshorten() function to allow a user to do the same.

":saveas" now resets 'readonly' if the file was successfully written.

Set $MYVIMRC file to the first found .vimrc file.
Set $MYGVIMRC file to the first found .gvimrc file.
Added menu item "Startup Settings" that edits the $MYVIMRC file

Added matcharg().

Error message E745 appeared twice. Renamed one to E786.

Fixed crash when using "au BufRead * Sexplore" and doing ":help". Was wiping out a buffer that's still in a window.

":hardcopy" resulted in an error message when 'encoding' is "utf-8" and 'printencoding' is empty. Now it assumes latin1. (Mike Williams)

The check for the toolbar feature for Motif, depending on certain included files, wasn't detailed enough, causing building to fail in gui_xmebw.c.

Using CTRL-E in Insert mode completion after CTRL-P inserted the first match instead of the original text.

When displaying a UTF-8 character with a zero lower byte Vim might think the previous character is double-wide.

The "nbsp" item of 'listchars' didn't work when 'encoding' was utf-8.

Motif: when Xm/xpm.h is missing gui_xmebw.c would not compile.
HAVE_XM_UNHIGHLIGHTT_H was missing a T.

Mac: Moved the .icns files into src/os_mac_rsrc, so that they can all be copied at once. Adjusted the Info.plist file for three icons.

When Visual mode is active while switching to another tabpage could get ml_get errors.

When 'list' is set, 'nowrap' the $ in the first column caused 'cursorcolumn' to move to the right.

When a line wraps, 'cursorcolumn' was never displayed past the end of the line.

'autochdir' was only available when compiled with NetBeans and GUI. Now it's a separate feature, also available in the "big" version.

Added CTRL-W gf: open file under cursor in new tab page.

When using the menu in the tab pages line, "New Tab" opens the new tab before where the click was. Beyond the labels the new tab appears at the end instead of after the current tab page.

Inside a mapping with an expression getchar() could not be used.

When vgetc is used recursively vgetc_busy protects it from being used recursively. But after a ":normal" command the protection was reset.

":s/a/b/n" didn't work when 'modifiable' was off.

When $VIMRUNTIME includes a multi-byte character then rgb.txt could not be found. (Yukihiro Nakadaira)

":mkspell" didn't work correctly for non-ASCII affix flags when conversion is needed on the spell file.

glob('/dir/\$ABC/*') didn't work.

When using several tab pages and changing 'cmdheight' the display could become messed up. Now store the value of 'cmdheight' separately for each tab page.

The user of the Enter key while the popup menu is visible was still confusing. Now use Enter to select the match after using a cursor key.

Added "usetab" to 'switchbuf'.

--- fixes and changes since Vim 7.0d ---

Added CTRL-W T: move a window to a new tab page.

Using CTRL-X s in Insert mode to complete spelling suggestions and using BS deleted characters before the bad word.

A few small fixes for the VMS makefile. (Zoltan Arpadffy)

With a window of 91 lines 45 cols, ":vsp" scrolled the window. Copy w_wrow when splitting a window and skip setting the height when it's already at the right value.

Using <silent> in a mapping with a shell command and the GUI caused redraw to use wrong attributes.

Win32: Using MSVC 4.1 for install.exe resulted in the start menu items to be created in the administrator directory instead of "All Users". Define the CSIDL_ items if they are missing.

Motif: The GUI tabline did not use the space above the right scrollbar. Work around a bug in the Motif library. (Yegappan Lakshmanan)

The extra files for XML Omni completion are now also installed.
 xml-omni-datafile

GTK GUI: when 'm' is missing from 'guioptions' during startup and pressing
<F10> GTK produced error messages. Now do create the menu but disable it just
after the first gui_mch_update().

":mkspell" doesn't work well with the Hungarian dictionary from the Hunspell
project. Back to the Myspell dictionary.

In help files hide the | used around tags.

Renamed pycomplete to pythoncomplete.

Added "tabpages" to 'sessionoptions'.

When 'guitablabel' is set the effect wasn't visible right away.

Fixed a few 'cindent' errors.

When completing menu names, e.g., after ":emenu", don't sort the entries but
keep them in the original order.

Fixed a crash when editing a directory in diff mode. Don't trigger
autocommands when executing the diff command.

Getting a keystroke could get stuck if 'encoding' is a multi-byte encoding and
typing a special key.

When 'foldignore' is set the folds were not updated right away.

When a list is indexed with [a : b] and b was greater than the length an error
message was given. Now silently truncate the result.

When using BS during Insert mode completion go back to the original text, so
that CTRL-N selects the first matching entry.

Added the 'M' flag to 'cinoptions'.

Win32: Make the "gvim --help" window appear in the middle of the screen
instead of at an arbitrary position. (Randall W. Morris)

Added gettabwinvar() and settabwinvar().

Command line completion: pressing <Tab> after ":e /usr/*" expands the whole
tree, because it becomes ":e /usr/**". Don't add a star if there already is
one.

Added grey10 to grey90 to all GUIs, so that they can all be used for
initializing highlighting. Use grey40 for CursorColumn and CursorLine when
'background' is "dark".

When reading a file and using iconv for conversion, an incomplete byte
sequence at the end caused problems. (Yukihiro Nakadaira)

--- fixes and changes since Vim 7.0e ---

Default color for MatchParen when 'background' is "dark" is now DarkCyan.

":syn off" had to be used twice in a file that sets 'syntax' in a modeline.
(Michael Geddes)

When using ":vsp" or ":sp" the available space wasn't used equally between
windows. (Servatius Brandt)

Expanding <cWORD> on a trailing blank resulted in the first word in the line
if 'encoding' is a multi-byte encoding.

Spell checking: spellbadword() didn't see a missing capital in the first word
of a line. Popup menu now only suggest the capitalized word when appropriate.

When using whole line completion CTRL-L moves through the matches but it
didn't work when at the original text.

When completion finds the longest match, don't go to the first match but stick
at the original text, so that CTRL-N selects the first one.

Recognize "zsh-beta" like "zsh" for setting the 'shellpipe' default. (James
Vega)

When using ":map <expr>" and the expression results in something with a
special byte (NUL or CSI) then it didn't work properly. Now escape special
bytes.

The default Visual highlighting for a color xterm with 8 colors was a magenta
background, which made magenta text disappear. Now use reverse in this
specific situation.

After completing the longest match "." didn't insert the same text. Repeating
also didn't work correctly for multi-byte text.

When using Insert mode completion and BS the whole word that was completed
would result in all possible matches. Now stop completion. Also fixes that
for spell completion the previous word was deleted.

GTK: When 'encoding' is "latin1" and using non-ASCII characters in a file name
the tab page label was wrong and an error message would be given.

The taglist() function could hang on a tags line with a non-ASCII character.

Win32: When 'encoding' differs from the system encoding tab page labels with
non-ASCII characters looked wrong. (Yegappan Lakshmanan)

Motif: building failed when Xm/Notebook.h doesn't exist. Added a configure
check, disable GUI tabline when it's missing.

Mac: When compiled without multi-byte feature the clipboard didn't work.

It was possible to switch to another tab page when the cmdline window is open.

Completion could hang when 'lines' is 6 and a preview window was opened.

Added CTRL-W gF: open file under cursor in new tab page and jump to the line number following the file name.
Added 'guitabtooltip'. Implemented for Win32 (Yegappan Lakshmanan).

Added "throw" to 'debug' option: throw an exception for error messages even whey they would otherwise be ignored.

When 'keymap' is set and a line contains an invalid entry could get a "No mapping found" warning instead of a proper error message.

Motif: default to using XpmAttributes instead of XpmAttributes_21.

A few more changes for 64 bit MS-Windows. (George Reilly)

Got ml_get errors when doing "o" and selecting in other window where there are less lines shorter than the cursor position in the other window. ins_mouse() was using position in wrong window.

Win32 GUI: Crash when giving a lot of messages during startup. Allocate twice as much memory for the dialog template.

Fixed a few leaks and wrong pointer use reported by coverity.

When showing menus the mode character was sometimes wrong.

Added feedkeys(). (Yakov Lerner)

Made matchlist() always return all submatches.

Moved triggering QuickFixCmdPost to before jumping to the first location.

Mac: Added the 'macatsui' option as a temporary work around for text drawing problems.

Line completion on "/**" gave error messages when scanning an unloaded buffer.

--- fixes and changes since Vim 7.0f ---

Win32: The height of the tab page labels is now adjusted to the font height. (Yegappan Lakshmanan)

Win32: selecting the tab label was off by one. (Yegappan Lakshmanan)

Added tooltips for Motif and GTK tab page labels. (Yegappan Lakshmanan)

When 'encoding' is "utf-8" then ":help spell" would report an illegal byte and the file was not converted from latin1 to utf-8. Now retry with latin1 if reading the file as utf-8 results in illegal bytes.

Escape the argument of feedkeys() before putting it in the typeahead buffer.
(Yukihiro Nakadaira)

Added the v:char variable for evaluating 'formatexpr'. (Yukihiro Nakadaira)

With 8 colors Search highlighting combined with Statement highlighted text
made the text disappear.

VMS: avoid warnings for redefining MAX and MIN. (Zoltan Arpadffy)

When 'virtualedit' includes "onemore", stopping Visual selection would still
move the cursor left.

Prevent that using CTRL-R = in Insert mode can start Visual mode.

Fixed a crash that occurred when in Insert mode with completion active and a
mapping caused edit() to be called recursively.

When using CTRL-O in Insert mode just after the last character while
'virtualedit' is "all", then typing CR moved the last character to the next
line. Call coladvance() before starting the new line.

When using :shell ignore clicks on the tab page labels. Also when using the
command line window.

When 'eventignore' is "all" then adding more to ignoring some events, e.g.,
for ":vimgrep", would actually trigger more events.

Win32: When a running Vim uses server name GVIM1 then "gvim --remote fname"
didn't find it. When looking for a server name that doesn't end in a digit
and it is not found then use another server with that name and a number (just
like on Unix).

When using "double" in 'spellsuggest' when the language doesn't support sound
folding resulted in too many suggestions.

Win32: Dropping a shortcut on the Vim icon didn't edit the referred file like
editing it in another way would. Use fname_expand() in buf_set_name() instead
of simply make the file name a full path.

Using feedkeys() could cause Vim to hang.

When closing another tab page from the tabline menu in Insert mode the tabline
was not updated right away.

The syntax menu didn't work in compatible mode.

After using ":tag id" twice with the same "id", ":ts" and then ":pop" a ":ts"
reported no matching tag. Clear the cached tag name.

In Insert mode the matchparen plugin highlighted the wrong paren when there is
a string just next to a paren.

GTK: After opening a new tab page the text was sometimes not drawn correctly.

Flush output and catch up with events when updating the tab page labels.

In the GUI, using CTRL-W q to close the last window of a tab page could cause a crash.

GTK: The tab pages line menu was not converted from 'encoding' to utf-8.

Typing a multi-byte character or a special key at the hit-enter prompt did not work.

When 'virtualedit' contains "onemore" CTRL-O in Insert mode still moved the cursor left when it was after the end of the line, even though it's allowed to be there.

Added test for using tab pages.

towupper() and towlower() were not used, because of checking for __STDC__ISO_10646__ instead of __STDC_ISO_10646__. (sertacyildiz)

For ":map <expr>" forbid changing the text, jumping to another buffer and using ":normal" to avoid nasty side effects.

--- fixes and changes since Vim 7.0g ---

Compilation error on HP-UX, use of "dlerr" must be inside a #ifdef.
(Gary Johnson)

Report +reltime feature in ":version" output.

The tar and zip plugins detect failure to get the contents of the archive and edit the file as-is.

When the result of 'guitablabel' is empty fall back to the default label.

Fixed crash when using ":insert" in a while loop and missing "endwhile".

"gt" and other commands could move to another window when textlock active and when the command line window was open.

Spell checking a file with syntax highlighting and a bad word at the end of the line is ignored could make "]s" hang.

Mac: inputdialog() didn't work when compiled with big features.

Interrupting ":vimgrep" while it is busy loading a file left a modified and hidden buffer behind. Use enter_cleanup() and leave_cleanup() around wipe_buffer().

When making 'keymap' empty the b:keymap_name variable wasn't deleted.

Using CTRL-N that searches a long time, pressing space to interrupt the searching and accept the first match, the popup menu was still displayed briefly.

When setting the Vim window height with -geometry the 'window' option could be at a value that makes CTRL-F behave differently.

When opening a quickfix window in two tabs they used different buffers, causing redrawing problems later. Now use the same buffer for all quickfix windows. (Yegappan Lakshmanan)

When 'mousefocus' is set moving the mouse to the text tab pages line would move focus to the first window. Also, the mouse pointer would jump to the active window.

In a session file, when an empty buffer is wiped out, do this silently.

When one window has the cursor on the last line and another window is resized to make that window smaller, the cursor line could go below the displayed lines. In win_new_height() subtract one from the available space.
Also avoid that using "~" lines makes the window scroll down.

Mac: When sourcing the "macmap.vim" script and then finding a .vimrc file the 'cpo' option isn't set properly, because it was already set and restored.
Added the <special> argument to ":map", so that 'cpo' doesn't need to be changed to be able to use <> notation. Also do this for ":menu" for consistency.

When using "/encoding=abc" in a spell word list, only "bc" was used.

When 'encoding' and 'printencoding' were both "utf-8" then ":hardcopy" didn't work. (Mike Williams)

Mac: When building with "--disable-gui" the install directory would still be "/Applications" and Vim.app would be installed. Now install in /usr/local as usual for a console application.

GUI: when doing completion and there is one match and still searching for another, the cursor was displayed at the end of the line instead of after the match. Now show the cursor after the match while still searching for matches.

GUI: The mouse shape changed on the statusline even when 'mouse' was empty and they can't be dragged.

GTK2: Selecting a button in the confirm() dialog with Tab or cursor keys and hitting Enter didn't select that button. Removed GTK 1 specific code. (Neil Bird)

When evaluating 'balloonexpr' takes a long time it could be called recursively, which could cause a crash.

exists() could not be used to detect whether ":2match" is supported. Added a check for it specifically.

GTK1: Tab page labels didn't work. (Yegappan Lakshmanan)

Insert mode completion: When finding matches use 'ignorecase', but when adding matches to the list don't use it, so that all words with different case are

added, "word", "Word" and "WORD".

When 'cursorline' and 'hlsearch' are set and the search pattern is "x\n"
the rest of the line was highlighted as a match.

Cursor moved while evaluating 'balloonexpr' that invokes ":isearch" and
redirects the output. Don't move the cursor to the command line if msg_silent
is set.

exists() ignored text after a function name and option name, which could
result in false positives.

exists() ignored characters after the recognized word, which can be wrong when
using a name with non-keyword characters. Specifically, these calls no longer
allow characters after the name: exists('*funcname') exists('*funcname(...')
exists('&option') exists(':cmd') exists('g:name') exists('g:name[n]')
exists('g:name.n')

Trigger the TabEnter autocommand only after entering the current window of the
tab page, otherwise the commands are executed with an invalid current window.

Win32: When using two monitors and Vim is on the second monitor, changing the
width of the Vim window could make it jump to the first monitor.

When scrolling back at the more prompt and the quitting a line of text would
be left behind when 'cmdheight' is 2 or more.

Fixed a few things for Insert mode completion, especially when typing BS,
CTRL-N or a printable character while still searching for matches.

==
VERSION 7.1   version-7.1 version7.1

This section is about improvements made between version 7.0 and 7.1.

This is a bug-fix release, there are no fancy new features.

Changed   changed-7.1

Added setting 'mouse' in vimrc_example.vim.

When building with MZscheme also look for include files in the "plt"
subdirectory. That's where they are for FreeBSD.

The Ruby interface module is now called "Vim" instead of "VIM". But "VIM" is
an alias, so it's backwards compatible. (Tim Pope)

Added   added-7.1

New syntax files:
	/var/log/messages (Yakov Lerner)
	Autohotkey (Nikolai Weibull)
	AutoIt v3 (Jared Breland)
	Bazaar commit file "bzr". (Dmitry Vasiliev)
	Cdrdao TOC (Nikolai Weibull)
	Cmusrc (Nikolai Weibull)
	Conary recipe (rPath Inc)
	Framescript (Nikolai Weibull)
	FreeBasic (Mark Manning)
	Hamster (David Fishburn)
	IBasic (Mark Manning)
	Initng (Elan Ruusamae)
	Ldapconf (Nikolai Weibull)
	Litestep (Nikolai Weibull)
	Privoxy actions file (Doug Kearns)
	Streaming Descriptors "sd" (Puria Nafisi Azizi)

New tutor files:
	Czech (Lubos Turek)
	Hungarian (Arpad Horvath)
	Turkish (Serkan kkk)
	utf-8 version of Greek tutor.
	utf-8 version of Russian tutor.
	utf-8 version of Slowak tutor.

New filetype plugins:
	Bst (Tim Pope)
	Cobol (Tim Pope)
	Fvwm (Gautam Iyer)
	Hamster (David Fishburn)
	Django HTML template (Dave Hodder)

New indent files:
	Bst (Tim Pope)
	Cobol (Tim Pope)
	Hamster (David Fishburn)
	Django HTML template (Dave Hodder)
	Javascript
	JSP (David Fishburn)

New keymap files:
	Bulgarian (Boyko Bantchev)
	Mongolian (Natsagdorj Shagdar)
	Thaana (Ibrahim Fayaz)
	Vietnamese (Samuel Thibault)

Other new runtime files:
	Ada support files. (Neil Bird, Martin Krischik)
	Slovenian menu translations (Mojca Miklavec)
	Mono C# compiler plugin (Jarek Sobiecki)

Fixed fixed-7.1

Could not build the Win32s version. Added a few structure definitions in
src/gui_w32.c

Patch 7.0.001
Problem: ":set spellsuggest+=10" does not work. (Suresh Govindachar)
Solution: Add P_COMMA to the 'spellsuggest' flags.
Files: src/option.c

Patch 7.0.002
Problem: C omni completion has a problem with tags files with a path
            containing "#" or "%".
Solution: Escape these characters. (Sebastian Baberowski)
Files: runtime/autoload/ccomplete.vim

Patch 7.0.003
Problem: GUI: clicking in the lower part of a label in the tab pages line
            while 'mousefocus' is set may warp the mouse pointer. (Robert
            Webb)
Solution: Check for a negative mouse position.
Files: src/gui.c

Patch 7.0.004
Problem: Compiler warning for debug_saved used before set. (Todd Blumer)
Solution: Remove the "else" for calling save_dbg_stuff().
Files: src/ex_docmd.c

Patch 7.0.005 (extra)
Problem: Win32: The installer doesn't remove the "autoload" and "spell"
            directories. (David Fishburn)
Solution: Add the directories to the list to be removed.
Files: nsis/gvim.nsi

Patch 7.0.006
Problem: Mac: "make shadow" doesn't make a link for infplist.xml. (Axel
            Kielhorn)
Solution: Make the link.
Files: src/Makefile

Patch 7.0.007
Problem: AIX: compiling fails for message.c. (Ruediger Hornig)
Solution: Move the #if outside of memchr().
Files: src/message.c

Patch 7.0.008
Problem: Can't call a function that uses both <SID> and {expr}. (Thomas)
Solution: Check both the expanded and unexpanded name for <SID>.
Files: src/eval.c

Patch 7.0.009
Problem: ml_get errors with both 'sidescroll' and 'spell' set.
Solution: Use ml_get_buf() instead of ml_get(), get the line from the right

            buffer, not the current one.
Files: src/spell.c

Patch 7.0.010
Problem: The spellfile plugin required typing login name and password.
Solution: Use "anonymous" and "vim7user" by default. No need to setup a
            .netrc file.
Files: runtime/autoload/spellfile.vim

Patch 7.0.011
Problem: Can't compile without the folding and with the eval feature.
Solution: Add an #ifdef. (Vallimar)
Files: src/option.c

Patch 7.0.012
Problem: Using the matchparen plugin, moving the cursor in Insert mode to a
            shorter line that ends in a brace, changes the preferred column
Solution: Use winsaveview()/winrestview() instead of getpos()/setpos().
Files: runtime/plugin/matchparen.vim

Patch 7.0.013
Problem: Insert mode completion: using CTRL-L to add an extra character
            also deselects the current match, making it impossible to use
            CTRL-L a second time.
Solution: Keep the current match. Also make CTRL-L work at the original
            text, using the first displayed match.
Files: src/edit.c

Patch 7.0.014
Problem: Compiling gui_xmebw.c fails on Dec Alpha Tru64. (Rolfe)
Solution: Disable some code for Motif 1.2 and older.
Files: src/gui_xmebw.c

Patch 7.0.015
Problem: Athena: compilation problems with modern compiler.
Solution: Avoid type casts for lvalue. (Alexey Froloff)
Files: src/gui_at_fs.c

Patch 7.0.016
Problem: Printing doesn't work for "dec-mcs" encoding.
Solution: Add "dec-mcs", "mac-roman" and "hp-roman8" to the list of
            recognized 8-bit encodings. (Mike Williams)
Files: src/mbyte.c

Patch 7.0.017 (after 7.0.014)
Problem: Linking gui_xmebw.c fails on Dec Alpha Tru64. (Rolfe)
Solution: Adjust defines for Motif 1.2 and older.
Files: src/gui_xmebw.c

Patch 7.0.018
Problem: VMS: plugins are not loaded on startup.
Solution: Remove "**" from the path. (Zoltan Arpadffy)
Files: src/main.c

```
Patch 7.0.019
Problem:    Repeating "VjA789" may cause a crash. (James Vega)
Solution:   Check the cursor column after moving it to another line.
Files:      src/ops.c

Patch 7.0.020
Problem:    Crash when using 'mousefocus'. (William Fulton)
Solution:   Make buffer for mouse coordinates 2 bytes longer. (Juergen Weigert)
Files:      src/gui.c

Patch 7.0.021
Problem:    Crash when using "\\[" and "\\]" in 'errorformat'. (Marc Weber)
Solution:   Check for valid submatches after matching the pattern.
Files:      src/quickfix.c

Patch 7.0.022
Problem:    Using buffer.append() in Ruby may append the line to the wrong
            buffer. (Alex Norman)
Solution:   Properly switch to the buffer to do the appending.  Also for
            buffer.delete() and setting a buffer line.
Files:      src/if_ruby.c

Patch 7.0.023
Problem:    Crash when doing spell completion in an empty line and pressing
            CTRL-E.
Solution:   Check for a zero pointer. (James Vega)
            Also handle a situation without a matching pattern better, report
            "No matches" instead of remaining in undefined CTRL-X mode.  And
            get out of CTRL-X mode when typing a letter.
Files:      src/edit.c

Patch 7.0.024
Problem:    It is possible to set arbitrary "v:" variables.
Solution:   Disallow setting "v:" variables that are not predefined.
Files:      src/eval.c

Patch 7.0.025
Problem:    Crash when removing an element of a:000.  (Nikolai Weibull)
Solution:   Mark the a:000 list with VAR_FIXED.
Files:      src/eval.c

Patch 7.0.026
Problem:    Using libcall() may show an old error.
Solution:   Invoke dlerror() to clear a previous error. (Yukihiro Nakadaira)
Files:      src/os_unix.c

Patch 7.0.027 (extra)
Problem:    Win32: When compiled with SNIFF gvim may hang on exit.
Solution:   Translate and dispatch the WM_USER message. (Mathias Michaelis)
Files:      src/gui_w48.c

Patch 7.0.028 (extra)
Problem:    OS/2: Vim doesn't compile with gcc 3.2.1.
Solution:   Add argument to after_pathsep(), don't define vim_handle_signal(),
```

            define HAVE_STDARG_H. (David Sanders)
Files: src/os_unix.c, src/vim.h, src/os_os2_cfg.h

Patch 7.0.029
Problem: getchar() may not position the cursor after a space.
Solution: Position the cursor explicitly.
Files: src/eval.c

Patch 7.0.030
Problem: The ":compiler" command can't be used in a FileChangedRO event.
            (Hari Krishna Dara)
Solution: Add the CMDWIN flag to the ":compiler" command.
Files: src/ex_cmds.h

Patch 7.0.031
Problem: When deleting a buffer the buffer-local mappings for Select mode
            remain.
Solution: Add the Select mode bit to MAP_ALL_MODES. (Edwin Steiner)
Files: src/vim.h

Patch 7.0.032 (extra, after 7.0.027)
Problem: Missing semicolon.
Solution: Add the semicolon.
Files: src/gui_w48.c

Patch 7.0.033
Problem: When pasting text, with the menu or CTRL-V, autoindent is removed.
Solution: Use "x<BS>" to avoid indent to be removed. (Benji Fisher)
Files: runtime/autoload/paste.vim

Patch 7.0.034
Problem: After doing completion and typing more characters or using BS
            repeating with "." didn't work properly. (Martin Stubenschrott)
Solution: Don't put BS and other characters in the redo buffer right away,
            do this when finishing completion.
Files: src/edit.c

Patch 7.0.035
Problem: Insert mode completion works when typed but not when replayed from
            a register. (Hari Krishna Dara)
            Also: Mappings for Insert mode completion don't always work.
Solution: When finding a non-completion key in the input don't interrupt
            completion when it wasn't typed.
            Do use mappings when checking for typeahead while still finding
            completions. Avoids that completion is interrupted too soon.
            Use "compl_pending" in a different way.
Files: src/edit.c

Patch 7.0.036
Problem: Can't compile with small features and syntax highlighting or the
            diff feature.
Solution: Define LINE_ATTR whenever syntax highlighting or the diff feature
            is enabled.
Files: src/screen.c

```
Patch 7.0.037
Problem:    Crash when resizing the GUI window vertically when there is a line
            that doesn't fit.
Solution:   Don't redraw while the screen data is invalid.
Files:      src/screen.c

Patch 7.0.038
Problem:    When calling complete() from an Insert mode expression mapping
            text could be inserted in an improper way.
Solution:   Make undo_allowed() global and use it in complete().
Files:      src/undo.c, src/proto/undo.pro, src/eval.c

Patch 7.0.039
Problem:    Calling inputdialog() with a third argument in the console doesn't
            work.
Solution:   Make a separate function for input() and inputdialog(). (Yegappan
            Lakshmanan)
Files:      src/eval.c

Patch 7.0.040
Problem:    When 'cmdheight' is larger than 1 using inputlist() or selecting
            a spell suggestion with the mouse gets the wrong entry.
Solution:   Start listing the first alternative on the last line of the screen.
Files:      src/eval.c, src/spell.c

Patch 7.0.041
Problem:    cursor([1, 1]) doesn't work. (Peter Hodge)
Solution:   Allow leaving out the third item of the list and use zero for the
            virtual column offset.
Files:      src/eval.c

Patch 7.0.042
Problem:    When pasting a block of text in Insert mode Vim hangs or crashes.
            (Noam Halevy)
Solution:   Avoid that the cursor is positioned past the NUL of a line.
Files:      src/ops.c

Patch 7.0.043
Problem:    Using "%!" at the start of 'statusline' doesn't work.
Solution:   Recognize the special item when the option is being set.
Files:      src/option.c

Patch 7.0.044
Problem:    Perl: setting a buffer line in another buffer may result in
            changing the current buffer.
Solution:   Properly change to the buffer to be changed.
Files:      src/if_perl.xs

Patch 7.0.045 (extra)
Problem:    Win32: Warnings when compiling OLE version with MSVC 2005.
Solution:   Move including vim.h to before windows.h. (Ilya Bobir)
Files:      src/if_ole.cpp
```

```
Patch 7.0.046
Problem:    The matchparen plugin ignores parens in strings, but not in single
            quotes, often marked with "character".
Solution:   Also ignore parens in syntax items matching "character".
Files:      runtime/plugin/matchparen.vim

Patch 7.0.047
Problem:    When running configure the exit status is wrong.
Solution:   Handle the exit status properly. (Matthew Woehlke)
Files:      configure, src/configure

Patch 7.0.048
Problem:    Writing a compressed file fails when there are parens in the name.
            (Wang Jian)
Solution:   Put quotes around the temp file name.
Files:      runtime/autoload/gzip.vim

Patch 7.0.049
Problem:    Some TCL scripts are not recognized. (Steven Atkinson)
Solution:   Check for "exec wish" in the file.
Files:      runtime/scripts.vim

Patch 7.0.050
Problem:    After using the netbeans interface close command a stale pointer
            may be used.
Solution:   Clear the pointer to the closed buffer. (Xavier de Gaye)
Files:      src/netbeans.c

Patch 7.0.051 (after 7.0.44)
Problem:    The Perl interface doesn't compile or doesn't work properly.
Solution:   Remove the spaces before #ifdef and avoid an empty line above it.
Files:      src/if_perl.xs

Patch 7.0.052
Problem:    The user may not be aware that the Vim server allows others more
            functionality than desired.
Solution:   When running Vim as root don't become a Vim server without an
            explicit --servername argument.
Files:      src/main.c

Patch 7.0.053
Problem:    Shortening a directory name may fail when there are multi-byte
            characters.
Solution:   Copy the correct bytes. (Titov Anatoly)
Files:      src/misc1.c

Patch 7.0.054
Problem:    Mac: Using a menu name that only has a mnemonic or accelerator
            causes a crash.  (Elliot Shank)
Solution:   Check for an empty menu name.  Also delete empty submenus that
            were created before detecting the error.
Files:      src/menu.c

Patch 7.0.055
```

```
Problem:    ":startinsert" in a CmdwinEnter autocommand doesn't take immediate
            effect. (Bradley White)
Solution:   Put a NOP key in the typeahead buffer.  Also avoid that using
            CTRL-C to go back to the command line moves the cursor left.
Files:      src/edit.c, src/ex_getln.c

Patch 7.0.056
Problem:    "#!something" gives an error message.
Solution:   Ignore this line, so that it can be used in an executable Vim
            script.
Files:      src/ex_docmd.c

Patch 7.0.057 (extra, after 7.0.45)
Problem:    Win32: Compilation problem with Borland C 5.5.
Solution:   Include vim.h as before. (Mark S. Williams)
Files:      src/if_ole.cpp

Patch 7.0.058
Problem:    The gbk and gb18030 encodings are not recognized.
Solution:   Add aliases to cp936. (Edward L. Fox)
Files:      src/mbyte.c

Patch 7.0.059
Problem:    The Perl interface doesn't compile with ActiveState Perl 5.8.8.
Solution:   Remove the __attribute__() items. (Liu Yubao)
Files:      src/if_perl.xs

Patch 7.0.060 (after 7.0.51)
Problem:    Code for temporarily switching to another buffer is duplicated in
            quite a few places.
Solution:   Use aucmd_prepbuf() and aucmd_restbuf() also when FEAT_AUTOCMD is
            not defined.
Files:      src/buffer.c, src/eval.c, src/fileio.c, src/if_ruby.c,
            src/if_perl.xs, src/quickfix.c, src/structs.h

Patch 7.0.061
Problem:    Insert mode completion for Vim commands may crash if there is
            nothing to complete.
Solution:   Instead of freeing the pattern make it empty, so that a "not
            found" error is given. (Yukihiro Nakadaira)
Files:      src/edit.c

Patch 7.0.062
Problem:    Mac: Crash when using the popup menu for spell correction.  The
            popup menu appears twice when letting go of the right mouse button
            early.
Solution:   Don't show the popup menu on the release of the right mouse
            button.  Also check that a menu pointer is actually valid.
Files:      src/proto/menu.pro, src/menu.c, src/normal.c, src/term.c

Patch 7.0.063
Problem:    Tiny chance for a memory leak. (coverity)
Solution:   Free pointer when next memory allocation fails.
Files:      src/eval.c
```

```
Patch 7.0.064
Problem:    Using uninitialized variable. (Tony Mechelynck)
Solution:   When not used set "temp" to zero.  Also avoid a warning for
            "files" in ins_compl_dictionaries().
Files:      src/edit.c

Patch 7.0.065 (extra)
Problem:    Mac: left-right movement of the scrollwheel causes up-down
            scrolling.
Solution:   Ignore mouse wheel events that are not up-down. (Nicolas Weber)
Files:      src/gui_mac.c

Patch 7.0.066
Problem:    After the popup menu for Insert mode completion overlaps the tab
            pages line it is not completely removed.
Solution:   Redraw the tab pages line after removing the popup menu. (Ori
            Avtalion)
Files:      src/popupmnu.c

Patch 7.0.067
Problem:    Undo doesn't always work properly when using "scim" input method.
            Undo is split up when using preediting.
Solution:   Reset xim_has_preediting also when preedit_start_col is not
            MAXCOL.  Don't split undo when <Left> is used while preediting.
            (Yukihiro Nakadaira)
Files:      src/edit.c, src/mbyte.c

Patch 7.0.068
Problem:    When 'ignorecase' is set and using Insert mode completion,
            typing characters to change the list of matches, case is not
            ignored. (Hugo Ahlenius)
Solution:   Store the 'ignorecase' flag with the matches where needed.
Files:      src/edit.c, src/search.c, src/spell.c

Patch 7.0.069
Problem:    Setting 'guitablabel' to %!expand(\%)  causes Vim to free an
            invalid pointer. (Kim Schulz)
Solution:   Don't try freeing a constant string pointer.
Files:      src/buffer.c

Patch 7.0.070
Problem:    Compiler warnings for shadowed variables and uninitialized
            variables.
Solution:   Rename variables such as "index", "msg" and "dup".  Initialize
            variables.
Files:      src/edit.c, src/eval.c, src/ex_cmds.c, src/ex_cmds2.c,
            src/ex_docmd.c, src/gui_beval.c, src/gui_gtk.c, src/gui_gtk_x11.c,
            src/hardcopy.c, src/if_cscope.c, src/main.c, src/mbyte.c,
            src/memline.c, src/netbeans.c, src/normal.c, src/option.c,
            src/os_unix.c, src/quickfix.c, src/regexp.c, src/screen.c,
            src/search.c, src/spell.c, src/ui.c, src/undo.c, src/window.c,
            src/version.c
```

```
Patch 7.0.071
Problem:    Using an empty search pattern may cause a crash.
Solution:   Avoid using a NULL pointer.
Files:      src/search.c

Patch 7.0.072
Problem:    When starting the GUI fails there is no way to adjust settings or
            do something else.
Solution:   Add the GUIFailed autocommand event.
Files:      src/fileio.c, src/gui.c, src/vim.h

Patch 7.0.073
Problem:    Insert mode completion: Typing <CR> sometimes selects the original
            text instead of keeping what was typed.  (Justin Constantino)
Solution:   Don't let <CR> select the original text if there is no popup menu.
Files:      src/edit.c

Patch 7.0.074 (extra)
Problem:    Win32: tooltips were not converted from 'encoding' to Unicode.
Solution:   Set the tooltip to use Unicode and do the conversion.  Also
            cleanup the code for the tab pages tooltips. (Yukihiro Nakadaira)
Files:      src/gui_w32.c, src/gui_w48.c

Patch 7.0.075
Problem:    winsaveview() did not store the actual value of the desired cursor
            column.  This could move the cursor in the matchparen plugin.
Solution:   Call update_curswant() before using the value w_curswant.
Files:      src/eval.c

Patch 7.0.076 (after 7.0.010)
Problem:    Automatic downloading of spell files only works for ftp.
Solution:   Don't add login and password for non-ftp URLs. (Alexander Patrakov)
Files:      runtime/autoload/spellfile.vim

Patch 7.0.077
Problem:    ":unlet v:this_session" causes a crash. (Marius Roets)
Solution:   When trying to unlet a fixed variable give an error message.
Files:      src/eval.c

Patch 7.0.078
Problem:    There are two error messages E46.
Solution:   Change the number for the sandbox message to E794.
Files:      src/globals.h

Patch 7.0.079
Problem:    Russian tutor doesn't work when 'encoding' is "utf-8".
Solution:   Use tutor.ru.utf-8 as the master, and generate the other encodings
            from it.  Select the right tutor depending on 'encoding'. (Alexey
            Froloff)
Files:      runtime/tutor/Makefile, runtime/tutor/tutor.vim,
            runtime/tutor/tutor.ru.utf-8

Patch 7.0.080
Problem:    Generating auto/pathdef.c fails for CFLAGS with a backslash.
```

```
Solution:   Double backslashes in the string. (Alexey Froloff)
Files:      src/Makefile

Patch 7.0.081
Problem:    Command line completion doesn't work for a shell command with an
            absolute path.
Solution:   Don't use $PATH when there is an absolute path.
Files:      src/ex_getln.c

Patch 7.0.082
Problem:    Calling a function that waits for input may cause List and
            Dictionary arguments to be freed by the garbage collector.
Solution:   Keep a list of all arguments to internal functions.
Files:      src/eval.c

Patch 7.0.083
Problem:    Clicking with the mouse on an item for inputlist() doesn't work
            when 'compatible' is set and/or when 'cmdheight' is more than one.
            (Christian J.  Robinson)
Solution:   Also decrement "lines_left" when 'more' isn't set.  Set
            "cmdline_row" to zero to get all mouse events.
Files:      src/message.c, src/misc1.c

Patch 7.0.084
Problem:    The garbage collector may do its work while some Lists or
            Dictionaries are used internally, e.g., by ":echo" that runs into
            the more-prompt or ":echo [garbagecollect()]".
Solution:   Only do garbage collection when waiting for a character at the
            toplevel.  Let garbagecollect() set a flag that is handled at the
            toplevel before waiting for a character.
Files:      src/eval.c, src/getchar.c, src/globals.h, src/main.c

Patch 7.0.085
Problem:    When doing "make test" the viminfo file is modified.
Solution:   Use another viminfo file after setting 'compatible'.
Files:      src/testdir/test56.in

Patch 7.0.086
Problem:    getqflist() returns entries for pattern and text with the number
            zero.  Passing these to setqflist() results in the string "0".
Solution:   Use an empty string instead of the number zero.
Files:      src/quickfix.c

Patch 7.0.087
Problem:    After ":file fname" and ":saveas fname" the 'autochdir' option
            does not take effect. (Yakov Lerner)
            Commands for handling 'autochdir' are repeated many times.
Solution:   Add the DO_AUTOCHDIR macro and do_autochdir().  Use it for
            ":file fname" and ":saveas fname".
Files:      src/proto/buffer.pro, src/buffer.c, src/ex_cmds.c, src/macros.h,
            src/netbeans.c, src/option.c, src/window.c

Patch 7.0.088
Problem:    When compiled with Perl the generated prototypes have "extern"
```

            unnecessarily added.
Solution: Remove the "-pipe" argument from PERL_CFLAGS.
Files: src/auto/configure, src/configure.in

Patch 7.0.089
Problem: "ga" does not work properly for a non-Unicode multi-byte encoding.
Solution: Only check for composing chars for utf-8. (Taro Muraoka)
Files: src/ex_cmds.c

Patch 7.0.090
Problem: Cancelling the conform() dialog on the console with Esc requires
            typing it twice. (Benji Fisher)
Solution: When the start of an escape sequence is found use 'timeoutlen' or
            'ttimeoutlen'.
Files: src/misc1.c

Patch 7.0.091
Problem: Using winrestview() while 'showcmd' is set causes the cursor to be
            displayed in the wrong position. (Yakov Lerner)
Solution: Set the window topline properly.
Files: src/eval.c

Patch 7.0.092 (after 7.0.082 and 7.0.084)
Problem: The list of internal function arguments is obsolete now that
            garbage collection is only done at the toplevel.
Solution: Remove the list of all arguments to internal functions.
Files: src/eval.c

Patch 7.0.093
Problem: The matchparen plugin can't handle a 'matchpairs' value where a
            colon is matched.
Solution: Change the split() that is used to change 'matchpairs' into a
            List.
Files: runtime/plugin/matchparen.vim

Patch 7.0.094
Problem: When a hidden buffer is made the current buffer and another file
            edited later, the file message will still be given. Using
            ":silent" also doesn't prevent the file message. (Marvin Renich)
Solution: Reset the need_fileinfo flag when reading a file. Don't set
            need_fileinfo when msg_silent is set.
Files: src/buffer.c, src/fileio.c

Patch 7.0.095
Problem: The Greek tutor is not available in utf-8. "el" is used for the
            language, only "gr" for the country is recognized.
Solution: Add the utf-8 Greek tutor. Use it for conversion to iso-8859-7
            and cp737. (Lefteris Dimitroulakis)
Files: runtime/tutor/Makefile, runtime/tutor/tutor.gr.utf-8,
            runtime/tutor/tutor.vim

Patch 7.0.096
Problem: taglist() returns the filename relative to the tags file, while
            the directory of the tags file is unknown. (Hari Krishna Dara)

```
Solution:   Expand the file name. (Yegappan Lakshmanan)
Files:      src/tag.c

Patch 7.0.097
Problem:    ":tabclose N" that closes another tab page does not remove the tab
            pages line.  Same problem when using the mouse.
Solution:   Adjust the tab pages line when needed in tabpage_close_other().
Files:      src/ex_docmd.c

Patch 7.0.098
Problem:    Redirecting command output in a cmdline completion function
            doesn't work. (Hari Krishna Dara)
Solution:   Enable redirection when redirection is started.
Files:      src/ex_docmd.c, src/ex_getln.c

Patch 7.0.099
Problem:    GUI: When the popup menu is visible using the scrollbar messes up
            the display.
Solution:   Disallow scrolling the current window.  Redraw the popup menu
            after scrolling another window.
Files:      src/gui.c

Patch 7.0.100
Problem:    "zug" may report the wrong filename. (Lawrence Kesteloot)
Solution:   Call home_replace() to fill NameBuff[].
Files:      src/spell.c

Patch 7.0.101
Problem:    When the "~/.vim/spell" directory does not exist "zg" may create
            a wrong directory.  "zw" doesn't work.
Solution:   Use the directory of the file name instead of NameBuff.  For "zw"
            not only remove a good word but also add the word with "!".
Files:      src/spell.c

Patch 7.0.102
Problem:    Redrawing cmdline is not correct when using SCIM.
Solution:   Don't call im_get_status(). (Yukihiro Nakadaira)
Files:      src/ex_getln.c

Patch 7.0.103 (after 7.0.101)
Problem:    Compiler warning for uninitialized variable. (Tony Mechelynck)
Solution:   Init variable.
Files:      src/spell.c

Patch 7.0.104
Problem:    The CursorHoldI event only triggers once in Insert mode.  It also
            triggers after CTRL-V and other two-key commands.
Solution:   Set "did_cursorhold" before getting a second key.  Reset
            "did_cursorhold" after handling a command.
Files:      src/edit.c, src/fileio.c

Patch 7.0.105
Problem:    When using incremental search the statusline ruler isn't updated.
            (Christoph Koegl)
```

```
Solution:   Update the statusline when it contains the ruler.
Files:      src/ex_getln.c

Patch 7.0.106
Problem:    The spell popup menu uses ":amenu", triggering mappings.  Other
            PopupMenu autocommands are removed. (John Little)
Solution:   Use ":anoremenu" and use an autocmd group.
Files:      runtime/menu.vim

Patch 7.0.107
Problem:    Incremental search doesn't redraw the text tabline. (Ilya Bobir)
            Also happens in other situations with one window in a tab page.
Solution:   Redraw the tabline after clearing the screen.
Files:      src/screen.c

Patch 7.0.108 (extra)
Problem:    Amiga: Compilation problem.
Solution:   Have mch_mkdir() return a failure flag. (Willy Catteau)
Files:      src/os_amiga.c, src/proto/os_amiga.pro

Patch 7.0.109
Problem:    Lisp indenting is confused by escaped quotes in strings. (Dorai
            Sitaram)
Solution:   Check for backslash inside strings. (Sergey Khorev)
Files:      src/misc1.c

Patch 7.0.110
Problem:    Amiga: Compilation problems when not using libnix.
Solution:   Change a few #ifdefs. (Willy Catteau)
Files:      src/memfile.c

Patch 7.0.111
Problem:    The gzip plugin can't handle filenames with single quotes.
Solution:   Add and use the shellescape() function. (partly by Alexey Froloff)
Files:      runtime/autoload/gzip.vim, runtime/doc/eval.txt, src/eval.c,
            src/mbyte.c, src/misc2.c, src/proto/misc2.pro

Patch 7.0.112
Problem:    Python interface does not work with Python 2.5.
Solution:   Change PyMem_DEL() to Py_DECREF(). (Sumner Hayes)
Files:      src/if_python.c

Patch 7.0.113
Problem:    Using CTRL-L in Insert completion when there is no current match
            may cause a crash. (Yukihiro Nakadaira)
Solution:   Check for compl_leader to be NULL
Files:      src/edit.c

Patch 7.0.114
Problem:    When aborting an insert with CTRL-C an extra undo point is
            created in the GUI. (Yukihiro Nakadaira)
Solution:   Call gotchars() only when advancing.
Files:      src/getchar.c
```

Patch 7.0.115
Problem: When 'ignorecase' is set, Insert mode completion only adds "foo"
            and not "Foo" when both are found.
            A found match isn't displayed right away when 'completeopt' does
            not have "menu" or "menuone".
Solution: Do not ignore case when checking if a completion match already
            exists. call ins_compl_check_keys() also when not using a popup
            menu. (Yukihiro Nakadaira)
Files: src/edit.c

Patch 7.0.116
Problem: 64 bit Windows version reports "32 bit" in the ":version" output.
            (M. Veerman)
Solution: Change the text for Win64.
Files: src/version.c

Patch 7.0.117
Problem: Using "extend" on a syntax item inside a region with "keepend", an
            intermediate item may be truncated.
            When applying the "keepend" and there is an offset to the end
            pattern the highlighting of a contained item isn't adjusted.
Solution: Use the seen_keepend flag to remember when to apply the "keepend"
            flag. Adjust the keepend highlighting properly. (Ilya Bobir)
Files: src/syntax.c

Patch 7.0.118
Problem: printf() does not do zero padding for strings.
Solution: Do allow zero padding for strings.
Files: src/message.c

Patch 7.0.119
Problem: When going back from Insert to Normal mode the CursorHold event
            doesn't trigger. (Yakov Lerner)
Solution: Reset "did_cursorhold" when leaving Insert mode.
Files: src/edit.c

Patch 7.0.120
Problem: Crash when using CTRL-R = at the command line and entering
            "getreg('=')". (James Vega)
Solution: Avoid recursiveness of evaluating the = register.
Files: src/ops.c

Patch 7.0.121
Problem: GUI: Dragging the last status line doesn't work when there is a
            text tabline. (Markus Wolf)
Solution: Take the text tabline into account when deciding to start modeless
            selection.
Files: src/gui.c

Patch 7.0.122
Problem: GUI: When clearing after a bold, double-wide character half a
            character may be drawn.
Solution: Check for double-wide character and redraw it. (Yukihiro Nakadaira)
Files: src/screen.c

```
Patch 7.0.123
Problem:    On SCO Openserver configure selects the wrong terminal library.
Solution:   Put terminfo before the other libraries. (Roger Cornelius)
            Also fix a small problem compiling on Mac without Darwin.
Files:      src/configure.in, src/auto/configure

Patch 7.0.124
Problem:    getwinvar() obtains a dictionary with window-local variables, but
            it's always for the current window.
Solution:   Get the variables of the specified window. (Geoff Reedy)
Files:      src/eval.c

Patch 7.0.125
Problem:    When "autoselect" is in the 'clipboard' option then the '< and '>
            marks are set while Visual mode is still active.
Solution:   Don't set the '< and '> marks when yanking the selected area for
            the clipboard.
Files:      src/normal.c

Patch 7.0.126
Problem:    When 'formatexpr' uses setline() and later internal formatting is
            used undo information is not correct. (Jiri Cerny, Benji Fisher)
Solution:   Set ins_need_undo after using 'formatexpr'.
Files:      src/edit.c

Patch 7.0.127
Problem:    Crash when swap files has invalid timestamp.
Solution:   Check return value of ctime() for being NULL.
Files:      src/memline.c

Patch 7.0.128
Problem:    GUI: when closing gvim is cancelled because there is a changed
            buffer the screen isn't updated to show the changed buffer in the
            current window.  (Krzysztof Kacprzak)
Solution:   Redraw when closing gvim is cancelled.
Files:      src/gui.c

Patch 7.0.129
Problem:    GTK GUI: the GTK file dialog can't handle a relative path.
Solution:   Make the initial directory a full path before passing it to GTK.
            (James Vega)  Also postpone adding the default file name until
            after setting the directory.
Files:      src/gui_gtk.c

Patch 7.0.130 (extra)
Problem:    Win32: Trying to edit or write devices may cause Vim to get stuck.
Solution:   Add the 'opendevice' option, default off.  Disallow
            reading/writing from/to devices when it's off.
            Also detect more devices by the full name starting with "\\.\".
Files:      runtime/doc/options.txt, src/fileio.c, src/option.c, src/option.h,
            src/os_win32.c

Patch 7.0.131
```

Problem: Win32: "vim -r" does not list all the swap files.
Solution: Also check for swap files starting with a dot.
Files: src/memline.c

Patch 7.0.132 (after 7.0.130)
Problem: Win32: Crash when Vim reads from stdin.
Solution: Only use mch_nodetype() when there is a file name.
Files: src/fileio.c

Patch 7.0.133
Problem: When searching included files messages are added to the history.
Solution: Set msg_hist_off for messages about scanning included files.
            Set msg_silent to avoid message about wrapping around.
Files: src/edit.c, src/globals.h, src/message.c, src/search.c

Patch 7.0.134
Problem: Crash when comparing a recursively looped List or Dictionary.
Solution: Limit recursiveness for comparing to 1000.
Files: src/eval.c

Patch 7.0.135
Problem: Crash when garbage collecting list or dict with loop.
Solution: Don't use DEL_REFCOUNT but don't recurse into Lists and
            Dictionaries when freeing them in the garbage collector.
            Also add allocated Dictionaries to the list of Dictionaries to
            avoid leaking memory.
Files: src/eval.c, src/proto/eval.pro, src/tag.c

Patch 7.0.136
Problem: Using "O" while matching parens are highlighted may not remove the
            highlighting. (Ilya Bobir)
Solution: Also trigger CursorMoved when a line is inserted under the cursor.
Files: src/misc1.c

Patch 7.0.137
Problem: Configure check for big features is wrong.
Solution: Change "==" to "=". (Martti Kuparinen)
Files: src/auto/configure, src/configure.in

Patch 7.0.138 (extra)
Problem: Mac: modifiers don't work with function keys.
Solution: Use GetEventParameter() to obtain modifiers. (Nicolas Weber)
Files: src/gui_mac.c

Patch 7.0.139
Problem: Using CTRL-PageUp or CTRL-PageDown in Insert mode to go to another
            tab page does not prepare for undo properly. (Stefano Zacchiroli)
Solution: Call start_arrow() before switching tab page.
Files: src/edit.c

Patch 7.0.140 (after 7.0.134)
Problem: Comparing recursively looped List or Dictionary doesn't work well.
Solution: Detect comparing a List or Dictionary with itself.
Files: src/eval.c

Patch 7.0.141
Problem: When pasting a while line on the command line an extra CR is added
            literally.
Solution: Don't add the trailing CR when pasting with the mouse.
Files: src/ex_getln.c, src/proto/ops.pro, src/ops.c

Patch 7.0.142
Problem: Using the middle mouse button in Select mode to paste text results
            in an extra "y". (Kriton Kyrimis)
Solution: Let the middle mouse button replace the selected text with the
            contents of the clipboard.
Files: src/normal.c

Patch 7.0.143
Problem: Setting 'scroll' to its default value was not handled correctly.
Solution: Compare the right field to PV_SCROLL.
Files: src/option.c

Patch 7.0.144
Problem: May compare two unrelated pointers when matching a pattern against
            a string. (Dominique Pelle)
Solution: Avoid calling reg_getline() when REG_MULTI is false.
Files: src/regexp.c

Patch 7.0.145 (after 7.0.142)
Problem: Compiler warning.
Solution: Add type cast.
Files: src/normal.c

Patch 7.0.146
Problem: When 'switchbuf' is set to "usetab" and the current tab has only a
            quickfix window, jumping to an error always opens a new window.
            Also, when the buffer is open in another tab page it's not found.
Solution: Check for the "split" value of 'switchbuf' properly. Search in
            other tab pages for the desired buffer. (Yegappan Lakshmanan)
Files: src/buffer.c, src/quickfix.c

Patch 7.0.147
Problem: When creating a session file and there are several tab pages and
            some windows have a local directory a short file name may be used
            when it's not valid. (Marius Roets)
            A session with multiple tab pages may result in "No Name" buffers.
            (Bill McCarthy)
Solution: Don't enter tab pages when going through the list, only use a
            pointer to the first window in each tab page.
            Use "tabedit" instead of "tabnew | edit" when possible.
Files: src/ex_docmd.c

Patch 7.0.148
Problem: When doing "call a.xyz()" and "xyz" does not exist in dictionary
            "a" there is no error message. (Yegappan Lakshmanan)
Solution: Add the error message.
Files: src/eval.c

```
Patch 7.0.149
Problem:    When resizing a window that shows "~" lines the text sometimes
            jumps down.
Solution:   Remove code that uses "~" lines in some situations.  Fix the
            computation of the screen line of the cursor.  Also set w_skipcol
            to handle very long lines.
Files:      src/misc1.c, src/window.c

Patch 7.0.150
Problem:    When resizing the Vim window scrollbinding doesn't work. (Yakov
            Lerner)
Solution:   Do scrollbinding in set_shellsize().
Files:      src/term.c

Patch 7.0.151
Problem:    Buttons in file dialog are not according to Gnome guidelines.
Solution:   Swap Cancel and Open buttons. (Stefano Zacchiroli)
Files:      src/gui_gtk.c

Patch 7.0.152
Problem:    Crash when using lesstif 2.
Solution:   Fill in the extension field. (Ben Hutchings)
Files:      src/gui_xmebw.c

Patch 7.0.153
Problem:    When using cscope and opening the temp file fails Vim crashes.
            (Kaya Bekiroglu)
Solution:   Check for NULL pointer returned from mch_open().
Files:      src/if_cscope.c

Patch 7.0.154
Problem:    When 'foldnestmax' is negative Vim can hang. (James Vega)
Solution:   Avoid the fold level becoming negative.
Files:      src/fold.c, src/syntax.c

Patch 7.0.155
Problem:    When getchar() returns a mouse button click there is no way to get
            the mouse coordinates.
Solution:   Add v:mouse_win, v:mouse_lnum and v:mouse_col.
Files:      runtime/doc/eval.txt, src/eval.c, src/vim.h

Patch 7.0.156 (extra)
Problem:    Vim doesn't compile for Amiga OS 4.
Solution:   Various changes for Amiga OS4. (Peter Bengtsson)
Files:      src/feature.h, src/mbyte.c, src/memfile.c, src/memline.c,
            src/os_amiga.c, src/os_amiga.h, src/pty.c

Patch 7.0.157
Problem:    When a function is used recursively the profiling information is
            invalid. (Mikolaj Machowski)
Solution:   Put the start time on the stack instead of in the function.
Files:      src/eval.c
```

```
Patch 7.0.158
Problem:    In a C file with ":set foldmethod=syntax", typing {<CR> on the
            last line results in the cursor being in a closed fold. (Gautam
            Iyer)
Solution:   Open fold after inserting a new line.
Files:      src/edit.c

Patch 7.0.159
Problem:    When there is an I/O error in the swap file the cause of the error
            cannot be seen.
Solution:   Use PERROR() instead of EMSG() where possible.
Files:      src/memfile.c

Patch 7.0.160
Problem:    ":@a" echoes the command, Vi doesn't do that.
Solution:   Set the silent flag in the typeahead buffer to avoid echoing the
            command.
Files:      src/ex_docmd.c, src/normal.c, src/ops.c, src/proto/ops.pro

Patch 7.0.161
Problem:    Win32: Tab pages line popup menu isn't using the right encoding.
            (Yongwei Wu)
Solution:   Convert the text when necessary.  Also fixes the Find/Replace
            dialog title. (Yegappan Lakshmanan)
Files:      src/gui_w48.c

Patch 7.0.162
Problem:    "vim -o a b" when file "a" triggers the ATTENTION dialog,
            selecting "Quit" exits Vim instead of editing "b" only.
            When file "b" triggers the ATTENTION dialog selecting "Quit" or
            "Abort" results in editing file "a" in that window.
Solution:   When selecting "Abort" exit Vim.  When selecting "Quit" close the
            window.  Also avoid hit-enter prompt when selecting Abort.
Files:      src/buffer.c, src/main.c

Patch 7.0.163
Problem:    Can't retrieve the position of a sign after it was set.
Solution:   Add the netbeans interface getAnno command. (Xavier de Gaye)
Files:      runtime/doc/netbeans.txt, src/netbeans.c

Patch 7.0.164
Problem:    ":redir @+" doesn't work.
Solution:   Accept "@+" just like "@*". (Yegappan Lakshmanan)
Files:      src/ex_docmd.c

Patch 7.0.165
Problem:    Using CTRL-L at the search prompt adds a "/" and other characters
            without escaping, causing the pattern not to match.
Solution:   Escape special characters with a backslash.
Files:      src/ex_getln.c

Patch 7.0.166
Problem:    Crash in cscope code when connection could not be opened.
            (Kaya Bekiroglu)
```

```
Solution:   Check for the file descriptor to be NULL.
Files:      src/if_cscope.c

Patch 7.0.167
Problem:    ":function" redefining a dict function doesn't work properly.
            (Richard Emberson)
Solution:   Allow a function name to be a number when it's a function
            reference.
Files:      src/eval.c

Patch 7.0.168
Problem:    Using uninitialized memory and memory leak. (Dominique Pelle)
Solution:   Use alloc_clear() instead of alloc() for w_lines.  Free
            b_ml.ml_stack after recovery.
Files:      src/memline.c, src/window.c

Patch 7.0.169
Problem:    With a Visual block selection, with the cursor in the left upper
            corner, pressing "I" doesn't remove the highlighting. (Guopeng
            Wen)
Solution:   When checking if redrawing is needed also check if Visual
            selection is still active.
Files:      src/screen.c

Patch 7.0.170 (extra)
Problem:    Win32: Using "gvim --remote-tab foo" when gvim is minimized while
            it previously was maximized, un-maximizing doesn't work properly.
            And the labels are not displayed properly when 'encoding' is
            utf-8.
Solution:   When minimized check for SW_SHOWMINIMIZED.  When updating the tab
            pages line use TCM_SETITEMW instead of TCM_INSERTITEMW. (Liu
            Yubao)
Files:      src/gui_w48.c

Patch 7.0.171 (extra)
Problem:    VMS: A file name with multiple paths is written in the wrong file.
Solution:   Get the actually used file name. (Zoltan Arpadffy)
            Also add info to the :version command about compilation.
Files:      src/Make_vms.mms, src/buffer.c, src/os_unix.c, src/version.c

Patch 7.0.172
Problem:    Crash when recovering and quitting at the "press-enter" prompt.
Solution:   Check for "msg_list" to be NULL. (Liu Yubao)
Files:      src/ex_eval.c

Patch 7.0.173
Problem:    ":call f().TT()" doesn't work.  (Richard Emberson)
Solution:   When a function returns a Dictionary or another composite continue
            evaluating what follows.
Files:      src/eval.c

Patch 7.0.174
Problem:    ":mksession" doesn't restore window layout correctly in tab pages
            other than the current one. (Zhibin He)
```

```
Solution:   Use the correct topframe for producing the window layout commands.
Files:      src/ex_docmd.c

Patch 7.0.175
Problem:    The result of tr() is missing the terminating NUL. (Ingo Karkat)
Solution:   Add the NUL.
Files:      src/eval.c

Patch 7.0.176
Problem:    ":emenu" isn't executed directly, causing the encryption key
            prompt to fail. (Life Jazzer)
Solution:   Fix wrong #ifdef.
Files:      src/menu.c

Patch 7.0.177
Problem:    When the press-enter prompt gets a character from a non-remappable
            mapping, it's put back in the typeahead buffer as remappable,
            which may cause an endless loop.
Solution:   Restore the non-remappable flag and the silent flag when putting a
            char back in the typeahead buffer.
Files:      src/getchar.c, src/message.c, src/normal.c

Patch 7.0.178
Problem:    When 'enc' is "utf-8" and 'ignorecase' is set the result of ":echo
            ("\xe4" == "\xe4")" varies.
Solution:   In mb_strnicmp() avoid looking past NUL bytes.
Files:      src/mbyte.c

Patch 7.0.179
Problem:    Using ":recover" or "vim -r" without a swapfile crashes Vim.
Solution:   Check for "buf" to be unequal NULL. (Yukihiro Nakadaira)
Files:      src/memline.c

Patch 7.0.180 (extra, after 7.0.171)
Problem:    VMS: build failed.  Problem with swapfiles.
Solution:   Add "compiled_arch".  Always expand path and pass it to
            buf_modname().  (Zoltan Arpadffy)
Files:      src/globals.h, src/memline.c, src/os_unix.c, runtime/menu.vim

Patch 7.0.181
Problem:    When reloading a file that starts with an empty line, the reloaded
            buffer has an extra empty line at the end. (Motty Lentzitzky)
Solution:   Delete all lines, don't use bufempty().
Files:      src/fileio.c

Patch 7.0.182
Problem:    When using a mix of undo and "g-" it may no longer be possible to
            go to every point in the undo tree.  (Andy Wokula)
Solution:   Correctly update pointers in the undo tree.
Files:      src/undo.c

Patch 7.0.183
Problem:    Crash in ":let" when redirecting to a variable that's being
            displayed. (Thomas Link)
```

```
Solution:   When redirecting to a variable only do the assignment when
            stopping redirection to avoid that setting the variable causes a
            freed string to be accessed.
Files:      src/eval.c

Patch 7.0.184
Problem:    When the cscope program is called "mlcscope" the Cscope interface
            doesn't work.
Solution:   Accept "\S*cscope:" instead of "cscope:". (Frodak D. Baksik)
Files:      src/if_cscope.c

Patch 7.0.185
Problem:    Multi-byte characters in a message are displayed with attributes
            from what comes before it.
Solution:   Don't use the attributes for a multi-byte character.  Do use
            attributes for special characters. (Yukihiro Nakadaira)
Files:      src/message.c

Patch 7.0.186
Problem:    Get an ml_get error when 'encoding' is "utf-8" and searching for
            "/\_s*/e" in an empty buffer.  (Andrew Maykov)
Solution:   Don't try getting the line just below the last line.
Files:      src/search.c

Patch 7.0.187
Problem:    Can't source a remote script properly.
Solution:   Add the SourceCmd event. (Charles Campbell)
Files:      runtime/doc/autocmd.txt, src/ex_cmds2.c, src/fileio.c, src/vim.h

Patch 7.0.188 (after 7.0.186)
Problem:    Warning for wrong pointer type.
Solution:   Add a type cast.
Files:      src/search.c

Patch 7.0.189
Problem:    Translated message about finding matches is truncated. (Yukihiro
            Nakadaira)
Solution:   Enlarge the buffer.  Also use vim_snprintf().
Files:      src/edit.c

Patch 7.0.190
Problem:    "syntax spell default" results in an error message.
Solution:   Change 4 to 7 for STRNICMP(). (Raul Nunez de Arenas Coronado)
Files:      src/syntax.c

Patch 7.0.191
Problem:    The items used by getqflist() and setqflist() don't match.
Solution:   Support the "bufnum" item for setqflist(). (Yegappan Lakshmanan)
Files:      runtime/doc/eval.txt, src/quickfix.c

Patch 7.0.192
Problem:    When 'swapfile' is switched off in an empty file it is possible
            that not all blocks are loaded into memory, causing ml_get errors
            later.
```

```
Solution:   Rename "dont_release" to "mf_dont_release" and also use it to
            avoid using the cached line and locked block.
Files:      src/globals.h, src/memfile.c, src/memline.c

Patch 7.0.193
Problem:    Using --remote or --remote-tab with an argument that matches
            'wildignore' causes a crash.
Solution:   Check the argument count before using ARGLIST[0].
Files:      src/ex_cmds.c

Patch 7.0.194
Problem:    Once an ml_get error is given redrawing part of the screen may
            cause it again, resulting in an endless loop.
Solution:   Don't give the error message for a recursive call.
Files:      src/memline.c

Patch 7.0.195
Problem:    When a buffer is modified and 'autowriteall' is set, ":quit"
            results in an endless loop when there is a conversion error while
            writing. (Nikolai Weibull)
Solution:   Make autowrite() return FAIL if the buffer is still changed after
            writing it.
            /* put the cursor on the last char, for 'tw' formatting */
Files:      src/ex_cmds2.c

Patch 7.0.196
Problem:    When using ":vert ball" the computation of the mouse pointer
            position may be off by one column. (Stefan Karlsson)
Solution:   Recompute the frame width when moving the vertical separator from
            one window to another.
Files:      src/window.c

Patch 7.0.197 (extra)
Problem:    Win32: Compiling with EXITFREE doesn't work.
Solution:   Adjust a few #ifdefs. (Alexei Alexandrof)
Files:      src/misc2.c, src/os_mswin.c

Patch 7.0.198 (extra)
Problem:    Win32: Compiler warnings.  No need to generate gvim.exe.mnf.
Solution:   Add type casts.  Use "*" for processorArchitecture. (George Reilly)
Files:      src/Make_mvc.mak, src/eval.c, src/gvim.exe.mnf, src/misc2.c

Patch 7.0.199
Problem:    When using multi-byte characters the combination of completion and
            formatting may result in a wrong cursor position.
Solution:   Don't decrement the cursor column, use dec_cursor(). (Yukihiro
            Nakadaira)  Also check for the column to be zero.
Files:      src/edit.c

Patch 7.0.200
Problem:    Memory leaks when out of memory.
Solution:   Free the memory.
Files:      src/edit.c, src/diff.c
```

```
Patch 7.0.201
Problem:    Message for ":diffput" about buffer not being in diff mode may be
            wrong.
Solution:   Check for buffer in diff mode but not modifiable.
Files:      src/diff.c

Patch 7.0.202
Problem:    Problems on Tandem systems while compiling and at runtime.
Solution:   Recognize root uid is 65535.  Check select() return value for it
            not being supported.  Avoid wrong function prototypes.  Mention
            use of -lfloss.  (Matthew Woehlke)
Files:      src/Makefile, src/ex_cmds.c, src/fileio.c, src/main.c,
            src/osdef1.h.in, src/osdef2.h.in, src/os_unix.c, src/pty.c,
            src/vim.h

Patch 7.0.203
Problem:    0x80 characters in a register are not handled correctly for the
            "@" command.
Solution:   Escape CSI and 0x80 characters. (Yukihiro Nakadaira)
Files:      src/ops.c

Patch 7.0.204
Problem:    Cscope: Parsing matches for listing isn't done properly.
Solution:   Check for line number being found. (Yu Zhao)
Files:      src/if_cscope.c

Patch 7.0.205 (after 7.0.203)
Problem:    Can't compile.
Solution:   Always include the vim_strsave_escape_csi function.
Files:      src/getchar.c

Patch 7.0.206 (after 7.0.058)
Problem:    Some characters of the "gb18030" encoding are not handled
            properly.
Solution:   Do not use "cp936" as an alias for "gb18030" encoding.  Instead
            initialize 'encoding' to "cp936".
Files:      src/mbyte.c, src/option.c

Patch 7.0.207
Problem:    After patch 2.0.203 CSI and K_SPECIAL characters are escaped when
            recorded and then again when the register is executed.
Solution:   Remove escaping before putting the recorded characters in a
            register.  (Yukihiro Nakadaira)
Files:      src/getchar.c, src/ops.c, src/proto/getchar.pro

Patch 7.0.208 (after 7.0.171 and 7.0.180)
Problem:    VMS: changes to path handling cause more trouble than they solve.
Solution:   Revert changes.
Files:      src/buffer.c, src/memline.c, src/os_unix.c

Patch 7.0.209
Problem:    When replacing a line through Python the cursor may end up beyond
            the end of the line.
Solution:   Check the cursor column after replacing the line.
```

```
Files:      src/if_python.c

Patch 7.0.210
Problem:    ":cbuffer" and ":lbuffer" always fail when the buffer is modified.
            (Gary Johnson)
Solution:   Support adding a !. (Yegappan Lakshmanan)
Files:      runtime/doc/quickfix.txt, src/ex_cmds.h

Patch 7.0.211
Problem:    With ":set cindent noai bs=0" using CTRL-U in Insert mode will
            delete auto-indent.  After ":set ai" it doesn't.
Solution:   Also check 'cindent' being set. (Ryan Lortie)
Files:      src/edit.c

Patch 7.0.212
Problem:    The GUI can't be terminated with SIGTERM. (Mark Logan)
Solution:   Use the signal protection in the GUI as in the console, allow
            signals when waiting for 100 msec or longer.
Files:      src/ui.c

Patch 7.0.213
Problem:    When 'spellfile' has two regions that use the same sound folding
            using "z=" will cause memory to be freed twice. (Mark Woodward)
Solution:   Clear the hashtable properly so that the items are only freed once.
Files:      src/spell.c

Patch 7.0.214
Problem:    When using <f-args> in a user command it's not possible to have an
            argument end in '\ '.
Solution:   Change the handling of backslashes. (Yakov Lerner)
Files:      runtime/doc/map.txt, src/ex_docmd.c

Patch 7.0.215 (extra)
Problem:    Mac: Scrollbar size isn't set.  Context menu has disabled useless
            Help entry.  Call to MoreMasterPointers() is ignored.
Solution:   Call SetControlViewSize() in gui_mch_set_scrollbar_thumb().  Use
            kCMHelpItemRemoveHelp for ContextualMenuSelect().  Remove call to
            MoreMasterPointers(). (Nicolas Weber)
Files:      src/gui_mac.c

Patch 7.0.216
Problem:    ":tab wincmd ]" does not open a tab page. (Tony Mechelynck)
Solution:   Copy the cmdmod.tab value to postponed_split_tab and use it.
Files:      src/globals.h, src/ex_docmd.c, src/if_cscope.c, src/window.c

Patch 7.0.217
Problem:    This hangs when pressing "n": ":%s/\n/,\r/gc". (Ori Avtalion)
Solution:   Set "skip_match" to advance to the next line.
Files:      src/ex_cmds.c

Patch 7.0.218
Problem:    "%B" in 'statusline' always shows zero in Insert mode. (DervishD)
Solution:   Remove the exception for Insert mode, check the column for being
            valid instead.
```

```
Files:      src/buffer.c

Patch 7.0.219
Problem:    When using the 'editexisting.vim' script and a file is being
            edited in another tab page the window is split.  The "+123"
            argument is not used.
Solution:   Make the tab page with the file the current tab page.  Set
            v:swapcommand when starting up to the first "+123" or "-c" command
            line argument.
Files:      runtime/macros/editexisting.vim, src/main.c

Patch 7.0.220
Problem:    Crash when using winnr('#') in a new tab page. (Andy Wokula)
Solution:   Check for not finding the window.
Files:      src/eval.c

Patch 7.0.221
Problem:    finddir() uses 'path' by default, where "." means relative to the
            current file.  But it works relative to the current directory.
            (Tye Zdrojewski)
Solution:   Add the current buffer name to find_file_in_path_option() for the
            relative file name.
Files:      runtime/doc/eval.txt, src/eval.c

Patch 7.0.222
Problem:    Perl indenting using 'cindent' works almost right.
Solution:   Recognize '#' to start a comment. (Alex Manoussakis)  Added '#'
            flag in 'cinoptions'.
Files:      runtime/doc/indent.txt, src/misc1.c

Patch 7.0.223
Problem:    Unprintable characters in completion text mess up the popup menu.
            (Gombault Damien)
Solution:   Use strtrans() to make the text printable.
Files:      src/charset.c, src/popupmnu.c

Patch 7.0.224
Problem:    When expanding "##" spaces are escaped twice.  (Pavol Juhas)
Solution:   Don't escape the spaces that separate arguments.
Files:      src/eval.c, src/ex_docmd.c, src/proto/ex_docmd.pro

Patch 7.0.225
Problem:    When using setline() in an InsertEnter autocommand and doing "A"
            the cursor ends up on the last byte in the line. (Yukihiro
            Nakadaira)
Solution:   Only adjust the column when using setline() for the cursor line.
            Move it back to the head byte if necessary.
Files:      src/eval.c, src/misc2.c

Patch 7.0.226
Problem:    Display flickering when updating signs through the netbeans
            interface. (Xavier de Gaye)
Solution:   Remove the redraw_later(CLEAR) call.
Files:      src/netbeans.c
```

```
Patch 7.0.227
Problem:    Crash when closing a window in the GUI. (Charles Campbell)
Solution:   Don't call out_flush() from win_free().
Files:      src/window.c

Patch 7.0.228
Problem:    Cygwin: problem with symlink to DOS style path.
Solution:   Invoke cygwin_conv_to_posix_path(). (Luca Masini)
Files:      src/os_unix.c

Patch 7.0.229
Problem:    When 'pastetoggle' starts with Esc then pressing Esc in Insert
            mode will not time out. (Jeffery Small)
Solution:   Use KL_PART_KEY instead of KL_PART_MAP, so that 'ttimeout' applies
            to the 'pastetoggle' key.
Files:      src/getchar.c

Patch 7.0.230
Problem:    After using ":lcd" a script doesn't know how to restore the
            current directory.
Solution:   Add the haslocaldir() function. (Bob Hiestand)
Files:      runtime/doc/usr_41.txt, runtime/doc/eval.txt, src/eval.c

Patch 7.0.231
Problem:    When recovering from a swap file the page size is likely to be
            different from the minimum.  The block used for the first page
            then has a buffer of the wrong size, causing a crash when it's
            reused later.  (Zephaniah Hull)
Solution:   Reallocate the buffer when the page size changes.  Also check that
            the page size is at least the minimum value.
Files:      src/memline.c

Patch 7.0.232 (extra)
Problem:    Mac: doesn't support GUI tab page labels.
Solution:   Add GUI tab page labels. (Nicolas Weber)
Files:      src/feature.h, src/gui.c, src/gui.h, src/gui_mac.c,
            src/proto/gui_mac.pro

Patch 7.0.233 (extra)
Problem:    Mac: code formatted badly.
Solution:   Fix code formatting
Files:      src/gui_mac.c

Patch 7.0.234
Problem:    It's possible to use feedkeys() from a modeline.  That is a
            security issue, can be used for a trojan horse.
Solution:   Disallow using feedkeys() in the sandbox.
Files:      src/eval.c

Patch 7.0.235
Problem:    It is possible to use writefile() in the sandbox.
Solution:   Add a few more checks for the sandbox.
Files:      src/eval.c
```

```
Patch 7.0.236
Problem:    Linux 2.4 uses sysinfo() with a mem_unit field, which is not
            backwards compatible.
Solution:   Add an autoconf check for sysinfo.mem_unit.  Let mch_total_mem()
            return Kbyte to avoid overflow.
Files:      src/auto/configure, src/configure.in, src/config.h.in,
            src/option.c, src/os_unix.c

Patch 7.0.237
Problem:    For root it is recommended to not use 'modeline', but in
            not-compatible mode the default is on.
Solution:   Let 'modeline' default to off for root.
Files:      runtime/doc/options.txt, src/option.c

Patch 7.0.238
Problem:    Crash when ":match" pattern runs into 'maxmempattern'. (Yakov
            Lerner)
Solution:   Don't free the regexp program of match_hl.
Files:      src/screen.c

Patch 7.0.239
Problem:    When using local directories and tab pages ":mksession" uses a
            short file name when it shouldn't.  Window-local options from a
            modeline may be applied to the wrong window. (Teemu Likonen)
Solution:   Add the did_lcd flag, use the full path when it's set.  Don't use
            window-local options from the modeline when using the current
            window for another buffer in ":doautoall".
Files:      src/fileio.c,  src/ex_docmd.c

Patch 7.0.240
Problem:    Crash when splitting a window in the GUI. (opposite of 7.0.227)
Solution:   Don't call out_flush() from win_alloc().  Also avoid this for
            win_delete().  Also block autocommands while the window structure
            is invalid.
Files:      src/window.c

Patch 7.0.241
Problem:    ":windo throw 'foo'" loops forever. (Andy Wokula)
Solution:   Detect that win_goto() doesn't work.
Files:      src/ex_cmds2.c

Patch 7.0.242 (extra)
Problem:    Win32: Using "-register" in a Vim that does not support OLE causes
            a crash.
Solution:   Don't use EMSG() but mch_errmsg().  Check p_go for being NULL.
            (partly by Michael Wookey)
Files:      src/gui_w32.c

Patch 7.0.243 (extra)
Problem:    Win32: When GvimExt is built with MSVC 2005 or later, the "Edit
            with vim" context menu doesn't appear in the Windows Explorer.
Solution:   Embed the linker manifest file into the resources of GvimExt.dll.
            (Mathias Michaelis)
```

```
Files:      src/GvimExt/Makefile

Fixes after Vim 7.1a BETA:

The extra archive had CVS directories included below "farsi" and
"runtime/icons".  CVS was missing the farsi icon files.

Fix compiling with Gnome 2.18, undefine bind_textdomain_codeset. (Daniel
Drake)

Mac: "make install" didn't copy rgb.txt.

When editing a compressed file while there are folds caused "ml_get" errors
and some lines could be missing.  When decompressing failed option values were
not restored.

Patch 7.1a.001
Problem:    Crash when downloading a spell file.  (Szabolcs Horvat)
Solution:   Avoid that did_set_spelllang() is used recursively when a new
            window is opened for the download.
            Also avoid wiping out the wrong buffer.
Files:      runtime/autoload/spellfile.vim, src/buffer.c, src/ex_cmds.c,
            src/spell.c

Patch 7.1a.002 (extra)
Problem:    Compilation error with MingW.
Solution:   Check for LPTOOLTIPTEXT to be defined.
Files:      src/gui_w32.c

Fixes after Vim 7.1b BETA:

Made the Mzscheme interface build both with old and new versions of Mzscheme,
using an #ifdef. (Sergey Khorev)
Mzscheme interface didn't link, missing function.  Changed order of libraries
in the configure script.

Ruby interface didn't compile on Mac.  Changed #ifdef. (Kevin Ballard)

Patch 7.1b.001 (extra)
Problem:    Random text in a source file.  No idea how it got there.
Solution:   Delete the text.
Files:      src/gui_w32.c

Patch 7.1b.002
Problem:    When 'maxmem' is large there can be an overflow in computations.
            (Thomas Wiegner)
Solution:   Use the same mechanism as in mch_total_mem(): first reduce the
            multiplier as much as possible.
Files:      src/memfile.c

==============================================================================
```

VERSION 7.2 version-7.2 version7.2

This section is about improvements made between version 7.1 and 7.2.

This is mostly a bug-fix release. The main new feature is floating point support. Float

Changed changed-7.2

Changed the command line buffer name from "command-line" to "[Command Line]".

Removed optional ! for ":caddexpr", ":cgetexpr", ":cgetfile", ":laddexpr", ":lgetexpr" and ":lgetfile". They are not needed. (Yegappan Lakshmanan)

An offset for syntax matches worked on bytes instead of characters. That is inconsistent and can easily be done wrong. Use character offsets now. (Yukihiro Nakadaira)

The FileChangedShellPost event was also given when a file didn't change. (John Little)

When the current line is long (doesn't fit) the popup menu can't be seen. Display it below the screen line instead of below the text line. (Francois Ingelrest)

Switched to autoconf version 2.62.

Moved including fcntl.h to vim.h and removed it from all .c files.

Introduce macro STRMOVE(d, s), like STRCPY() for overlapping strings. Use it instead of mch_memmove(p, p + x, STRLEN(p + x) + 1).

Removed the bulgarian.vim keymap file, two more standard ones replace it. (Boyko Bantchev)

Increased the maximum number of tag matches for command line completion from 200 to 300.

Renamed help file sql.txt to ft_sql.txt and ada.txt to ft_ada.txt.

Added added-7.2

New syntax files:
- CUDA (Timothy B. Terriberry)
- Cdrdao config (Nikolai Weibull)
- Coco/R (Ashish Shukla)
- Denyhosts config (Nikolai Weibull)
- Dtrace script (Nicolas Weber)
- Git output, commit, config, rebase, send-email (Tim Pope)
- HASTE and HastePreProc (M. Tranchero)

	Haml (Tim Pope)
	Host conf (Nikolai Weibull)
	Linden script (Timo Frenay)
	MS messages (Kevin Locke)
	PDF (Tim Pope)
	ProMeLa (Maurizio Tranchero)
	Reva Foth (Ron Aaron)
	Sass (Tim Pope)
	Symbian meta-makefile, MMP (Ron Aaron)
	VOS CM macro (Andrew McGill)
	XBL (Doug Kearns)

New tutor files:
	Made UTF-8 versions of all the tutor files.
	Greek renamed from ".gr" to ".el" (Greek vs Greece).
	Esperanto (Dominique Pelle)
	Croatian (Paul B. Mahol)

New filetype plugins:
	Cdrdao config (Nikolai Weibull)
	Debian control files (Debian Vim maintainers)
	Denyhosts (Nikolai Weibull)
	Dos .ini file (Nikolai Weibull)
	Dtrace script (Nicolas Weber)
	FnameScript (Nikolai Weibull)
	Git, Git config, Git commit, Git rebase, Git send-email (Tim Pope)
	Haml (Tim Pope)
	Host conf (Nikolai Weibull)
	Host access (Nikolai Weibull)
	Logtalk (Paulo Moura)
	MS messages (Kevin Locke)
	NSIS script (Nikolai Weibull)
	PDF (Tim Pope)
	Reva Forth (Ron Aaron)
	Sass (Tim Pope)

New indent files:
	DTD (Nikolai Weibull)
	Dtrace script (Nicolas Weber)
	Erlang (Csaba Hoch)
	FrameScript (Nikolai Weibull)
	Git config (Tim Pope)
	Haml (Tim Pope)
	Logtalk (Paulo Moura)
	Sass (Tim Pope)
	Tiny Fugue (Christian J. Robinson)

New compiler plugins:
	RSpec (Tim Pope)

New keymap files:
	Croatian (Paul B. Mahol)
	Russian Dvorak (Serhiy Boiko)
	Ukrainian Dvorak (Serhiy Boiko)

	Removed plain Bulgarian, "bds" and phonetic are sufficient.

Other new runtime files:
	Esperanto menu and message translations. (Dominique Pelle)
	Finnish menu and message translations. (Flammie Pirinen)
	Brazilian Portuguese message translations. (Eduardo Dobay)

Added floating point support. Float

Added argument to mode() to return a bit more detail about the current mode.
(Ben Schmidt)

Added support for BSD console mouse: sysmouse . (Paul B. Mahol)

Added the "newtab" value for the 'switchbuf' option. (partly by Yegappan
Lakshmanan)

Improved error messages for the netbeans interface. (Philippe Fremy)

Added support for using xterm mouse codes for screen. (Micah Cowan)

Added support for cross compiling:
Adjusted configure.in and added INSTALLcross.txt. (Marc Haisenko) Fixed
mistakes in configure.in after that.
Don't use /usr/local/include and /usr/local/lib in configure. (Philip
Prindeville)
For cross compiling the Cygwin version on Unix, change VIM.TLB to vim.tlb in
src/vim.rc. (Tsuneo Nakagawa)

Added v:searchforward variable: What direction we're searching in. (Yakov
Lerner)

Fixed   fixed-7.2

Patch 7.1.001
Problem: Still can't build with Gnome libraries.
Solution: Fix typo in bind_textdomain_codeset. (Mike Kelly)
Files: src/gui_gtk.c, src/gui_gtk_x11.c

Patch 7.1.002
Problem: Oracle Pro*C/C++ files are not detected.
Solution: Add the missing star. (Micah J. Cowan)
Files: runtime/filetype.vim

Patch 7.1.003 (extra)
Problem: The "Tear off this menu" message appears in the message history
            when using a menu. (Yongwei Wu)
Solution: Disable message history when displaying the menu tip.
Files: src/gui_w32.c

Patch 7.1.004
Problem: Crash when doing ":next directory". (Raphael Finkel)

```
Solution:   Do not use "buf", it may be invalid after autocommands.
Files:      src/ex_cmds.c

Patch 7.1.005
Problem:    "cit" used on <foo></foo> deletes <foo>.  Should not delete
            anything and start insertion, like "ci'" does on "". (Michal
            Bozon)
Solution:   Handle an empty object specifically.  Made it work consistent for
            various text objects.
Files:      src/search.c

Patch 7.1.006
Problem:    Resetting 'modified' in a StdinReadPost autocommand doesn't work.
Solution:   Set 'modified' before the autocommands instead of after it.
Files:      src/buffer.c

Patch 7.1.007 (extra)
Problem:    Mac: Context menu doesn't work on Intel Macs.
            Scrollbars are not dimmed when Vim is not the active application.
Solution:   Remove the test whether context menus are supported.  They are
            always there in OS/X.  Handle the dimming. (Nicolas Weber)
Files:      src/gui_mac.c, src/gui.h

Patch 7.1.008
Problem:    getfsize() returns a negative number for very big files.
Solution:   Check for overflow and return -2.
Files:      runtime/doc/eval.txt, src/eval.c

Patch 7.1.009
Problem:    In diff mode, displaying the difference between a tab and spaces
            is not highlighted correctly.
Solution:   Only change highlighting at the end of displaying a tab.
Files:      src/screen.c

Patch 7.1.010
Problem:    The Gnome session file doesn't restore tab pages.
Solution:   Add SSOP_TABPAGES to the session flags. (Matias D'Ambrosio)
Files:      src/gui_gtk_x11.c

Patch 7.1.011
Problem:    Possible buffer overflow when $VIMRUNTIME is very long. (Victor
            Stinner)
Solution:   Use vim_snprintf().
Files:      src/main.c

Patch 7.1.012
Problem:    ":let &shiftwidth = 'asdf'" doesn't produce an error message.
Solution:   Check for a string argument. (Chris Lubinski)
Files:      src/option.c

Patch 7.1.013
Problem:    ":syn include" only loads the first file, while it is documented
            as doing the equivalent of ":runtime!".
Solution:   Change the argument to source_runtime(). (James Vega)
```

```
Files:      src/syntax.c

Patch 7.1.014
Problem:    Crash when doing C indenting. (Chris Monson)
Solution:   Obtain the current line again after invoking cin_islabel().
Files:      src/edit.c

Patch 7.1.015
Problem:    MzScheme interface: current-library-collection-paths produces no
            list.  Interface doesn't build on a Mac.
Solution:   Use a list instead of a pair. (Bernhard Fisseni)  Use "-framework"
            argument for MZSCHEME_LIBS in configure.
Files:      src/configure.in, src/if_mzsch.c, src/auto/configure

Patch 7.1.016 (after patch 7.1.012)
Problem:    Error message about setting 'diff' to a string.
Solution:   Don't pass an empty string to set_option_value() when setting
            'diff'.
Files:      src/quickfix.c, src/popupmnu.c

Patch 7.1.017
Problem:    ":confirm w" does give a prompt when 'readonly' is set, but not
            when the file permissions are read-only.  (Michael Schaap)
Solution:   Provide a dialog in both situations.  (Chris Lubinski)
Files:      src/ex_cmds.c, src/fileio.c, src/proto/fileio.pro

Patch 7.1.018
Problem:    When 'virtualedit' is set a "p" of a block just past the end of
            the line inserts before the cursor. (Engelke)
Solution:   Check for the cursor being just after the line (Chris Lubinski)
Files:      src/ops.c

Patch 7.1.019
Problem:    ":py" asks for an argument, ":py asd" then gives the error that
            ":py" isn't implemented.  Should already happen for ":py".
Solution:   Compare with ex_script_ni. (Chris Lubinski)
Files:      src/ex_docmd.c

Patch 7.1.020
Problem:    Reading from uninitialized memory when using a dialog. (Dominique
            Pelle)
Solution:   In msg_show_console_dialog() append a NUL after every appended
            character.
Files:      src/message.c

Patch 7.1.021 (after 7.1.015)
Problem:    Mzscheme interface doesn't compile on Win32.
Solution:   Fix the problem that 7.1.015 fixed in a better way. (Sergey Khorev)
Files:      src/if_mzsch.c

Patch 7.1.022
Problem:    When setting 'keymap' twice the b:keymap_name variable isn't set.
            (Milan Berta)
Solution:   Don't unlet b:keymap_name for ":loadkeymap". (Martin Toft)
```

```
Files:      src/digraph.c

Patch 7.1.023
Problem:    "dw" in a line with one character deletes the line.  Vi and nvi
            don't do this.  (Kjell Arne Rekaa)
Solution:   Check for one-character words especially.
Files:      src/search.c

Patch 7.1.024
Problem:    Using a pointer that has become invalid. (Chris Monson)
Solution:   Obtain the line pointer again after we looked at another line.
Files:      src/search.c

Patch 7.1.025
Problem:    search() and searchpos() don't use match under cursor at start of
            line when using 'bc' flags. (Viktor Kojouharov)
Solution:   Don't go to the previous line when the 'c' flag is present.
            Also fix that "j" doesn't move the cursor to the right column.
Files:      src/eval.c, src/search.c

Patch 7.1.026
Problem:    "[p" doesn't work in Visual mode. (David Brown)
Solution:   Use checkclearop() instead of checkclearopq().
Files:      src/normal.c

Patch 7.1.027
Problem:    On Sun systems opening /dev/fd/N doesn't work, and they are used
            by process substitutions.
Solution:   Allow opening specific character special files for Sun systems.
            (Gary Johnson)
Files:      src/fileio.c, src/os_unix.h

Patch 7.1.028
Problem:    Can't use last search pattern for ":sort". (Brian McKee)
Solution:   When the pattern is empty use the last search pattern. (Martin
            Toft)
Files:      runtime/doc/change.txt, src/ex_cmds.c

Patch 7.1.029 (after 7.1.019)
Problem:    Can't compile when all interfaces are used. (Taylor Venable)
Solution:   Only check for ex_script_ni when it's defined.
Files:      src/ex_docmd.c

Patch 7.1.030
Problem:    The "vimtutor" shell script checks for "vim6" but not for "vim7".
            (Christian Robinson)
Solution:   Check for more versions, but prefer using "vim".
Files:      src/vimtutor

Patch 7.1.031
Problem:    virtcol([123, '$']) doesn't work. (Michael Schaap)
Solution:   When '$' is used for the column number get the last column.
Files:      runtime/doc/eval.txt, src/eval.c
```

```
Patch 7.1.032
Problem:    Potential crash when editing a command line. (Chris Monson)
Solution:   Check the position to avoid access before the start of an array.
Files:      src/ex_getln.c

Patch 7.1.033
Problem:    A buffer is marked modified when it was first deleted and then
            added again using a ":next" command. (John Mullin)
Solution:   When checking if a buffer is modified use the BF_NEVERLOADED flag.
Files:      src/option.c

Patch 7.1.034
Problem:    Win64: A few compiler warnings.  Problems with optimizer.
Solution:   Use int instead of size_t.  Disable the optimizer in one function.
            (George V.  Reilly)
Files:      src/eval.c, src/spell.c

Patch 7.1.035
Problem:    After ":s/./&/#" all listed lines have a line number. (Yakov
            Lerner)
Solution:   Reset the line number flag when not using the "&" flag.
Files:      src/ex_cmds.c

Patch 7.1.036
Problem:    Completing ":echohl" argument should include "None". (Ori
            Avtalion)  ":match" should have "none" too.
Solution:   Add flags to use expand_highlight().  Also fix that when disabling
            FEAT_CMDL_COMPL compilation fails.  (Chris Lubinski)
Files:      src/eval.c, src/ex_docmd.c, src/ex_getln.c, src/proto/syntax.pro
            src/syntax.c

Patch 7.1.037
Problem:    strcpy() used for overlapping strings. (Chris Monson)
Solution:   Use mch_memmove() instead.
Files:      src/option.c

Patch 7.1.038
Problem:    When 'expandtab' is set then a Tab copied for 'copyindent' is
            expanded to spaces, even when 'preserveindent' is set. (Alexei
            Alexandrov)
Solution:   Remove the check for 'expandtab'.  Also fix that ">>" doesn't obey
            'preserveindent'. (Chris Lubinski)
Files:      src/misc1.c

Patch 7.1.039
Problem:    A tag in a help file that starts with "help-tags" and contains a
            percent sign may make Vim crash. (Ulf Harnhammar)
Solution:   Use puts() instead of fprintf().
Files:      src/ex_cmds.c

Patch 7.1.040
Problem:    ":match" only supports three matches.
Solution:   Add functions clearmatches(), getmatches(), matchadd(),
            matchdelete() and setmatches().  Changed the data structures for
```

```
            this.  A small bug in syntax.c is fixed, so newly created
            highlight groups can have their name resolved correctly from their
            ID.  (Martin Toft)
Files:      runtime/doc/eval.txt, runtime/doc/pattern.txt,
            runtime/doc/usr_41.txt, src/eval.c, src/ex_docmd.c,
            src/proto/window.pro, src/screen.c, src/structs.h, src/syntax.c,
            src/testdir/Makefile, src/testdir/test63.in,
            src/testdir/test63.ok, src/window.c

Patch 7.1.041 (extra, after 7.1.040)
Problem:    Some changes for patch 7.1.040 are in extra files.
Solution:   Update the extra files.
Files:      src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms

Patch 7.1.042 (after 7.1.040)
Problem:    Internal error when using matchadd(). (David Larson)
Solution:   Check the third argument to be present before using the fourth
            argument. (Martin Toft)
Files:      src/eval.c

Patch 7.1.043
Problem:    In Ex mode using CTRL-D twice may cause a crash.  Cursor isn't
            positioned properly after CTRL-D.
Solution:   Set prev_char properly.  Position the cursor correctly. (Antony
            Scriven)
Files:      src/ex_getln.c

Patch 7.1.044
Problem:    In Insert mode 0 CTRL-T deletes all indent, it should add indent.
            (Gautam Iyer)
Solution:   Check for CTRL-D typed.
Files:      src/edit.c

Patch 7.1.045
Problem:    Unnecessary screen redrawing. (Jjgod Jiang)
Solution:   Reset "must_redraw" after clearing the screen.
Files:      src/screen.c

Patch 7.1.046
Problem:    ":s" command removes combining characters. (Ron Aaron)
Solution:   Copy composing characters individually. (Chris Lubinski)
Files:      src/regexp.c

Patch 7.1.047
Problem:    vim_regcomp() called with invalid argument. (Xiaozhou Liu)
Solution:   Change TRUE to RE_MAGIC + RE_STRING.
Files:      src/ex_eval.c

Patch 7.1.048
Problem:    The matchparen plugin doesn't update the match when scrolling with
            the mouse wheel. (Ilya Bobir)
Solution:   Set the match highlighting for text that can be scrolled into the
            viewable area without moving the cursor. (Chris Lubinski)
```

```
Files:      runtime/plugin/matchparen.vim

Patch 7.1.049
Problem:    Cannot compile GTK2 version with Hangul input feature.
Solution:   Don't define FEAT_XFONTSET when using GTK2.
Files:      src/feature.h

Patch 7.1.050
Problem:    Possible crash when using C++ indenting. (Chris Monson)
Solution:   Keep the line pointer to the line to compare with.  Avoid going
            past the end of line.
Files:      src/misc1.c

Patch 7.1.051
Problem:    Accessing uninitialized memory when finding spell suggestions.
Solution:   Don't try swapping characters at the end of a word.
Files:      src/spell.c

Patch 7.1.052
Problem:    When creating a new match not all fields are initialized, which
            may lead to unpredictable results.
Solution:   Initialise rmm_ic and rmm_maxcol.
Files:      src/window.c

Patch 7.1.053
Problem:    Accessing uninitialized memory when giving a message.
Solution:   Check going the length before checking for a NUL byte.
Files:      src/message.c

Patch 7.1.054
Problem:    Accessing uninitialized memory when displaying the fold column.
Solution:   Add a NUL to the extra array. (Dominique Pelle).  Also do this in
            a couple of other situations.
Files:      src/screen.c

Patch 7.1.055
Problem:    Using strcpy() with arguments that overlap.
Solution:   Use mch_memmove() instead.
Files:      src/buffer.c, src/charset.c, src/eval.c, src/ex_getln.c,
            src/misc1.c, src/regexp.c, src/termlib.c

Patch 7.1.056
Problem:    More prompt does not behave correctly after scrolling back.
            (Randall W. Morris)
Solution:   Avoid lines_left becomes negative. (Chris Lubinski)  Don't check
            mp_last when deciding to show the more prompt. (Martin Toft)
Files:      src/message.c

Patch 7.1.057
Problem:    Problem with CursorHoldI when using "r" in Visual mode (Max
            Dyckhoff)
Solution:   Ignore CursorHold(I) when getting a second character for a Normal
            mode command.  Also abort the "r" command in Visual when a special
            key is typed.
```

```
Files:      src/normal.c

Patch 7.1.058
Problem:    When 'rightleft' is set the completion menu is positioned wrong.
            (Baha-Eddine MOKADEM)
Solution:   Fix the completion menu. (Martin Toft)
Files:      src/popupmnu.c, src/proto/search.pro, src/search.c

Patch 7.1.059
Problem:    When in Ex mode and doing "g/^/vi" and then pressing CTRL-C Vim
            hangs and beeps. (Antony Scriven)
Solution:   Clear "got_int" in the main loop to avoid the hang.  When typing
            CTRL-C twice in a row abort the ":g" command.  This is Vi
            compatible.
Files:      src/main.c

Patch 7.1.060
Problem:    Splitting quickfix window messes up window layout. (Marius
            Gedminas)
Solution:   Compute the window size in a smarter way. (Martin Toft)
Files:      src/window.c

Patch 7.1.061
Problem:    Win32: When 'encoding' is "latin1" 'ignorecase' doesn't work for
            characters with umlaut. (Joachim Hofmann)
Solution:   Do not use islower()/isupper()/tolower()/toupper() but our own
            functions. (Chris Lubinski)
Files:      src/mbyte.c, src/regexp.c, src/vim.h

Patch 7.1.062 (after 7.1.038)
Problem:    Indents of C comments can be wrong. (John Mullin)
Solution:   Adjust ind_len. (Chris Lubinski)
Files:      src/misc1.c

Patch 7.1.063 (after 7.1.040)
Problem:    Warning for uninitialized variable.
Solution:   Initialise it to NULL.
Files:      src/ex_docmd.c

Patch 7.1.064
Problem:    On Interix some files appear not to exist.
Solution:   Remove the top bit from st_mode. (Ligesh)
Files:      src/os_unix.c

Patch 7.1.065 (extra)
Problem:    Win32: Compilation problem for newer version of w32api.
Solution:   Only define __IID_DEFINED__ when needed. (Chris Sutcliffe)
Files:      src/Make_ming.mak, src/iid_ole.c

Patch 7.1.066
Problem:    When 'bomb' is set or reset the file should be considered
            modified.  (Tony Mechelynck)
Solution:   Handle like 'endofline'. (Martin Toft)
Files:      src/buffer.c, src/fileio.c, src/option.c, src/structs.h
```

```
Patch 7.1.067
Problem:    'thesaurus' doesn't work when 'infercase' is set. (Mohsin)
Solution:   Don't copy the characters being completed but check the case and
            apply it to the suggested word.  Also fix that the first word in
            the thesaurus line is not used.  (Martin Toft)
Files:      src/edit.c

Patch 7.1.068
Problem:    When 'equalalways' is set and splitting a window, it's possible
            that another small window gets bigger.
Solution:   Only equalize window sizes when after a split the windows are
            smaller than another window. (Martin Toft)
Files:      runtime/doc/options.txt, runtime/doc/windows.txt, src/window.c

Patch 7.1.069
Problem:    GTK GUI: When using confirm() without a default button there still
            is a default choice.
Solution:   Ignore Enter and Space when there is no default button. (Chris
            Lubinski)
Files:      src/gui_gtk.c

Patch 7.1.070 (extra)
Problem:    Win32 GUI: When using confirm() without a default button there
            still is a default choice.
Solution:   Set focus on something else than a button. (Chris Lubinski)
Files:      src/gui_w32.c

Patch 7.1.071 (after 7.1.040)
Problem:    Regexp patterns are not tested.
Solution:   Add a basic test, to be expanded later.
            Also add (commented-out) support for valgrind.
Files:      src/testdir/Makefile, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.1.072 (extra, after 7.1.041 and 7.1.071)
Problem:    Some changes for patch 7.1.071 are in extra files.
Solution:   Update the extra files.  Also fix a few warnings from the DOS test
            makefile.
Files:      src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms

Patch 7.1.073 (after 7.1.062)
Problem:    Wrong cursor position and crash when 'preserveindent' is set.
            (Charles Campbell)
Solution:   Handle the situation that we start without indent. (Chris
            Lubinski)
Files:      src/misc1.c

Patch 7.1.074
Problem:    Crash when calling string() on a recursively nested List.
Solution:   Check result value for being NULL. (Yukihiro Nakadaira)
Files:      src/eval.c

Patch 7.1.075
```

```
Problem:    ":let v:statusmsg" reads memory already freed.
Solution:   Don't set v:statusmsg when listing it.
Files:      src/eval.c

Patch 7.1.076
Problem:    Another strcpy() with overlapping arguments.
Solution:   Use mch_memmove(). (Dominique Pelle)  And another one.
Files:      src/ex_docmd.c, src/normal.c

Patch 7.1.077
Problem:    Using "can_spell" without initializing it. (Dominique Pelle)
Solution:   Set a default for get_syntax_attr().
Files:      src/syntax.c

Patch 7.1.078
Problem:    Dropping a file name on gvim that contains a CSI byte doesn't work
            when editing the command line.
Solution:   Escape the CSI byte when inserting in the input buffer. (Yukihiro
            Nakadaira)
Files:      src/gui.c, src/ui.c

Patch 7.1.079
Problem:    When the locale is "C" and 'encoding' is "latin1" then the "@"
            character in 'isfname', 'isprint', etc. doesn't pick up accented
            characters.
Solution:   Instead of isalpha() use MB_ISLOWER() and MB_ISUPPER().
Files:      src/charset.c, src/macros.h

Patch 7.1.080 (extra)
Problem:    Compiler warnings for using "const char *" for "char *".
Solution:   Add type casts. (Chris Sutcliffe)
Files:      src/GvimExt/gvimext.cpp

Patch 7.1.081
Problem:    Command line completion for a shell command: "cat </tmp/file<Tab>"
            doesn't work.
Solution:   Start the file name at any character that can't be in a file name.
            (Martin Toft)
Files:      src/ex_docmd.c

Patch 7.1.082
Problem:    After a ":split" the matchparen highlighting isn't there.
Solution:   Install a WinEnter autocommand.  Also fixes that after
            ":NoMatchParen" only the current window is updated. (Martin Toft)
Files:      runtime/doc/pi_paren.txt, runtime/plugin/matchparen.vim

Patch 7.1.083 (after 7.1.081)
Problem:    Command line completion doesn't work with wildcards.
Solution:   Add vim_isfilec_or_wc() and use it. (Martin Toft)
Files:      src/charset.c, src/proto/charset.pro, src/ex_docmd.c

Patch 7.1.084
Problem:    Using the "-nb" argument twice causes netbeans not to get
            fileOpened events.
```

```
Solution:   Change "&" to "&&". (Xavier de Gaye)
Files:      src/ex_cmds.c

Patch 7.1.085
Problem:    ":e fold.c" then ":sp fold.c" results in folds of original window
            to disappear. (Akita Noek)
Solution:   Invoke foldUpdateAll() for all windows of the changed buffer.
            (Martin Toft)
Files:      src/ex_cmds.c

Patch 7.1.086
Problem:    Crash when using specific Python syntax highlighting.  (Quirk)
Solution:   Check for a negative index, coming from a keyword match at the
            start of a line from a saved state.
Files:      src/syntax.c

Patch 7.1.087
Problem:    Reading past ":cscope find" command.  Writing past end of a buffer.
Solution:   Check length of the argument before using the pattern.  Use
            vim_strncpy().  (Dominique Pelle)
Files:      if_cscope.c

Patch 7.1.088 (extra)
Problem:    The coordinates used by ":winpos" differ from what getwinposx()
            and getwinposy() return.
Solution:   Use MoveWindowStructure() instead of MoveWindow(). (Michael Henry)
Files:      src/gui_mac.c

Patch 7.1.089
Problem:    ":let loaded_getscriptPlugin" doesn't clear to eol, result is
            "#1in".
Solution:   Clear to the end of the screen after displaying the first variable
            value.
Files:      src/eval.c

Patch 7.1.090
Problem:    Compiler warning on Mac OS X 10.5.
Solution:   Don't redeclare sigaltstack(). (Hisashi T Fujinaka)
Files:      src/os_unix.c

Patch 7.1.091 (extra)
Problem:    Win32: Can't embed Vim inside another application.
Solution:   Add the --windowid argument. (Nageshwar)
Files:      runtime/doc/gui_w32.txt, runtime/doc/starting.txt,
            runtime/doc/vi_diff.txt, src/globals.h, src/gui_w32.c, src/main.c

Patch 7.1.092 (extra, after 7.1.088)
Problem:    Wrong arguments for MoveWindowStructure().
Solution:   Remove "TRUE". (Michael Henry)
Files:      src/gui_mac.c

Patch 7.1.093
Problem:    Reading past end of a screen line when determining cell width.
            (Dominique Pelle)
```

```
Solution:   Add an argument to mb_off2cells() for the maximum offset.
Files:      src/globals.h, src/gui.c, src/mbyte.c, src/proto/mbyte.pro,
            src/screen.c

Patch 7.1.094
Problem:    When checking if syntax highlighting is present, looking in the
            current buffer instead of the specified one.
Solution:   Use "buf" instead of "curbuf".
Files:      src/syntax.c

Patch 7.1.095
Problem:    The FocusLost and FocusGained autocommands are triggered
            asynchronously in the GUI.  This may cause arbitrary problems.
Solution:   Put the focus event in the input buffer and handle it when ready
            for it.
Files:      src/eval.c, src/getchar.c, src/gui.c, src/gui_gtk_x11.c,
            src/keymap.h

Patch 7.1.096
Problem:    Reading past end of a string when resizing Vim. (Dominique Pelle)
Solution:   Check the string pointer before getting the char it points to.
Files:      src/message.c

Patch 7.1.097
Problem:    ":setlocal stl=%!1+1" does not work.
Solution:   Adjust check for pointer. (Politz)
Files:      src/option.c

Patch 7.1.098
Problem:    ":call s:var()" doesn't work if "s:var" is a Funcref. (Andy Wokula)
Solution:   Before converting "s:" into a script ID, check if it is a Funcref.
Files:      src/eval.c

Patch 7.1.099
Problem:    When the 'keymap' and 'paste' options have a non-default value,
            ":mkexrc" and ":mksession" do not correctly set the options.
Solution:   Set the options with side effects before other options.
Files:      src/option.c

Patch 7.1.100
Problem:    Win32: Executing cscope doesn't always work properly.
Solution:   Use another way to invoke cscope. (Mike Williams)
Files:      src/if_cscope.c, src/if_cscope.h, src/main.c,
            src/proto/if_cscope.pro

Patch 7.1.101
Problem:    Ruby: The Buffer.line= method does not work.
Solution:   Add the "self" argument to set_current_line(). (Jonathan Hankins)
Files:      src/if_ruby.c

Patch 7.1.102
Problem:    Perl interface doesn't compile with new version of Perl.
Solution:   Add two variables to the dynamic library loading. (Suresh
            Govindachar)
```

```
Files:      src/if_perl.xs

Patch 7.1.103
Problem:    Using "dw" with the cursor past the end of the last line (using
            CTRL-\ CTRL-O from Insert mode) deletes a character. (Tim Chase)
Solution:   Don't move the cursor back when the movement failed.
Files:      src/normal.c

Patch 7.1.104 (after 7.1.095)
Problem:    When 'lazyredraw' is set a focus event causes redraw to be
            postponed until a key is pressed.
Solution:   Instead of not returning from vgetc() when a focus event is
            encountered return K_IGNORE.  Add plain_vgetc() for when the
            caller doesn't want to get K_IGNORE.
Files:      src/digraph.c, src/edit.c, src/ex_cmds.c, src/ex_getln.c,
            src/getchar.c, src/normal.c, src/proto/getchar.pro, src/window.c

Patch 7.1.105
Problem:    Internal error when using "0 ? {'a': 1} : {}". (A.Politz)
Solution:   When parsing a dictionary value without using the value, don't try
            obtaining the key name.
Files:      src/eval.c

Patch 7.1.106
Problem:    ":messages" doesn't quit listing on ":".
Solution:   Break the loop when "got_int" is set.
Files:      src/message.c

Patch 7.1.107
Problem:    When doing a block selection and using "s" to change the text,
            while triggering auto-indenting, causes the wrong text to be
            repeated in other lines. (Adri Verhoef)
Solution:   Compute the change of indent and compensate for that.
Files:      src/ops.c

Patch 7.1.108 (after 7.1.100)
Problem:    Win32: Compilation problems in Cscope code. (Jeff Lanzarotta)
Solution:   Use (long) instead of (intptr_t) when it's not defined.
Files:      src/if_cscope.c

Patch 7.1.109
Problem:    GTK: when there are many tab pages, clicking on the arrow left of
            the labels moves to the next tab page on the right. (Simeon Bird)
Solution:   Check the X coordinate of the click and pass -1 as value for the
            left arrow.
Files:      src/gui_gtk_x11.c, src/term.c

Patch 7.1.110 (after 7.1.102)
Problem:    Win32: Still compilation problems with Perl.
Solution:   Change the #ifdefs. (Suresh Govindachar)
Files:      src/if_perl.xs

Patch 7.1.111
Problem:    When using ":vimgrep" with the "j" flag folds from another buffer
```

```
            may be displayed. (A.Politz)
Solution:   When not jumping to another buffer update the folds.
Files:      src/quickfix.c

Patch 7.1.112
Problem:    Using input() with a wrong argument may crash Vim. (A.Politz)
Solution:   Init the input() return value to NULL.
Files:      src/eval.c

Patch 7.1.113
Problem:    Using map() to go over an empty list causes memory to be freed
            twice. (A.Politz)
Solution:   Don't clear the typeval in restore_vimvar().
Files:      src/eval.c

Patch 7.1.114
Problem:    Memory leak in getmatches().
Solution:   Don't increment the refcount twice.
Files:      src/eval.c

Patch 7.1.115 (after 7.1.105)
Problem:    Compiler warning for uninitialized variable. (Tony Mechelynck)
Solution:   Init variable to NULL.
Files:      src/eval.c

Patch 7.1.116
Problem:    Cannot display Unicode characters above 0x10000.
Solution:   Remove the replacement with a question mark when UNICODE16 is not
            defined. (partly by Nicolas Weber)
Files:      src/screen.c

Patch 7.1.117
Problem:    Can't check whether Vim was compiled with Gnome. (Tony Mechelynck)
Solution:   Add gui_gnome to the has() list.
Files:      src/eval.c

Patch 7.1.118 (after 7.1.107)
Problem:    Compiler warning for Visual C compiler.
Solution:   Add typecast. (Mike Williams)
Files:      src/ops.c

Patch 7.1.119
Problem:    Crash when 'cmdheight' set to very large value. (A.Politz)
Solution:   Limit 'cmdheight' to 'lines' minus one.  Store right value of
            'cmdheight' when running out of room.
Files:      src/option.c, src/window.c

Patch 7.1.120
Problem:    Can't properly check memory leaks while running tests.
Solution:   Add an argument to garbagecollect().  Delete functions and
            variables in the test scripts.
Files:      runtime/doc/eval.txt src/eval.c, src/globals.h, src/main.c,
            src/testdir/Makefile, src/testdir/test14.in,
            src/testdir/test26.in, src/testdir/test34.in,
```

```
            src/testdir/test45.in, src/testdir/test47.in,
            src/testdir/test49.in, src/testdir/test55.in,
            src/testdir/test56.in, src/testdir/test58.in,
            src/testdir/test59.in, src/testdir/test60.in,
            src/testdir/test60.vim, src/testdir/test62.in,
            src/testdir/test63.in, src/testdir/test64.in,

Patch 7.1.121
Problem:    Using ":cd %:h" when editing a file in the current directory
            results in an error message for using an empty string.
Solution:   When "%:h" results in an empty string use ".".
Files:      src/eval.c

Patch 7.1.122
Problem:    Mac: building Vim.app fails.  Using wrong architecture.
Solution:   Use line continuation for the gui_bundle dependency.  Detect the
            system architecture with "uname -a".
Files:      src/main.aap

Patch 7.1.123
Problem:    Win32: ":edit foo ~ foo" expands "~".
Solution:   Change the call to expand_env().
Files:      src/ex_docmd.c, src/misc1.c, src/proto/misc1.pro, src/option.c

Patch 7.1.124 (extra)
Problem:    Mac: When dropping a file on Vim.app that is already in the buffer
            list (from .viminfo) results in editing an empty, unnamed buffer.
            (Axel Kielhorn)  Also: warning for unused variable.
Solution:   Move to the buffer of the first argument.  Delete unused variable.
Files:      src/gui_mac.c

Patch 7.1.125
Problem:    The TermResponse autocommand event is not always triggered. (Aron
            Griffis)
Solution:   When unblocking autocommands check if v:termresponse changed and
            trigger the event then.
Files:      src/buffer.c, src/diff.c, src/ex_getln.c, src/fileio.c,
            src/globals.h, src/misc2.c, src/proto/fileio.pro, src/window.c

Patch 7.1.126 (extra)
Problem:    ":vimgrep */*" fails when a BufRead autocommand changes directory.
            (Bernhard Kuhn)
Solution:   Change back to the original directory after loading a file.
            Also: use shorten_fname1() to avoid duplicating code.
Files:      src/buffer.c, src/ex_docmd.c, src/fileio.c, src/gui_gtk.c,
            src/gui_w48.c, src/proto/ex_docmd.pro, src/proto/fileio.pro,
            src/quickfix.c

Patch 7.1.127
Problem:    Memory leak when doing cmdline completion. (Dominique Pelle)
Solution:   Free "orig" argument of ExpandOne() when it's not used.
Files:      src/ex_getln.c

Patch 7.1.128 (extra)
```

```
Problem:    Build problems with new version of Cygwin.
Solution:   Remove -D__IID_DEFINED__, like with MingW. (Guopeng Wen)
Files:      src/Make_cyg.mak

Patch 7.1.129 (extra)
Problem:    Win32: Can't get the user name when it is longer than 15
            characters.
Solution:   Use UNLEN instead of MAX_COMPUTERNAME_LENGTH. (Alexei Alexandrov)
Files:      src/os_win32.c

Patch 7.1.130
Problem:    Crash with specific order of undo and redo. (A.Politz)
Solution:   Clear and adjust pointers properly.  Add u_check() for debugging.
Files:      src/undo.c, src/structs.h

Patch 7.1.131
Problem:    ":mksession" always adds ":setlocal autoread". (Christian J.
            Robinson)
Solution:   Skip boolean global/local option using global value.
Files:      src/option.c

Patch 7.1.132
Problem:    getpos("'>") may return a negative column number for a Linewise
            selection. (A.Politz)
Solution:   Don't add one to MAXCOL.
Files:      src/eval.c

Patch 7.1.133 (after 7.1.126)
Problem:    shorten_fname1() linked when it's not needed.
Solution:   Add #ifdef.
Files:      src/fileio.c

Patch 7.1.134 (extra)
Problem:    Win32: Can't build with VC8
Solution:   Detect the MSVC version instead of using NMAKE_VER.
            (Mike Williams)
Files:      src/Make_mvc.mak

Patch 7.1.135
Problem:    Win32: When editing a file c:\tmp\foo and c:\tmp\\foo we have two
            buffers for the same file. (Suresh Govindachar)
Solution:   Invoke FullName_save() when a path contains "//" or "\\".
Files:      src/buffer.c

Patch 7.1.136
Problem:    Memory leak when using Ruby syntax highlighting. (Dominique Pelle)
Solution:   Free the contained-in list.
Files:      src/syntax.c

Patch 7.1.137
Problem:    Build failure when using EXITFREE. (Dominique Pelle)
Solution:   Add an #ifdef around using clip_exclude_prog.
Files:      src/misc2.c
```

```
Patch 7.1.138
Problem:    The Perl Msg() function doesn't stop when "q" is typed at the more
            prompt. (Hari Krishna Dara)
Solution:   Check got_int.
Files:      src/if_perl.xs

Patch 7.1.139
Problem:    When using marker folding and ending Insert mode with CTRL-C the
            current fold is truncated. (Fred Kater)
Solution:   Ignore got_int while updating folds.
Files:      src/fold.c

Patch 7.1.140
Problem:    v:count is set only after typing a non-digit, that makes it
            difficult to make a nice mapping.
Solution:   Set v:count while still typing the count.
Files:      src/normal.c

Patch 7.1.141
Problem:    GTK: -geom argument doesn't support a negative offset.
Solution:   Compute position from the right/lower corner.
Files:      src/gui_gtk_x11.c

Patch 7.1.142
Problem:    ":redir @A>" doesn't work.
Solution:   Ignore the extra ">" also when appending. (James Vega)
Files:      src/ex_docmd.c

Patch 7.1.143
Problem:    Uninitialized memory read when diffing three files. (Dominique
            Pelle)
Solution:   Remove "+ !notset" so that we don't use fields that were not
            computed.
Files:      src/diff.c

Patch 7.1.144
Problem:    After ":diffup" cursor can be in the wrong position.
Solution:   Force recomputing the cursor position.
Files:      src/diff.c

Patch 7.1.145
Problem:    Insert mode completion: When using the popup menu, after
            completing a word and typing a non-word character Vim is still
            completing the same word, following CTRL-N doesn't work.
            Insert mode Completion: When using CTRL-X O and there is only
            "struct." before the cursor, typing one char to reduce the
            matches, then BS completion stops.
Solution:   When typing a character that is not part of the item being
            completed, stop complete mode.  For whole line completion also
            accept a space.  For file name completion stop at a path
            separator.
            For omni completion stay in completion mode even if completing
            with empty string.
Files:      src/edit.c
```

```
Patch 7.1.146 (extra)
Problem:    VMS: Files with a very rare record organization (VFC) cannot be
            properly written by Vim.
            On older VAX systems mms runs into a syntax error.
Solution:   Check for this special situation.  Do not wrap a comment, make it
            one long line.  (Zoltan Arpadffy)
Files:      src/fileio.c, src/Make_vms.mms

Patch 7.1.147 (after 7.1.127)
Problem:    Freeing memory already freed when completing user name. (Meino
            Cramer)
Solution:   Use a flag to remember if "orig" needs to be freed.
Files:      src/ex_getln.c

Patch 7.1.148
Problem:    Some types are not found by configure.
Solution:   Test for the sys/types.h header file. (Sean Boudreau)
Files:      src/configure.in, src/auto/configure

Patch 7.1.149
Problem:    GTK GUI: When the completion popup menu is used scrolling another
            window by the scrollbar is OK, but using the scroll wheel it
            behaves line <Enter>.
Solution:   Ignore K_MOUSEDOWN and K_MOUSEUP.  Fix redrawing the popup menu.
Files:      src/edit.c, src/gui.c

Patch 7.1.150
Problem:    When 'clipboard' has "unnamed" using "p" in Visual mode doesn't
            work correctly. (Jianrong Yu)
Solution:   When 'clipboard' has "unnamed" also obtain the selection when
            getting the default register.
Files:      src/ops.c

Patch 7.1.151
Problem:    Using whole line completion with 'ignorecase' and 'infercase' set
            and the line is empty get an lalloc(0) error.
Solution:   Don't try changing case for an empty match. (Matthew Wozniski)
Files:      src/edit.c

Patch 7.1.152
Problem:    Display problem when 'hls' and 'cursorcolumn' are set and
            searching for "$".  (John Mullin)  Also when scrolling
            horizontally when 'wrap' is off.
Solution:   Keep track of the column where highlighting was set.  Check the
            column offset when skipping characters.
Files:      src/screen.c

Patch 7.1.153
Problem:    Compiler warnings on SGI.  Undefined XpmAllocColor (Charles
            Campbell)
Solution:   Add type casts.  Init st_dev and st_ino separately.  Don't use
            type casts for vim_snprintf() when HAVE_STDARG_H is defined.
            Define XpmAllocColor when needed.
```

```
Files:      src/eval.c, src/ex_cmds.c, src/fileio.c, src/misc2.c,
            src/gui_xmebw.c

Patch 7.1.154
Problem:    Compiler warning for signed/unsigned compare.
Solution:   Add type cast.
Files:      src/screen.c

Patch 7.1.155
Problem:    Crash when 'undolevels' is 0 and repeating "udd". (James Vega)
Solution:   When there is only one branch use u_freeheader() to delete it.
Files:      src/undo.c

Patch 7.1.156
Problem:    Overlapping arguments for strcpy() when expanding command line
            variables.
Solution:   Use mch_memmove() instead of STRCPY().  Also fix a few typos.
            (Dominique Pelle)
Files:      src/ex_docmd.c

Patch 7.1.157
Problem:    In Ex mode, :" gives an error at end-of-file. (Michael Hordijk)
Solution:   Only give an error for an empty line, not for a comment.
Files:      src/ex_docmd.c

Patch 7.1.158 (extra)
Problem:    Win32 console: When 'encoding' is "utf-8" and typing Alt-y the
            result is wrong.  Win32 GUI: Alt-y results in "u" when 'encoding'
            is "cp1250" (Lukas Cerman)
Solution:   For utf-8 don't set the 7th bit in a byte, convert to the correct
            byte sequence.  For cp1250, when conversion to 'encoding' results
            in the 7th bit not set, set the 7th bit after conversion.
Files:      src/os_win32.c, src/gui_w48.c

Patch 7.1.159
Problem:    strcpy() has overlapping arguments.
Solution:   Use mch_memmove() instead. (Dominique Pelle)
Files:      src/ex_cmds.c

Patch 7.1.160
Problem:    When a focus autocommand is defined, getting or losing focus
            causes the hit-enter prompt to be redrawn. (Bjorn Winckler)
Solution:   Overwrite the last line.
Files:      src/message.c

Patch 7.1.161
Problem:    Compilation errors with tiny features and EXITFREE.
Solution:   Add #ifdefs. (Dominique Pelle)
Files:      src/edit.c, src/misc2.c

Patch 7.1.162
Problem:    Crash when using a modifier before "while" or "for". (A.Politz)
Solution:   Skip modifiers when checking for a loop command.
Files:      src/proto/ex_docmd.pro, src/ex_docmd.c, src/ex_eval.c
```

```
Patch 7.1.163
Problem:    Warning for the unknown option 'bufsecret'.
Solution:   Remove the lines .vim that use this option. (Andy Wokula)
Files:      runtime/menu.vim

Patch 7.1.164
Problem:    Reading past end of regexp pattern. (Dominique Pelle)
Solution:   Use utf_ptr2len().
Files:      src/regexp.c

Patch 7.1.165
Problem:    Crash related to getting X window ID. (Dominique Pelle)
Solution:   Don't trust the window ID that we got in the past, check it every
            time.
Files:      src/os_unix.c

Patch 7.1.166
Problem:    Memory leak for using "gp" in Visual mode.
Solution:   Free memory in put_register(). (Dominique Pelle)
Files:      src/ops.c

Patch 7.1.167
Problem:    Xxd crashes when using "xxd -b -c 110". (Debian bug 452789)
Solution:   Allocate more memory.  Fix check for maximum number of columns.
Files:      src/xxd/xxd.c

Patch 7.1.168 (extra)
Problem:    Win32 GUI: Since patch 7.1.095, when the Vim window does not have
            focus, clicking in it doesn't position the cursor. (Juergen
            Kraemer)
Solution:   Don't reset s_button_pending just after receiving focus.
Files:      src/gui_w48.c

Patch 7.1.169
Problem:    Using uninitialized variable when system() fails. (Dominique
            Pelle)
Solution:   Let system() return an empty string when it fails.
Files:      src/eval.c

Patch 7.1.170
Problem:    Valgrind warning for overlapping arguments for strcpy().
Solution:   Use mch_memmove() instead. (Dominique Pelle)
Files:      src/getchar.c

Patch 7.1.171
Problem:    Reading one byte before allocated memory.
Solution:   Check index not to become negative. (Dominique Pelle)
Files:      src/ex_getln.c

Patch 7.1.172
Problem:    When 'buftype' is "acwrite" Vim still checks if the file or
            directory exists before overwriting.
Solution:   Don't check for overwriting when the buffer name is not a file
```

```
            name.
Files:      src/ex_cmds.c

Patch 7.1.173
Problem:    Accessing freed memory. (Dominique Pelle)
Solution:   Don't call reg_getline() to check if a line is the first in the
            file.
Files:      src/regexp.c

Patch 7.1.174
Problem:    Writing NUL past end of a buffer.
Solution:   Copy one byte less when using strncat(). (Dominique Pelle)
Files:      src/ex_cmds.c, src/ex_docmd.c,

Patch 7.1.175
Problem:    <BS> doesn't work with some combination of 'sts', 'linebreak' and
            'backspace'. (Francois Ingelrest)
Solution:   When adding white space results in not moving back delete one
            character.
Files:      src/edit.c

Patch 7.1.176
Problem:    Building with Aap fails when the "compiledby" argument contains
            '<' or '>' characters. (Alex Yeh)
Solution:   Change how quoting is done in the Aap recipe.
Files:      src/main.aap

Patch 7.1.177
Problem:    Freeing memory twice when in debug mode while reading a script.
Solution:   Ignore script input while in debug mode.
Files:      src/ex_cmds2.c, src/getchar.c, src/globals.h

Patch 7.1.178
Problem:    "%" doesn't work on "/* comment  //  comment */".
Solution:   Don't handle the "//" in "*//*" as a C++ comment. (Markus
            Heidelberg)
Files:      src/search.c

Patch 7.1.179
Problem:    Need to check for TCL 8.5.
Solution:   Adjust configure script. (Alexey Froloff)
Files:      src/configure.in, src/auto/configure

Patch 7.1.180
Problem:    Regexp patterns not tested sufficiently.
Solution:   Add more checks to the regexp test.
Files:      src/testdir/test64.in, src/testdir/test64.ok

Patch 7.1.181
Problem:    Accessing uninitialized memory in Farsi mode. (Dominique Pelle)
Solution:   Only invoke lrF_sub() when there is something to do.
Files:      src/ex_cmds.c

Patch 7.1.182
```

```
Problem:    When using tab pages and an argument list the session file may
            contain wrong "next" commands. (Alexander Bluem)
Solution:   Use "argu" commands and only when needed.
Files:      src/ex_docmd.c

Patch 7.1.183
Problem:    "Internal error" for ":echo matchstr('a', 'a\%[\&]')" (Mitanu
            Paul)
Solution:   Inside "\%[]" detect \&, \| and \) as an error.
Files:      src/regexp.c

Patch 7.1.184
Problem:    Crash when deleting backwards over a line break in Insert mode.
Solution:   Don't advance the cursor when it's already on the NUL after a
            line. (Matthew Wozniski)
Files:      src/normal.c

Patch 7.1.185
Problem:    Using "gR" with a multi-byte encoding and typing a CR pushes
            characters onto the replace stack incorrectly, resulting in BS
            putting back the wrong characters. (Paul B. Mahol)
Solution:   Push multi-byte characters onto the replace stack in reverse byte
            order.  Add replace_push_mb().
Files:      src/edit.c, src/misc1.c, src/proto/edit.pro

Patch 7.1.186
Problem:    "expand('<afile>')" returns a bogus value after changing
            directory. (Dave Fishburn)
Solution:   Copy "autocmd_fname" to allocated memory and expand to full
            filename.  Shorten the path when expanding <afile>.
Files:      src/ex_docmd.c, src/fileio.c

Patch 7.1.187
Problem:    Win32 GUI: Custom completion using system() no longer works
            after patch 7.1.104. (Erik Falor)
Solution:   Loop when safe_vgetc() returns K_IGNORE.
Files:      src/ex_getln.c

Patch 7.1.188
Problem:    When 'showmode' is off the message for changing a readonly file is
            given in the second column instead of the first.  (Payl B. Mahol)
Solution:   Put the W10 message in the first column.
Files:      src/edit.c

Patch 7.1.189 (after 7.1.104)
Problem:    Patch 7.1.104 was incomplete.
Solution:   Also call plain_vgetc() in ask_yesno().
Files:      src/misc1.c

Patch 7.1.190
Problem:    Cursor after end-of-line: "iA sentence.<Esc>)"
Solution:   Move cursor back and make motion inclusive.
Files:      src/normal.c
```

```
Patch 7.1.191
Problem:    Win32 GUI: after patch 7.1.168 there is still a problem when
            clicking in a scrollbar. (Juergen Jottkaerr)
Solution:   Don't check the input buffer when dragging the scrollbar.
Files:      src/gui.c

Patch 7.1.192
Problem:    With Visual block selection, "s" and typing something, CTRL-C
            doesn't stop Vim from repeating the replacement in other lines,
            like happens for "I".
Solution:   Check for "got_int" to be set.
Files:      src/ops.c

Patch 7.1.193
Problem:    Some Vim 5.x digraphs are missing in Vim 7, even though the
            character pairs are not used. (Philippe de Muyter)
Solution:   Add those Vim 5.x digraphs that don't conflict with others.
Files:      src/digraph.c

Patch 7.1.194
Problem:    ":echo glob('~/{}')" results in /home/user//.
Solution:   Don't add a slash if there already is one.
Files:      src/os_unix.c

Patch 7.1.195
Problem:    '0 mark doesn't work for "~/foo ~ foo".
Solution:   Don't expand the whole file name, only "~/".
Files:      src/mark.c

Patch 7.1.196 (extra)
Problem:    Win32 GUI: "\n" in a tooltip doesn't cause a line break. (Erik
            Falor)
Solution:   Use the TTM_SETMAXTIPWIDTH message.
Files:      src/gui_w32.c

Patch 7.1.197
Problem:    Mac: "make install" doesn't work when prefix defined.
Solution:   Pass different arguments to "make installruntime".  (Jjgod Jiang)
Files:      src/Makefile

Patch 7.1.198
Problem:    Hang when using ":s/\n//gn". (Burak Gorkemli)
Solution:   Set "skip_match".
Files:      src/ex_cmds.c

Patch 7.1.199
Problem:    Can't do command line completion for a specific file name
            extension.
Solution:   When the pattern ends in "$" don't add a star for completion and
            remove the "$" before matching with file names.
Files:      runtime/doc/cmdline.txt, src/ex_getln.c

Patch 7.1.200 (after 7.1.177 and 7.1.182)
Problem:    Compiler warnings for uninitialized variables.
```

```
Solution:   Init variables.
Files:      src/ex_cmds2.c, src/ex_docmd.c

Patch 7.1.201
Problem:    When reading stdin 'fenc' and 'ff' are not set.
Solution:   Set the options after reading stdin. (Ben Schmidt)
Files:      src/fileio.c

Patch 7.1.202
Problem:    Incomplete utf-8 byte sequence is not checked for validity.
Solution:   Check the bytes that are present for being valid. (Ben Schmidt)
Files:      src/mbyte.c

Patch 7.1.203
Problem:    When 'virtualedit' is "onemore" then "99|" works but ":normal 99|"
            doesn't.  (Andy Wokula)
Solution:   Check for "onemore" flag in check_cursor_col().
Files:      src/misc2.c

Patch 7.1.204 (extra)
Problem:    Win32: Using the example at 'balloonexpr' the balloon disappears
            after four seconds and then comes back again.  Also moves the
            mouse pointer a little bit.  (Yongwei Wu)
Solution:   Set the autopop time to 30 seconds (the max value).  (Sergey
            Khorev)  Move the mouse two pixels forward and one back to end up
            in the same position (really!).
Files:      src/gui_w32.c

Patch 7.1.205
Problem:    Can't get the operator in an ":omap".
Solution:   Add the "v:operator" variable. (Ben Schmidt)
Files:      runtime/doc/eval.txt, src/eval.c, src/normal.c, src/vim.h

Patch 7.1.206
Problem:    Compiler warnings when using MODIFIED_BY.
Solution:   Add type casts. (Ben Schmidt)
Files:      src/version.c

Patch 7.1.207
Problem:    Netbeans: "remove" cannot delete one line.
Solution:   Remove partial lines and whole lines properly.  Avoid a memory
            leak.  (Xavier de Gaye)
Files:      src/netbeans.c

Patch 7.1.208
Problem:    On Alpha get an unaligned access error.
Solution:   Store the dictitem pointer before using it. (Matthew Luckie)
Files:      src/eval.c

Patch 7.1.209
Problem:    GTK: When using the netrw plugin and doing ":gui" Vim hangs.
Solution:   Stop getting a selection after three seconds.  This is a hack.
Files:      src/gui_gtk_x11.c
```

```
Patch 7.1.210
Problem:    Listing mapping for 0xdb fails when 'encoding' is utf-8. (Tony
            Mechelynck)
Solution:   Recognize K_SPECIAL KS_EXTRA KE_CSI as a CSI byte.
Files:      src/mbyte.c

Patch 7.1.211
Problem:    The matchparen plugin may take an unexpected amount of time, so
            that it looks like Vim hangs.
Solution:   Add a timeout to searchpair(), searchpairpos(), search() and
            searchpos().  Use half a second timeout in the plugin.
Files:      runtime/doc/eval.txt, runtime/plugin/matchparen.vim, src/edit.c,
            src/eval.c, src/ex_cmds2.c, src/ex_docmd.c, src/normal.c,
            src/proto/eval.pro, src/proto/ex_cmds2.pro, src/proto/search.pro,
            src/search.c

Patch 7.1.212
Problem:    Accessing a byte before a line.
Solution:   Check that the column is 1 or more. (Dominique Pelle)
Files:      src/edit.c

Patch 7.1.213
Problem:    A ":tabedit" command that results in the "swap file exists" dialog
            and selecting "abort" doesn't close the new tab. (Al Budden)
Solution:   Pass "old_curwin" to do_exedit().
Files:      src/ex_docmd.c

Patch 7.1.214
Problem:    ":1s/g\n\zs1//" deletes characters from the first line. (A Politz)
Solution:   Start replacing in the line where the match starts.
Files:      src/ex_cmds.c

Patch 7.1.215
Problem:    It is difficult to figure out what syntax items are nested at a
            certain position.
Solution:   Add the synstack() function.
Files:      runtime/doc/eval.txt, src/eval.c, src/proto/syntax.pro,
            src/syntax.c

Patch 7.1.216
Problem:    Variants of --remote-tab are not mentioned for "vim --help".
Solution:   Display optional -wait and -silent.
Files:      src/main.c

Patch 7.1.217
Problem:    The "help-tags" tag may be missing from runtime/doc/tags when it
            was generated during "make install".
Solution:   Add the "++t" argument to ":helptags" to force adding the tag.
Files:      runtime/doc/Makefile, runtime/doc/various.txt, src/ex_cmds.c,
            src/ex_cmds.h

Patch 7.1.218
Problem:    A syntax region without a "keepend", containing a region with
            "extend" could be truncated at the end of the containing region.
```

```
Solution:   Do not call syn_update_ends() when there are no keepend items.
Files:      src/syntax.c

Patch 7.1.219 (after 7.1.215)
Problem:    synstack() returns situation after the current character, can't
            see the state for a one-character region.
Solution:   Don't update ending states in the requested column.
Files:      runtime/doc/eval.txt, src/eval.c, src/hardcopy.c,
            src/proto/syntax.pro, src/screen.c, src/spell.c, src/syntax.c

Patch 7.1.220
Problem:    When a ")" or word movement command moves the cursor back from the
            end of the line it may end up on the trail byte of a multi-byte
            character.  It's also moved back when it isn't needed.
Solution:   Add the adjust_cursor() function.
Files:      src/normal.c

Patch 7.1.221
Problem:    When inserting a "(", triggering the matchparen plugin, the
            following highlighting may be messed up.
Solution:   Before triggering the CursorMovedI autocommands update the display
            to update the stored syntax stacks for the change.
Files:      src/edit.c

Patch 7.1.222 (after 7.1.217)
Problem:    Wildcards in argument of ":helptags" are not expanded.  (Marcel
            Svitalsky)
Solution:   Expand wildcards in the directory name.
Files:      src/ex_cmds.c

Patch 7.1.223
Problem:    glob() doesn't work properly when 'shell' is "sh" or "bash" and
            the expanded name contains spaces, '~', single quotes and other
            special characters.  (Adri Verhoef, Charles Campbell)
Solution:   For Posix shells define a vimglob() function to list the matches
            instead of using "echo" directly.
Files:      src/os_unix.c

Patch 7.1.224
Problem:    When using "vim -F -o file1 file2" only one window is
            right-to-left.  Same for "-H".  (Ben Schmidt)
Solution:   use set_option_value() to set 'rightleft'.
Files:      src/main.c

Patch 7.1.225
Problem:    Using uninitialized value when XGetWMNormalHints() fails.
Solution:   Check the return value. (Dominique Pelle)
Files:      src/os_unix.c

Patch 7.1.226
Problem:    Command line completion doesn't work when a file name contains a
            '&' character.
Solution:   Accept all characters in a file name, except ones that end a
            command or white space.
```

```
Files:      src/ex_docmd.c

Patch 7.1.227
Problem:    Hang in syntax HL when moving over a ")". (Dominique Pelle)
Solution:   Avoid storing a syntax state in the wrong position in the list of
            remembered states.
Files:      src/syntax.c

Patch 7.1.228
Problem:    When 'foldmethod' is "indent" and a fold is created with ">>" it
            can't be closed with "zc".  (Daniel Shahaf)
Solution:   Reset the "small" flag of a fold when adding a line to it.
Files:      src/fold.c

Patch 7.1.229
Problem:    A fold is closed when it shouldn't when 'foldmethod' is "indent"
            and backspacing a non-white character so that the indent increases.
Solution:   Keep the fold open after backspacing a character.
Files:      src/edit.c

Patch 7.1.230
Problem:    Memory leak when executing SourceCmd autocommands.
Solution:   Free the memory. (Dominique Pelle)
Files:      src/ex_cmds2.c

Patch 7.1.231
Problem:    When shifting lines the change is acted upon multiple times.
Solution:   Don't have shift_line() call changed_bytes.
Files:      src/edit.c, src/ops.c, src/proto/edit.pro, src/proto/ops.pro

Patch 7.1.232 (after 7.1.207 and 7.1.211)
Problem:    Compiler warnings with MSVC.
Solution:   Add type casts. (Mike Williams)
Files:      src/ex_cmds2.c, src/netbeans.c

Patch 7.1.233
Problem:    Crash when doing Insert mode completion for a user defined
            command.  (Yegappan Lakshmanan)
Solution:   Don't use the non-existing command line.
Files:      src/ex_getln.c

Patch 7.1.234
Problem:    When diff'ing three files the third one isn't displayed correctly.
            (Gary Johnson)
Solution:   Compute the size of diff blocks correctly when merging blocks.
            Compute filler lines correctly when scrolling.
Files:      src/diff.c

Patch 7.1.235
Problem:    Pattern matching is slow when using a lot of simple patterns.
Solution:   Avoid allocating memory by not freeing it when it's not so much.
            (Alexei Alexandrov)
Files:      src/regexp.c
```

```
Patch 7.1.236
Problem:    When using 'incsearch' and 'hlsearch' a complicated pattern may
            make Vim hang until CTRL-C is pressed.
Solution:   Add the 'redrawtime' option.
Files:      runtime/doc/options.txt, src/ex_cmds.c, src/ex_docmd.c,
            src/ex_getln.c, src/gui.c, src/misc1.c, src/normal.c,
            src/option.c, src/quickfix.c, src/regexp.c, src/proto/regexp.pro,
            src/proto/search.pro, src/search.c, src/screen.c,
            src/option.h, src/spell.c, src/structs.h, src/syntax.c, src/tag.c,
            src/vim.h

Patch 7.1.237
Problem:    Compiler warning on an Alpha processor in Motif code.
Solution:   Change a typecast. (Adri Verhoef)
Files:      src/gui_motif.c

Patch 7.1.238
Problem:    Using the 'c' flag with searchpair() may cause it to fail.  Using
            the 'r' flag doesn't work when 'wrapscan' is set.  (A.Politz)
Solution:   Only use the 'c' flag for the first search, not for repeating.
            When using 'r' imply 'W'. (Antony Scriven)
Files:      src/eval.c

Patch 7.1.239 (after 7.1.233)
Problem:    Compiler warning for sprintf() argument.
Solution:   Add a typecast. (Nico Weber)
Files:      src/ex_getln.c

Patch 7.1.240
Problem:    When "gUe" turns a German sharp s into SS the operation stops
            before the end of the word.  Latin2 has the same sharp s but it's
            not changed to SS there.
Solution:   Make sure all the characters are operated upon.  Detect the sharp
            s in latin2.  Also fixes that changing case of a multi-byte
            character that changes the byte count doesn't always work.
Files:      src/ops.c

Patch 7.1.241
Problem:    Focus change events not always ignored.  (Erik Falor)
Solution:   Ignore K_IGNORE in Insert mode in a few more places.
Files:      src/edit.c

Patch 7.1.242 (after 7.1.005)
Problem:    "cib" doesn't work properly on "(x)". (Tim Pope)
Solution:   Use ltoreq() instead of lt().  Also fix "ciT" on "<a>x</a>".
Files:      src/search.c

Patch 7.1.243 (after 7.1.240)
Problem:    "U" doesn't work on all text in Visual mode. (Adri Verhoef)
Solution:   Loop over all the lines to be changed.  Add tests for this.
Files:      src/ops.c, src/testdir/test39.in, src/testdir/test39.ok

Patch 7.1.244
Problem:    GUI may have part of the command line cut off.
```

```
Solution:   Don't round the number of lines up, always round down.
            (Tony Houghton, Scott Dillard)
Files:      src/gui.c

Patch 7.1.245
Problem:    Pressing CTRL-\ three times causes Vim to quit.  (Ranganath Rao).
            Also for f CTRL-\ CTRL-\.
Solution:   When going to cooked mode in mch_delay() set a flag to ignore
            SIGQUIT.
Files:      src/os_unix.c

Patch 7.1.246
Problem:    Configure hangs when the man pager is something strange. (lorien)
Solution:   Set MANPAGER and PAGER to "cat". (Micah Cowan)
Files:      src/auto/configure, src/configure.in

Patch 7.1.247
Problem:    When using Netbeans backspacing in Insert mode skips a character
            now and then. (Ankit Jain)
Solution:   Avoid calling netbeans_removed(), it frees the line pointer.
            (partly by Dominique Pelle).
Files:      src/misc1.c

Patch 7.1.248
Problem:    Can't set the '" mark.  Can't know if setpos() was successful.
Solution:   Allow setting the '" mark with setpos().  Have setpos() return a
            value indicating success/failure.
Files:      runtime/doc/eval.txt, src/eval.c, src/mark.c

Patch 7.1.249
Problem:    After "U" the cursor can be past end of line.  (Adri Verhoef)
Solution:   Adjust the cursor position in u_undoline().
Files:      src/undo.c

Patch 7.1.250
Problem:    ":setglobal fenc=anything" gives an error message in a buffer
            where 'modifiable' is off.  (Ben Schmidt)
Solution:   Don't give an error if 'modifiable' doesn't matter.
Files:      src/option.c

Patch 7.1.251
Problem:    Using freed memory when spell checking enabled.
Solution:   Obtain the current line again after calling spell_move_to().
            (Dominique Pelle)
Files:      src/screen.c

Patch 7.1.252 (after 7.1.243)
Problem:    Test 39 fails when the environment has a utf-8 locale. (Dominique
            Pelle)
Solution:   Force 'encoding' to be latin1.
Files:      src/testdir/test39.in

Patch 7.1.253
Problem:    ":sort" doesn't work in a one line file. (Patrick Texier)
```

```
Solution:   Don't sort if there is only one line. (Dominique Pelle)
Files:      src/ex_cmds.c

Patch 7.1.254
Problem:    Tests 49 and 55 fail when the locale is French.
Solution:   Using C messages for test 49.  Filter the error message in test 55
            such that it works when the number is halfway the message.
Files:      src/testdir/test49.in, src/testdir/test55.in

Patch 7.1.255
Problem:    Vim doesn't support utf-32. (Yongwei Wu)
Solution:   Add aliases for utf-32, it's the same as ucs-4.
Files:      src/mbyte.c

Patch 7.1.256
Problem:    findfile() also returns directories.
Solution:   Cleanup the code for finding files and directories in a list of
            directories.  Remove the ugly global ff_search_ctx.
Files:      src/eval.c, src/misc2.c, src/vim.h, src/tag.c

Patch 7.1.257
Problem:    Configure can't always find the Tcl header files.
Solution:   Also look in /usr/local/include/tcl$tclver and
            /usr/include/tcl$tclver (James Vega)
Files:      src/auto/configure, src/configure.in

Patch 7.1.258
Problem:    Crash when doing "d/\n/e" and 'virtualedit' is "all". (Andy Wokula)
Solution:   Avoid that the column becomes negative.  Also fixes other problems
            with the end of a pattern match is in column zero. (A.Politz)
Files:      src/search.c

Patch 7.1.259
Problem:    Cursor is in the wrong position when 'rightleft' is set,
            'encoding' is "utf-8" and on an illegal byte.  (Dominique Pelle)
Solution:   Only put the cursor in the first column when actually on a
            double-wide character.  (Yukihiro Nakadaira)
Files:      src/screen.c

Patch 7.1.260
Problem:    Cursor positioning problem after ^@ wrapping halfway when
            'encoding' is utf-8.
Solution:   Only count a position for printable characters.  (partly by
            Yukihiro Nakadaira)
Files:      src/charset.c

Patch 7.1.261
Problem:    When a 2 byte BOM is detected Vim uses UCS-2, which doesn't work
            for UTF-16 text. (Tony Mechelynck)
Solution:   Default to UTF-16.
Files:      src/fileio.c, src/testdir/test42.ok

Patch 7.1.262
Problem:    Can't get the process ID of Vim.
```

```
Solution:   Implement getpid().
Files:      src/eval.c, runtime/doc/eval.txt

Patch 7.1.263
Problem:    The filetype can consist of two dot separated names.  This works
            for syntax and ftplugin, but not for indent. (Brett Stahlman)
Solution:   Use split() and loop over each dot separated name.
Files:      runtime/indent.vim

Patch 7.1.264
Problem:    Crash when indenting lines. (Dominique Pelle)
Solution:   Set the cursor column when changing the cursor line.
Files:      src/ops.c, src/misc1.c

Patch 7.1.265
Problem:    When 'isfname' contains a space, cmdline completion can hang.
            (James Vega)
Solution:   Reset the "len" variable.
Files:      src/ex_docmd.c

Patch 7.1.266
Problem:    When the version string returned by the terminal contains
            unexpected characters, it is used as typed input. (James Vega)
Solution:   Assume the escape sequence ends in a letter.
Files:      src/term.c

Patch 7.1.267
Problem:    When changing folds cursor may be positioned in the wrong place.
Solution:   Call changed_window_setting_win() instead of
            changed_window_setting().
Files:      src/fold.c

Patch 7.1.268
Problem:    Always shows "+" at end of screen line with: ":set
            listchars=eol:$,extends:+ nowrap list cursorline" (Gary Johnson)
Solution:   Check for lcs_eol_one instead of lcs_eol.
Files:      src/screen.c

Patch 7.1.269
Problem:    The matchparen plugin has an arbitrary limit for the number of
            lines to look for a match.
Solution:   Rely on the searchpair() timeout.
Files:      runtime/plugin/matchparen.vim

Patch 7.1.270
Problem:    ":?foo?" matches in current line since patch 7.1.025. (A.Politz)
Solution:   Remove the SEARCH_START flag.
Files:      src/ex_docmd.c, src/search.c

Patch 7.1.271
Problem:    In a Vim build without autocommands, checking a file that was
            changed externally causes the current buffer to be changed
            unexpectedly.  (Karsten Hopp)
Solution:   Store "curbuf" instead of "buf".
```

```
Files:      src/fileio.c

Patch 7.1.272
Problem:    The special buffer name [Location List] is not used for a buffer
            displayed in another tab page.
Solution:   Use FOR_ALL_TAB_WINDOWS instead of FOR_ALL_WINDOWS. (Hiroaki
            Nishihara)
Files:      src/buffer.c

Patch 7.1.273
Problem:    When profiling on Linux Vim exits early. (Liu Yubao)
Solution:   When profiling don't exit on SIGPROF.
Files:      src/Makefile, src/os_unix.c

Patch 7.1.274 (after 7.1.272)
Problem:    Compiler warning for optimized build.
Solution:   Init win to NULL.
Files:      src/buffer.c

Patch 7.1.275 (extra)
Problem:    Mac: ATSUI and 'antialias' don't work properly together.
Solution:   Fix this and the input method. (Jjgod Jiang)
Files:      src/vim.h, src/gui_mac.c

Patch 7.1.276
Problem:    "gw" uses 'formatexpr', even though the docs say it doesn't.
Solution:   Don't use 'formatexpr' for "gw".
Files:      src/vim.h, src/edit.c, src/ops.c, src/proto/ops.pro

Patch 7.1.277
Problem:    Default for 'paragraphs' misses some items (Colin Watson)
Solution:   Add TP, HP, Pp, Lp and It to 'paragraphs'. (James Vega)
Files:      runtime/doc/options.txt, src/option.c

Patch 7.1.278 (extra, after 7.1.275)
Problem:    Build failure when USE_CARBONKEYHANDLER is not defined.
Solution:   Remove #ifdef.
Files:      src/gui_mac.c

Patch 7.1.279
Problem:    When using cscope temporary files are left behind.
Solution:   Send the quit command to cscope and give it two seconds to exit
            nicely before killing it. (partly by Dominique Pelle)
Files:      src/if_cscope.c

Patch 7.1.280  (after 7.1.275)
Problem:    Mac: build problems when not using multibyte feature. (Nicholas
            Stallard)
Solution:   Don't define USE_IM_CONTROL when not using multibyte.
Files:      src/vim.h

Patch 7.1.281 (after 7.1.279)
Problem:    sa.sa_mask is not initialized.  Cscope may not exit.
Solution:   Use sigemptyset().  Use SIGKILL instead of SIGTERM. (Dominique
```

            Pelle)
Files: src/if_cscope.c

Patch 7.1.282 (extra)
Problem: Win64: Edit with Vim context menu isn't installed correctly.
            Compiler warnings and a few other things.
Solution: Add [and] to entry of class name. Use UINT_PTR instead of UINT.
            And fixes for other things. (George V. Reilly)
Files: src/GvimExt/Makefile, src/dosinst.c, src/if_ole.cpp, src/if_ole.h,
            src/if_ole.idl, src/INSTALLpc.txt, src/Make_mvc.mak,
            src/os_win32.c,

Patch 7.1.283
Problem: Non-extra part for 7.1.282.
Solution: Various changes.
Files: src/ex_docmd.c, src/globals.h, src/if_cscope.c, src/main.c,
            src/mark.c, src/netbeans.c, src/popupmnu.c, src/vim.h,
            src/window.c

Patch 7.1.284
Problem: Compiler warnings for functions without prototype.
Solution: Add the function prototypes. (Patrick Texier)
Files: src/eval.c, src/quickfix.c

Patch 7.1.285 (extra)
Problem: Mac: dialog hotkeys don't work.
Solution: Add hotkey support. (Dan Sandler)
Files: src/gui_mac.c

Patch 7.1.286 (after 7.1.103)
Problem: "w" at the end of the buffer moves the cursor past the end of the
            line. (Markus Heidelberg)
Solution: Move the cursor back from the NUL when it was moved forward.
Files: src/normal.c

Patch 7.1.287
Problem: Crash when reversing a list after using it. (Andy Wokula)
Solution: Update the pointer to the last used element. (Dominique Pelle)
Files: src/eval.c

Patch 7.1.288 (after 7.1.281)
Problem: Cscope still leaves behind temp files when using gvim.
Solution: When getting the ECHILD error loop for a while until cscope exits.
            (Dominique Pelle)
Files: if_cscope.c

Patch 7.1.289
Problem: When EXITFREE is defined and 'acd' is set freed memory is used.
            (Dominique Pelle)
Solution: Reset p_acd before freeing all buffers.
Files: src/misc2.c

Patch 7.1.290
Problem: Reading bytes that were not written when spell checking and a line

            has a very large indent.
Solution: Don't copy the start of the next line when it only contains
            spaces. (Dominique Pelle)
Files: src/spell.c

Patch 7.1.291 (after 7.1.288)
Problem: Compiler warning.
Solution: Change 50 to 50L.
Files: src/if_cscope.c

Patch 7.1.292
Problem: When using a pattern with "\@<=" the submatches can be wrong.
            (Brett Stahlman)
Solution: Save the submatches when attempting a look-behind match.
Files: src/regexp.c

Patch 7.1.293
Problem: Spell checking considers super- and subscript characters as word
            characters.
Solution: Recognize the Unicode super and subscript characters.
Files: src/spell.c

Patch 7.1.294
Problem: Leaking memory when executing a shell command.
Solution: Free memory when not able to save for undo. (Dominique Pelle)
Files: src/ex_cmds.c

Patch 7.1.295
Problem: Vimtutor only works with vim, not gvim.
Solution: Add the -g flag to vimtutor. (Dominique Pelle) Add gvimtutor.
Files: src/Makefile, src/gvimtutor, src/vimtutor, runtime/doc/vimtutor.1

Patch 7.1.296
Problem: SELinux is not supported.
Solution: Detect the selinux library and use mch_copy_sec(). (James Vega)
Files: src/auto/configure, src/config.h.in, src/configure.in,
            src/fileio.c, src/memfile.c, src/os_unix.c, src/proto/os_unix.pro

Patch 7.1.297
Problem: When using the search/replace dialog the parenmatch highlighting
            can be wrong. (Tim Duncan)
Solution: In the GUI redraw function invoke the CursorMoved autocmd.
Files: src/gui.c

Patch 7.1.298 (after 7.1.295)
Problem: src/gvimtutor is not distributed.
Solution: Add it to the list of distributed files.
Files: Filelist

Patch 7.1.299
Problem: Filetype detection doesn't work properly for file names ending in
            a part that is ignored and contain a space or other special
            characters.
Solution: Escape the special characters using the new fnameescape function.

```
Files:      runtime/doc/eval.txt, runtime/filetype.vim, src/eval.c,
            src/ex_getln.c, src/proto/ex_getln.pro, src/vim.h

Patch 7.1.300
Problem:    Value of asmsyntax argument isn't checked for valid characters.
Solution:   Only accepts letters and digits.
Files:      runtime/filetype.vim

Patch 7.1.301
Problem:    When the "File/Save" menu is used in Insert mode, a tab page label
            is not updated to remove the "+".
Solution:   Call draw_tabline() from showruler(). (Bjorn Winckler)
Files:      src/screen.c

Patch 7.1.302 (after 7.1.299)
Problem:    Compilation error on MS-Windows.
Solution:   Don't use xp_shell when it's not defined.
Files:      src/ex_getln.c

Patch 7.1.303 (after 7.1.302)
Problem:    Compilation error on MS-Windows, again.
Solution:   Declare p.
Files:      src/ex_getln.c

Patch 7.1.304
Problem:    Shortpath_for_invalid_fname() does not work correctly and is
            unnecessary complex.
Solution:   Clean up shortpath_for_invalid_fname(). (mostly by Yegappan
            Lakshmanan)
Files:      src/eval.c

Patch 7.1.305
Problem:    Editing a compressed file with special characters in the name
            doesn't work properly.
Solution:   Escape special characters.
Files:      runtime/autoload/gzip.vim

Patch 7.1.306
Problem:    Some Unicode characters are handled like word characters while
            they are symbols.
Solution:   Adjust the table for Unicode classification.
Files:      src/mbyte.c

Patch 7.1.307
Problem:    Many warnings when compiling with Python 2.5.
Solution:   Use ssize_t instead of int for some types. (James Vega)
Files:      src/if_python.c

Patch 7.1.308
Problem:    When in readonly mode ":options" produces an error.
Solution:   Reset 'readonly'. (Gary Johnson)
Files:      runtime/optwin.vim

Patch 7.1.309
```

```
Problem:    Installing and testing with a shadow directory doesn't work.
            (James Vega)
Solution:   Add "po" to the list of directories to link.  Also link the Vim
            scripts in testdir.  And a few more small fixes.
Files:      src/Makefile

Patch 7.1.310
Problem:    Incomplete utf-8 byte sequence at end of the file is not detected.
            Accessing memory that wasn't written.
Solution:   Check the last bytes in the buffer for being a valid utf-8
            character. (mostly by Ben Schmidt)
            Also fix that the reported line number of the error was wrong.
Files:      src/fileio.c

Patch 7.1.311
Problem:    Compiler warning for missing sentinel in X code.
Solution:   Change 0 to NULL. (Markus Heidelberg)
Files:      src/mbyte.c

Patch 7.1.312
Problem:    The .po files have mistakes in error numbers.
Solution:   Search for these mistakes in the check script. (Dominique Pelle)
Files:      src/po/check.vim

Patch 7.1.313
Problem:    When the netbeans interface setModified call is used the status
            lines and window title are not updated.
Solution:   Redraw the status lines and title. (Philippe Fremy)
Files:      src/netbeans.c

Patch 7.1.314
Problem:    The value of 'pastetoggle' is written to the session file without
            any escaping. (Randall Hansen)
Solution:   Use put_escstr(). (Ben Schmidt)
Files:      src/option.c

Patch 7.1.315
Problem:    Crash with specific search pattern using look-behind match.
            (Andreas Politz)
Solution:   Also save the value of "need_clear_subexpr".
Files:      src/regexp.c

Patch 7.1.316
Problem:    When 'cscopetag' is set ":tag" gives an error message instead of
            going to the next tag in the tag stack.
Solution:   Don't call do_cstag() when there is no argument. (Mark Goldman)
Files:      src/ex_docmd.c

Patch 7.1.317
Problem:    Compiler warnings in Motif calls.
Solution:   Change zero to NULL. (Dominique Pelle)
Files:      src/gui_motif.c

Patch 7.1.318
```

```
Problem:    Memory leak when closing xsmp connection.  Crash on exit when
            using Lesstif.
Solution:   Don't close the X display to work around a Lesstif bug.  Free
            clientid.  Also fix a leak for Motif and Athena. (Dominique Pelle)
Files:      src/gui_x11.c, src/os_unix.c

Patch 7.1.319
Problem:    When a register has an illegal utf-8 sequence, pasting it on the
            command line causes an illegal memory access.
Solution:   Use mb_cptr2char_adv(). (Dominique Pelle)
Files:      src/ex_getln.c

Patch 7.1.320 (extra)
Problem:    Win64: Warnings while compiling Python interface.
Solution:   Use PyInt in more places.  Also update version message for the
            console. (George Reilly)
Files:      src/if_python.c, src/version.c

Patch 7.1.321 (extra)
Problem:    Win32 / Win64: Install file is outdated.
Solution:   Update the text for recent compiler. (George Reilly)
Files:      src/INSTALLpc.txt

Patch 7.1.322
Problem:    Can't get start of Visual area in an <expr> mapping.
Solution:   Add the 'v' argument to getpos().
Files:      runtime/doc/eval.txt, src/eval.c

Patch 7.1.323
Problem:    Test 19 fails with some termcaps. (Dominique Pelle)
Solution:   Set the t_kb and t_kD termcap values.
Files:      src/testdir/test19.in, src/testdir/test38.in

Patch 7.1.324
Problem:    File name path length on Unix is limited to 1024.
Solution:   Use PATH_MAX when it's more than 1000.
Files:      src/os_unix.h

Patch 7.1.325
Problem:    When editing a command line that's longer than available space in
            the window, the characters at the end are in reverse order.
Solution:   Increment the insert position even when the command line doesn't
            fit.  (Ingo Karkat)
Files:      src/ex_getln.c

Patch 7.1.326
Problem:    ":s!from!to!" works, but ":smagic!from!to!" doesn't.  It sees the
            "!" as a flag to the command.  Same for ":snomagic". (Johan Spetz)
Solution:   When checking for a forced command also ignore ":smagic" and
            ":snomagic". (Ian Kelling)
Files:      src/ex_docmd.c

Patch 7.1.327
Problem:    The GUI tutor is installed when there is no GUI version.
```

Solution: Only install gvimtutor when building a GUI version.
Files: src/Makefile

Patch 7.1.328
Problem: Crash when using Cygwin and non-posix path name in tags file.
Solution: Use separate buffer for posix path. (Ben Schmidt)
Files: src/os_unix.c

Patch 7.1.329
Problem: When the popup menu is removed a column of cells, the right halve
            of double-wide characters, may not be redrawn.
Solution: Check if the right halve of a character needs to be redrawn.
            (Yukihiro Nakadaira)
Files: src/screen.c

Patch 7.1.330
Problem: Reading uninitialized memory when using Del in replace mode.
Solution: Use utfc_ptr2len_len() instead of mb_ptr2len(). (Dominique Pelle)
Files: src/misc1.c

Warning for missing sentinel in gui_xmldlg.c. (Dominique Pelle)

A search offset from the end of a match didn't work properly for multi-byte
characters. (Yukihiro Nakadaira)

When displaying the value of 'key' don't show "*****" when the value is empty.
(Ben Schmidt)

Internal error when compiled with EXITFREE and using the nerd_tree plugin.
Set last_msg_hist to NULL when history becomes empty. Call
free_all_functions() after garbage collection. (Dominique Pelle)

GTK with XIM: <S-Space> does not work. (Yukihiro Nakadaira)

Some shells do not support "echo -n", which breaks glob(). Use "echo" instead
of "echo -n $1; echo". (Gary Johnson)

"echo 22,44" printed "22" on top of the command, the error messages caused
the rest not to be cleared. Added the need_clr_eos flag.

Netbeans events are handled while updating the screen, causing a crash.
Change the moment when events are handled. Rename nb_parse_messages() to
netbeans_parse_messages(). (Xavier de Gaye)

Test 11 was broken after patch 7.1.186 on Win32 console. (Daniel Shahaf)
Use shellescape() on the file name.

IM was turned off in im_preedit_end_cb() for no good reason. (Takuhiro
Nishioka)

A corrupted spell file could cause Vim to use lots of memory. Better
detection for running into the end of the file. (idea from James Vega)

Mac: Included a patch to make it build with GTK. Moved language init to
mac_lang_init() function. (Ben Schmidt)

Problem with 'wildmenu' after ":lcd", up/down arrows don't work. (Erik Falor)

Fix configure.in to avoid "implicitly declared" warnings when running
configure.

Fixed a memory leak when redefining a keymap. (Dominique Pelle)

Setting 'pastetoggle' to "jj" didn't work.

'ic' and 'smartcase' don't work properly when using \%V in a search pattern.
(Kana Natsuno)

Patch 7.2a.001
Problem: On some systems X11/Xlib.h exists (from X11-dev package) but
            X11/Intrinsic.h does not (in Xt-dev package). This breaks the
            build. Also, on Solaris 9 sys/ptem.h isn't found.
Solution: Have configure only accept X11 when X11/Intrinsic.h exists.
            Check for sys/ptem.h while including sys/stream.h. (Vladimir
            Marek)
Files: src/auto/configure, src/configure.in

Patch 7.2a.002
Problem: getbufvar(N, "") gets the dictionary of the current buffer instead
            of buffer N.
Solution: Set curbuf before calling find_var_in_ht(). (Kana Natsuno)
Files: src/eval.c

Patch 7.2a.003
Problem: Leaking memory when using ":file name" and using access control
            lists.
Solution: Invoke mch_free_acl() in vim_rename(). (Dominique Pelle)
Files: src/fileio.c

Patch 7.2a.004
Problem: Some systems can't get spell files by ftp.
Solution: Use http when it looks like it's possible. (James Vega)
Files: runtime/autoload/spellfile.vim

Patch 7.2a.005
Problem: A few error messages use confusing names. Misspelling.
Solution: Change "dissallows" to "disallows". (Dominique Pelle) Change
            "number" to "Number".
Files: src/eval.c, src/fileio.c

Patch 7.2a.006
Problem: Reading past NUL in a string.
Solution: Check for invalid utf-8 byte sequence. (Dominique Pelle)
Files: src/charset.c

Patch 7.2a.007
Problem: ":let v = 1.2.3" was OK in Vim 7.1, now it gives an error.

```
Solution:   Don't look for a floating point number after the "." operator.
Files:      src/eval.c

Patch 7.2a.008
Problem:    printf("%g", 1) doesn't work.
Solution:   Convert Number to Float when needed.
Files:      src/message.c

Patch 7.2a.009
Problem:    cygwin_conv_to_posix_path() does not specify buffer size.
Solution:   Use new Cygwin function: cygwin_conv_path(). (Corinna Vinschen)
Files:      src/main.c, src/os_unix.c

Patch 7.2a.010
Problem:    When a file name has an illegal byte sequence Vim may read
            uninitialised memory.
Solution:   Don't use UTF_COMPOSINGLIKE() on an illegal byte.  In
            msg_outtrans_len_attr() use char2cells() instead of ptr2cells().
            In utf_ptr2char() don't check second byte when first byte is
            illegal.  (Dominique Pelle)
Files:      src/mbyte.c, src/message.c

Patch 7.2a.011
Problem:    The Edit/Startup Settings menu doesn't work.
Solution:   Expand environment variables. (Ben Schmidt)
Files:      runtime/menu.vim

Patch 7.2a.012
Problem:    Compiler warnings for casting int to pointer.
Solution:   Add cast to long in between. (Martin Toft)
Files:      src/gui_gtk_x11.c

Patch 7.2a.013
Problem:    shellescape() does not escape "%" and "#" characters.
Solution:   Add find_cmdline_var() and use it when the second argument to
            shellescape() is non-zero.
Files:      runtime/doc/eval.txt, src/eval.c, src/ex_docmd.c,
            src/proto/ex_docmd.pro, src/proto/misc2.pro, src/misc2.c

Patch 7.2a.014
Problem:    Problem with % in message.
Solution:   Put % in single quotes.
Files:      src/eval.c

Patch 7.2a.015 (after 7.2a.010)
Problem:    Misaligned messages.
Solution:   Compute length of unprintable chars correctly.
Files:      src/message.c

Patch 7.2a.016
Problem:    Using CTRL-W v in the quickfix window results in two quickfix
            windows, which is not allowed.  ":tab split" should be allowed to
            open a new quickfix window in another tab.
Solution:   For CTRL-W v instead of splitting the window open a new one.
```

            When using ":tab" do allow splitting the quickfix window (was
            already included in patch 7.2a.013).
Files: src/window.c

Patch 7.2a.017
Problem: ":doautoall" executes autocommands for all buffers instead of just
            for loaded buffers.
Solution: Change "curbuf" to "buf".
Files: src/fileio.c

Patch 7.2a.018
Problem: Compiler warnings when compiling with Gnome. (Tony Mechelynck)
Solution: Add type casts.
Files: src/gui_gtk_x11.c

Patch 7.2a.019
Problem: ":let &g:tw = 44" sets the local option value. (Cyril Slobin)
Solution: Use get_varp_scope() instead of get_varp(). (Ian Kelling)
Files: src/option.c

There is no way to avoid adding /usr/local/{include|lib} to the build
commands. Add the --with-local-dir argument to configure. (Michael
Haubenwallner)

When using CTRL-D after ":help", the number of matches could be thousands.
Restrict to TAG_MANY to avoid this taking too long. (Ian Kelling)

The popup menu could be placed at a weird location. Caused by w_wcol computed
by curs_columns(). (Dominique Pelle)

Overlapping STRCPY() arguments when using %r item in 'errorformat'. Use
STRMOVE() instead. (Ralf Wildenhues)

Mac: On Leopard gvim, when using the mouse wheel nothing would happen until
another event occurs, such as moving the mouse. Then the recorded scrolling
would take place all at once. (Eckehard Berns)

Solution for cursor color not reflecting IM status for GTK 2. Add
preedit_is_active flag. (SungHyun Nam)

filereadable() can hang on a FIFO on Linux. Use open() instead of fopen(),
with O_NONBLOCK. (suggested by Lars Kotthoff)

Included patch to support Perl 5.10. (Yasuhiro Matsumoto)

When files are dropped on gvim while the screen is being updated, ignore the
drop command to avoid freeing memory that is being used.

In a terminal, when drawing the popup menu over double-wide characters, half
characters may not be cleared properly. (Yukihiro Nakadaira)

The #ifdef for including "vimio.h" was inconsistent. In a few files it
depended on MSWIN, which isn't defined until later.

```
Patch 7.2b.001
Problem:    Compilation problem: mb_fix_col() missing with multi-byte feature
            but without GUI or clipboard.
Solution:   Remove #ifdef.
Files:      src/mbyte.c

Patch 7.2b.002
Problem:    Compiler warnings for signed/unsigned mismatch.
Solution:   Add type casts.
Files:      src/screen.c

Patch 7.2b.003
Problem:    Still a compilation problem, check_col() and check_row() missing.
Solution:   Add FEAT_MBYTE to the #if.
Files:      src/ui.c

Patch 7.2b.004
Problem:    Trying to free memory for a static string when using ":helpgrep".
            (George Reilly)
Solution:   Set 'cpo' to empty_option instead of an empty string.  Also for
            searchpair() and substitute().
Files:      src/quickfix.c, src/eval.c

Patch 7.2b.005
Problem:    The special character "!" isn't handled properly in shellescape().
            (Jan Minar)
Solution:   Escape "!" when using a "csh" like shell and with
            shellescape(s, 1).  Twice for both.  Also escape <NL>.
Files:      src/misc2.c

Patch 7.2b.006
Problem:    Reading past end of string when reading info from tags line.
Solution:   Break the loop when encountering a NUL. (Dominique Pelle)
Files:      src/tag.c

Patch 7.2b.007
Problem:    Part of a message cannot be translated.
Solution:   Put _() around the message.
Files:      src/search.c

Patch 7.2b.008
Problem:    A few filetypes are not detected or not detected properly.
Solution:   Add filetype detection patterns. (Nikolai Weibull)
Files:      runtime/filetype.vim

Patch 7.2b.009
Problem:    Reading past end of screen line. (Epicurus)
Solution:   Avoid going past the value of Columns.
Files:      src/screen.c

Patch 7.2b.010
Problem:    ":mksession" doesn't work for ":map , foo", ":sunmap ,". (Ethan
            Mallove)
Solution:   Check for "nxo", "nso" and other strange mapping combinations.
```

```
Files:      src/getchar.c

Patch 7.2b.011
Problem:    Configure for TCL ends up with include file in compiler command.
            (Richard Hogg)
Solution:   Delete items from $TCL_DEFS that do not start with a dash.
Files:      src/auto/configure, src/configure.in

Patch 7.2b.012
Problem:    Build failure with +multi_byte but without +diff.
Solution:   Add #ifdef. (Patrick Texier)
Files:      src/main.c

Patch 7.2b.013
Problem:    Build fails with tiny features and Perl. (Dominique Pelle)
Solution:   Define missing functions.  Also when compiling Python.
Files:      src/if_perl.xs, src/if_python.c

Patch 7.2b.014
Problem:    Configure uses an unsafe temp file to store commands.
Solution:   Create the temp file in local directory.
Files:      src/auto/configure, src/configure.in

Patch 7.2b.015
Problem:    Build fails on Mac when using Aap.
Solution:   Fix typo in configure script.
Files:      src/auto/configure, src/configure.in

Patch 7.2b.016
Problem:    Build fails with normal features but without +autocmd.
Solution:   Fix #ifdefs. (Ian Kelling)
Files:      src/eval.c, src/ex_cmds.c, src/quickfix.c, src/option.c,
            src/ex_docmd.c

Patch 7.2b.017
Problem:    "vim -O foo foo" results in only one window.  (Zdenek Sekera)
Solution:   Handle result of ATTENTION prompt properly. (Ian Kelling)
Files:      src/main.c

Patch 7.2b.018
Problem:    When doing command line completion on a file name for a csh-like
            shell argument a '!' character isn't escaped properly.
Solution:   Add another backslash.
Files:      src/ex_getln.c, src/misc2.c, src/proto/misc2.pro, src/screen.c

Patch 7.2b.019 (extra)
Problem:    Win32: Various compiler warnings.
Solution:   Use __w64 attribute.  Comment-out unused parameters.  Adjust a few
            #ifdefs. (George Reilly)
Files:      src/gui_w48.c, src/GvimExt/gvimext.cpp, src/Make_mvc.mak,
            src/os_mswin.c, src/os_win32.c, src/vim.h

Patch 7.2b.020
Problem:    ":sort n" doesn't handle negative numbers. (James Vega)
```

```
Solution:   Include '-' in the number.
Files:      src/charset.c, src/ex_cmds.c

Patch 7.2b.021
Problem:    Reloading doesn't read the BOM correctly. (Steve Gardner)
Solution:   Accept utf-8 BOM when specified file encoding is utf-8.
Files:      src/fileio.c

Patch 7.2b.022
Problem:    When using ":normal" while updating the status line the count of
            an operator is lost. (Dominique Pelle)
Solution:   Save and restore "opcount".
Files:      src/ex_docmd.c, src/globals.h, src/normal.c

Patch 7.2b.023
Problem:    Crash when using the result of synstack(0,0). (Matt Wozniski)
Solution:   Check for v_list to be NULL in a few more places.
Files:      src/eval.c

Patch 7.2b.024
Problem:    Using ":gui" while the netrw plugin is active causes a delay in
            updating the display.
Solution:   Don't check for terminal codes when starting the GUI.
Files:      src/term.c

Patch 7.2b.025
Problem:    When the CursorHold event triggers a pending count is lost.
            (Juergen Kraemer)
Solution:   Save the counts and restore them.
Files:      src/normal.c, src/structs.h

Patch 7.2b.026
Problem:    The GTK 2 file chooser causes the ~/.recently-used.xbel file to be
            written over and over again.  This may cause a significant
            slowdown. (Guido Berhoerster)
Solution:   Don't use the GTK 2 file chooser.
Files:      src/gui_gtk.c

Patch 7.2b.027
Problem:    Memory leak for Python, Perl, etc. script command with end marker.
Solution:   Free the memory of the end marker. (Andy Kittner)
Files:      src/ex_getln.c

Patch 7.2b.028
Problem:    Reading uninitialized memory when doing ":gui -f". (Dominique
            Pelle)
Solution:   Don't position the cursor when the screen size is invalid.
Files:      src/gui.c

Patch 7.2b.029
Problem:    ":help a" doesn't jump to "a" tag in docs. (Tony Mechelynck)
Solution:   Get all tags and throw away more than TAG_MANY after sorting.
            When there is no argument find matches for "help" to avoid a long
            delay.
```

```
Files:      src/ex_cmds.c, src/ex_getln.c

Patch 7.2b.030
Problem:    When changing the value of t_Co from 8 to 16 the Visual
            highlighting keeps both reverse and a background color.
Solution:   Remove the attribute when setting the default highlight color.
            (Markus Heidelberg)
Files:      src/syntax.c

Error when cancelling completion menu and auto-formatting. (fixed by Ian
Kelling)

Patch 7.2c.001
Problem:    ":let x=['']  | let x += x" causes hang. (Matt Wozniski)
Solution:   Only insert elements up to the original length of the List.
Files:      runtime/doc/eval.txt, src/eval.c

Patch 7.2c.002
Problem:    fnameescape() doesn't handle a leading '+' or '>'. (Jan Minar)
Solution:   Escape a leading '+' and '>'.  And a single '-'.
Files:      runtime/doc/eval.txt, src/ex_getln.c

Patch 7.2c.003
Problem:    Searching for "foo\%[bar]\+" gives a "Corrupted regexp program"
            error. (Joachim Hofmann)
Solution:   Mark the \%[] item as not being simple.
Files:      src/regexp.c

On Vista access to system directories is virtualized. (Michael Mutschler)
Adjusted the manifest file to avoid this. (George Reilly)

Memory leak when using CTRL-C to cancel listing the jump list. (Dominique
Pelle)

Mac: Could not build with Perl interface.

==============================================================================
VERSION 7.3                                          version-7.3   version7.3

This section is about improvements made between version 7.2 and 7.3.

This release has hundreds of bug fixes and there are a few new features.  The
most notable new features are:

Persistent undo                                      new-persistent-undo
---------------

Store undo information in a file.  Can undo to before when the file was read,
also for unloaded buffers. See  undo-persistence  (partly by Jordan Lewis)

Added the ":earlier 1f" and ":later 1f" commands.
Added file save counter to undo information.
Added the  undotree()  and  undofile()  functions.
```

Also added the 'undoreload' option. This makes it possible to save the
current text when reloading the buffer, so that the reload can be undone.

More encryption   new-more-encryption

Support for Blowfish encryption. Added the 'cryptmethod' option.
Mostly by Mohsin Ahmed.

Also encrypt the text in the swap file and the undo file.

Conceal text   new-conceal

Added the +conceal feature. (Vince Negri)
This allows hiding stretches of text, based on syntax highlighting.
It also allows replacing a stretch of text by a character :syn-cchar .
The 'conceallevel' option specifies what happens with text matching a syntax
item that has the conceal attribute.
The 'concealcursor' option specifies what happens in the cursor line.

The help files conceal characters used to mark tags and examples.

Added the synconcealed() function and use it for :TOhtml. (Benjamin Fritz)

Added the 'cursorbind' option, keeps the cursor in two windows with the same
text in sync.

Lua interface   new-lua

Added the Lua interface. (Luis Carvalho)

Python3 interface   new-python3

Added the Python3 interface. It exists next to Python 2.x, both can be used
at the same time. See python3 (Roland Puntaier)

Changed   changed-7.3

The MS-Windows installer no longer requires the user to type anything in the
console windows. The installer now also works on 64 bit systems, including
the "Edit with Vim" context menu.
The gvim executable is 32 bits, the installed gvimext.dll is either a 32 or 64
bit version. (mostly by George Reilly)
Made the DOS installer work with more compilers.

The MS-Windows big gvim is now built with Python 2.7 and 3.1.2, Perl 5.12 and Ruby 1.9.1. You need the matching .dll files to use them.

The extra and language files are no longer distributed separately.
The source files for all systems are included in one distribution.

After using ":recover" or recovering a file in another way, ":x" and "ZZ" didn't save what you see. This could result in work being lost. Now the text after recovery is compared to the original file contents. When they differ the buffer is marked as modified.

When Vim is exiting because of a deadly signal, when v:dying is 2 or more, VimLeavePre, VimLeave, BufWinLeave and BufUnload autocommands are not executed.

Removed support for GTK 1. It was no longer maintained and required a lot of #ifdefs in the source code. GTK 2 should be available for every system.
(James Vega)

It is no longer allowed to set the 'encoding' option from a modeline. It would corrupt the text. (Patrick Texier)

Renamed runtime/spell/fixdup to runtime/spell/fixdup.vim.

Removed obsolete Mac code.

Updated spell files for Ubuntu locale names.

Switched from autoconf 2.63 to 2.65.

Removed Mupad indent and ftplugin files, they are not useful.

The maximum number of messages remembered in the history is now 200 (was 100).

Added   added-7.3

Added the 'relativenumber' option. (Markus Heidelberg)

Added the 'colorcolumn' option: highlight one or more columns in a window.
E.g. to highlight the column after 'textwidth'. (partly by Gregor Uhlenheuer)

Added support for NetBeans in a terminal. Added :nbstart and :nbclose .
(Xavier de Gaye)

More floating point functions: acos() , asin() , atan2() , cosh() , exp() , fmod() , log() , sinh() , tan() , tanh() . (Bill McCarthy)

Added the gettabvar() and settabvar() functions. (Yegappan Lakshmanan)

Added the strchars() , strwidth() and strdisplaywidth() functions.

Support GDK_SUPER_MASK for GTK on Mac. (Stephan Schulz)

Made CTRL and ALT modifier work for mouse wheel. (Benjamin Haskell)

Added support for horizontal scroll wheel. (Bjorn Winckler)

When the buffer is in diff mode, have :TOhtml create HTML to show the diff
side-by-side. (Christian Brabandt)

Various improvements to ":TOhtml" and the 2html.vim script. (Benjamin Fritz)

Add the 'L' item to 'cinoptions'. (Manuel Konig)

Improve Javascript indenting. Add "J" flag to 'cinoptions'. (Hari Kumar G)

Mac: Support disabling antialias. (LC Mi)

Mac: Add clipboard support in the Mac console. (Bjorn Winckler)

Make it possible to drag a tab page label to another position. (Paul B. Mahol)

Better implementation of creating the Color Scheme menu. (Juergen Kraemer)

In Visual mode with 'showcmd' display the number of bytes and characters.

Allow synIDattr() getting GUI attributes when built without GUI. (Matt
Wozniski)

Support completion for ":find". Added test 73. (Nazri Ramliy)

Command line completion for :ownsyntax and :setfiletype. (Dominique Pelle)

Command line completion for :lmap and :lunmap.

Support syntax and filetype completion for user commands. (Christian Brabandt)

Avoid use of the GTK main_loop() so that the GtkFileChooser can be used.
(James Vega)

When 'formatexpr' evaluates to non-zero fall back to internal formatting, also
for "gq". (James Vega)

Support :browse for commands that use an error file argument. (Lech Lorens)

Support wide file names in gvimext. (Szabolcs Horvat)

Improve test for joining lines. (Milan Vancura)
Make joining a range of lines much faster. (Milan Vancura)

Add patch to improve support of z/OS (OS/390). (Ralf Schandl)

Added the helphelp.txt file. Moved text from various.txt to it.

Added "q" item for 'statusline'. Added w:quickfix_title . (Lech Lorens)

Various improvements for VMS. (Zoltan Arpadffy)

New syntax files:
Haskell Cabal build file (Vincent Berthoux)
ChaiScript (Jason Turner)
Cucumber (Tim Pope)
Datascript (Dominique Pelle)
Fantom (Kamil Toman)
Liquid (Tim Pope)
Markdown (Tim Pope)
wavefront's obj file (Vincent Berthoux)
Perl 6 (Andy Lester)
SDC - Synopsys Design Constraints (Maurizio Tranchero)
SVG - Scalable Vector Graphics (Vincent Berthoux)
task data (John Florian)
task 42 edit (John Florian)

New filetype plugins:
Cucumber (Tim Pope)
Liquid (Tim Pope)
Logcheck (Debian)
Markdown (Tim Pope)
Perl 6 (Andy Lester)
Quickfix window (Lech Lorens)
Tcl (Robert L Hicks)

New indent plugins:
CUDA (Bram Moolenaar)
ChaiScript (Jason Turner)
Cucumber (Tim Pope)
LifeLines (Patrick Texier)
Liquid (Tim Pope)
Mail (Bram Moolenaar)
Perl 6 (Andy Lester)

Other new runtime files:
Breton spell file (Dominique Pelle)
Dvorak keymap (Ashish Shukla)
Korean translations. (SungHyun Nam)
Python 3 completion (Aaron Griffin)
Serbian menu translations (Aleksandar Jelenak)
Tetum spell files
Tutor Bairish (Sepp Hell)
Tutor in Esperanto. (Dominique Pellé)
Tutor in Portuguese.
Norwegian Tutor now also available as tutor.nb

Removed the Mupad runtime files, they were not maintained.

Fixed fixed-7.3

```
Patch 7.2.001
Problem:    Mac: pseudo-ttys don't work properly on Leopard, resulting in the
            shell not to have a prompt, CTRL-C not working, etc.
Solution:   Don't use SVR4 compatible ptys, even though they are detected.
            (Ben Schmidt)
Files:      src/pty.c

Patch 7.2.002
Problem:    Leaking memory when displaying menus.
Solution:   Free allocated memory. (Dominique Pelle)
Files:      src/menu.c

Patch 7.2.003
Problem:    Typo in translated message.  Message not translated.
Solution:   Correct spelling. Add _(). (Dominique Pelle)
Files:      src/spell.c, src/version.c

Patch 7.2.004
Problem:    Cscope help message is not translated.
Solution:   Put it in _(). (Dominique Pelle)
Files:      src/if_cscope.c, src/if_cscope.h

Patch 7.2.005
Problem:    A few problems when profiling.  Using flag pointer instead of flag
            value.  Allocating zero bytes.  Not freeing used memory.
Solution:   Remove wrong '&' characters.  Skip dumping when there is nothing
            to dump.  Free used memory. (Dominique Pelle)
Files:      src/eval.c

Patch 7.2.006
Problem:    HTML files are not recognized by contents.
Solution:   Add a rule to the scripts file. (Nico Weber)
Files:      runtime/scripts.vim

Patch 7.2.007 (extra)
Problem:    Minor issues for VMS.
Solution:   Minor fixes for VMS.  Add float support. (Zoltan Arpadffy)
Files:      runtime/doc/os_vms.txt, src/os_vms_conf.h, src/Make_vms.mms,
            src/testdir/Make_vms.mms, src/testdir/test30.in,
            src/testdir/test54.in

Patch 7.2.008
Problem:    With a BufHidden autocommand that invokes ":bunload" the window
            count for a buffer can be wrong. (Bob Hiestand)
Solution:   Don't call enter_buffer() when already in that buffer.
Files:      src/buffer.c

Patch 7.2.009
Problem:    Can't compile with Perl 5.10 on MS-Windows. (Cesar Romani)
Solution:   Add the Perl_sv_free2 function for dynamic loading. (Dan Sharp)
Files:      src/if_perl.xs

Patch 7.2.010
Problem:    When using "K" in Visual mode not all characters are properly
```

            escaped. (Ben Schmidt)
Solution: Use a function with the functionality of shellescape(). (Jan
            Minar)
Files: src/mbyte.c, src/misc2.c, src/normal.c

Patch 7.2.011
Problem: Get an error when inserting a float value from the expression
            register.
Solution: Convert the Float to a String automatically in the same place
            where a List would be converted to a String.
Files: src/eval.c

Patch 7.2.012
Problem: Compiler warnings when building with startup timing.
Solution: Add type casts.
Files: src/ex_cmds2.c

Patch 7.2.013
Problem: While waiting for the X selection Vim consumes a lot of CPU time
            and hangs until a response is received.
Solution: Sleep a bit when the selection event hasn't been received yet.
            Time out after a couple of seconds to avoid a hang when the
            selection owner isn't responding.
Files: src/ui.c

Patch 7.2.014
Problem: synstack() doesn't work in an empty line.
Solution: Accept column zero as a valid position.
Files: src/eval.c

Patch 7.2.015
Problem: "make all test install" doesn't stop when the test fails. (Daniel
            Shahaf)
Solution: When test.log contains failures exit with non-zero status.
Files: src/testdir/Makefile

Patch 7.2.016
Problem: The pattern being completed may be in freed memory when the
            command line is being reallocated. (Dominique Pelle)
Solution: Keep a pointer to the expand_T in the command line structure.
            Don't use <S-Tab> as CTRL-P when there are no results. Clear the
            completion when using a command line from the history.
Files: src/ex_getln.c

Patch 7.2.017
Problem: strlen() used on text that may not end in a NUL. (Dominique Pelle)
            Pasting a very big selection doesn't work.
Solution: Use the length passed to the XtSelectionCallbackProc() function.
            After getting the SelectionNotify event continue dispatching
            events until the callback is actually called. Also dispatch the
            PropertyNotify event.
Files: src/ui.c

Patch 7.2.018

```
Problem:    Memory leak when substitute is aborted.
Solution:   Free the buffer allocated for the new text. (Dominique Pelle)
Files:      src/ex_cmds.c

Patch 7.2.019
Problem:    Completion of ":noautocmd" doesn't work and exists(":noautocmd")
            returns zero. (Ben Fritz)
Solution:   Add "noautocmd" to the list of modifiers and commands.
Files:      src/ex_cmds.h, src/ex_docmd.c

Patch 7.2.020
Problem:    Starting the GUI when the executable starts with 'k', but the KDE
            version no longer exists.
Solution:   Don't have "kvim" start the GUI.
Files:      src/main.c

Patch 7.2.021
Problem:    When executing autocommands getting the full file name may be
            slow. (David Kotchan)
Solution:   Postpone calling FullName_save() until autocmd_fname is used.
Files:      src/ex_docmd.c, src/fileio.c, src/globals.h

Patch 7.2.022 (extra)
Problem:    Testing is not possible when compiling with MingW.
Solution:   Add a MingW specific test Makefile. (Bill McCarthy)
Files:      Filelist, src/testdir/Make_ming.mak

Patch 7.2.023
Problem:    'cursorcolumn' is in the wrong place in a closed fold when the
            display is shifted left. (Gary Johnson)
Solution:   Subtract w_skipcol or w_leftcol when needed.
Files:      src/screen.c

Patch 7.2.024
Problem:    It's possible to set 'history' to a negative value and that causes
            an out-of-memory error.
Solution:   Check that 'history' has a positive value. (Doug Kearns)
Files:      src/option.c

Patch 7.2.025
Problem:    When a CursorHold event invokes system() it is retriggered over
            and over again.
Solution:   Don't reset did_cursorhold when getting K_IGNORE.
Files:      src/normal.c

Patch 7.2.026 (after 7.2.010)
Problem:    "K" doesn't use the length of the identifier but uses the rest of
            the line.
Solution:   Copy the desired number of characters first.
Files:      src/normal.c

Patch 7.2.027
Problem:    Can use cscope commands in the sandbox.
Solution:   Disallow them, they might not be safe.
```

```
Files:      src/ex_cmds.h

Patch 7.2.028
Problem:    Confusing error message for missing ().
Solution:   Change "braces" to "parentheses". (Gary Johnson)
Files:      src/eval.c

Patch 7.2.029
Problem:    No completion for ":doautoall".
Solution:   Complete ":doautoall" like ":doautocmd".  (Doug Kearns)
Files:      src/ex_docmd.c

Patch 7.2.030 (after 7.2.027)
Problem:    Can't compile.
Solution:   Remove prematurely added ex_oldfiles.
Files:      src/ex_cmds.h

Patch 7.2.031
Problem:    Information in the viminfo file about previously edited files is
            not available to the user.  There is no way to get a complete list
            of files edited in previous Vim sessions.
Solution:   Add v:oldfiles and fill it with the list of old file names when
            first reading the viminfo file.  Add the ":oldfiles" command,
            ":browse oldfiles" and the "#<123" special file name.  Increase
            the default value for 'viminfo' from '20 to '100.
Files:      runtime/doc/cmdline.txt, runtime/doc/eval.txt,
            runtime/doc/starting.txt, runtime/doc/usr_21.txt, src/eval.c,
            src/ex_cmds.c, src/ex_cmds.h, src/ex_docmd.c, src/feature.h,
            src/fileio.c, src/main.c, src/mark.c, src/misc1.c,
            src/proto/eval.pro, src/proto/ex_cmds.pro, src/proto/mark.pro,
            src/option.c, src/structs.h, src/vim.h

Patch 7.2.032 (after 7.2.031)
Problem:    Can't build with EXITFREE defined. (Dominique Pelle)
Solution:   Change vv_string to vv_str.
Files:      src/eval.c

Patch 7.2.033
Problem:    When detecting a little endian BOM "ucs-2le" is used, but the text
            might be "utf-16le".
Solution:   Default to "utf-16le", it also works for "ucs-2le". (Jia Yanwei)
Files:      src/fileio.c, src/testdir/test42.ok

Patch 7.2.034
Problem:    Memory leak in spell info when deleting buffer.
Solution:   Free the memory. (Dominique Pelle)
Files:      src/buffer.c

Patch 7.2.035
Problem:    Mismatches between alloc/malloc, free/vim_free,
            realloc/vim_realloc.
Solution:   Use the right function. (Dominique Pelle)
Files:      src/gui_x11.c, src/mbyte.c, src/misc2.c, src/os_unix.c
```

```
Patch 7.2.036 (extra)
Problem:    Mismatches between alloc/malloc, free/vim_free,
            realloc/vim_realloc.
Solution:   Use the right function. (Dominique Pelle)
Files:      src/gui_riscos.c, src/gui_w48.c, src/mbyte.c, src/os_vms.c,
            src/os_w32exe.c, src/os_win16.c

Patch 7.2.037
Problem:    Double free with GTK 1 and compiled with EXITFREE.
Solution:   Don't close display. (Dominique Pelle)
Files:      src/os_unix.c

Patch 7.2.038
Problem:    Overlapping arguments to memcpy().
Solution:   Use mch_memmove(). (Dominique Pelle)
Files:      src/if_xcmdsrv.c

Patch 7.2.039
Problem:    Accessing freed memory on exit when EXITFREE is defined.
Solution:   Call hash_init() on the v: hash table.
Files:      src/eval.c

Patch 7.2.040
Problem:    When using ":e ++ff=dos fname" and the file contains a NL without
            a CR before it and 'ffs' contains "unix" then the fileformat
            becomes unix.
Solution:   Ignore 'ffs' when using the ++ff argument. (Ben Schmidt)
            Also remove unreachable code.
Files:      src/fileio.c

Patch 7.2.041
Problem:    In diff mode, when using two tabs, each with two diffed buffers,
            editing a buffer of the other tab messes up the diff.  (Matt
            Mzyzik)
Solution:   Only copy options from a window where the buffer was edited that
            doesn't have 'diff' set or is for the current tab page.
            Also fix that window options for a buffer are stored with the
            wrong window.
Files:      src/buffer.c, src/ex_cmds.c, src/ex_cmds2.c, src/ex_docmd.c,
            src/ex_getln.c, src/if_sniff.c, src/main.c, src/netbeans.c,
            src/normal.c, src/popupmnu.c, src/proto/buffer.pro,
            src/proto/ex_cmds.pro src/quickfix.c, src/window.c

Patch 7.2.042
Problem:    When using winrestview() in a BufWinEnter autocommand the window
            is scrolled anyway. (Matt Zyzik)
Solution:   Don't recompute topline when above 'scrolloff' from the bottom.
            Don't always put the cursor halfway when entering a buffer.  Add
            "w_topline_was_set".
Files:      src/buffer.c, src/move.c, src/structs.h

Patch 7.2.043
Problem:    VMS: Too many characters are escaped in filename and shell
            commands.
```

```
Solution:   Escape fewer characters. (Zoltan Arpadffy)
Files:      src/vim.h

Patch 7.2.044
Problem:    Crash because of STRCPY() being over protective of the destination
            size. (Dominique Pelle)
Solution:   Add -D_FORTIFY_SOURCE=1 to CFLAGS.  Use an intermediate variable
            for the pointer to avoid a warning.
Files:      src/auto/configure, src/configure.in, src/eval.c

Patch 7.2.045
Problem:    The Python interface has an empty entry in sys.path.
Solution:   Filter out the empty entry. (idea from James Vega)
Files:      src/if_python.c

Patch 7.2.046
Problem:    Wrong check for filling buffer with encoding. (Danek Duvall)
Solution:   Remove pointers. (Dominique Pelle)
Files:      src/mbyte.c

Patch 7.2.047
Problem:    Starting Vim with the -nb argument while it's not supported causes
            the other side to hang.
Solution:   When -nb is used while it's not supported exit Vim. (Xavier de
            Gaye)
Files:      src/main.c, src/vim.h

Patch 7.2.048
Problem:    v:prevcount is changed too often.  Counts are not multiplied when
            setting v:count.
Solution:   Set v:prevcount properly.  Multiply counts. (idea by Ben Schmidt)
Files:      src/eval.c, src/normal.c, src/proto/eval.pro

Patch 7.2.049 (extra)
Problem:    Win32: the clipboard doesn't support UTF-16.
Solution:   Change UCS-2 support to UTF-16 support. (Jia Yanwei)
Files:      src/gui_w32.c, src/gui_w48.c, src/mbyte.c, src/misc1.c,
            src/os_mswin.c, src/os_win32.c, src/proto/os_mswin.pro

Patch 7.2.050
Problem:    Warnings for not checking return value of fwrite(). (Chip Campbell)
Solution:   Use the return value.
Files:      src/spell.c

Patch 7.2.051
Problem:    Can't avoid 'wildignore' and 'suffixes' for glob() and globpath().
Solution:   Add an extra argument to these functions. (Ingo Karkat)
Files:      src/eval.c, src/ex_getln.c, src/proto/ex_getln.pro,
            runtime/doc/eval.txt, runtime/doc/options.txt

Patch 7.2.052
Problem:    synIDattr() doesn't support "sp" for special color.
Solution:   Recognize "sp" and "sp#".  (Matt Wozniski)
Files:      runtime/doc/eval.txt, src/eval.c
```

```
Patch 7.2.053
Problem:    Crash when using WorkShop command ":ws foo". (Dominique Pelle)
Solution:   Avoid using a NULL pointer.
Files:      src/workshop.c

Patch 7.2.054
Problem:    Compilation warnings for format in getchar.c.
Solution:   Use fputs() instead of fprintf().  (Dominique Pelle)
Files:      src/getchar.c

Patch 7.2.055
Problem:    Various compiler warnings with strict checking.
Solution:   Avoid the warnings by using return values and renaming.
Files:      src/diff.c, src/eval.c, src/ex_cmds.c, src/ex_docmd.c,
            src/fileio.c, src/fold.c, src/globals.h, src/gui.c,
            src/gui_at_sb.c, src/gui_gtk_x11.c, src/gui_xmdlg.c,
            src/gui_xmebw.c, src/main.c, src/mbyte.c, src/message.c,
            src/netbeans.c, src/option.c, src/os_unix.c, src/spell.c,
            src/ui.c, src/window.c

Patch 7.2.056 (after 7.2.050)
Problem:    Tests 58 and 59 fail.
Solution:   Don't invoke fwrite() with a zero length. (Dominique Pelle)
Files:      src/spell.c

Patch 7.2.057 (after 7.2.056)
Problem:    Combination of int and size_t may not work.
Solution:   Use size_t for variable.
Files:      src/spell.c

Patch 7.2.058
Problem:    Can't add a patch name to the ":version" output.
Solution:   Add the extra_patches array.
Files:      src/version.c

Patch 7.2.059
Problem:    Diff display is not always updated.
Solution:   Update the display more often.
Files:      src/diff.c

Patch 7.2.060
Problem:    When a spell files has many compound rules it may take a very long
            time making the list of suggestions.  Displaying also can be slow
            when there are misspelled words.
            Can't parse some Hunspell .aff files.
Solution:   Check if a compounding can possibly work before trying a
            combination, if the compound rules don't contain wildcards.
            Implement using CHECKCOMPOUNDPATTERN.
            Ignore COMPOUNDRULES.  Ignore a comment after most items.
            Accept ONLYINCOMPOUND as an alias for NEEDCOMPOUND.
            Accept FORBIDDENWORD as an alias for BAD.
Files:      runtime/doc/spell.txt, src/spell.c
```

```
Patch 7.2.061
Problem:    Can't create a funcref for an autoload function without loading
            the script first. (Marc Weber)
Solution:   Accept autoload functions that don't exist yet in function().
Files:      src/eval.c

Patch 7.2.062
Problem:    "[Scratch]" is not translated.
Solution:   Mark the string for translation. (Dominique Pelle)
Files:      src/buffer.c

Patch 7.2.063
Problem:    Warning for NULL argument of Perl_sys_init3().
Solution:   Use Perl_sys_init() instead. (partly by Dominique Pelle)
Files:      src/if_perl.xs

Patch 7.2.064
Problem:    Screen update bug when repeating "~" on a Visual block and the
            last line doesn't change.
Solution:   Keep track of changes for all lines.  (Moritz Orbach)
Files:      src/ops.c

Patch 7.2.065
Problem:    GTK GUI: the cursor disappears when doing ":vsp" and the Vim
            window is maximized.  (Dominique Pelle, Denis Smolyar)
Solution:   Don't change "Columns" back to an old value at a wrong moment.
            Do change "Rows" when it should not be a problem.
Files:      src/gui.c

Patch 7.2.066
Problem:    It's not easy to see whether 'encoding' is a multi-byte encoding.
Solution:   Add has('multi_byte_encoding').
Files:      runtime/doc/eval.txt, src/eval.c

Patch 7.2.067
Problem:    Session file can't load extra file when the path contains special
            characters.
Solution:   Escape the file name. (Lech Lorens)
Files:      src/ex_docmd.c

Patch 7.2.068
Problem:    Emacs tags file lines can be too long, resulting in an error
            message. (James Vega)
Solution:   Ignore lines with errors if they are too long.
Files:      src/tag.c

Patch 7.2.069 (after 7.2.060)
Problem:    Compiler warning for storing size_t in int.
Solution:   Add type cast.
Files:      src/spell.c

Patch 7.2.070
Problem:    Crash when a function returns a:000. (Matt Wozniski)
Solution:   Don't put the function struct on the stack, allocate it.  Free it
```

```
            only when nothing in it is used.
Files:      src/eval.c

Patch 7.2.071 (extra)
Problem:    Win32: Handling netbeans events while Vim is busy updating the
            screen may cause a crash.
Solution:   Like with GTK, only handle netbeans messages in the main loop.
            (Xavier de Gaye)
Files:      src/gui_w48.c, src/netbeans.c

Patch 7.2.072 (extra)
Problem:    Compiler warning in Sniff code.
Solution:   Use return value of pipe(). (Dominique Pelle)
Files:      src/if_sniff.c

Patch 7.2.073
Problem:    ":set <xHome>" has the same output as ":set <Home>". (Matt
            Wozniski)
Solution:   Don't translate "x" keys to its alternative for ":set".
Files:      src/gui_mac.c, src/misc2.c, src/option.c, src/proto/misc2.pro

Patch 7.2.074 (extra, after 7.2.073)
Problem:    ":set <xHome>" has the same output as ":set <Home>". (Matt
            Wozniski)
Solution:   Don't translate "x" keys to its alternative for ":set".
Files:      src/gui_mac.c

Patch 7.2.075 (after 7.2.058)
Problem:    Explanation about making a diff for extra_patches is unclear.
Solution:   Adjust comment.
Files:      src/version.c

Patch 7.2.076
Problem:    rename(from, to) deletes the file if "from" and "to" are not equal
            but still refer to the same file.  E.g., on a FAT32 filesystem
            under Unix.
Solution:   Go through another file name.
Files:      src/fileio.c

Patch 7.2.077 (after 7.2.076)
Problem:    rename(from, to) doesn't work if "from" and "to" differ only in
            case on a system that ignores case in file names.
Solution:   Go through another file name.
Files:      src/fileio.c

Patch 7.2.078
Problem:    When deleting a fold that is specified with markers the cursor
            position may be wrong.  Folds may not be displayed properly after
            a delete.  Wrong fold may be deleted.
Solution:   Fix the problems. (mostly by Lech Lorens)
Files:      src/fold.c

Patch 7.2.079
Problem:    "killed" netbeans events are not handled correctly.
```

```
Solution:   A "killed" netbeans event is sent when the buffer is deleted or
            wiped out (in this case, the netbeans annotations in this buffer
            have been removed).  A user can still remove a sign with the
            command ":sign unplace" and this does not trigger a "killed"
            event.  (Xavier de Gaye)
Files:      runtime/doc/netbeans.txt, src/buffer.c, src/globals.h,
            src/netbeans.c, src/proto/netbeans.pro

Patch 7.2.080
Problem:    When typing a composing character just after starting completion
            may access memory before its allocation point. (Dominique Pelle)
Solution:   Don't delete before the completion start column.  Add extra checks
            for the offset not being negative.
Files:      src/edit.c

Patch 7.2.081
Problem:    Compiler warning for floating point overflow on VAX.
Solution:   For VAX use a smaller number. (Zoltan Arpadffy)
Files:      src/message.c

Patch 7.2.082
Problem:    When 'ff' is "mac" then "ga" on a ^J shows 0x0d instead of 0x0a.
            (Andy Wokula)
Solution:   Use NL for this situation. (Lech Lorens)
Files:      src/ex_cmds.c

Patch 7.2.083
Problem:    ":tag" does not return to the right tag entry from the tag stack.
Solution:   Don't change the current match when there is no argument.
            (Erik Falor)
Files:      src/tag.c

Patch 7.2.084
Problem:    Recursive structures are not handled properly in Python
            vim.eval().
Solution:   Keep track of references in a better way. (Yukihiro Nakadaira)
Files:      src/if_python.c

Patch 7.2.085
Problem:    ":set <M-b>=<Esc>b" does not work when 'encoding' is utf-8.
Solution:   Put the <M-b> character in the input buffer as valid utf-8.
            (partly by Matt Wozniski)
Files:      src/term.c

Patch 7.2.086
Problem:    Using ":diffget 1" in buffer 1 corrupts the text.
Solution:   Don't do anything when source and destination of ":diffget" or
            ":diffput" is the same buffer. (Dominique Pelle)
Files:      src/diff.c

Patch 7.2.087
Problem:    Adding URL to 'path' doesn't work to edit a file.
Solution:   Skip simplify_filename() for URLs. (Matt Wozniski)
Files:      src/misc2.c
```

```
Patch 7.2.088 (extra)
Problem:    OpenClipboard() may fail when another application is using the
            clipboard.
Solution:   Retry OpenClipboard() a few times. (Jianrong Yu)
Files:      src/os_mswin.c

Patch 7.2.089 (extra)
Problem:    Win32: crash when using Ultramon buttons.
Solution:   Don't use a WM_OLE message of zero size. (Ray Megal)
Files:      src/if_ole.cpp, src/gui_w48.c

Patch 7.2.090
Problem:    User command containing 0x80 in multi-byte character does not work
            properly. (Yasuhiro Matsumoto)
Solution:   Undo replacement of K_SPECIAL and CSI characters when executing
            the command.
Files:      src/ex_docmd.c

Patch 7.2.091
Problem:    ":cs help" output is not aligned for some languages.
Solution:   Compute character size instead of byte size. (Dominique Pelle)
Files:      src/if_cscope.c

Patch 7.2.092
Problem:    Some error messages are not translated.
Solution:   Add _() around the messages. (Dominique Pelle)
Files:      src/eval.c

Patch 7.2.093 (extra)
Problem:    Win32: inputdialog() and find/replace dialogs can't handle
            multi-byte text.
Solution:   Use the wide version of dialog functions when available. (Yanwei
            Jia)
Files:      src/gui_w32.c, src/gui_w48.c

Patch 7.2.094
Problem:    Compiler warning for signed/unsigned compare.
Solution:   Add type cast.  Also fix a few typos.
Files:      src/edit.c

Patch 7.2.095
Problem:    With Visual selection, "r" and then CTRL-C Visual mode is stopped
            but the highlighting is not removed.
Solution:   Call reset_VIsual().
Files:      src/normal.c

Patch 7.2.096
Problem:    After ":number" the "Press Enter" message may be on the wrong
            screen, if switching screens for shell commands.
Solution:   Reset info_message. (James Vega)
Files:      src/ex_cmds.c

Patch 7.2.097
```

```
Problem:    "!xterm&" doesn't work when 'shell' is "bash".
Solution:   Ignore SIGHUP after calling setsid(). (Simon Schubert)
Files:      src/os_unix.c

Patch 7.2.098
Problem:    Warning for signed/unsigned pointer.
Solution:   Add type cast.
Files:      src/eval.c

Patch 7.2.099
Problem:    Changing GUI options causes an unnecessary redraw when the GUI
            isn't active.
Solution:   Avoid the redraw. (Lech Lorens)
Files:      src/option.c

Patch 7.2.100
Problem:    When using ":source" on a FIFO or something else that can't rewind
            the first three bytes are skipped.
Solution:   Instead of rewinding read the first line and detect a BOM in that.
            (mostly by James Vega)
Files:      src/ex_cmds2.c

Patch 7.2.101 (extra)
Problem:    MSVC version not recognized.
Solution:   Add the version number to the list.  (Zhong Zhang)
Files:      src/Make_mvc.mak

Patch 7.2.102 (after 7.2.100)
Problem:    When 'encoding' is "utf-8" a BOM at the start of a Vim script is
            not removed. (Tony Mechelynck)
Solution:   When no conversion is taking place make a copy of the line without
            the BOM.
Files:      src/ex_cmds2.c

Patch 7.2.103
Problem:    When 'bomb' is changed the window title is updated to show/hide a
            "+", but the tab page label isn't. (Patrick Texier)
Solution:   Set "redraw_tabline" in most places where "need_maketitle" is set.
            (partly by Lech Lorens)
Files:      src/option.c

Patch 7.2.104
Problem:    When using ":saveas bar.c" the tab label isn't updated right away.
Solution:   Set redraw_tabline. (Francois Ingelrest)
Files:      src/ex_cmds.c

Patch 7.2.105
Problem:    Modeline setting for 'foldmethod' overrules diff options. (Ingo
            Karkat)
Solution:   Don't set 'foldmethod' and 'wrap' from a modeline when 'diff' is
            on.
Files:      src/option.c

Patch 7.2.106
```

```
Problem:    Endless loop when using "]s" in HTML when there are no
            misspellings. (Ingo Karkat)
Solution:   Break the search loop.  Also fix pointer alignment for systems
            with pointers larger than int.
Files:      src/spell.c

Patch 7.2.107
Problem:    When using a GUI dialog and ":echo" commands the messages are
            deleted after the dialog. (Vincent Birebent)
Solution:   Don't call msg_end_prompt() since there was no prompt.
Files:      src/message.c

Patch 7.2.108 (after 7.2.105)
Problem:    Can't build without the diff feature.
Solution:   Add #ifdef.
Files:      src/option.c

Patch 7.2.109
Problem:    'langmap' does not work for multi-byte characters.
Solution:   Add a list of mapped multi-byte characters. (based on work by
            Konstantin Korikov, Agathoklis Hatzimanikas)
Files:      runtime/doc/options.txt, src/edit.c, src/getchar.c, src/macros.h,
            src/normal.c, src/option.c, src/proto/option.pro, src/window.c

Patch 7.2.110
Problem:    Compiler warning for unused variable.
Solution:   Init the variable.
Files:      src/ex_docmd.c

Patch 7.2.111
Problem:    When using Visual block mode with 'cursorcolumn' it's unclear what
            is selected.
Solution:   Don't use 'cursorcolumn' highlighting inside the Visual selection.
            (idea by Dominique Pelle)
Files:      src/screen.c

Patch 7.2.112
Problem:    Cursor invisible in Visual mode when 'number' is set and cursor in
            first column. (Matti Niemenmaa, Renato Alves)
Solution:   Check that vcol_prev is smaller than vcol.
Files:      src/screen.c

Patch 7.2.113
Problem:    Crash for substitute() call using submatch(1) while there is no
            such submatch. (Yukihiro Nakadaira)
Solution:   Also check the start of the submatch is set, it can be NULL when
            an attempted match didn't work out.
Files:      src/regexp.c

Patch 7.2.114
Problem:    Using wrong printf format.
Solution:   Use "%ld" instead of "%d". (Dominique Pelle)
Files:      src/netbeans.c
```

```
Patch 7.2.115
Problem:    Some debugging code is never used.
Solution:   Remove nbtrace() and nbprt(). (Dominique Pelle)
Files:      src/nbdebug.c, src/nbdebug.h

Patch 7.2.116
Problem:    Not all memory is freed when EXITFREE is defined.
Solution:   Free allocated memory on exit. (Dominique Pelle)
Files:      src/ex_docmd.c, src/gui_gtk_x11.c, src/misc2.c, src/search.c,
            src/tag.c

Patch 7.2.117
Problem:    Location list incorrectly labelled "Quickfix List".
Solution:   Break out of both loops for finding window for location list
            buffer. (Lech Lorens)
Files:      src/buffer.c, src/quickfix.c, src/screen.c

Patch 7.2.118
Problem:    <PageUp> at the more prompt only does half a page.
Solution:   Make <PageUp> go up a whole page.  Also make 'f' go a page
            forward, but not quit the more prompt. (Markus Heidelberg)
Files:      src/message.c

Patch 7.2.119
Problem:    Status line is redrawn too often.
Solution:   Check ScreeenLinesUC[] properly. (Yukihiro Nakadaira)
Files:      src/screen.c

Patch 7.2.120
Problem:    When opening the quickfix window or splitting the window and
            setting the location list, the location list is copied and then
            deleted, which is inefficient.
Solution:   Don't copy the location list when not needed. (Lech Lorens)
Files:      src/quickfix.c, src/vim.h, src/window.c

Patch 7.2.121
Problem:    In gvim "!grep a *.c" spews out a lot of text that can't be
            stopped with CTRL-C.
Solution:   When looping to read and show text, do check for typed characters
            every two seconds.
Files:      src/os_unix.c

Patch 7.2.122
Problem:    Invalid memory access when the VimResized autocommand changes
            'columns' and/or 'lines'.
Solution:   After VimResized check for changed values. (Dominique Pelle)
Files:      src/screen.c

Patch 7.2.123
Problem:    Typing 'q' at more prompt for ":map" output still displays another
            line, causing another more prompt. (Markus Heidelberg)
Solution:   Quit listing maps when 'q' typed.
Files:      src/getchar.c
```

```
Patch 7.2.124
Problem:    Typing 'q' at more prompt for ":tselect" output still displays
            more lines, causing another more prompt. (Markus Heidelberg)
Solution:   Quit listing tags when 'q' typed.
Files:      src/tag.c

Patch 7.2.125
Problem:    Leaking memory when reading XPM bitmap for a sign.
Solution:   Don't allocate the memory twice. (Dominique Pelle)
Files:      src/gui_x11.c

Patch 7.2.126
Problem:    When EXITFREE is defined signs are not freed.
Solution:   Free all signs on exit.  Also free keymaps. (Dominique Pelle)
Files:      src/misc2.c, src/ex_cmds.c, src/proto/ex_cmds.pro

Patch 7.2.127
Problem:    When listing mappings and a wrapping line causes the more prompt,
            after typing 'q' there can be another more prompt. (Markus
            Heidelberg)
Solution:   Set "lines_left" to allow more lines to be displayed.
Files:      src/message.c

Patch 7.2.128 (after 7.2.055)
Problem:    Using ":lcd" makes session files not work.
Solution:   Compare return value of mch_chdir() properly. (Andreas Bernauer)
Files:      src/ex_docmd.c

Patch 7.2.129
Problem:    When opening a command window from input() it uses the search
            history.
Solution:   Use get_cmdline_type(). (James Vega)
Files:      src/ex_getln.c

Patch 7.2.130
Problem:    Vim may hang until CTRL-C is typed when using CTRL-Z.
Solution:   Avoid using pause().  Also use "volatile" for variables used in
            signal functions. (Dominique Pelle)
Files:      src/auto/configure, src/configure.in, src/config.h.in,
            src/globals.h, src/os_unix.c

Patch 7.2.131
Problem:    When 'keymap' is cleared may still use the cursor highlighting for
            when it's enabled.
Solution:   Reset 'iminsert' and 'imsearch'. (partly by Dominique Pelle)
            Also avoid ":setlocal" for these options have a global effect.
Files:      src/option.c

Patch 7.2.132
Problem:    When changing directory during a SwapExists autocmd freed memory
            may be accessed. (Dominique Pelle)
Solution:   Add the allbuf_lock flag.
Files:      src/ex_getln.c, src/globals.h, src/fileio.c,
            src/proto/ex_getln.pro
```

```
Patch 7.2.133
Problem:    ":diffoff!" changes settings in windows not in diff mode.
Solution:   Only change settings in other windows when 'diff' is set, always
            do it for the current window. (Lech Lorens)
Files:      src/diff.c

Patch 7.2.134
Problem:    Warning for discarding "const" from pointer.
Solution:   Don't pass const pointer to mch_memmove().
Files:      src/fileio.c

Patch 7.2.135
Problem:    Memory leak when redefining user command with complete argument.
Solution:   Free the old complete argument. (Dominique Pelle)
Files:      src/ex_docmd.c

Patch 7.2.136 (after 7.2.132)
Problem:    ":cd" is still possible in a SwapExists autocmd.
Solution:   Check the allbuf_lock flag in ex_cd().
Files:      src/ex_docmd.c

Patch 7.2.137
Problem:    When 'virtualedit' is set, a left shift of a blockwise selection
            that starts and ends inside a tab shifts too much. (Helmut
            Stiegler)
Solution:   Redo the block left shift code. (Lech Lorens)
Files:      src/ops.c, src/testdir/Makefile, src/testdir/test66.in,
            src/testdir/test66.ok

Patch 7.2.138 (extra part of 7.2.137)
Problem:    See 7.2.137.
Solution:   See 7.2.137.
Files:      src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms

Patch 7.2.139
Problem:    Crash when 'virtualedit' is "all". (James Vega)
Solution:   Avoid overflow when column is MAXCOL. (Dominique Pelle)
Files:      src/misc2.c

Patch 7.2.140
Problem:    Diff highlighting isn't displayed before the Visual area if it
            starts at the cursor position. (Markus Heidelberg)
Solution:   Also check fromcol_prev.
Files:      src/screen.c

Patch 7.2.141
Problem:    When redrawing a character for bold spill this causes the next
            character to be redrawn as well.
Solution:   Only redraw one extra character. (Yukihiro Nakadaira)
Files:      src/screen.c
```

```
Patch 7.2.142
Problem:    Motif and Athena balloons don't use tooltip colors.
Solution:   Set the colors. (Matt Wozniski)
Files:      src/gui_beval.c

Patch 7.2.143
Problem:    No command line completion for ":cscope" command.
Solution:   Add the completion for ":cscope". (Dominique Pelle)
Files:      src/ex_docmd.c, src/ex_getln.c, src/if_cscope.c,
            src/proto/if_cscope.pro, src/vim.h

Patch 7.2.144
Problem:    When 't_Co' is set to the value it already had the color scheme is
            reloaded anyway.
Solution:   Only load the colorscheme when the t_Co value changes. (Dominique
            Pelle)
Files:      src/option.c

Patch 7.2.145
Problem:    White space in ":cscope find" is not ignored.
Solution:   Ignore the white space, but not when the leading white space is
            useful for the argument.
Files:      runtime/doc/if_scop.txt, src/if_cscope.c

Patch 7.2.146
Problem:    v:warningmsg isn't used for all warnings.
Solution:   Set v:warningmsg for relevant warnings. (Ingo Karkat)
Files:      src/fileio.c, src/misc1.c, src/option.c

Patch 7.2.147
Problem:    When compiled as small version and 'number' is on the cursor is
            displayed in the wrong position after a tab. (James Vega)
Solution:   Don't increment vcol when still displaying the line number.
Files:      src/screen.c

Patch 7.2.148
Problem:    When searching for "$" while 'hlsearch' is set, highlighting the
            character after the line does not work in the cursor column.
            Also highlighting for Visual mode after the line end when this
            isn't needed.  (Markus Heidelberg)
Solution:   Only compare the cursor column in the cursor line.  Only highlight
            for Visual selection after the last character when it's needed to
            see where the Visual selection ends.
Files:      src/screen.c

Patch 7.2.149
Problem:    Using return value of function that doesn't return a value results
            in reading uninitialized memory.
Solution:   Set the default to return zero.  Make cursor() return -1 on
            failure.  Let complete() return an empty string in case of an
            error.  (partly by Dominique Pelle)
Files:      runtime/doc/eval.txt, src/eval.c

Patch 7.2.150 (extra)
```

```
Problem:    Can't use tab pages from VisVim.
Solution:   Add tab page support to VisVim. (Adam Slater)
Files:      src/VisVim/Commands.cpp, src/VisVim/Resource.h,
            src/VisVim/VisVim.rc

Patch 7.2.151
Problem:    ":hist a" doesn't work like ":hist all" as the docs suggest.
Solution:   Make ":hist a" and ":hist al" work. (Dominique Pelle)
Files:      src/ex_getln.c

Patch 7.2.152
Problem:    When using "silent echo x" inside ":redir" a next echo may start
            halfway the line. (Tony Mechelynck, Dennis Benzinger)
Solution:   Reset msg_col after redirecting silently.
Files:      src/ex_docmd.c, src/message.c, src/proto/message.pro

Patch 7.2.153
Problem:    Memory leak for ":recover empty_dir/".
Solution:   Free files[] when it becomes empty. (Dominique Pelle)
Files:      src/memline.c

Patch 7.2.154 (after 7.2.132)
Problem:    ":cd" is still possible in a SwapExists autocmd.
Solution:   Set allbuf_lock in do_swapexists().
Files:      src/memline.c

Patch 7.2.155
Problem:    Memory leak in ":function /pat".
Solution:   Free the memory. (Dominique Pelle)
Files:      src/eval.c

Patch 7.2.156 (after 7.2.143)
Problem:    No completion for :scscope and :lcscope commands.
Solution:   Implement the completion. (Dominique Pelle)
Files:      src/if_cscope.c, src/ex_docmd.c, src/proto/if_cscope.pro

Patch 7.2.157
Problem:    Illegal memory access when searching in path.
Solution:   Avoid looking at a byte after end of a string. (Dominique Pelle)
Files:      src/search.c

Patch 7.2.158
Problem:    Warnings from VisualC compiler.
Solution:   Add type casts. (George Reilly)
Files:      src/ops.c

Patch 7.2.159
Problem:    When $x_includes ends up being "NONE" configure fails.
Solution:   Check for $x_includes not to be "NONE" (Rainer)
Files:      src/auto/configure, src/configure.in

Patch 7.2.160
Problem:    Search pattern not freed on exit when 'rightleft' set.
Solution:   Free mr_pattern_alloced.
```

```
Files:      src/search.c

Patch 7.2.161
Problem:    Folds messed up in other tab page. (Vlad Irnov)
Solution:   Instead of going over all windows in current tab page go over all
            windows in all tab pages.  Also free memory for location lists in
            other tab pages when exiting. (Lech Lorens)
Files:      src/fileio.c, src/mark.c, src/misc1.c, src/misc2.c

Patch 7.2.162
Problem:    The quickfix window may get wrong filetype.
Solution:   Do not detect the filetype for the quickfix window. (Lech Lorens)
Files:      src/quickfix.c

Patch 7.2.163
Problem:    The command line window may get folding.
Solution:   Default to no/manual folding. (Lech Lorens)
Files:      src/ex_getln.c

Patch 7.2.164
Problem:    When 'showbreak' is set the size of the Visual block may be
            reported wrong. (Eduardo Daudt Flach)
Solution:   Temporarily make 'sbr' empty.
Files:      src/normal.c, src/ops.c

Patch 7.2.165
Problem:    The argument for the FuncUndefined autocmd event is expanded like
            a file name.
Solution:   Don't try expanding it. (Wang Xu)
Files:      src/fileio.c

Patch 7.2.166
Problem:    No completion for ":sign" command.
Solution:   Add ":sign" completion. (Dominique Pelle)
Files:      src/ex_cmds.c, src/ex_docmd.c, src/ex_getln.c, src/vim.h,
            src/proto/ex_cmds.pro

Patch 7.2.167
Problem:    Splint doesn't work well for checking the code.
Solution:   Add splint arguments in the Makefile.  Exclude some code from
            splint that it can't handle.  Tune splint arguments to give
            reasonable errors.  Add a filter for removing false warnings from
            splint output.  Many small changes to avoid warnings.  More to
            follow...
Files:      Filelist, src/Makefile, src/buffer.c, src/charset.c,
            src/cleanlint.vim, src/digraph.c, src/edit.c, src/ex_cmds.c,
            src/globals.h, src/ops.c, src/os_unix.c, src/os_unix.h,

            src/structs.h

Patch 7.2.168
Problem:    When no ctags program can be found, "make tags" attempts to
            execute the first C file.
Solution:   Default to "ctags" when no ctags program can be found.
```

```
Files:      src/configure.in, src/auto/configure

Patch 7.2.169
Problem:    Splint complains about a lot of things.
Solution:   Add type casts, #ifdefs and other changes to avoid warnings.
            Change colnr_T from unsigned to int.  Avoids mistakes with
            subtracting columns.
Files:      src/cleanlint.vim, src/diff.c, src/edit.c, src/ex_cmds.c,
            src/ex_cmds2.c, src/ex_docmd.c, src/proto/ex_cmds.pro,
            src/proto/spell.pro, src/quickfix.c, src/spell.c, src/structs.h,
            src/term.h, src/vim.h

Patch 7.2.170
Problem:    Using b_dev while it was not set. (Dominique Pelle)
Solution:   Add the b_dev_valid flag.
Files:      src/buffer.c, src/fileio.c, src/structs.h

Patch 7.2.171 (after 7.2.169)
Problem:    Compiler warnings. (Tony Mechelynck)
Solution:   Add function prototype. (Patrick Texier)  Init variable.
Files:      src/ex_cmds.c

Patch 7.2.172 (extra)
Problem:    Compiler warning.
Solution:   Adjust function prototype. (Patrick Texier)
Files:      src/os_mswin.c

Patch 7.2.173
Problem:    Without lint there is no check for unused function arguments.
Solution:   Use gcc -Wunused-parameter instead of lint.  For a few files add
            attributes to arguments that are known not to be used.
Files:      src/auto/configure, src/buffer.c, src/charset.c, src/diff.c,
            src/configure.in, src/config.h.in, src/edit.c, src/ex_cmds.c,
            src/ex_cmds2.c, src/version.c, src/vim.h

Patch 7.2.174
Problem:    Too many warnings from gcc -Wextra.
Solution:   Change initializer.  Add UNUSED.  Add type casts.
Files:      src/edit.c, src/eval.c, src/ex_cmds.c, src/ex_docmd.c,
            src/ex_getln.c, src/fileio.c, getchar.c, globals.h, main.c,
            memline.c, message.c, src/misc1.c, src/move.c, src/normal.c,
            src/option.c, src/os_unix.c, src/os_unix.h, src/regexp.c,
            src/search.c, src/tag.c

Patch 7.2.175
Problem:    Compiler warning in OpenBSD.
Solution:   Add type cast for NULL. (Dasn)
Files:      src/if_cscope.c

Patch 7.2.176
Problem:    Exceptions for splint are not useful.
Solution:   Remove the S_SPLINT_S ifdefs.
Files:      src/edit.c, src/ex_cmds.c, src/ex_docmd.c, src/os_unix.c,
            src/os_unix.h, src/os_unixx.h, src/structs.h, src/term.h
```

```
Patch 7.2.177
Problem:    Compiler warnings when using -Wextra
Solution:   Add UNUSED and type casts.
Files:      src/eval.c, src/ex_docmd.c, src/ex_eval.c, src/ex_getln.c,
            src/fileio.c, src/hardcopy.c, src/if_cscope.c, src/if_xcmdsrv.c,
            src/farsi.c, src/mark.c, src/menu.c

Patch 7.2.178
Problem:    Using negative value for device number might not work.
Solution:   Use a separate flag for whether ffv_dev was set.
Files:      src/misc2.c

Patch 7.2.179
Problem:    Using negative value for device number might not work.
Solution:   Use a separate flag for whether sn_dev was set.
Files:      src/ex_cmds2.c

Patch 7.2.180
Problem:    Some more compiler warnings when using gcc -Wextra.
Solution:   Add UNUSED and type casts.
Files:      src/buffer.c, src/ex_cmds.c, src/macros.h, src/main.c,
            src/menu.c, src/message.c, src/misc1.c, src/mbyte.c,
            src/normal.c, src/option.c, src/os_unix.c, src/quickfix.c,
            src/screen.c, src/search.c, src/spell.c, src/syntax.c, src/tag.c,
            src/term.c, src/ui.c

Patch 7.2.181
Problem:    Some more compiler warnings when using gcc -Wextra.
Solution:   Add UNUSED and type casts.
Files:      src/if_mzsch.c, src/gui.c, src/gui_gtk.c, src/gui_gtk_x11.c,
            src/gui_gtk_f.c, src/gui_beval.c, src/netbeans.c

Patch 7.2.182 (after 7.2.181)
Problem:    Compilation problems after previous patch for Motif.  Gvim with
            GTK crashes on startup.
Solution:   Add comma.  Init form structure to zeroes.
Files:      src/netbeans.c, src/gui_gtk_f.c

Patch 7.2.183
Problem:    Configure problem for sys/sysctl.h on OpenBSD. (Dasn)
Solution:   Add separate check for this header file.  Also switch to newer
            version of autoconf.
Files:      src/auto/configure, src/configure.in

Patch 7.2.184
Problem:    Some more compiler warnings when using gcc -Wextra.
Solution:   Add UNUSED and type casts.  Autoconf check for wchar_t.
Files:      src/auto/configure, src/config.h.in, src/configure.in,
            src/gui_athena.c, src/gui_x11.c, src/gui.c, src/gui_beval.c,
            src/gui_at_sb.c, src/gui_at_fs.c, src/gui_motif.c,
            src/gui_xmdlg.c, src/gui_xmebw.c, src/if_python.c, src/window.c,
            src/workshop.c
```

Patch 7.2.185
Problem: Some more compiler warnings when using gcc -Wextra.
Solution: Add UNUSED and type casts.
Files: src/Makefile, src/if_tlc.c, src/if_ruby.c

Patch 7.2.186
Problem: Some more compiler warnings when using gcc -Wextra.
Solution: Now with the intended if_tcl.c changes.
Files: src/if_tcl.c

Patch 7.2.187 (after 7.2.186)
Problem: Doesn't build with older versions of TCL. (Yongwei Wu)
Solution: Add #ifdefs. (Dominique Pelle)
Files: src/if_tcl.c

Patch 7.2.188
Problem: Crash with specific use of function calls. (Meikel Brandmeyer)
Solution: Make sure the items referenced by a function call are not freed
            twice. (based on patch from Nico Weber)
Files: src/eval.c

Patch 7.2.189
Problem: Possible hang for deleting auto-indent. (Dominique Pelle)
Solution: Make sure the position is not beyond the end of the line.
Files: src/edit.c

Patch 7.2.190
Problem: The register executed by @@ isn't restored.
Solution: Mark the executable register in the viminfo file.
Files: src/ops.c

Patch 7.2.191
Problem: Mzscheme interface doesn't work on Ubuntu.
Solution: Change autoconf rules. Define missing macro. Some changes to
            avoid gcc warnings. Remove per-buffer namespace. (Sergey Khorev)
Files: runtime/doc/if_mzsch.txt, src/Makefile, src/Make_ming.mak,
            src/Make_mvc.mak, src/auto/configure, src/configure.in,
            src/config.mk.in, src/eval.c, src/if_mzsch.c, src/if_mzsch.h,
            src/main.c, src/proto/if_mzsch.pro

Patch 7.2.192 (after 7.2.188)
Problem: Still a crash in the garbage collector for a very rare situation.
Solution: Make sure current_copyID is always incremented correctly. (Kent
            Sibilev)
Files: src/eval.c

Patch 7.2.193
Problem: Warning for uninitialized values.
Solution: Initialize all the struct items.
Files: src/eval.c

Patch 7.2.194 (extra)
Problem: MSVC: rem commands are echoed.
Solution: Add commands to switch off echo. (Wang Xu)

```
Files:      src/msvc2008.bat

Patch 7.2.195
Problem:    Leaking memory for the command Vim was started with.
Solution:   Remember the pointer and free it.
Files:      src/gui_gtk_x11.c

Patch 7.2.196 (after 7.2.167)
Problem:    Turns out splint doesn't work well enough to be usable.
Solution:   Remove splint support.
Files:      Filelist, src/cleanlint.vim

Patch 7.2.197
Problem:    Warning for uninitialized values.
Solution:   Initialize all the struct items of typebuf.
Files:      src/globals.h

Patch 7.2.198
Problem:    Size of buffer used for tgetent() may be too small.
Solution:   Use the largest known size everywhere.
Files:      src/vim.h

Patch 7.2.199
Problem:    Strange character in comment.
Solution:   Change to "message". (Yongwei Wu)
Files:      src/term.c

Patch 7.2.200
Problem:    Reading past end of string when navigating the menu bar or
            resizing the window.
Solution:   Add and use mb_ptr2len_len(). (partly by Dominique Pelle)
            Also add mb_ptr2cells_len() to prevent more trouble.
Files:      src/gui_gtk_x11.c, src/os_unix.c, src/globals.h, src/mbyte.c,
            src/proto/mbyte.pro

Patch 7.2.201
Problem:    Cannot copy/paste HTML to/from Firefox via the clipboard.
Solution:   Implement this for GTK.  Add the "html" value to 'clipboard'.
Files:      runtime/doc/options.txt, src/globals.h, src/gui_gtk_x11.c,
            src/mbyte.c, src/proto/mbyte.pro, src/option.c

Patch 7.2.202
Problem:    BufWipeout autocommand that edits another buffer causes problems.
Solution:   Check for the situation, give an error and quit the operation.
Files:      src/fileio.c

Patch 7.2.203
Problem:    When reloading a buffer or doing anything else with a buffer that
            is not displayed in a visible window, autocommands may be applied
            to the current window, folds messed up, etc.
Solution:   Instead of using the current window for the hidden buffer use a
            special window, splitting the current one temporarily.
Files:      src/fileio.c, src/globals.h, src/gui.c, src/if_perl.xs,
            src/progo/gui.pro, src/proto/window.pro, src/screen.c,
```

```
            src/structs.h, src/window.c

Patch 7.2.204 (extra)
Problem:    Win32: Can't build with Visual Studio 2010 beta 1.
Solution:   Fix the makefile. (George Reilly)
Files:      src/Make_mvc.mak

Patch 7.2.205 (extra)
Problem:    Win32: No support for High DPI awareness.
Solution:   Fix the manifest file. (George Reilly)
Files:      src/Make_mvc.mak, src/gvim.exe.mnf

Patch 7.2.206
Problem:    Win32: Can't build netbeans interface with Visual Studio 2010.
Solution:   Undefine ECONNREFUSED. (George Reilly)
Files:      src/netbeans.c

Patch 7.2.207
Problem:    Using freed memory with ":redrawstatus" when it works recursively.
Solution:   Prevent recursively updating the status line. (partly by Dominique
            Pelle)
Files:      src/screen.c

Patch 7.2.208
Problem:    "set novice" gives an error message, it should be ignored.
Solution:   Don't see "no" in "novice" as unsetting an option.  (Patrick
            Texier)
Files:      src/option.c

Patch 7.2.209
Problem:    For xxd setmode() is undefined on Cygwin.
Solution:   Include io.h. (Dominique Pelle)
Files:      src/xxd/xxd.c

Patch 7.2.210
Problem:    When a file that is being edited has its timestamp updated outside
            of Vim and ":checktime" is used still get a warning when writing
            the file. (Matt Mueller)
Solution:   Store the timestamp in b_mtime_read when the timestamp is the only
            thing that changed.
Files:      src/fileio.c

Patch 7.2.211
Problem:    Memory leak when expanding a series of file names.
Solution:   Use ga_clear_strings() instead of ga_clear().
Files:      src/misc1.c

Patch 7.2.212 (extra)
Problem:    Warnings for redefining SIG macros.
Solution:   Don't define them if already defined. (Bjorn Winckler)
Files:      src/os_mac.h

Patch 7.2.213
Problem:    Warning for using vsprintf().
```

```
Solution:   Use vim_vsnprintf().
Files:      src/netbeans.c

Patch 7.2.214
Problem:    Crash with complete function for user command. (Andy Wokula)
Solution:   Avoid using a NULL pointer (Dominique Pelle)
Files:      src/ex_getln.c

Patch 7.2.215
Problem:    ml_get error when using ":vimgrep".
Solution:   Load the memfile for the hidden buffer before putting it in a
            window.  Correct the order of splitting the window and filling
            the window and buffer with data.
Files:      src/fileio.c, src/proto/window.pro, src/quickfix.c, src/window.c

Patch 7.2.216
Problem:    Two error messages have the same number E812.
Solution:   Give one message a different number.
Files:      runtime/doc/autocmd.txt, runtime/doc/if_mzsch.txt, src/if_mzsch.c

Patch 7.2.217
Problem:    Running tests with valgrind doesn't work as advertised.
Solution:   Fix the line in the Makefile.
Files:      src/testdir/Makefile

Patch 7.2.218
Problem:    Cannot build GTK with hangul_input feature. (Dominique Pelle)
Solution:   Adjust #ifdef.  (SungHyun Nam)
Files:      src/gui.c

Patch 7.2.219 (extra)
Problem:    Photon GUI is outdated.
Solution:   Updates for QNX 6.4.0. (Sean Boudreau)
Files:      src/gui_photon.c

Patch 7.2.220 (after 7.2.215)
Problem:    a BufEnter autocommand that changes directory causes problems.
            (Ajit Thakkar)
Solution:   Disable autocommands when opening a hidden buffer in a window.
Files:      src/fileio.c

Patch 7.2.221
Problem:    X cut_buffer0 text is used as-is, it may be in the wrong encoding.
Solution:   Convert between 'enc' and latin1. (James Vega)
Files:      src/gui_gtk_x11.c, src/message.c, src/ops.c, src/proto/ui.pro,
            src/ui.c

Patch 7.2.222
Problem:    ":mksession" doesn't work properly with 'acd' set.
Solution:   Make it work. (Yakov Lerner)
Files:      src/ex_docmd.c

Patch 7.2.223
Problem:    When a script is run with ":silent" it is not able to give warning
```

            messages.
Solution: Add the ":unsilent" command.
Files: runtime/doc/various.txt, src/ex_cmds.h, src/ex_docmd.c

Patch 7.2.224
Problem: Crash when using 'completefunc'. (Ingo Karkat)
Solution: Disallow entering edit() recursively when doing completion.
Files: src/edit.c

Patch 7.2.225
Problem: When using ":normal" a saved character may be executed.
Solution: Also store old_char when saving typeahead.
Files: src/getchar.c, src/structs.h

Patch 7.2.226
Problem: ml_get error after deleting the last line. (Xavier de Gaye)
Solution: When adjusting marks a callback may be invoked. Adjust the cursor
            position before invoking deleted_lines_mark().
Files: src/ex_cmds.c, src/ex_docmd.c, src/if_mzsch.c, src/if_python.c,
            src/if_perl.xs, src/misc1.c

Patch 7.2.227
Problem: When using ":cd" in a script there is no way to track this.
Solution: Display the directory when 'verbose' is 5 or higher.
Files: src/ex_docmd.c

Patch 7.2.228
Problem: Cscope is limited to 8 connections.
Solution: Allocated the connection array to handle any number of
            connections. (Dominique Pelle)
Files: runtime/doc/if_cscop.txt, src/if_cscope.h, src/if_cscope.c

Patch 7.2.229
Problem: Warning for shadowed variable.
Solution: Rename "wait" to "wait_time".
Files: src/os_unix.c

Patch 7.2.230
Problem: A few old lint-style ARGUSED comments.
Solution: Change to the new UNUSED style.
Files: src/getchar.c

Patch 7.2.231
Problem: Warning for unreachable code.
Solution: Add #ifdef.
Files: src/if_perl.xs

Patch 7.2.232
Problem: Cannot debug problems with being in a wrong directory.
Solution: When 'verbose' is 5 or higher report directory changes.
Files: src/os_unix.c, src/os_unix.h, src/proto/os_unix.pro

Patch 7.2.233 (extra part of 7.2.232)
Problem: Cannot debug problems with being in a wrong directory.

```
Solution:   When 'verbose' is 5 or higher report directory changes.
Files:      src/os_msdos.c, src/os_mswin.c, src/os_riscos.c, src/os_mac.h

Patch 7.2.234
Problem:    It is not possible to ignore file names without a suffix.
Solution:   Use an empty entry in 'suffixes' for file names without a dot.
Files:      runtime/doc/cmdline.txt, src/misc1.c

Patch 7.2.235
Problem:    Using CTRL-O z= in Insert mode has a delay before redrawing.
Solution:   Reset msg_didout and msg_scroll.
Files:      src/misc1.c, src/spell.c

Patch 7.2.236
Problem:    Mac: Compiling with Ruby doesn't always work.
Solution:   In configure filter out the --arch argument (Bjorn Winckler)
Files:      src/configure.in, src/auto/configure

Patch 7.2.237
Problem:    Crash on exit when window icon not set.
Solution:   Copy terminal name when using it for the icon name.
Files:      src/os_unix.c

Patch 7.2.238
Problem:    Leaking memory when setting term to "builtin_dumb".
Solution:   Free memory when resetting term option t_Co.
Files:      src/option.c, src/proto/option.pro, src/term.c

Patch 7.2.239
Problem:    Using :diffpatch twice or when patching fails causes memory
            corruption and/or a crash.  (Bryan Venteicher)
Solution:   Detect missing output file.  Avoid using non-existing buffer.
Files:      src/diff.c

Patch 7.2.240
Problem:    Crash when using find/replace dialog repeatedly. (Michiel
            Hartsuiker)
Solution:   Avoid doing the operation while busy or recursively.  Also refuse
            replace when text is locked.
Files:      src/gui.c

Patch 7.2.241
Problem:    When using a combination of ":bufdo" and "doautoall" we may end up
            in the wrong directory. (Ajit Thakkar)
            Crash when triggering an autocommand in ":vimgrep".  (Yukihiro
            Nakadaira)
Solution:   Clear w_localdir and globaldir when using the aucmd_win.
            Use a separate flag to decide aucmd_win needs to be restored.
Files:      src/fileio.c, src/globals.h, src/structs.h

Patch 7.2.242
Problem:    Setting 'lazyredraw' causes the cursor column to be recomputed.
            (Tom Link)
Solution:   Only recompute the cursor column for a boolean option if changes
```

```
            the cursor position.
Files:      src/option.c

Patch 7.2.243
Problem:    Memory leak when using :vimgrep and resizing. (Dominique Pelle)
Solution:   Free memory for aucmd_win when resizing and don't allocate it
            twice.
Files:      src/screen.c

Patch 7.2.244
Problem:    When 'enc' is utf-8 and 'fenc' is latin1, writing a non-latin1
            character gives a conversion error without any hint what is wrong.
Solution:   When known add the line number to the error message.
Files:      src/fileio.c

Patch 7.2.245
Problem:    When 'enc' is "utf-16" and 'fenc' is "utf-8" writing a file does
            conversion while none should be done. (Yukihiro Nakadaira) When
            'fenc' is empty the file is written as utf-8 instead of utf-16.
Solution:   Do proper comparison of encodings, taking into account that all
            Unicode values for 'enc' use utf-8 internally.
Files:      src/fileio.c

Patch 7.2.246
Problem:    Cscope home page link is wrong.
Solution:   Update the URL. (Sergey Khorev)
Files:      runtime/doc/if_cscop.txt

Patch 7.2.247
Problem:    Mzscheme interface minor problem.
Solution:   Better error message when build fails. (Sergey Khorev)
Files:      src/if_mzsch.c

Patch 7.2.248 (extra)
Problem:    Mzscheme interface building minor problems.
Solution:   Update Win32 makefiles. (Sergey Khorev)
Files:      src/Make_cyg.mak, src/Make_ming.mak, src/Make_mvc.mak

Patch 7.2.249
Problem:    The script to check .po files can't handle '%' in plural forms.
Solution:   Remove "Plural-Forms:" from the checked string.
Files:      src/po/check.vim

Patch 7.2.250 (extra)
Problem:    Possible buffer overflow.
Solution:   Compute the remaining space. (Dominique Pelle)
Files:      src/GvimExt/gvimext.cpp

Patch 7.2.251 (after 7.2.044)
Problem:    Compiler adds invalid memory bounds check.
Solution:   Remove _FORTIFY_SOURCE=2 from CFLAGS. (Dominique Pelle)
Files:      src/auto/configure, src/configure.in

Patch 7.2.252
```

Problem: When using a multi-byte 'enc' the 'iskeyword' option cannot
            contain characters above 128.
Solution: Use mb_ptr2char_adv().
Files: src/charset.c

Patch 7.2.253
Problem: Netbeans interface: getLength always uses current buffer.
Solution: Use ml_get_buf() instead of ml_get(). (Xavier de Gaye)
Files: src/netbeans.c

Patch 7.2.254
Problem: Compiler warning for assigning size_t to int.
Solution: Use size_t for the variable. (George Reilly)
Files: src/fileio.c

Patch 7.2.255 (after 7.2.242)
Problem: Setting 'rightleft', 'linebreak' and 'wrap' may cause cursor to be
            in wrong place.
Solution: Recompute the cursor column for these options.
Files: src/option.c

Patch 7.2.256
Problem: When 'guifont' was not set GTK font dialog doesn't have a default.
            (Andreas Metzler)
Solution: Set default to DEFAULT_FONT. (James Vega)
Files: src/gui_gtk_x11.c

Patch 7.2.257
Problem: With GTK 2.17 lots of assertion error messages.
Solution: Remove check for static gravity. (Sebastian Droege)
Files: src/gui_gtk_f.c

Patch 7.2.258
Problem: v:beval_col and b:beval_text are wrong in UTF-8 text. (Tony
            Mechelynck)
Solution: Use byte number instead of character number for the column.
Files: src/ui.c

Patch 7.2.259
Problem: exists() doesn't work properly for an empty aucmd group.
Solution: Change how au_exists() handles a missing pattern. Also add a
            test for this. (Bob Hiestand)
Files: src/fileio.c, src/testdir/Makefile, src/testdir/test67.in,
            src/testdir/test67.ok

Patch 7.2.260 (extra part of 7.2.259)
Problem: exists() doesn't work properly for empty aucmd group.
Solution: Change how au_exists() handles a missing pattern. Also add a
            test for this. (Bob Hiestand)
Files: src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms

Patch 7.2.261

```
Problem:    When deleting lines with a specific folding configuration E38 may
            appear. (Shahaf)
Solution:   When adjusting nested folds for deleted lines take into account
            that they don't start at the top of the enclosing fold.
Files:      src/fold.c

Patch 7.2.262
Problem:    When using custom completion for a user command the pattern string
            goes beyond the cursor position. (Hari Krishna Dara)
Solution:   Truncate the string at the cursor position.
Files:      src/ex_getln.c, src/structs.h

Patch 7.2.263
Problem:    GTK2: when using the -geom argument with an offset from the right
            edge and the size is smaller than the default, the Vim window is
            not positioned properly.
Solution:   Use another function to set the size. (Vitaly Minko)
Files:      src/gui_gtk_x11.c

Patch 7.2.264
Problem:    GTK2: When the Vim window is maximized setting 'columns' or
            'lines' doesn't work.
Solution:   Unmaximize the window before setting the size. (Vitaly Minko)
Files:      src/gui.c, src/gui_gtk_x11.c, src/proto/gui_gtk_x11.pro

Patch 7.2.265
Problem:    When using ":silent broken" inside try/catch silency may persist.
            (dr-dr xp)
Solution:   Set msg_silent when there is an error and it's bigger than the
            saved value.
Files:      src/ex_docmd.c

Patch 7.2.266
Problem:    When an expression abbreviation is triggered, the typed character
            is unknown.
Solution:   Make the typed character available in v:char.
Files:      runtime/doc/map.txt, src/eval.c, src/getchar.c, src/ops.c,
            src/proto/eval.pro

Patch 7.2.267
Problem:    Crash for narrow window and double-width character.
Solution:   Check for zero width.  (Taro Muraoka)
Files:      src/charset.c

Patch 7.2.268
Problem:    Crash when using Python to set cursor beyond end of line.
            (winterTTr)
Solution:   Check the column to be valid.
Files:      src/if_python.c

Patch 7.2.269
Problem:    Many people struggle to find out why Vim startup is slow.
Solution:   Add the --startuptime command line flag.
Files:      runtime/doc/starting.txt, src/globals.h, src/feature.h,
```

```
            src/main.c, src/macros.h

Patch 7.2.270
Problem:    Using ":@c" when the c register contains a CR causes the rest to
            be executed later. (Dexter Douglas)
Solution:   Don't check for typeahead to start with ':', keep executing
            commands until all added typeahead has been used.
Files:      src/ex_docmd.c

Patch 7.2.271
Problem:    Using freed memory in Motif GUI version when making a choice.
Solution:   Free memory only after using it. (Dominique Pelle)
Files:      src/gui_xmdlg.c

Patch 7.2.272
Problem:    "_.svz" is not recognized as a swap file. (David M. Besonen)
Solution:   Accept .s[uvw][a-z] as a swap file name extension.
Files:      src/memline.c

Patch 7.2.273
Problem:    Crash with redir to unknown array. (Christian Brabandt)
Solution:   Don't assign the redir result when there was an error.
Files:      src/eval.c

Patch 7.2.274
Problem:    Syntax folding doesn't work properly when adding a comment.
Solution:   Fix it and add a test. (Lech Lorens)
Files:      src/fold.c, src/testdir/test45.in, src/testdir/test45.ok

Patch 7.2.275
Problem:    Warning for unused argument and comparing signed and unsigned.
Solution:   Add type cast.
Files:      src/memline.c

Patch 7.2.276
Problem:    Crash when setting 'isprint' to a small bullet. (Raul Coronado)
Solution:   Check for the character to be < 256.  Also make it possible to
            specify a range of multi-byte characters. (Lech Lorens)
Files:      src/charset.c

Patch 7.2.277
Problem:    CTRL-Y in a diff'ed window may move the cursor outside of the
            window. (Lech Lorens)
Solution:   Limit the number of filler lines to the height of the window.
            Don't reset filler lines to zero for an empty buffer.
Files:      src/move.c

Patch 7.2.278
Problem:    Using magic number in the folding code.
Solution:   Use the defined MAX_LEVEL.
Files:      src/fold.c

Patch 7.2.279
Problem:    Invalid memory read with visual mode "r". (Dominique Pelle)
```

```
Solution:   Make sure the cursor position is valid.  Don't check the cursor
            position but the position being used.  And make sure we get the
            right line.
Files:      src/misc2.c, src/ops.c

Patch 7.2.280
Problem:    A redraw in a custom statusline with %! may cause a crash.
            (Yukihiro Nakadaira)
Solution:   Make a copy of 'statusline'.  Also fix typo in function name
            redraw_custom_statusline. (partly by Dominique Pelle)
Files:      src/screen.c

Patch 7.2.281
Problem:    'cursorcolumn' highlighting is wrong in diff mode.
Solution:   Adjust the column computation. (Lech Lorens)
Files:      src/screen.c

Patch 7.2.282
Problem:    A fold can't be closed.
Solution:   Initialize fd_small to MAYBE. (Lech Lorens)
Files:      src/fold.c

Patch 7.2.283
Problem:    Changing font while the window is maximized doesn't keep the
            window maximized.
Solution:   Recompute number of lines and columns after changing font. (James
            Vega)
Files:      src/gui_gtk_x11.c

Patch 7.2.284
Problem:    When editing the same buffer in two windows, one with folding,
            display may be wrong after changes.
Solution:   Call set_topline() to take care of side effects. (Lech Lorens)
Files:      src/misc1.c

Patch 7.2.285 (after 7.2.169)
Problem:    CTRL-U in Insert mode also deletes indent. (Andrey Voropaev)
Solution:   Fix mistake made in patch 7.2.169.
Files:      src/edit.c

Patch 7.2.286 (after 7.2.269)
Problem:    The "--startuptime=<file>" argument is not consistent with other
            arguments.
Solution:   Use "--startuptime <file>".  Added the +startuptime feature.
Files:      runtime/doc/eval.txt, runtime/doc/starting.txt,
            runtime/doc/various.txt, src/eval.c, src/main.c, src/version.c

Patch 7.2.287
Problem:    Warning from gcc 3.4 about uninitialized variable.
Solution:   Move assignment outside of #ifdef.
Files:      src/if_perl.xs

Patch 7.2.288
Problem:    Python 2.6 pyconfig.h redefines macros.
```

```
Solution:   Undefine the macros before including pyconfig.h.
Files:      src/if_python.c

Patch 7.2.289
Problem:    Checking wrong struct member.
Solution:   Change tb_buf to tb_noremap. (Dominique Pelle)
Files:      src/getchar.c

Patch 7.2.290
Problem:    Not freeing memory from ":lmap", ":xmap" and ":menutranslate".
Solution:   Free the memory when exiting. (Dominique Pelle)
Files:      src/misc2.c

Patch 7.2.291
Problem:    Reading uninitialised memory in arabic mode.
Solution:   Use utfc_ptr2char_len() rather than utfc_ptr2char().  (Dominique
            Pelle)
Files:      src/screen.c

Patch 7.2.292
Problem:    Block right-shift doesn't work properly with multi-byte encoding
            and 'list' set.
Solution:   Add the missing "else". (Lech Lorens)
Files:      src/ops.c

Patch 7.2.293
Problem:    When setting 'comments' option it may be used in a wrong way.
Solution:   Don't increment after skipping over digits. (Yukihiro Nakadaira)
Files:      src/misc1.c

Patch 7.2.294
Problem:    When using TEMPDIRS dir name could get too long.
Solution:   Overwrite tail instead of appending each time.  Use mkdtemp() when
            available. (James Vega)
Files:      src/auto/configure, src/config.h.in, src/configure.in, src/fileio.c

Patch 7.2.295
Problem:    When using map() on a List the index is not known.
Solution:   Set v:key to the  index. (Hari Krishna Dara)
Files:      runtime/doc/eval.txt, src/eval.c

Patch 7.2.296
Problem:    Help message about startuptime is wrong. (Dominique Pelle)
Solution:   Remove the equal sign.
Files:      src/main.c

Patch 7.2.297
Problem:    Reading freed memory when writing ":reg" output to a register.
            (Dominique Pelle)
Solution:   Skip the register being written to.
Files:      src/ops.c

Patch 7.2.298
Problem:    ":vimgrep" crashes when there is an autocommand that sets a
```

            window-local variable.
Solution: Initialize the w: hashtab for re-use. (Yukihiro Nakadaira)
Files: src/fileio.c

Patch 7.2.299
Problem: Crash when comment middle is longer than start.
Solution: Fix size computation. (Lech Lorens)
Files: src/misc1.c

Patch 7.2.300
Problem: Vim doesn't close file descriptors when forking and executing
            another command, e.g., ":shell".
Solution: Use FD_CLOEXEC when available. (James Vega)
Files: auto/configure, src/config.h.in, src/configure.in,
            src/ex_cmdds2.c, src/fileio.c, src/memfile.c, src/memline.c

Patch 7.2.301
Problem: Formatting is wrong when 'tw' is set to a small value.
Solution: Fix it and add tests. Also fix behavior of "1" in 'fo'. (Yukihiro
            Nakadaira)
Files: src/edit.c, src/testdir/Makefile, src/testdir/test68.in,
            src/testdir/test68.ok, src/testdir/test69.in,
            src/testdir/test69,ok

Patch 7.2.302 (extra part of 7.2.301)
Problem: Formatting wrong with small 'tw' value.
Solution: Add build rules for tests.
Files: src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms

Patch 7.2.303 (after 7.2.294)
Problem: Can't build on MS-Windows.
Solution: Add #ifdef around vim_settempdir(). (James Vega)
Files: src/fileio.c

Patch 7.2.304
Problem: Compiler warning for bad pointer cast.
Solution: Use another variable for int pointer.
Files: src/ops.c

Patch 7.2.305
Problem: Recursively redrawing causes a memory leak. (Dominique Pelle)
Solution: Disallow recursive screen updating.
Files: src/screen.c

Patch 7.2.306
Problem: shellescape("10%%", 1) only escapes first %. (Christian Brabandt)
Solution: Don't copy the character after the escaped one.
Files: src/misc2.c

Patch 7.2.307
Problem: Crash with a very long syntax match statement. (Guy Gur Ari)
Solution: When the offset does not fit in the two bytes available give an

```
            error instead of continuing with invalid pointers.
Files:      src/regexp.c

Patch 7.2.308
Problem:    When using a regexp in the "\=" expression of a substitute
            command, submatch() returns empty strings for further lines.
            (Clockwork Jam)
Solution:   Save and restore the line number and line count when calling
            reg_getline().
Files:      src/regexp.c

Patch 7.2.309 (after 7.2.308)
Problem:    Warning for missing function prototype. (Patrick Texier)
Solution:   Add the prototype.
Files:      src/regexp.c

Patch 7.2.310
Problem:    When a filetype plugin in ~/.vim/ftdetect uses ":setfiletype" and
            the file starts with a "# comment" it gets "conf" filetype.
Solution:   Check for "conf" filetype after using ftdetect plugins.
Files:      runtime/filetype.vim

Patch 7.2.311
Problem:    Can't compile with FreeMiNT.
Solution:   Change #ifdef for limits.h. (Alan Hourihane)
Files:      src/fileio.c

Patch 7.2.312
Problem:    iconv() returns an invalid character sequence when conversion
            fails.  It should return an empty string. (Yongwei Wu)
Solution:   Be more strict about invalid characters in the input.
Files:      src/mbyte.c

Patch 7.2.313
Problem:    Command line completion doesn't work after "%:h" and similar.
Solution:   Expand these items before doing the completion.
Files:      src/ex_getln.c, src/misc1.c, src/proto/misc1.pro

Patch 7.2.314
Problem:    Missing function in small build.
Solution:   Always include concat_str.
Files:      src/misc1.c

Patch 7.2.315
Problem:    Python libs can't be found on 64 bit system.
Solution:   Add lib64 to the list of directories. (Michael Henry)
Files:      src/auto/configure, src/configure.in

Patch 7.2.316
Problem:    May get multiple _FORTIFY_SOURCE arguments. (Tony Mechelynck)
Solution:   First remove all these arguments and then add the one we want.
            (Dominique Pelle)
Files:      src/auto/configure, src/configure.in
```

```
Patch 7.2.317
Problem:    Memory leak when adding a highlight group with unprintable
            characters, resulting in E669.
Solution:   Free the memory.  And fix a few typos. (Dominique Pelle)
Files:      src/syntax.c

Patch 7.2.318
Problem:    Wrong locale value breaks floating point numbers for gvim.
Solution:   Set the locale again after doing GUI inits. (Dominique Pelle)
Files:      src/main.c

Patch 7.2.319
Problem:    Motif: accessing freed memory when cancelling font dialog.
Solution:   Destroy the widget only after accessing it. (Dominique Pelle)
Files:      src/gui_xmdlg.c

Patch 7.2.320
Problem:    Unused function in Mzscheme interface.
Solution:   Remove the function and what depends on it. (Dominique Pelle)
Files:      src/if_mzsch.c, src/proto/if_mzsch.pro

Patch 7.2.321
Problem:    histadd() and searching with "*" fails to add entry to history
            when it is empty.
Solution:   Initialize the history. (Lech Lorens)
Files:      src/eval.c, src/normal.c

Patch 7.2.322
Problem:    Wrong indenting in virtual replace mode with CTRL-Y below a short
            line.
Solution:   Check for character to be NUL. (suggested by Lech Lorens)
Files:      src/edit.c

Patch 7.2.323 (extra)
Problem:    Balloon evaluation crashes on Win64.
Solution:   Change pointer types. (Sergey Khorev)
Files:      src/gui_w32.c

Patch 7.2.324
Problem:    A negative column argument in setpos() may cause a crash.
Solution:   Check for invalid column number. (James Vega)
Files:      src/eval.c, src/misc2.c

Patch 7.2.325
Problem:    A stray "w" in the startup vimrc file causes the edited file to be
            replaced with an empty file. (Stone Kang).
Solution:   Do not write a buffer when it has never been loaded.
Files:      src/fileio.c

Patch 7.2.326
Problem:    Win32: $HOME doesn't work when %HOMEPATH% is not defined.
Solution:   Use "\" for %HOMEPATH% when it is not defined.
Files:      src/misc1.c
```

```
Patch 7.2.327
Problem:    Unused functions in Workshop.
Solution:   Add "#if 0" and minor cleanup. (Dominique Pelle)
Files:      src/workshop.c, src/integration.c, src/integration.h

Patch 7.2.328
Problem:    has("win64") does not return 1 on 64 bit MS-Windows version.
Solution:   Also check for _WIN64 besides WIN64.
Files:      src/eval.c

Patch 7.2.329
Problem:    "g_" doesn't position cursor correctly when in Visual mode and
            'selection' is "exclusive". (Ben Fritz)
Solution:   Call adjust_for_sel().
Files:      src/normal.c

Patch 7.2.330
Problem:    Tables for Unicode case operators are outdated.
Solution:   Add a Vim script for generating the tables.  Include tables for
            Unicode 5.2.
Files:      runtime/tools/README.txt, runtime/tools/unicode.vim, src/mbyte.c

Patch 7.2.331
Problem:    Can't interrupt "echo list" for a very long list.
Solution:   Call line_breakcheck() in list_join().
Files:      src/eval.c

Patch 7.2.332
Problem:    Crash when spell correcting triggers an autocommand that reloads
            the buffer.
Solution:   Make a copy of the line to be modified. (Dominique Pelle)
Files:      src/spell.c

Patch 7.2.333
Problem:    Warnings from static code analysis.
Solution:   Small changes to various lines. (Dominique Pelle)
Files:      src/buffer.c, src/edit.c, src/ex_getln.c, src/fileio.c,
            src/if_cscope.c, src/netbeans.c, src/ops.c, src/quickfix.c,
            src/syntax.c, src/ui.c

Patch 7.2.334
Problem:    Postponing keys in Netbeans interface does not work properly.
Solution:   Store the key string instead of the number.  Avoid an infinite
            loop. (Mostly by Xavier de Gaye)
Files:      src/netbeans.c, src/proto/netbeans.pro

Patch 7.2.335
Problem:    The CTRL-] command escapes too many characters.
Solution:   Use a different list of characters to be escaped. (Sergey Khorev)
Files:      src/normal.c

Patch 7.2.336
Problem:    MzScheme interface can't evaluate an expression.
Solution:   Add mzeval(). (Sergey Khorev)
```

```
Files:      runtime/doc/eval.txt, runtime/doc/if_mzsch.txt,
            runtime/doc/usr_41.txt, src/eval.c, src/if_mzsch.c,
            src/proto/eval.pro, src/proto/if_mzsch.pro,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Makefile, src/testdir/main.aap, src/testdir/test1.in,
            src/testdir/test70.in, src/testdir/test70.ok

Patch 7.2.337
Problem:    The :compiler command doesn't function properly when invoked in a
            function.
Solution:   Add "g:" before "current_compiler". (Yukihiro Nakadaira)
Files:      src/ex_cmds2.c

Patch 7.2.338 (after 7.2.300)
Problem:    Part of FD_CLOEXEC change is missing.
Solution:   Include source file skipped because of typo.
Files:      src/ex_cmds2.c

Patch 7.2.339 (after 7.2.269)
Problem:    Part of --startuptime patch is missing.
Solution:   Add check for time_fd.
Files:      src/ex_cmds2.c

Patch 7.2.340
Problem:    Gcc warning for condition that can never be true. (James Vega)
Solution:   Use start_lvl instead flp->lvl.
Files:      src/fold.c

Patch 7.2.341
Problem:    Popup menu wraps to next line when double-wide character doesn't
            fit. (Jiang Ma)
Solution:   Display a ">" instead. (Dominique Pelle)
Files:      src/screen.c

Patch 7.2.342
Problem:    Popup menu displayed wrong in 'rightleft' mode when there are
            multi-byte characters.
Solution:   Adjust the column computations. (Dominique Pelle)
Files:      src/popupmnu.c

Patch 7.2.343 (after 7.2.338)
Problem:    Can't compile on Win32.
Solution:   Insert the missing '|'.
Files:      src/ex_cmds2.c

Patch 7.2.344 (after 7.2.343)
Problem:    Can't compile on some systems
Solution:   Move the #ifdef outside of the mch_open macro. (Patrick Texier)
Files:      src/ex_cmds2.c

Patch 7.2.345
Problem:    Tab line is not updated when the value of 'bt' is changed.
Solution:   Call redraw_titles(). (Lech Lorens)
Files:      src/option.c
```

```
Patch 7.2.346
Problem:    Repeating a command with @: causes a mapping to be applied twice.
Solution:   Do not remap characters inserted in the typeahead buffer. (Kana
            Natsuno)
Files:      src/ops.c

Patch 7.2.347
Problem:    Crash when executing <expr> mapping redefines that same mapping.
Solution:   Save the values used before evaluating the expression.
Files:      src/getchar.c

Patch 7.2.348 (after 7.2.330)
Problem:    Unicode double-width characters are not up-to date.
Solution:   Produce the double-width table like the others.
Files:      runtime/tools/unicode.vim, src/mbyte.c

Patch 7.2.349
Problem:    CTRL-W gf doesn't put the new tab in the same place as "tab split"
            and "gf". (Tony Mechelynck)
Solution:   Store the tab number in cmdmod.tab.
Files:      src/window.c

Patch 7.2.350
Problem:    Win32: When changing font the window may jump from the secondary
            to the primary screen. (Michael Wookey)
Solution:   When the screen position was negative don't correct it to zero.
Files:      src/gui.c

Patch 7.2.351 (after 7.2.347)
Problem:    Can't build with some compilers.
Solution:   Move the #ifdef outside of a macro.  Cleanup the code.
Files:      src/getchar.c

Patch 7.2.352 (extra)
Problem:    Win64: Vim doesn't work when cross-compiled with MingW libraries.
Solution:   Always return TRUE for the WM_NCCREATE message. (Andy Kittner)
Files:      src/gui_w48.c

Patch 7.2.353
Problem:    No command line completion for ":profile".
Solution:   Complete the subcommand and file name.
Files:      src/ex_docmd.c, src/ex_cmds2.c, src/ex_getln.c,
            src/proto/ex_cmds2.pro, src/vim.h

Patch 7.2.354
Problem:    Japanese single-width double-byte characters not handled correctly.
Solution:   Put 0x8e in ScreenLines[] and the second byte in ScreenLines2[].
            (partly by Kikuchan)
Files:      src/screen.c

Patch 7.2.355
Problem:    Computing the cursor column in validate_cursor_col() is wrong when
            line numbers are used and 'n' is not in 'cpoptions', causing the
```

            popup menu to be positioned wrong.
Solution: Correctly use the offset. (partly by Dominique Pelle)
Files: src/move.c

Patch 7.2.356
Problem: When 'foldmethod' is changed not all folds are closed as expected.
Solution: In foldUpdate() correct the start position and reset fd_flags when
            w_foldinvalid is set. (Lech Lorens)
Files: src/fold.c

Patch 7.2.357
Problem: When changing 'fileformat' from/to "mac" and there is a CR in the
            text the display is wrong.
Solution: Redraw the text when 'fileformat' is changed. (Ben Schmidt)
Files: src/option.c

Patch 7.2.358
Problem: Compiler warnings on VMS. (Zoltan Arpadffy)
Solution: Pass array itself instead its address. Return a value.
Files: src/gui_gtk_x11.c, src/os_unix.c

Patch 7.2.359
Problem: Crash when using the Netbeans join command.
Solution: Make sure the ml_flush_line() function is not used recursively.
            (Xavier de Gaye)
Files: src/memline.c

Patch 7.2.360
Problem: Ruby on MS-Windows: can't use sockets.
Solution: Call NtInitialize() during initialization. (Ariya Mizutani)
Files: src/if_ruby.c

Patch 7.2.361
Problem: Ruby 1.9 is not supported.
Solution: Add Ruby 1.9 support. (Masaki Suketa)
Files: src/Makefile, src/auto/configure, src/configure.in, src/if_ruby.c

Patch 7.2.362 (extra, after 7.2.352)
Problem: Win64: Vim doesn't work when cross-compiled with MingW libraries.
Solution: Instead of handling WM_NCCREATE, create wide text area window
            class if the parent window iw side. (Sergey Khorev)
Files: src/gui_w32.c, src/gui_w48.c

Patch 7.2.363
Problem: Can't dynamically load Perl 5.10.
Solution: Add the function Perl_croak_xs_usage. (Sergey Khorev)
Files: src/if_perl.xs

Patch 7.2.364 (extra)
Problem: Can't build gvimext.dll on Win 7 x64 using MinGW (John Marriott)
Solution: Check if _MSC_VER is defined. (Andy Kittner)
Files: src/GvimExt/gvimext.h

Patch 7.2.365 (extra)

```
Problem:    MS-Windows with MingW: "File->Save As" does not work. (John
            Marriott)
Solution:   Correctly fill in structure size. (Andy Kittner)
Files:      src/gui_w48.c

Patch 7.2.366
Problem:    CTRL-B doesn't go back to the first line of the buffer.
Solution:   Avoid an overflow when adding MAXCOL.
Files:      src/move.c

Patch 7.2.367
Problem:    "xxd -r -p" doesn't work as documented.
Solution:   Skip white space. (James Vega)
Files:      src/xxd/xxd.c

Patch 7.2.368 (after 7.2.361)
Problem:    Ruby interface: Appending line doesn't work. (Michael Henry)
Solution:   Reverse check for NULL line. (James Vega)
Files:      src/if_ruby.c

Patch 7.2.369
Problem:    Error message is not easy to understand.
Solution:   Add quotes. (SungHyun Nam)
Files:      src/ex_cmds2.c

Patch 7.2.370 (after 7.2.356)
Problem:    A redraw may cause folds to be closed.
Solution:   Revert part of the previous patch.  Add a test. (Lech Lorens)
Files:      src/diff.c, src/fold.c, src/option.c, src/testdir/test45.in,
            src/testdir/test45.ok

Patch 7.2.371
Problem:    Build problems on Tandem NonStop.
Solution:   A few changes to #ifdefs (Joachim Schmitz)
Files:      src/auto/configure, src/configure.in, src/config.h.in, src/vim.h,
            src/if_cscope.c, src/osdef1.h.in, src/tag.c

Patch 7.2.372 (extra)
Problem:    Cross-compiling GvimExt and xxd doesn't work.
Solution:   Change the build files. (Markus Heidelberg)
Files:      src/INSTALLpc.txt, src/GvimExt/Make_ming.mak, src/Make_cyg.mak,
            src/Make_ming.mak, src/xxd/Make_cyg.mak

Patch 7.2.373
Problem:    Gcc 4.5 adds more error messages. (Chris Indy)
Solution:   Update default 'errorformat'.
Files:      src/option.h

Patch 7.2.374
Problem:    Ruby eval() doesn't understand Vim types.
Solution:   Add the vim_to_ruby() function.  (George Gensure)
Files:      src/eval.c, src/if_ruby.c

Patch 7.2.375
```

```
Problem:    ml_get errors when using ":bprevious" in a BufEnter autocmd.
            (Dominique Pelle)
Solution:   Clear w_valid when entering another buffer.
Files:      src/buffer.c

Patch 7.2.376
Problem:    ml_get error when using SiSU syntax. (Nathan Thomas)
Solution:   If the match ends below the last line move it to the end of the
            last line.
Files:      src/syntax.c

Patch 7.2.377 (extra, after 7.2.372)
Problem:    Misplaced assignment.  Duplicate build line for gvimext.dll.
Solution:   Move setting CROSS_COMPILE to before ifneq.  Remove the wrong
            build line. (Markus Heidelberg)
Files:      src/Make_ming.mak

Patch 7.2.378
Problem:    C function declaration indented too much. (Rui)
Solution:   Don't see a line containing { or } as a type. (Matt Wozniski)
Files:      src/misc1.c

Patch 7.2.379
Problem:    'eventignore' is set to an invalid value inside ":doau". (Antony
            Scriven)
Solution:   Don't include the leading comma when the option was empty.
Files:      src/fileio.c

Patch 7.2.380 (after 7.2.363)
Problem:    Perl interface builds with 5.10.1 but not with 5.10.0.
Solution:   Change the #ifdefs. (Sergey Khorev)
Files:      src/if_perl.xs

Patch 7.2.381
Problem:    No completion for :behave.
Solution:   Add :behave completion.  Minor related fixes. (Dominique Pelle)
Files:      src/ex_docmd.c, src/ex_getln.c, src/proto/ex_docmd.pro, src/vim.h

Patch 7.2.382
Problem:    Accessing freed memory when closing the cmdline window when
            'bufhide' is set to "wipe".
Solution:   Check if the buffer still exists before invoking close_buffer()
            (Dominique Pelle)
Files:      src/ex_getln.c

Patch 7.2.383
Problem:    Vim doesn't build cleanly with MSVC 2010.
Solution:   Change a few types. (George Reilly)
Files:      src/ex_cmds2.c, src/if_python.c, src/syntax.c

Patch 7.2.384 (extra)
Problem:    Vim doesn't build properly with MSVC 2010.
Solution:   Add the nmake version to the build file. (George Reilly)
Files:      src/Make_mvc.mak, src/testdir/Make_dos.mak
```

```
Patch 7.2.385
Problem:    When in the command line window dragging status line only works
            for last-but-one window. (Jean Johner)
Solution:   Remove the code that disallows this.
Files:      src/ui.c

Patch 7.2.386
Problem:    Focus hack for KDE 3.1 causes problems for other window managers.
Solution:   Remove the hack. (forwarded by Joel Bradshaw)
Files:      src/gui_gtk.c

Patch 7.2.387
Problem:    Ruby with MingW still doesn't build all versions.
Solution:   More #ifdefs for the  Ruby code. (Sergey Khorev)
Files:      src/if_ruby.c

Patch 7.2.388 (extra part of 7.2.387)
Problem:    Ruby with MingW still doesn't build all versions.
Solution:   Different approach to build file. (Sergey Khorev)
Files:      src/Make_ming.mak

Patch 7.2.389
Problem:    synIDattr() cannot return the font.
Solution:   Support the "font" argument. (Christian Brabandt)
Files:      runtime/doc/eval.txt, src/eval.c, src/syntax.c

Patch 7.2.390
Problem:    In some situations the popup menu can be displayed wrong.
Solution:   Remove the popup menu if the cursor moved. (Lech Lorens)
Files:      src/edit.c

Patch 7.2.391
Problem:    Internal alloc(0) error when doing "CTRL-V $ c". (Martti Kuparinen)
Solution:   Fix computations in getvcol(). (partly by Lech Lorens)
Files:      src/charset.c, src/memline.c

Patch 7.2.392
Problem:    Netbeans hangs reading from a socket at the maximum block size.
Solution:   Use select() or poll(). (Xavier de Gaye)
Files:      src/vim.h, src/os_unixx.h, src/if_xcmdsrv.c, src/netbeans.c

Patch 7.2.393
Problem:    Mac: Can't build with different Xcode developer tools directory.
Solution:   make "Developer" directory name configurable. (Rainer Muller)
Files:      src/configure.in, src/auto/configure

Patch 7.2.394
Problem:    .lzma and .xz files are not supported.
Solution:   Recognize .lzma and .xz files so that they can be edited.
Files:      runtime/plugin/gzip.vim

Patch 7.2.395
Problem:    In help CTRL=] on g?g? escapes the ?, causing it to fail. (Tony
```

```
            Mechelynck)
Solution:   Don't escape ? for a help command. (Sergey Khorev)
Files:      src/normal.c

Patch 7.2.396
Problem:    Get E38 errors. (Dasn)
Solution:   Set cursor to line 1 instead of 0. (Dominique Pelle)
Files:      src/popupmnu.c

Patch 7.2.397
Problem:    Redundant check for w_lines_valid.
Solution:   Remove the if.  (Lech Lorens)
Files:      src/fold.c

Patch 7.2.398
Problem:    When moving windows the cursor ends up in the wrong line.
Solution:   Set the window width and height properly. (Lech Lorens)
Files:      src/window.c

Patch 7.2.399 (extra, after 7.2.388)
Problem:    Cannot compile on MingW.
Solution:   Move ifneq to separate line. (Vlad Sandrini, Dominique Pelle)
Files:      src/Make_ming.mak

Patch 7.2.400 (after 7.2.387)
Problem:    Dynamic Ruby is not initialised properly for version 1.9.1.
            Ruby cannot create strings from NULL.
Solution:   Cleanup #ifdefs.  Handle NULL like an empty string.  Add
            ruby_init_stack. (Sergey Khorev)
Files:      src/if_ruby.c

Patch 7.2.401
Problem:    ":e dir<Tab>" with 'wildmode' set to "list" doesn't highlight
            directory names with a space. (Alexandre Provencio)
Solution:   Remove the backslash before checking if the name is a directory.
            (Dominique Pelle)
Files:      src/ex_getln.c

Patch 7.2.402
Problem:    This gives a #705 error: let X = function('haslocaldir')
            let X = function('getcwd')
Solution:   Don't give E705 when the name is found in the hashtab. (Sergey
            Khorev)
Files:      src/eval.c

Patch 7.2.403 (after 7.2.400)
Problem:    Compiler warning for pointer type. (Tony Mechelynck)
Solution:   Move type cast to the right place.
Files:      src/if_ruby.c

Patch 7.2.404
Problem:    Pointers for composing characters are not properly initialized.
Solution:   Compute the size of the pointer, not what it points to. (Yukihiro
            Nakadaira)
```

```
Files:      src/screen.c

Patch 7.2.405
Problem:    When built with small features the matching text is not
            highlighted for ":s/pat/repl/c".
Solution:   Remove the #ifdef for IncSearch. (James Vega)
Files:      src/syntax.c

Patch 7.2.406
Problem:    Patch 7.2.119 introduces uninit mem read. (Dominique Pelle)
Solution:   Only used ScreeenLinesC when ScreeenLinesUC is not zero. (Yukihiro
            Nakadaira)  Also clear ScreeenLinesC when allocating.
Files:      src/screen.c

Patch 7.2.407
Problem:    When using an expression in ":s" backslashes in the result are
            dropped. (Sergey Goldgaber, Christian Brabandt)
Solution:   Double backslashes.
Files:      src/regexp.c

Patch 7.2.408
Problem:    With ":g/the/s/foo/bar/" the '[ and '] marks can be set to a line
            that was not changed.
Solution:   Only set '[ and '] marks when a substitution was done.
Files:      src/ex_cmds.c

Patch 7.2.409
Problem:    Summary of number of substitutes is incorrect for ":folddo". (Jean
            Johner)
Solution:   Reset sub_nsubs and sub_nlines in global_exe().
Files:      src/ex_cmds.c

Patch 7.2.410
Problem:    Highlighting directories for completion doesn't work properly.
Solution:   Don't halve backslashes when not needed, expanded "~/".
            (Dominique Pelle)
Files:      src/ex_getln.c

Patch 7.2.411
Problem:    When parsing 'cino' a comma isn't skipped properly.
Solution:   Skip the comma. (Lech Lorens)
Files:      src/misc1.c

Patch 7.2.412
Problem:    [ or ] followed by mouse click doesn't work.
Solution:   Reverse check for key being a mouse event. (Dominique Pelle)
Files:      src/normal.c

Patch 7.2.413
Problem:    Large file support is incorrect.
Solution:   Add AC_SYS_LARGEFILE to configure. (James Vega)
Files:      src/configure.in, src/config.h.in, src/auto/configure

Patch 7.2.414
```

```
Problem:    CTRK-K <space> <space> does not produce 0xa0 as expected. (Tony
            Mechelynck)
Solution:   Remove the Unicode range 0xe000 - 0xefff from digraphs, these are
            not valid characters.
Files:      src/digraph.c

Patch 7.2.415
Problem:    Win32: Can't open a remote file when starting Vim.
Solution:   Don't invoke cygwin_conv_path() for URLs. (Tomoya Adachi)
Files:      src/main.c

Patch 7.2.416
Problem:    Logtalk.dict is not installed.
Solution:   Add it to the install target. (Markus Heidelberg)
Files:      src/Makefile

Patch 7.2.417
Problem:    When 'shell' has an argument with a slash then 'shellpipe' is not
            set properly. (Britton Kerin)
Solution:   Assume there are no spaces in the path, arguments follow.
Files:      src/option.c

Patch 7.2.418
Problem:    Vim tries to set the background or foreground color in a terminal
            to -1.  (Graywh)  Happens with ":hi Normal ctermbg=NONE".
Solution:   When resetting the foreground or background color don't set the
            color, let the clear screen code do that.
Files:      src/syntax.c

Patch 7.2.419
Problem:    Memory leak in Motif when clicking on "Search Vim Help".
Solution:   Free string returned by XmTextGetString(). (Dominique Pelle)
Files:      src/gui_motif.c

Patch 7.2.420
Problem:    ":argedit" does not accept "++enc=utf8" as documented. (Dominique
            Pelle)
Solution:   Add the ARGOPT flag to ":argedit".
Files:      src/ex_cmds.h

Patch 7.2.421
Problem:    Folds are sometimes not updated properly and there is no way to
            force an update.
Solution:   Make "zx" and "zX" recompute folds (suggested by Christian
            Brabandt)
Files:      src/normal.c

Patch 7.2.422
Problem:    May get E763 when using spell dictionaries.
Solution:   Avoid utf-8 case folded character to be truncated to 8 bits and
            differ from latin1. (Dominique Pelle)
Files:      src/spell.c

Patch 7.2.423
```

```
Problem:    Crash when assigning s: to variable. (Yukihiro Nakadaira)
Solution:   Make ga_scripts contain pointer to scriptvar_T instead of
            scriptvar_T itself. (Dominique Pelle)
Files:      src/eval.c

Patch 7.2.424
Problem:    ":colorscheme" without an argument doesn't do anything.
Solution:   Make it echo the current color scheme name.  (partly by Christian
            Brabandt)
Files:      runtime/doc/syntax.txt, src/ex_cmds.h, src/ex_docmd.c

Patch 7.2.425
Problem:    Some compilers complain about fourth EX() argument.
Solution:   Add cast to long_u.
Files:      src/ex_cmds.h

Patch 7.2.426
Problem:    Commas in 'langmap' are not always handled correctly.
Solution:   Require commas to be backslash escaped. (James Vega)
Files:      src/option.c

Patch 7.2.427
Problem:    The swapfile is created using the destination of a symlink, but
            recovery doesn't follow symlinks.
Solution:   When recovering, resolve symlinks. (James Vega)
Files:      src/memline.c

Patch 7.2.428
Problem:    Using setqflist([]) to clear the error list doesn't work properly.
Solution:   Set qf_nonevalid to TRUE when appropriate. (Christian Brabandt)
Files:      src/quickfix.c

Patch 7.2.429
Problem:    A file that exists but access is denied may result in a "new file"
            message.  E.g. when its directory is unreadable.
Solution:   Specifically check for ENOENT to decide a file doesn't exist.
            (partly by James Vega)
Files:      src/fileio.c

Patch 7.2.430
Problem:    The ++bad argument is handled wrong, resulting in an invalid
            memory access.
Solution:   Use the bad_char field only for the replacement character, add
            bad_char_idx to store the position. (Dominique Pelle)
Files:      src/eval.c, src/ex_cmds.h, src/ex_docmd.c

Patch 7.2.431
Problem:    ":amenu" moves the cursor when in Insert mode.
Solution:   Use CTRL-\ CTRL-O instead of CTRL-O. (Christian Brabandt)
Files:      src/menu.c

Patch 7.2.432
Problem:    When menus are translated they can only be found by the translated
            name.  That makes ":emenu" difficult to use.
```

```
Solution:   Store the untranslated name and use it for completion and :emenu.
            (Liang Peng (Bezetek James), Edward L. Fox)
Files:      src/menu.c, src/structs.h

Patch 7.2.433
Problem:    Can't use cscope with QuickFixCmdPre and QuickFixCmdPost.
Solution:   Add cscope support for these autocmd events. (Bryan Venteicher)
Files:      runtime/doc/autocmd.txt, src/if_cscope.c

Patch 7.2.434 (after 7.2.432)
Problem:    Compilation fails without the multi-lang feature.
Solution:   Add #ifdefs. (John Marriott)
Files:      src/menu.c

Patch 7.2.435 (after 7.2.430)
Problem:    Crash when using bad_char_idx uninitialized. (Patrick Texier)
Solution:   Don't use bad_char_idx, reproduce the ++bad argument from bad_char.
Files:      src/eval.c, src/ex_cmds.h, src/ex_docmd.c

Patch 7.2.436
Problem:    Reproducible crash in syntax HL. (George Reilly, Dominique Pelle)
Solution:   Make sst_stacksize an int instead of short. (Dominique Pelle)
Files:      src/structs.h

Patch 7.2.437 (after 7.2.407)
Problem:    When "\\\n" appears in the expression result the \n doesn't result
            in a line break. (Andy Wokula)
Solution:   Also replace a \n after a backslash into \r.
Files:      src/regexp.c

Patch 7.2.438 (after 7.2.427)
Problem:    "vim -r" crashes.
Solution:   Don't use NULL pointer argument.
Files:      src/memline.c

Patch 7.2.439
Problem:    Invalid memory access when doing thesaurus completion and
            'infercase' is set.
Solution:   Use the minimal length of completed word and replacement.
            (Dominique Pelle)
Files:      src/edit.c

Patch 7.2.440
Problem:    Calling a function through a funcref, where the function deletes
            the funcref, leads to an invalid memory access.
Solution:   Make a copy of the function name. (Lech Lorens)
Files:      src/eval.c, src/testdir/test34.in, src/testdir/test34.ok

Patch 7.2.441
Problem:    When using ":earlier" undo information may be wrong.
Solution:   When changing alternate branches also adjust b_u_oldhead.
Files:      src/undo.c

Patch 7.2.442 (after 7.2.201)
```

```
Problem:    Copy/paste with OpenOffice doesn't work.
Solution:   Do not offer the HTML target when it is not supported. (James
            Vega)
Files:      src/gui_gtk_x11.c, src/option.c, src/proto/gui_gtk_x11.pro

Patch 7.2.443
Problem:    Using taglist() on a tag file with duplicate fields generates an
            internal error. (Peter Odding)
Solution:   Check for duplicate field names.
Files:      src/eval.c, src/proto/eval.pro, src/tag.c

Patch 7.2.444 (after 7.2.442)
Problem:    Can't build with GTK 1, gtk_selection_clear_targets() is not
            available. (Patrick Texier)
Solution:   Don't change the targets for GTK 1, set them once.
Files:      src/gui_gtk_x11.c, src/option.c

Patch 7.2.445
Problem:    Crash when using undo/redo and a FileChangedRO autocmd event that
            reloads the buffer. (Dominique Pelle)
Solution:   Do not allow autocommands while performing and undo or redo.
Files:      src/misc1.c, src/undo.c

Patch 7.2.446
Problem:    Crash in GUI when closing the last window in a tabpage. (ryo7000)
Solution:   Remove the tabpage from the list before freeing the window.
Files:      src/window.c

When writing a file, switching tab pages and selecting a word the file write
message would be displayed again.  This happened in Insert mode and with
'cmdheight' set to 2.

When using ":lang" to set a locale that uses a comma for decimal separator and
using GTK floating point numbers stop working.  Use gtk_disable_setlocale().
(James Vega)

"g8" didn't produce the right value on a NUL. (Dominique Pelle)

Use BASEMODLIBS instead of MODLIBS for Python configuration to pick up the
right compiler flags. (Michael Bienia)

Window title was not updated after dropping a file on Vim. (Hari G)

synstack() did not return anything when just past the end of the line.  Useful
when using the cursor position in Insert mode.

When entering a digraph or special character after a line that fits the window
the '?' or '^' on the next line is not redrawn. (Ian Kelling)

Composing characters in  :s  substitute text were dropped.

 exists()  was causing an autoload script to be loaded.

Filter out -pthread for cproto.
```

Make CTRL-L in command line mode respect 'ignorecase' and 'smartcase'. (Martin Toft)

Spell menu moved the cursor, causing Copy not to work. Spell replacement didn't work in 'compatible' mode.

Various small fixes from Dominique Pelle.

Fix that :mksession may generate "2argu" even though there is no such argument. (Peter Odding)

Fixes for time in clipboard request. Also fix ownership. (David Fries)

Fixed completion of file names with '%' and '*'.

Fixed MSVC makefile use of /Wp64 flag.

Correct use of long instead of off_t for file size. (James Vega)

Add a few #ifdefs to exclude functions that are not used. (Dominique Pelle)

Remove old and unused method to allocate memory for undo.

Fix definition of UINT_PTR for 64 bit systems.

Some versions of Ruby redefine rb_str_new2 to rb_str_new_cstr.

Window title not updated after file dropped.

Fixed crash for ":find" completion, might also happen in other path expansion usage.

When 'searchhl' causes a hang make CTRL-C disable 'searchhl'.

When resetting both 'title' and 'icon' the title would be set after a shell command.

Reset 'title' and 'icon' in test47 to avoid the xterm title getting messed up.

Fix for compiler warning about function prototype in pty.c.

Added 'window' to the options window.

Fixed: errors for allocating zero bytes when profiling an empty function.

Remove -arch flag from build flags for Perl. (Bjorn Wickler)

Fix 'autochdir' not showing up in :options window. (Dominique Pelle)

Fix: test 69 didn't work on MS-Windows. Test 72 beeped too often.

Avoid illegal memory access in spell suggestion. (Dominique Pelle)
Fix: crash in spell checking with a 0x300 character.

Avoid that running tests changes viminfo.

Fix: changing case of a character removed combining characters.
Fixed: CTRL-R in Insert mode doesn't insert composing characters.

Added the WOW64 flag to OLE registration, for 64 bit Windows systems.

Various fixes for coverity warnings.

Fix compile warnings, esp. for 64-bit systems. (Mike Williams)

Fix: :redir to a dictionary that is changed before ":redir END" causes a
memory access error.

Fix: terminal title not properly restored when there are multi-byte
characters. (partly by James Vega)

Set 'wrapscan' when checking the .po files. (Mike Williams)

Win32: Put quotes around the gvim.exe path for the "Open with" menu entry.

On MS-Windows sometimes files with number 4913 or higher are left behind.

'suffixesadd' was used for finding tags file.

Removed unused code.

Improved positioning of combining characters in GTK.

Made test 11 pass when there is no gzip program. (John Beckett)

Changed readfile() to ignore byte order marks, unless in binary mode.

On MS-Windows completion of shell commands didn't work.

An unprintable multi-byte character at the start of the screen line caused the
following text to be drawn at the wrong position.

Got ml_get errors when using undo with 'virtualedit'.

Call gui_mch_update() before triggering GuiEnter autocmd. (Ron Aaron)

Unix "make install" installed a few Amiga .info files.

Disallow setting 'ambiwidth' to "double" when 'listchars' or 'fillchars'
contains a character that would become double width.

Set 'wrapscan' when checking the .po files. (Mike Williams)

Fixed: using expression in command line may cause a crash.

Avoid warnings from the clang compiler. (Dominique Pelle)

Fix: Include wchar.h in charset.c for towupper().

Fixed: Using ":read file" in an empty buffer when 'compatible' is set caused an error. Was caused by patch 7.2.132.

Make the references to features in the help more consistent. (Sylvain Hitier)

==
VERSION 7.4   version-7.4 version7.4 vim-7.4

This section is about improvements made between version 7.3 and 7.4.

This release has hundreds of bug fixes and there are a few new features. The most notable new features are:

- New regexp engine   new-regexp-engine
- A more pythonic Python interface   better-python-interface

New regexp engine   new-regexp-engine

What is now called the "old" regexp engine uses a backtracking algorithm. It tries to match the pattern with the text in one way, and when that fails it goes back and tries another way. This works fine for simple patterns, but complex patterns can be very slow on longer text.

The new engine uses a state machine. It tries all possible alternatives at the current character and stores the possible states of the pattern. This is a bit slower for simple patterns, but much faster for complex patterns and long text.

Most notably, syntax highlighting for Javascript and XML files with long lines is now working fine. Previously Vim could get stuck.

More information here: two-engines

Better Python interface   better-python-interface

Added python-bindeval function. Unlike python-eval this one returns python-Dictionary , python-List and python-Function objects for dictionaries lists and functions respectively in place of their Python built-in equivalents (or None if we are talking about function references).
   For simple types this function returns Python built-in types and not only Python `str()` like python-eval does. On Python 3 it will return `bytes()` objects in place of `str()` ones avoiding possibility of UnicodeDecodeError.
   Interface of new objects mimics standard Python `dict()` and `list()` interfaces to some extent. Extent will be improved in the future.

Added special python-vars objects also available for python-buffer and python-window . They ease access to Vim script variables from Python.

Now you no longer need to alter `sys.path` to import your module: special hooks are responsible for importing from {rtp}/python2, {rtp}/python3 and {rtp}/pythonx directories (for Python 2, Python 3 and both respectively). See python-special-path .

Added possibility to work with tabpage s through python-tabpage object.

Added automatic conversion of Vim errors and exceptions to Python exceptions.

Changed the behavior of the python-buffers object: it now uses buffer numbers as keys in place of the index of the buffer in the internal buffer list. This should not break anything as the only way to get this index was iterating over python-buffers .

Added :pydo and :py3do commands.

Added the pyeval() and py3eval() functions.

Now in all places which previously accepted `str()` objects, `str()` and `unicode()` (Python 2) or `bytes()` and `str()` (Python 3) are accepted.

python-window has gained `.col` and `.row` attributes that are currently the only way to get internal window positions.

Added or fixed support for `dir()` in Vim Python objects.

Changed changed-7.4

Old Python versions (≤2.2) are no longer supported. Building with them did not work anyway.

Options:

Added ability to automatically save the selection into the system clipboard when using non-GUI version of Vim (autoselectplus in 'clipboard'). Also added ability to use the system clipboard as default register (previously only primary selection could be used). (Ivan Krasilnikov, Christian Brabandt, Bram Moolenaar)

Added a special 'shiftwidth' value that makes 'sw' follow 'tabstop'. As indenting via 'indentexpr' became tricky shiftwidth() function was added. Also added equivalent special value to 'softtabstop' option. (Christian Brabandt, so8res)

Show absolute number in number column when 'relativenumber' option is on. Now there are four combinations with 'number' and 'relativenumber'. (Christian Brabandt)

Commands:

:diffoff now saves the local values of some settings and restores them in place of blindly resetting them to the defaults. (Christian Brabandt)

Other:
	Lua interface now also uses userdata binded to Vim structures. (Taro Muraoka, Luis Carvalho)

	glob() and autocommand patterns used to work with the undocumented "\{n,m\}" item from a regexp. "\{" is now used for a literal "{", as this is normal in shell file patterns. Now used "\\\{n,m\}" to get "\{n,m}" in the regexp pattern.

Added added-7.4

Various syntax, indent and other plugins were added.

Added support for Lists and Dictionaries in viminfo . (Christian Brabandt)

Functions:
	Bitwise functions: and() , or() , invert() , xor() .

	Added luaeval() function. (Taro Muraoka, Luis Carvalho)

	Added sha256() function. (Tyru, Hirohito Higashi)

	Added wildmenumode() function. (Christian Brabandt)

	Debugging functions: screenattr() , screenchar() , screencol() , screenrow() . (Simon Ruderich, Bram Moolenaar)

	Added ability to use Dictionary-function s for sort() ing, via optional third argument. (Nikolay Pavlov)

	Added special expand() argument that expands to the current line number.

	Made it possible to force char2nr() to always give unicode codepoints regardless of current encoding. (Yasuhiro Matsumoto)

	Made it possible for functions generating file list generate List and not NL-separated string. (e.g. glob() , expand()) (Christian Brabandt)

	Functions that obtain variables from the specific window, tabpage or buffer scope dictionary can now return specified default value in place of empty string in case variable is not found. (gettabvar() , getwinvar() , getbufvar()) (Shougo Matsushita, Hirohito Higashi)

Autocommands:
	Added InsertCharPre event launched before inserting character. (Jakson A. Aquino)

	Added CompleteDone event launched after finishing completion in insert mode. (idea by Florian Klein)

Added QuitPre event launched when commands that can either close Vim or only some window(s) are launched.

Added TextChanged and TextChangedI events launched when text is changed.

Commands:
:syntime command useful for debugging.

Made it possible to remove all signs from the current buffer using :sign-unplace . (Christian Brabandt)

Added :language autocompletion. (Dominique Pelle)

Added more :command-complete completion types: :behave suboptions, color schemes, compilers, :cscope suboptions, files from 'path', :history suboptions, locale names, :syntime suboptions, user names. (Dominique Pelle)

Added :map-nowait creating mapping which when having lhs that is the prefix of another mapping's lhs will not allow Vim to wait for user to type more characters to resolve ambiguity, forcing Vim to take the shorter alternative: one with <nowait>.

Options:
Made it possible to ignore case when completing: 'wildignorecase'.

Added ability to delete comment leader when using J by `j` flag in 'formatoptions' (fo-table). (Lech Lorens)

Added ability to control indentation inside namespaces: cino-N . (Konstantin Lepa)

Added ability to control alignment inside `if` condition separately from alignment inside function arguments: cino-k . (Lech Lorens)

Other:
Improved support for cmd.exe. (Ben Fritz, Bram Moolenaar)

Added v:windowid variable containing current window number in GUI Vim. (Christian J. Robinson, Lech Lorens)

Added rxvt-unicode and SGR mouse support. (Yiding Jia, Hayaki Saito)

All changes in 7.4 fixed-7.4

Patch 7.3.001
Problem: When editing "src/main.c" and 'path' set to "./proto", ":find e<C-D" shows ./proto/eval.pro instead of eval.pro.
Solution: Check for path separator when comparing names. (Nazri Ramliy)
Files: src/misc1.c

```
Patch 7.3.002
Problem:    ":find" completion doesn't work when halfway an environment
            variable. (Dominique Pelle)
Solution:   Only use in-path completion when expanding file names. (Nazri
            Ramliy)
Files:      src/ex_docmd.c

Patch 7.3.003
Problem:    Crash with specific BufWritePost autocmd. (Peter Odding)
Solution:   Don't free the quickfix title twice. (Lech Lorens)
Files:      src/quickfix.c

Patch 7.3.004
Problem:    Crash when using very long regexp. (Peter Odding)
Solution:   Reset reg_toolong. (Carlo Teubner)
Files:      src/regexp.c

Patch 7.3.005
Problem:    Crash when using undotree(). (Christian Brabandt)
Solution:   Increase the list reference count.  Add a test for undotree()
            (Lech Lorens)
Files:      src/eval.c, src/testdir/Makefile, src/testdir/test61.in

Patch 7.3.006
Problem:    Can't build some multi-byte code with C89.
Solution:   Move code to after declarations. (Joachim Schmitz)
Files:      src/mbyte.c, src/spell.c

Patch 7.3.007
Problem:    Python code defines global "buffer".  Re-implements a grow-array.
Solution:   Use a grow-array instead of coding the same functionality.  Handle
            out-of-memory situation properly.
Files:      src/if_py_both.h

Patch 7.3.008
Problem:    'cursorbind' is kept in places where 'scrollbind' is reset.
Solution:   Reset 'cursorbind'.
Files:      src/buffer.c, src/diff.c, src/ex_cmds.c, src/ex_cmds2.c,
            src/ex_docmd.c, src/ex_getln.c, src/if_cscope.c, src/macros.h,
            src/quickfix.c, src/search.c, src/tag.c, src/window.c

Patch 7.3.009
Problem:    Win32: Crash on Windows when using a bad argument for strftime().
            (Christian Brabandt)
Solution:   Use the bad_param_handler(). (Mike Williams)
Files:      src/os_win32.c

Patch 7.3.010
Problem:    Mac GUI: Missing break statements.
Solution:   Add the break statements. (Dominique Pelle)
Files:      src/gui_mac.c

Patch 7.3.011
```

```
Problem:    X11 clipboard doesn't work in Athena/Motif GUI.  First selection
            after a shell command doesn't work.
Solution:   When using the GUI use XtLastTimestampProcessed() instead of
            changing a property.  (partly by Toni Ronkko)
            When executing a shell command disown the selection.
Files:      src/ui.c, src/os_unix.c

Patch 7.3.012
Problem:    Problems building with MingW.
Solution:   Adjust the MingW makefiles. (Jon Maken)
Files:      src/Make_ming.mak, src/GvimExt/Make_ming.mak

Patch 7.3.013
Problem:    Dynamic loading with Ruby doesn't work for 1.9.2.
Solution:   Handle rb_str2cstr differently.  Also support dynamic loading on
            Unix. (Jon Maken)
Files:      src/if_ruby.c

Patch 7.3.014
Problem:    Ending a line in a backslash inside an ":append" or ":insert"
            command in Ex mode doesn't work properly. (Ray Frush)
Solution:   Halve the number of backslashes, only insert a NUL after an odd
            number of backslashes.
Files:      src/ex_getln.c

Patch 7.3.015
Problem:    Test is using error message that no longer exists.
Solution:   Change E106 to E121. (Dominique Pelle)
Files:      src/testdir/test49.vim

Patch 7.3.016
Problem:    Netbeans doesn't work under Athena.
Solution:   Support Athena, just like Motif. (Xavier de Gaye)
Files:      runtime/doc/netbeans.txt, src/gui.c, src/main.c, src/netbeans.c

Patch 7.3.017
Problem:    smatch reports errors.
Solution:   Fix the reported errors. (Dominique Pelle)
Files:      src/spell.c, src/syntax.c

Patch 7.3.018 (after 7.3.012)
Problem:    Missing argument to windres in MingW makefiles.
Solution:   Add the argument that was wrapped in the patch. (Jon Maken)
Files:      src/Make_ming.mak, src/GvimExt/Make_ming.mak

Patch 7.3.019
Problem:    ":nbstart" can fail silently.
Solution:   Give an error when netbeans is not supported by the GUI. (Xavier
            de Gaye)
Files:      src/netbeans.c

Patch 7.3.020
Problem:    Cursor position wrong when joining multiple lines and
            'formatoptions' contains "a". (Moshe Kamensky)
```

```
Solution:   Adjust cursor position for skipped indent. (Carlo Teubner)
Files:      src/ops.c, src/testdir/test68.in, src/testdir/test68.ok

Patch 7.3.021
Problem:    Conflict for defining Boolean in Mac header files.
Solution:   Define NO_X11_INCLUDES. (Rainer Muller)
Files:      src/os_macosx.m, src/vim.h

Patch 7.3.022
Problem:    When opening a new window the 'spellcapcheck' option is cleared.
Solution:   Copy the correct option value. (Christian Brabandt)
Files:      src/option.c

Patch 7.3.023
Problem:    External program may hang when it tries to write to the tty.
Solution:   Don't close the slave tty until after the child exits. (Nikola
            Knezevic)
Files:      src/os_unix.c

Patch 7.3.024
Problem:    Named signs do not use a negative number as intended.
Solution:   Fix the numbering of named signs. (Xavier de Gaye)
Files:      src/ex_cmds.c

Patch 7.3.025
Problem:    ":mksession" does not square brackets escape file name properly.
Solution:   Improve escaping of file names. (partly by Peter Odding)
Files:      src/ex_docmd.c

Patch 7.3.026
Problem:    CTRL-] in a help file doesn't always work. (Tony Mechelynck)
Solution:   Don't escape special characters. (Carlo Teubner)
Files:      src/normal.c

Patch 7.3.027
Problem:    Opening a file on a network share is very slow.
Solution:   When fixing file name case append "\*" to directory, server and
            network share names. (David Anderson, John Beckett)
Files:      src/os_win32.c

Patch 7.3.028 (after 7.3.024)
Problem:    Signs don't show up. (Charles Campbell)
Solution:   Don't use negative numbers.  Also assign a number to signs that
            have a name of all digits to avoid using a sign number twice.
Files:      src/ex_cmds.c

Patch 7.3.029
Problem:    ":sort n" sorts lines without a number as number zero. (Beeyawned)
Solution:   Make lines without a number sort before lines with a number.  Also
            fix sorting negative numbers.
Files:      src/ex_cmds.c, src/testdir/test57.in, src/testdir/test57.ok

Patch 7.3.030
Problem:    Cannot store Dict and List in viminfo file.
```

```
Solution:   Add support for this. (Christian Brabandt)
Files:      runtime/doc/options.txt, src/eval.c, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile, src/testdir/main.aap, src/testdir/test74.in,
            src/testdir/test74.ok

Patch 7.3.031
Problem:    Can't pass the X window ID to another application.
Solution:   Add v:windowid. (Christian J. Robinson, Lech Lorens)
Files:      runtime/doc/eval.txt, src/eval.c, src/gui.c, src/vim.h,
            src/os_unix.c

Patch 7.3.032
Problem:    maparg() doesn't return the flags, such as <buffer>, <script>,
            <silent>.  These are needed to save and restore a mapping.
Solution:   Improve maparg(). (also by Christian Brabandt)
Files:      runtime/doc/eval.txt, src/eval.c, src/getchar.c, src/gui_w48.c,
            src/message.c, src/proto/getchar.pro, src/proto/message.pro,
            src/structs.h src/testdir/test75.in, src/testdir/test75.ok

Patch 7.3.033 (after 7.3.032)
Problem:    Can't build without FEAT_LOCALMAP.
Solution:   Add an #ifdef. (John Marriott)
Files:      src/getchar.c

Patch 7.3.034
Problem:    Win32: may be loading .dll from the wrong directory.
Solution:   Go to the Vim executable directory when opening a library.
Files:      src/gui_w32.c, src/if_lua.c, src/if_mzsch.c, src/if_perl.xs,
            src/if_python.c, src/if_python3.c, src/if_ruby.c, src/mbyte.c,
            src/os_mswin.c, src/os_win32.c, src/proto/os_win32.pro

Patch 7.3.035 (after 7.3.034)
Problem:    Stray semicolon after if statement. (Hari G)
Solution:   Remove the semicolon.
Files:      src/os_win32.c

Patch 7.3.036
Problem:    Win32 GUI: When building without menus, the font for dialogs and
            tab page headers also changes.
Solution:   Define USE_SYSMENU_FONT always. (Harig G.)
Files:      src/gui_w32.c

Patch 7.3.037
Problem:    Compiler warnings for loss of data. (Mike Williams)
Solution:   Add type casts.
Files:      src/if_py_both.h, src/getchar.c, src/os_win32.c

Patch 7.3.038
Problem:    v:windowid isn't set on MS-Windows.
Solution:   Set it to the window handle. (Chris Sutcliffe)
Files:      runtime/doc/eval.txt, src/gui_w32.c
```

```
Patch 7.3.039
Problem:    Crash when using skk.vim plugin.
Solution:   Get length of expression evaluation result only after checking for
            NULL.  (Noriaki Yagi, Dominique Pelle)
Files:      src/ex_getln.c

Patch 7.3.040
Problem:    Comparing strings while ignoring case goes beyond end of the
            string when there are illegal bytes. (Dominique Pelle)
Solution:   Explicitly check for illegal bytes.
Files:      src/mbyte.c

Patch 7.3.041
Problem:    Compiler warning for accessing mediumVersion. (Tony Mechelynck)
Solution:   Use the pointer instead of the array itself. (Dominique Pelle)
Files:      src/version.c

Patch 7.3.042
Problem:    No spell highlighting when re-using an empty buffer.
Solution:   Clear the spell checking info only when clearing the options for a
            buffer. (James Vega)
Files:      src/buffer.c

Patch 7.3.043
Problem:    Can't load Ruby dynamically on Unix.
Solution:   Adjust the configure script. (James Vega)
Files:      src/Makefile, src/config.h.in, src/configure.in,
            src/auto/configure, src/if_ruby.c

Patch 7.3.044
Problem:    The preview window opened by the popup menu is larger than
            specified with 'previewheight'. (Benjamin Haskell)
Solution:   Use 'previewheight' if it's set and smaller.
Files:      src/popupmnu.c

Patch 7.3.045
Problem:    Compiler warning for uninitialized variable.
Solution:   Initialize the variable always.
Files:      src/getchar.c

Patch 7.3.046 (after 7.3.043)
Problem:    Can't build Ruby on MS-Windows.
Solution:   Add #ifdef, don't use WIN3264 before including vim.h.
Files:      src/if_ruby.c

Patch 7.3.047 (after 7.3.032)
Problem:    Missing makefile updates for test 75.
Solution:   Update the makefiles.
Files:      src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Makefile, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms

Patch 7.3.048
Problem:    ":earlier 1f" doesn't work after loading undo file.
```

```
Solution:   Set b_u_save_nr_cur when loading an undo file. (Christian
            Brabandt)
            Fix only showing time in ":undolist"
Files:      src/undo.c

Patch 7.3.049
Problem:    PLT has rebranded their Scheme to Racket.
Solution:   Add support for Racket 5.x. (Sergey Khorev)
Files:      src/Make_cyg.mak, src/Make_ming.mak, src/Make_mvc.mak,
            src/auto/configure, src/configure.in, src/if_mzsch.c

Patch 7.3.050
Problem:    The link script is clumsy.
Solution:   Use the --as-needed linker option if available. (Kirill A.
            Shutemov)
Files:      src/Makefile, src/auto/configure, src/config.mk.in,
            src/configure.in, src/link.sh

Patch 7.3.051
Problem:    Crash when $PATH is empty.
Solution:   Check for vim_getenv() returning NULL. (Yasuhiro Matsumoto)
Files:      src/ex_getln.c, src/os_win32.c

Patch 7.3.052
Problem:    When 'completefunc' opens a new window all kinds of errors follow.
            (Xavier Deguillard)
Solution:   When 'completefunc' goes to another window or buffer and when it
            deletes text abort completion.  Add a test for 'completefunc'.
Files:      src/edit.c, src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
            src/testdir/test76.in, src/testdir/test76.ok

Patch 7.3.053
Problem:    complete() function doesn't reset complete direction.  Can't use
            an empty string in the list of matches.
Solution:   Set compl_direction to FORWARD.  Add "empty" key to allow empty
            words. (Kikuchan)
Files:      src/edit.c

Patch 7.3.054
Problem:    Can define a user command for :Print, but it doesn't work. (Aaron
            Thoma)
Solution:   Let user command :Print overrule the builtin command (Christian
            Brabandt)  Disallow :X and :Next as a user defined command.
Files:      src/ex_docmd.c

Patch 7.3.055
Problem:    Recursively nested lists and dictionaries cause a near-endless
            loop when comparing them with a copy. (ZyX)
Solution:   Limit recursiveness in a way that non-recursive structures can
            still be nested very deep.
Files:      src/eval.c, src/testdir/test55.in, src/testdir/test55.ok
```

```
Patch 7.3.056
Problem:    "getline" argument in do_cmdline() shadows global.
Solution:   Rename the argument.
Files:      src/ex_docmd.c

Patch 7.3.057
Problem:    Segfault with command line abbreviation. (Randy Morris)
Solution:   Don't retrigger the abbreviation when abandoning the command line.
            Continue editing the command line after the error.
Files:      src/ex_getln.c

Patch 7.3.058
Problem:    Error "code converter not found" when loading Ruby script.
Solution:   Load Gem module. (Yasuhiro Matsumoto)
Files:      src/if_ruby.c

Patch 7.3.059
Problem:    Netbeans: Problem with recursively handling messages for Athena
            and Motif.
Solution:   Call netbeans_parse_messages() in the main loop, like it's done
            for GTK. (Xavier de Gaye)
Files:      src/gui_x11.c, src/netbeans.c

Patch 7.3.060
Problem:    Netbeans: crash when socket is disconnected unexpectedly.
Solution:   Don't cleanup when a read fails, put a message in the queue and
            disconnect later. (Xavier de Gaye)
Files:      src/netbeans.c

Patch 7.3.061
Problem:    Remote ":drop" does not respect 'autochdir'. (Peter Odding)
Solution:   Don't restore the directory when 'autochdir' is set. (Benjamin
            Fritz)
Files:      src/main.c

Patch 7.3.062
Problem:    Python doesn't work properly when installed in another directory
            than expected.
Solution:   Figure out home directory in configure and use Py_SetPythonHome()
            at runtime. (Roland Puntaier)
Files:      src/configure.in, src/auto/configure, src/if_python.c,
            src/if_python3.c

Patch 7.3.063
Problem:    Win32: Running a filter command makes Vim lose focus.
Solution:   Use SW_SHOWMINNOACTIVE instead of SW_SHOWMINIMIZED. (Hong Xu)
Files:      src/os_win32.c

Patch 7.3.064
Problem:    Win32: ":dis +" shows nothing, but "+p does insert text.
Solution:   Display the * register, since that's what will be inserted.
            (Christian Brabandt)
Files:      src/globals.h, src/ops.c
```

```
Patch 7.3.065
Problem:    Can't get current line number in a source file.
Solution:   Add the <slnum> item, similar to <sfile>.
Files:      src/ex_docmd.c

Patch 7.3.066
Problem:    Crash when changing to another window while in a :vimgrep command.
            (Christian Brabandt)
Solution:   When wiping out the dummy before, remove it from aucmd_win.
Files:      src/quickfix.c

Patch 7.3.067 (after 7.3.058)
Problem:    Ruby: Init_prelude is not always available.
Solution:   Remove use of Init_prelude. (Yasuhiro Matsumoto)
Files:      src/if_ruby.c

Patch 7.3.068
Problem:    Using freed memory when doing ":saveas" and an autocommand sets
            'autochdir'. (Kevin Klement)
Solution:   Get the value of fname again after executing autocommands.
Files:      src/ex_cmds.c

Patch 7.3.069
Problem:    GTK: pressing Enter in inputdialog() doesn't work like clicking OK
            as documented.
Solution:   call gtk_entry_set_activates_default(). (Britton Kerin)
Files:      src/gui_gtk.c

Patch 7.3.070
Problem:    Can set environment variables in the sandbox, could be abused.
Solution:   Disallow it.
Files:      src/eval.c

Patch 7.3.071
Problem:    Editing a file in a window that's in diff mode resets 'diff'
            but not cursor binding.
Solution:   Reset cursor binding in two more places.
Files:      src/quickfix.c, src/option.c

Patch 7.3.072
Problem:    Can't complete file names while ignoring case.
Solution:   Add 'wildignorecase'.
Files:      src/ex_docmd.c, src/ex_getln.c, src/misc1.c, src/option.c,
            src/option.h, src/vim.h, src/runtime/options.txt

Patch 7.3.073
Problem:    Double free memory when netbeans command follows DETACH.
Solution:   Only free the node when owned. (Xavier de Gaye)
Files:      src/netbeans.c

Patch 7.3.074
Problem:    Can't use the "+ register like "* for yank and put.
Solution:   Add "unnamedplus" to the 'clipboard' option. (Ivan Krasilnikov)
Files:      runtime/doc/options.txt, src/eval.c, src/globals.h, src/ops.c,
```

```
            src/option.c

Patch 7.3.075 (after 7.3.072)
Problem:    Missing part of 'wildignorecase'
Solution:   Also adjust expand()
Files:      src/eval.c

Patch 7.3.076
Problem:    Clang warnings for dead code.
Solution:   Remove it. (Carlo Teubner)
Files:      src/gui_gtk.c, src/if_ruby.c, src/misc2.c, src/netbeans.c,
            src/spell.c

Patch 7.3.077
Problem:    When updating crypt of swapfile fails there is no error message.
            (Carlo Teubner)
Solution:   Add the error message.
Files:      src/memline.c

Patch 7.3.078
Problem:    Warning for unused variable.
Solution:   Adjust #ifdefs.
Files:      src/ops.c

Patch 7.3.079
Problem:    Duplicate lines in makefile.
Solution:   Remove the lines. (Hong Xu)
Files:      src/Make_mvc.mak

Patch 7.3.080
Problem:    Spell doesn't work on VMS.
Solution:   Use different file names. (Zoltan Bartos, Zoltan Arpadffy)
Files:      src/spell.c

Patch 7.3.081
Problem:    Non-printable characters in 'statusline' cause trouble. (ZyX)
Solution:   Use transstr(). (partly by Caio Ariede)
Files:      src/screen.c

Patch 7.3.082
Problem:    Leaking file descriptor when hostname doesn't exist.
Solution:   Remove old debugging lines.
Files:      src/netbeans.c

Patch 7.3.083
Problem:    When a read() or write() is interrupted by a signal it fails.
Solution:   Add read_eintr() and write_eintr().
Files:      src/fileio.c, src/proto/fileio.pro, src/memfile.c, src/memline.c,
            src/os_unix.c, src/undo.c, src/vim.h

Patch 7.3.084
Problem:    When splitting the window, the new one scrolls with the cursor at
            the top.
Solution:   Compute w_fraction before setting the new height.
```

```
Files:      src/window.c

Patch 7.3.085 (after 7.3.083)
Problem:    Inconsistency with preproc symbols.  void * computation.
Solution:   Include vimio.h from vim.h.  Add type cast.
Files:      src/eval.c, src/ex_cmds.c, src/ex_cmds2.c, src/fileio.c,
            src/if_cscope.c, src/if_sniff.c, src/main.c, src/memfile.c,
            src/memline.c, src/netbeans.c, src/os_msdos.c, src/os_mswin.c,
            src/os_win16.c, src/os_win32.c, src/spell.c, src/tag.c,
            src/undo.c, src/vim.h

Patch 7.3.086
Problem:    When using a mapping with an expression and there was no count,
            v:count has the value of the previous command. (ZyX)
Solution:   Also set v:count and v:count1 before getting the character that
            could be a command or a count.
Files:      src/normal.c

Patch 7.3.087
Problem:    EINTR is not always defined.
Solution:   Include errno.h in vim.h.
Files:      src/if_cscope.c, src/if_tcl.c, src/integration.c, src/memline.c,
            src/os_mswin.c, src/os_win16.c, src/os_win32.c, src/vim.h,
            src/workshop.c

Patch 7.3.088
Problem:    Ruby can't load Gems sometimes, may cause a crash.
Solution:   Undefine off_t.  Use ruby_process_options(). (Yasuhiro Matsumoto)
Files:      src/if_ruby.c

Patch 7.3.089
Problem:    Compiler warning on 64 bit MS-Windows.
Solution:   Add type cast. (Mike Williams)
Files:      src/netbeans.c

Patch 7.3.090
Problem:    Wrong help text for Cscope.
Solution:   Adjust the help text for "t". (Dominique Pelle)
Files:      src/if_cscope.c

Patch 7.3.091
Problem:    "vim -w foo" writes special key codes for removed escape
            sequences. (Josh Triplett)
Solution:   Don't write K_IGNORE codes.
Files:      src/getchar.c, src/misc1.c, src/term.c, src/vim.h

Patch 7.3.092
Problem:    Resizing the window when exiting.
Solution:   Don't resize when exiting.
Files:      src/term.c

Patch 7.3.093
Problem:    New DLL dependencies in MingW with gcc 4.5.0.
Solution:   Add STATIC_STDCPLUS, LDFLAGS and split up WINDRES. (Guopeng Wen)
```

```
Files:      src/GvimExt/Make_ming.mak, src/Make_ming.mak

Patch 7.3.094
Problem:    Using abs() requires type cast to int.
Solution:   Use labs() so that the value remains long. (Hong Xu)
Files:      src/screen.c

Patch 7.3.095
Problem:    Win32: In Chinese tear-off menu doesn't work. (Weasley)
Solution:   Use menu_name_equal().  (Alex Jakushev)
Files:      src/menu.c

Patch 7.3.096
Problem:    "gvim -nb" is not interruptible.  Leaking file descriptor on
            netbeans connection error.
Solution:   Check for CTRL-C typed.  Free file descriptor.  (Xavier de Gaye)
Files:      src/netbeans.c

Patch 7.3.097
Problem:    Using ":call" inside "if 0" does not see that a function returns a
            Dict and gives error for "." as string concatenation.
Solution:   Use eval0() to skip over the expression.  (Yasuhiro Matsumoto)
Files:      src/eval.c

Patch 7.3.098
Problem:    Function that ignores error still causes called_emsg to be set.
            E.g. when expand() fails the status line is disabled.
Solution:   Move check for emsg_not_now() up. (James Vega)
Files:      src/message.c

Patch 7.3.099
Problem:    Crash when splitting a window with zero height. (Yukihiro
            Nakadaira)
Solution:   Don't set the fraction in a window with zero height.
Files:      src/window.c

Patch 7.3.100
Problem:    When using :normal v:count isn't set.
Solution:   Call normal_cmd() with toplevel set to TRUE.
Files:      src/ex_docmd.c

Patch 7.3.101
Problem:    ino_t defined with wrong size.
Solution:   Move including auto/config.h before other includes. (Marius
            Geminas)
Files:      src/if_ruby.c, src/if_lua.c

Patch 7.3.102
Problem:    When using ":make", typing the next command and then getting the
            "reload" prompt the next command is (partly) eaten by the reload
            prompt.
Solution:   Accept ':' as a special character at the reload prompt to accept
            the default choice and execute the command.
Files:      src/eval.c, src/fileio.c, src/gui.c, src/gui_xmdlg.c,
```

```
            src/memline.c, src/message.c, src/proto/message.pro,
            src/gui_athena.c, src/gui_gtk.c, src/gui_mac.c, src/gui_motif.c,
            src/gui_photon.c, src/gui_w16.c, src/gui_w32.c, src/os_mswin.c
            src/proto/gui_athena.pro, src/proto/gui_gtk.pro,
            src/proto/gui_mac.pro, src/proto/gui_motif.pro,
            src/proto/gui_photon.pro, src/proto/gui_w16.pro,
            src/proto/gui_w32.pro

Patch 7.3.103
Problem:    Changing 'fileformat' and then using ":w" in an empty file sets
            the 'modified' option.
Solution:   In unchanged() don't ignore 'ff' for an empty file.
Files:      src/misc1.c, src/option.c, src/proto/option.pro, src/undo.c

Patch 7.3.104
Problem:    Conceal: using Tab for cchar causes problems. (ZyX)
Solution:   Do not accept a control character for cchar.
Files:      src/syntax.c

Patch 7.3.105
Problem:    Can't get the value of "b:changedtick" with getbufvar().
Solution:   Make it work. (Christian Brabandt)
Files:      src/eval.c

Patch 7.3.106
Problem:    When 'cursorbind' is set another window may scroll unexpectedly
            when 'scrollbind' is also set. (Xavier Wang)
Solution:   Don't call update_topline() if 'scrollbind' is set.
Files:      src/move.c

Patch 7.3.107
Problem:    Year number for :undolist can be confused with month or day.
Solution:   Change "%y" to "%Y".
Files:      src/undo.c

Patch 7.3.108
Problem:    Useless check for NULL when calling vim_free().
Solution:   Remove the check. (Dominique Pelle)
Files:      src/eval.c, src/ex_cmds.c, src/os_win32.c

Patch 7.3.109
Problem:    Processing new Esperanto spell file fails and crashes Vim.
            (Dominique Pelle)
Solution:   When running out of memory give an error.  Handle '?' in
            COMPOUNDRULE properly.
Files:      src/spell.c

Patch 7.3.110
Problem:    The "nbsp" item in 'listchars' isn't used for ":list".
Solution:   Make it work. (Christian Brabandt)
Files:      src/message.c

Patch 7.3.111 (after 7.3.100)
Problem:    Executing a :normal command in 'statusline' evaluation causes the
```

```
            cursor to move. (Dominique Pelle)
Solution:   When updating the cursor for 'cursorbind' allow the cursor beyond
            the end of the line.  When evaluating 'statusline' temporarily
            reset 'cursorbind'.
Files:      src/move.c, src/screen.c

Patch 7.3.112
Problem:    Setting 'statusline' to "%!'asdf%' reads uninitialized memory.
Solution:   Check for NUL after %.
Files:      src/buffer.c

Patch 7.3.113
Problem:    Windows: Fall back directory for creating temp file is wrong.
Solution:   Use "." instead of empty string. (Hong Xu)
Files:      src/fileio.c

Patch 7.3.114
Problem:    Potential problem in initialization when giving an error message
            early.
Solution:   Initialize 'verbosefile' empty. (Ben Schmidt)
Files:      src/option.h

Patch 7.3.115
Problem:    Vim can crash when tmpnam() returns NULL.
Solution:   Check for NULL. (Hong Xu)
Files:      src/fileio.c

Patch 7.3.116
Problem:    'cursorline' is displayed too short when there are concealed
            characters and 'list' is set.  (Dennis Preiser)
Solution:   Check for 'cursorline' when 'list' is set. (Christian Brabandt)
Files:      src/screen.c

Patch 7.3.117
Problem:    On some systems --as-needed does not work, because the "tinfo"
            library is included indirectly from "ncurses". (Charles Campbell)
Solution:   In configure prefer using "tinfo" instead of "ncurses".
Files:      src/configure.in, src/auto/configure

Patch 7.3.118
Problem:    Ruby uses SIGVTALARM which makes Vim exit. (Alec Tica)
Solution:   Ignore SIGVTALARM. (Dominique Pelle)
Files:      src/os_unix.c

Patch 7.3.119
Problem:    Build problem on Mac. (Nicholas Stallard)
Solution:   Use "extern" instead of "EXTERN" for p_vfile.
Files:      src/option.h

Patch 7.3.120
Problem:    The message for an existing swap file is too long to fit in a 25
            line terminal.
Solution:   Make the message shorter. (Chad Miller)
Files:      src/memline.c
```

```
Patch 7.3.121
Problem:    Complicated 'statusline' causes a crash. (Christian Brabandt)
Solution:   Check that the number of items is not too big.
Files:      src/buffer.c

Patch 7.3.122
Problem:    Having auto/config.mk in the repository causes problems.
Solution:   Remove auto/config.mk from the distribution.  In the toplevel
            Makefile copy it from the "dist" file.
Files:      Makefile, src/Makefile, src/auto/config.mk

Patch 7.3.123
Problem:    ml_get error when executing register being recorded into, deleting
            lines and 'conceallevel' is set. (ZyX)
Solution:   Don't redraw a line for concealing when it doesn't exist.
Files:      src/main.c

Patch 7.3.124
Problem:    When writing a file in binary mode it may be missing the final EOL
            if a file previously read was missing the EOL. (Kevin Goodsell)
Solution:   Move the write_no_eol_lnum into the buffer struct.
Files:      src/structs.h, src/fileio.c, src/globals.h, src/os_unix.c

Patch 7.3.125
Problem:    MSVC: Problem with quotes in link argument.
Solution:   Escape backslashes and quotes. (Weasley)
Files:      src/Make_mvc.mak

Patch 7.3.126
Problem:    Compiler warning for signed pointer.
Solution:   Use unsigned int argument for sscanf().
Files:      src/blowfish.c

Patch 7.3.127
Problem:    Compiler complains about comma.
Solution:   Remove comma after last enum element.
Files:      src/ex_cmds2.c

Patch 7.3.128
Problem:    Another compiler warning for signed pointer.
Solution:   Use unsigned int argument for sscanf().
Files:      src/mark.c

Patch 7.3.129
Problem:    Using integer like a boolean.
Solution:   Nicer check for integer being non-zero.
Files:      src/tag.c

Patch 7.3.130
Problem:    Variable misplaced in #ifdef.
Solution:   Move clipboard_event_time outside of #ifdef.
Files:      src/gui_gtk_x11.c
```

```
Patch 7.3.131
Problem:    Including errno.h too often.
Solution:   Don't include errno.h in Unix header file.
Files:      src/os_unix.h

Patch 7.3.132
Problem:    C++ style comments.
Solution:   Change to C comments.
Files:      src/if_python3.c

Patch 7.3.133
Problem:    When using encryption it's not clear what method was used.
Solution:   In the file message show "blowfish" when using blowfish.
Files:      src/fileio.c

Patch 7.3.134
Problem:    Drag-n-drop doesn't work in KDE Dolphin.
Solution:   Add GDK_ACTION_MOVE flag. (Florian Degner)
Files:      src/gui_gtk_x11.c

Patch 7.3.135
Problem:    When there is no previous substitute pattern, the previous search
            pattern is used.  The other way around doesn't work.
Solution:   When there is no previous search pattern, use the previous
            substitute pattern if possible. (Christian Brabandt)
Files:      src/search.c

Patch 7.3.136
Problem:    Duplicate include of assert.h.
Solution:   Remove it.
Files:      src/if_cscope.c

Patch 7.3.137 (after 7.3.091)
Problem:    When 'lazyredraw' is set the screen may not be updated. (Ivan
            Krasilnikov)
Solution:   Call update_screen() before waiting for input.
Files:      src/misc1.c, src/getchar.c

Patch 7.3.138
Problem:    ":com" changes the multi-byte text of :echo. (Dimitar Dimitrov)
Solution:   Search for K_SPECIAL as a byte, not a character. (Ben Schmidt)
Files:      src/ex_docmd.c

Patch 7.3.139 (after 7.3.137)
Problem:    When 'lazyredraw' is set ":ver" output can't be read.
Solution:   Don't redraw the screen when at a prompt or command line.
Files:      src/getchar.c, src/message.c, src/misc1.c

Patch 7.3.140
Problem:    Crash when drawing the "$" at end-of-line for list mode just after
            the window border and 'cursorline' is set.
Solution:   Don't check for 'cursorline'. (Quentin Carbonneaux)
Files:      src/screen.c
```

```
Patch 7.3.141
Problem:    When a key code is not set get a confusing error message.
Solution:   Change the error message to say the key code is not set.
Files:      src/option.c, runtime/doc/options.txt

Patch 7.3.142
Problem:    Python stdout doesn't have a flush() method, causing an import to
            fail.
Solution:   Add a dummy flush() method. (Tobias Columbus)
Files:      src/if_py_both.h

Patch 7.3.143
Problem:    Memfile is not tested sufficiently.  Looking up blocks in a
            memfile is slow when there are many blocks.
Solution:   Add high level test and unittest.  Adjust the number of hash
            buckets to the number of blocks.  (Ivan Krasilnikov)
Files:      Filelist, src/Makefile, src/main.c, src/memfile.c,
            src/memfile_test.c src/structs.h src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mak,
            src/testdir/Makefile, src/testdir/test77.in, src/testdir/test77.ok

Patch 7.3.144
Problem:    Crash with ":python help(dir)". (Kearn Holliday)
Solution:   Fix the way the type is set on objects. (Tobias Columbus)
Files:      src/if_python.c

Patch 7.3.145 (after 7.3.144)
Problem:    Can't build with Python dynamically loading.
Solution:   Add dll_PyType_Ready.
Files:      src/if_python.c

Patch 7.3.146
Problem:    It's possible to assign to a read-only member of a dict.
            It's possible to create a global variable "0". (ZyX)
            It's possible to add a v: variable with ":let v:.name = 1".
Solution:   Add check for dict item being read-only.
            Check the name of g: variables.
            Disallow adding v: variables.
Files:      src/eval.c

Patch 7.3.147 (after 7.3.143)
Problem:    Can't build on HP-UX.
Solution:   Remove an unnecessary backslash. (John Marriott)
Files:      src/Makefile

Patch 7.3.148
Problem:    A syntax file with a huge number of items or clusters causes weird
            behavior, a hang or a crash. (Yukihiro Nakadaira)
Solution:   Check running out of IDs. (partly by Ben Schmidt)
Files:      src/syntax.c

Patch 7.3.149
Problem:    The cursor disappears after the processing of the 'setDot'
```

            netbeans command when vim runs in a terminal.
Solution: Show the cursor after a screen update. (Xavier de Gaye)
Files: src/netbeans.c

Patch 7.3.150
Problem: readline() does not return the last line when the NL is missing.
            (Hong Xu)
Solution: When at the end of the file Also check for a previous line.
Files: src/eval.c

Patch 7.3.151 (after 7.3.074)
Problem: When "unnamedplus" is in 'clipboard' the selection is sometimes
            also copied to the star register.
Solution: Avoid copy to the star register when undesired. (James Vega)
Files: src/ops.c

Patch 7.3.152
Problem: Xxd does not check for errors from library functions.
Solution: Add error checks. (Florian Zumbiehl)
Files: src/xxd/xxd.c

Patch 7.3.153 (after 7.3.152)
Problem: Compiler warning for ambiguous else, missing prototype.
Solution: Add braces. (Dominique Pelle) Add prototype for die().
Files: src/xxd/xxd.c

Patch 7.3.154 (after 7.3.148)
Problem: Can't compile with tiny features. (Tony Mechelynck)
Solution: Move #define outside of #ifdef.
Files: src/syntax.c

Patch 7.3.155
Problem: Crash when using map(), filter() and remove() on v:. (ZyX)
            Also for extend(). (Yukihiro Nakadaira)
Solution: Mark v: as locked. Also correct locking error messages.
Files: src/eval.c

Patch 7.3.156
Problem: Tty names possibly left unterminated.
Solution: Use vim_strncpy() instead of strncpy().
Files: src/pty.c

Patch 7.3.157
Problem: Superfluous assignment.
Solution: Remove assignment.
Files: src/misc1.c

Patch 7.3.158
Problem: Might use uninitialized memory in C indenting.
Solution: Init arrays to empty.
Files: src/misc1.c

Patch 7.3.159
Problem: Using uninitialized pointer when out of memory.

```
Solution:   Check for NULL return value.
Files:      src/mbyte.c

Patch 7.3.160
Problem:    Unsafe string copying.
Solution:   Use vim_strncpy() instead of strcpy().  Use vim_strcat() instead
            of strcat().
Files:      src/buffer.c, src/ex_docmd.c, src/hardcopy.c, src/menu.c,
            src/misc1.c, src/misc2.c, src/proto/misc2.pro, src/netbeans.c,
            src/os_unix.c, src/spell.c, src/syntax.c, src/tag.c

Patch 7.3.161
Problem:    Items on the stack may be too big.
Solution:   Make items static or allocate them.
Files:      src/eval.c, src/ex_cmds.c, src/ex_cmds2.c, src/ex_docmd.c,
            src/fileio.c, src/hardcopy.c, src/quickfix.c, src/main.c,
            src/netbeans.c, src/spell.c, src/tag.c, src/vim.h, src/xxd/xxd.c

Patch 7.3.162
Problem:    No error message when assigning to a list with an index out of
            range. (Yukihiro Nakadaira)
Solution:   Add the error message.
Files:      src/eval.c

Patch 7.3.163
Problem:    For the default of 'shellpipe' "mksh" and "pdksh" are not
            recognized.
Solution:   Recognize these shell names.
Files:      src/option.c

Patch 7.3.164
Problem:    C-indenting: a preprocessor statement confuses detection of a
            function declaration.
Solution:   Ignore preprocessor lines. (Lech Lorens)  Also recognize the style
            to put a comma before the argument name.
Files:      src/misc1.c, testdir/test3.in, testdir/test3.ok

Patch 7.3.165
Problem:    ":find" completion does not escape spaces in a directory name.
            (Isz)
Solution:   Add backslashes for EXPAND_FILES_IN_PATH. (Carlo Teubner)
Files:      src/ex_getln.c

Patch 7.3.166
Problem:    Buffer on the stack may be too big
Solution:   Allocate the space.
Files:      src/option.c

Patch 7.3.167
Problem:    When using the internal grep QuickFixCmdPost is not triggered.
            (Yukihiro Nakadaira)
Solution:   Change the place where autocommands are triggered.
Files:      src/quickfix.c
```

```
Patch 7.3.168
Problem:    When the second argument of input() contains a CR the text up to
            that is used without asking the user. (Yasuhiro Matsumoto)
Solution:   Change CR, NL and ESC in the text to a space.
Files:      src/getchar.c

Patch 7.3.169
Problem:    Freeing memory already freed, warning from static code analyzer.
Solution:   Initialize pointers to NULL, correct use of "mustfree". (partly by
            Dominique Pelle)
Files:      src/mis1.c

Patch 7.3.170
Problem:    VMS Makefile for testing was not updated for test77.
Solution:   Add test77 to the Makefile.
Files:      src/testdir/Make_vms.mms

Patch 7.3.171
Problem:    When the clipboard isn't supported: ":yank*" gives a confusing
            error message.
Solution:   Specifically mention that the register name is invalid.
            (Jean-Rene David)
Files:      runtime/doc/change.txt, src/ex_docmd.c, src/globals.h

Patch 7.3.172
Problem:    MS-Windows: rename() might delete the file if the name differs but
            it's actually the same file.
Solution:   Use the file handle to check if it's the same file. (Yukihiro
            Nakadaira)
Files:      src/if_cscope.c, src/fileio.c, src/os_win32.c,
            src/proto/os_win32.pro, src/vim.h

Patch 7.3.173
Problem:    After using setqflist() to make the quickfix list empty ":cwindow"
            may open the window anyway.  Also after ":vimgrep".
Solution:   Correctly check whether the list is empty. (Ingo Karkat)
Files:      src/quickfix.c

Patch 7.3.174
Problem:    When Exuberant ctags binary is exctags it's not found.
Solution:   Add configure check for exctags. (Hong Xu)
Files:      src/configure.in, src/auto/configure

Patch 7.3.175
Problem:    When 'colorcolumn' is set locally to a window, ":new" opens a
            window with the same highlighting but 'colorcolumn' is empty.
            (Tyru)
Solution:   Call check_colorcolumn() after clearing and copying options.
            (Christian Brabandt)
Files:      src/buffer.c

Patch 7.3.176
Problem:    Ruby linking doesn't work properly on Mac OS X.
Solution:   Fix the configure check for Ruby. (Bjorn Winckler)
```

```
Files:      src/configure.in, src/auto/configure

Patch 7.3.177
Problem:    MS-Windows: mkdir() doesn't work properly when 'encoding' is
            "utf-8".
Solution:   Convert to utf-16. (Yukihiro Nakadaira)
Files:      src/os_win32.c, src/os_win32.h, src/proto/os_win32.pro

Patch 7.3.178
Problem:    C-indent doesn't handle code right after { correctly.
Solution:   Fix detecting unterminated line. (Lech Lorens)
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.3.179
Problem:    C-indent doesn't handle colon in string correctly.
Solution:   Skip the string. (Lech Lorens)
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.3.180
Problem:    When both a middle part of 'comments' matches and an end part, the
            middle part was used erroneously.
Solution:   After finding the middle part match continue looking for a better
            end part match. (partly by Lech Lorens)
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.3.181
Problem:    When repeating the insert of CTRL-V or a digraph the display may
            not be updated correctly.
Solution:   Only call edit_unputchar() after edit_putchar(). (Lech Lorens)
Files:      src/edit.c

Patch 7.3.182 (after 7.3.180)
Problem:    Compiler warning for uninitialized variable.
Solution:   Add dummy initializer.
Files:      src/misc1.c

Patch 7.3.183 (after 7.3.174)
Problem:    When Exuberant ctags binary is exuberant-ctags it's not found.
Solution:   Add configure check for exuberant-ctags.
Files:      src/configure.in, src/auto/configure

Patch 7.3.184
Problem:    Static code analysis errors in riscOS.
Solution:   Make buffer size bigger. (Dominique Pelle)
Files:      src/gui_riscos.c

Patch 7.3.185
Problem:    ":windo g/pattern/q" closes windows and reports "N more lines".
            (Tim Chase)
Solution:   Remember what buffer ":global" started in. (Jean-Rene David)
Files:      src/ex_cmds.c

Patch 7.3.186
Problem:    When 'clipboard' contains "unnamed" or "unnamedplus" the value of
```

            v:register is wrong for operators without a specific register.
Solution: Adjust the register according to 'clipboard'. (Ingo Karkat)
Files: src/normal.c

Patch 7.3.187
Problem: The RISC OS port has obvious errors and is not being maintained.
Solution: Remove the RISC OS files and code.
Files: src/ascii.h, src/eval.c, src/ex_cmds.c, src/ex_cmds2.c,
            src/ex_docmd.c, src/fileio.c, src/globals.h, src/gui.c, src/gui.h,
            src/main.c, src/memfile.c, src/memline.c, src/misc1.c,
            src/proto.h, src/quickfix.c, src/search.c, src/structs.h,
            src/term.c, src/termlib.c, src/version.c, src/vim.h,
            src/gui_riscos.h, src/os_riscos.h, src/gui_riscos.c,
            src/os_riscos.c, runtime/doc/os_risc.txt

Patch 7.3.188
Problem: More RISC OS files to remove.
Solution: Remove them. Update the file list.
Files: src/proto/gui_riscos.pro, src/proto/os_riscos.pro, Filelist

Patch 7.3.189 (after 7.3.186)
Problem: Can't build without +clipboard feature. (Christian Ebert)
Solution: Add the missing #ifdef.
Files: src/normal.c

Patch 7.3.190
Problem: When there is a "containedin" syntax argument highlighting may be
            wrong. (Radek)
Solution: Reset current_next_list. (Ben Schmidt)
Files: src/syntax.c

Patch 7.3.191
Problem: Still some RISC OS stuff to remove.
Solution: Remove files and lines. (Hong Xu)
            Remove the 'osfiletype' option code.
Files: README_extra.txt, src/Make_ro.mak, src/INSTALL, src/Makefile,
            src/buffer.c, src/eval.c, src/feature.h, src/option.c,
            src/option.h, src/structs.h, src/version.c, src/pty.c, Filelist

Patch 7.3.192
Problem: Ex command ":s/ \?/ /g" splits multi-byte characters into bytes.
            (Dominique Pelle)
Solution: Advance over whole character instead of one byte.
Files: src/ex_cmds.c

Patch 7.3.193
Problem: In the command line window ":close" doesn't work properly. (Tony
            Mechelynck)
Solution: Use Ctrl_C instead of K_IGNORE for cmdwin_result. (Jean-Rene
            David)
Files: src/ex_docmd.c, src/ex_getln.c

Patch 7.3.194
Problem: When "b" is a symlink to directory "a", resolve("b/") doesn't

```
            result in "a/".  (ZyX)
Solution:   Remove the trailing slash. (Jean-Rene David)
Files:      src/eval.c

Patch 7.3.195
Problem:    "} else" causes following lines to be indented too much. (Rouben
            Rostamian)
Solution:   Better detection for the "else". (Lech Lorens)
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.3.196
Problem:    Can't intercept a character that is going to be inserted.
Solution:   Add the InsertCharPre autocommand event. (Jakson A. Aquino)
Files:      runtime/doc/autocmd.txt, runtime/doc/eval.txt,
            runtime/doc/map.txt, src/edit.c, src/eval.c, src/fileio.c,
            src/vim.h

Patch 7.3.197
Problem:    When a QuickfixCmdPost event removes all errors, Vim still tries
            to jump to the first error, resulting in E42.
Solution:   Get the number of error after the autocmd event. (Mike Lundy)
Files:      src/quickfix.c

Patch 7.3.198
Problem:    No completion for ":lang".
Solution:   Get locales to complete from. (Dominique Pelle)
Files:      src/eval.c, src/ex_cmds2.c, src/ex_getln.c,
            src/proto/ex_cmds2.pro, src/proto/ex_getln.pro, src/vim.h

Patch 7.3.199
Problem:    MS-Windows: Compilation problem of OLE with MingW compiler.
Solution:   Put #ifdef around declarations. (Guopeng Wen)
Files:      src/if_ole.h

Patch 7.3.200 (after 7.3.198)
Problem:    CTRL-D doesn't complete :lang.
Solution:   Add the missing part of the change. (Dominique Pelle)
Files:      src/ex_docmd.c

Patch 7.3.201 (after 7.3.195)
Problem:    "} else" still causes following lines to be indented too much.
Solution:   Better detection for the "else" block. (Lech Lorens)
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.3.202
Problem:    Cannot influence the indent inside a namespace.
Solution:   Add the "N" 'cino' parameter. (Konstantin Lepa)
Files:      runtime/doc/indent.txt, src/misc1.c, src/testdir/test3.in,
            src/testdir/test3.ok

Patch 7.3.203
Problem:    MS-Windows: Can't run an external command without a console window.
Solution:   Support ":!start /b cmd". (Xaizek)
Files:      runtime/doc/os_win32.txt, src/os_win32.c
```

```
Patch 7.3.204 (after 7.3.201)
Problem:    Compiler warning.
Solution:   Add type cast. (Mike Williams)
Files:      src/misc1.c

Patch 7.3.205
Problem:    Syntax "extend" doesn't work correctly.
Solution:   Avoid calling check_state_ends() recursively (Ben Schmidt)
Files:      src/syntax.c

Patch 7.3.206
Problem:    64bit MS-Windows compiler warning.
Solution:   Use HandleToLong() instead of type cast. (Mike Williams)
Files:      src/gui_w32.c

Patch 7.3.207
Problem:    Can't compile with MSVC with pentium4 and 64 bit.
Solution:   Only use SSE2 for 32 bit. (Mike Williams)
Files:      src/Make_mvc.mak

Patch 7.3.208
Problem:    Early terminated if statement.
Solution:   Remove the semicolon. (Lech Lorens)
Files:      src/gui_mac.c

Patch 7.3.209
Problem:    MSVC Install instructions point to wrong batch file.
Solution:   Add a batch file for use with MSVC 10.
Files:      src/msvc2010.bat, src/INSTALLpc.txt, Filelist

Patch 7.3.210
Problem:    Can't always find the file when using cscope.
Solution:   Add the 'cscoperelative' option. (Raghavendra D Prabhu)
Files:      runtime/doc/if_cscop.txt, runtime/doc/options.txt,
            src/if_cscope.c

Patch 7.3.211 (after 7.3.210)
Problem:    Compiler warning.
Solution:   Add type cast.
Files:      src/if_cscope.c

Patch 7.3.212
Problem:    With Python 3.2 ":py3" fails.
Solution:   Move PyEval_InitThreads() to after Py_Initialize(). (Roland
            Puntaier)  Check abiflags in configure. (Andreas Behr)
Files:      src/if_python3.c, src/auto/configure, src/configure.in

Patch 7.3.213
Problem:    Javascript object literal is not indented correctly.
Solution:   Make a special case for when "J1" is in 'cino'. (Luc Deschenaux)
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.3.214
```

```
Problem:    The text displayed by ":z-" isn't exactly like old Vi.
Solution:   Add one to the start line number. (ChangZhuo Chen)
Files:      src/ex_cmds.c

Patch 7.3.215 (after 7.3.210)
Problem:    Wrong file names in previous patch. (Toothpik)
Solution:   Include the option changes.
Files:      src/option.c, src/option.h

Patch 7.3.216
Problem:    When recovering a file a range of lines is missing. (Charles Jie)
Solution:   Reset the index when advancing to the next pointer block.  Add a
            test to verify recovery works.
Files:      src/memline.c, src/testdir/test78.in, src/testdir/test78.ok,
            src/testdir/Makefile, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms

Patch 7.3.217
Problem:    Inside an "if" a ":wincmd" causes problems.
Solution:   When skipping commands let ":wincmd" skip over its argument.
Files:      src/ex_docmd.c

Patch 7.3.218 (after 7.3.212)
Problem:    Tiny configuration problem with Python 3.
Solution:   Add abiflags in one more place. (Andreas Behr)
Files:      src/auto/configure, src/configure.in

Patch 7.3.219
Problem:    Can't compile with GTK on Mac.
Solution:   Add some #ifdef trickery. (Ben Schmidt)
Files:      src/os_mac_conv.c, src/os_macosx.m, src/vim.h

Patch 7.3.220
Problem:    Python 3: vim.error is a 'str' instead of an 'Exception' object,
            so 'except' or 'raise' it causes a 'SystemError' exception.
            Buffer objects do not support slice assignment.
            When exchanging text between Vim and Python, multibyte texts become
            garbage or cause Unicode Exceptions, etc.
            'py3file' tries to read in the file as Unicode, sometimes causes
            UnicodeDecodeException
Solution:   Fix the problems. (lilydjwg)
Files:      src/if_py_both.h, src/if_python.c, src/if_python3.c

Patch 7.3.221
Problem:    Text from the clipboard is sometimes handled as linewise, but not
            consistently.
Solution:   Assume the text is linewise when it ends in a CR or NL.
Files:      src/gui_gtk_x11.c, src/gui_mac.c, src/ops.c, src/os_msdos.c,
            src/os_mswin.c, src/os_qnx.c, src/ui.c

Patch 7.3.222
Problem:    Warning for building GvimExt.
Solution:   Comment-out the DESCRIPTION line. (Mike Williams)
```

```
Files:      src/GvimExt/gvimext.def, src/GvimExt/gvimext_ming.def

Patch 7.3.223
Problem:    MingW cross compilation doesn't work with tiny features.
Solution:   Move acp_to_enc(), enc_to_utf16() and utf16_to_enc() outside of
            "#ifdef CLIPBOARD".  Fix typo in makefile.
Files:      src/Make_ming.mak, src/os_mswin.c

Patch 7.3.224
Problem:    Can't pass dict to sort function.
Solution:   Add the optional {dict} argument to sort(). (ZyX)
Files:      runtime/doc/eval.txt, src/eval.c

Patch 7.3.225
Problem:    Using "\n" in a substitute inside ":s" does not result in a line
            break.
Solution:   Change behavior inside vim_regexec_nl().   Add tests.  (Motoya
            Kurotsu)
Files:      src/regexp.c, src/testdir/test79.in, src/testdir/test79.ok,
            src/testdir/test80.in, src/testdir/test80.ok,
            src/testdir/Makefile, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms

Patch 7.3.226
Problem:    On a 64 bit system "syn sync fromstart" is very slow.  (Bjorn
            Steinbrink)
Solution:   Store the state when starting to parse from the first line.
Files:      src/syntax.c

Patch 7.3.227 (after 7.3.221)
Problem:    Mac OS doesn't have the linewise clipboard fix.
Solution:   Also change the Mac OS file. (Bjorn Winckler)
Files:      src/os_macosx.m

Patch 7.3.228
Problem:    "2gj" does not always move to the correct position.
Solution:   Get length of line after moving to a next line. (James Vega)
Files:      src/normal.c

Patch 7.3.229
Problem:    Using fork() makes gvim crash on Mac when build with
            CoreFoundation.
Solution:   Disallow fork() when __APPLE__ is defined. (Hisashi T Fujinaka)
Files:      src/gui.c

Patch 7.3.230
Problem:    ":wundo" and ":rundo" don't unescape their argument.  (Aaron
            Thoma)
Solution:   Use FILE1 instead of XFILE.
Files:      src/ex_cmds.h

Patch 7.3.231
Problem:    Runtime file patches failed.
```

```
Solution:   Redo the patches made against the patched files instead of the
            files in the mercurial repository.
Files:      runtime/doc/indent.txt, runtime/doc/os_win32.txt

Patch 7.3.232
Problem:    Python doesn't compile without +multi_byte
Solution:   Use "latin1" when MULTI_BYTE is not defined.
Files:      src/if_py_both.h

Patch 7.3.233
Problem:    ":scriptnames" and ":breaklist" show long file names.
Solution:   Shorten to use "~/" when possible. (Jean-Rene David)
Files:      src/ex_cmds2.c

Patch 7.3.234
Problem:    With GTK menu may be popping down.
Solution:   Use event time instead of GDK_CURRENT_TIME. (Hong Xu)
Files:      src/gui.c, src/gui.h, src/gui_gtk.c, src/gui_gtk_x11.c

Patch 7.3.235
Problem:    ";" gets stuck on a "t" command, it's not useful.
Solution:   Add the ';' flag in 'cpo'. (Christian Brabandt)
Files:      runtime/doc/motion.txt, runtime/doc/options.txt, src/option.h,
            src/search.c src/testdir/test81.in, src/testdir/test81.ok,
            src/testdir/Makefile, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms

Patch 7.3.236 (after 7.3.232)
Problem:    Python 3 doesn't compile without +multi_byte
Solution:   Use "latin1" when MULTI_BYTE is not defined. (lilydjwg)
Files:      src/if_python3.c

Patch 7.3.237
Problem:    "filetype" completion doesn't work on Windows. (Yue Wu)
Solution:   Don't use a glob pattern for the directories, use a list of
            directories. (Dominique Pelle)
Files:      src/ex_getln.c

Patch 7.3.238
Problem:    Compiler warning for conversion.
Solution:   Add type cast. (Mike Williams)
Files:      src/ex_getln.c

Patch 7.3.239
Problem:    Python corrects the cursor column without taking 'virtualedit'
            into account. (lilydjwg)
Solution:   Call check_cursor_col_win().
Files:      src/if_py_both.h, src/mbyte.c, src/misc2.c, src/normal.c,
            src/proto/mbyte.pro, src/proto/misc2.pro

Patch 7.3.240
Problem:    External commands can't use pipes on MS-Windows.
Solution:   Implement pipes and use them when 'shelltemp' isn't set. (Vincent
```

```
            Berthoux)
Files:      src/eval.c, src/ex_cmds.c, src/misc2.c, src/os_unix.c,
            src/os_win32.c, src/proto/misc2.pro, src/ui.c

Patch 7.3.241
Problem:    Using CTRL-R CTRL-W on the command line may insert only part of
            the word.
Solution:   Use the cursor position instead of assuming it is at the end of
            the command. (Tyru)
Files:      src/ex_getln.c

Patch 7.3.242
Problem:    Illegal memory access in after_pathsep().
Solution:   Check that the pointer is not at the start of the file name.
            (Dominique Pelle)
Files:      src/misc2.c

Patch 7.3.243
Problem:    Illegal memory access in readline().
Solution:   Swap the conditions. (Dominique Pelle)
Files:      src/eval.c

Patch 7.3.244
Problem:    MS-Windows: Build problem with old compiler. (John Beckett)
Solution:   Only use HandleToLong() when available. (Mike Williams)
Files:      src/gui_w32.c

Patch 7.3.245
Problem:    Python 3.2 libraries not correctly detected.
Solution:   Add the suffix to the library name. (Niclas Zeising)
Files:      src/auto/configure, src/configure.in

Patch 7.3.246 (after 7.3.235)
Problem:    Repeating "f4" in "4444" skips one 4.
Solution:   Check the t_cmd flag. (Christian Brabandt)
Files:      src/search.c

Patch 7.3.247
Problem:    Running tests changes the users viminfo file.  Test for patch
            7.3.246 missing.
Solution:   Add "nviminfo" to the 'viminfo' option.  Include the test.
Files:      src/testdir/test78.in, src/testdir/test81.in

Patch 7.3.248
Problem:    PC Install instructions missing install instructions.
Solution:   Step-by-step explanation. (Michael Soyka)
Files:      src/INSTALLpc.txt

Patch 7.3.249
Problem:    Wrong indenting for array initializer.
Solution:   Detect '}' in a better way. (Lech Lorens)
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.3.250
```

```
Problem:    Python: Errors in Unicode characters not handled nicely.
Solution:   Add the surrogateescape error handler. (lilydjwg)
Files:      src/if_python3.c

Patch 7.3.251
Problem:    "gH<Del>" deletes the current line, except when it's the last
            line.
Solution:   Set the "include" flag to indicate the last line is to be deleted.
Files:      src/normal.c, src/ops.c

Patch 7.3.252 (after 7.3.247)
Problem:    Tests fail. (David Northfield)
Solution:   Add missing update for .ok file.
Files:      src/testdir/test81.ok

Patch 7.3.253
Problem:    "echo 'abc' > ''" returns 0 or 1, depending on 'ignorecase'.
            Checks in mb_strnicmp() for illegal and truncated bytes are
            wrong.  Should not assume that byte length is equal before case
            folding.
Solution:   Add utf_safe_read_char_adv() and utf_strnicmp(). Add a test for
            this. (Ivan Krasilnikov)
Files:      src/mbyte.c src/testdir/test82.in, src/testdir/test82.ok,
            src/testdir/Makefile, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms

Patch 7.3.254
Problem:    The coladd field is not reset when setting the line number for a
            ":call" command.
Solution:   Reset it.
Files:      src/eval.c

Patch 7.3.255
Problem:    When editing a file such as "File[2010-08-15].vim" an E16 error is
            given. (Manuel Stol)
Solution:   Don't give an error for failing to compile the regexp.
Files:      src/ex_docmd.c, src/misc1.c, src/vim.h

Patch 7.3.256
Problem:    Javascript indenting not sufficiently tested.
Solution:   Add more tests. (Luc Deschenaux)  Mark the lines that are indented
            wrong.
Files:      src/testdir/test3.in, src/testdir/test3.ok

Patch 7.3.257
Problem:    Not all completions are available to user commands.
Solution:   Add "color", "compiler", "file_in_path" and "locale". (Dominique
            Pelle)
Files:      src/ex_docmd.c, runtime/doc/map.txt

Patch 7.3.258
Problem:    MS-Windows: The edit with existing vim context menu entries can be
            unwanted.
```

```
Solution:   Let a registry entry disable them. (Jerome Vuarand)
Files:      src/GvimExt/gvimext.cpp

Patch 7.3.259
Problem:    Equivalence classes only work for latin characters.
Solution:   Add the Unicode equivalence characters. (Dominique Pelle)
Files:      runtime/doc/pattern.txt, src/regexp.c, src/testdir/test44.in,
            src/testdir/test44.ok

Patch 7.3.260
Problem:    CursorHold triggers on an incomplete mapping. (Will Gray)
Solution:   Don't trigger CursorHold when there is typeahead.
Files:      src/fileio.c

Patch 7.3.261
Problem:    G++ error message erroneously recognized as error.
Solution:   Ignore "In file included from" line also when it ends in a colon.
            (Fernando Castillo)
Files:      src/option.h

Patch 7.3.262
Problem:    Photon code style doesn't match Vim style.
Solution:   Clean up some of it.  (Elias Diem)
Files:      src/gui_photon.c

Patch 7.3.263
Problem:    Perl and Tcl have a few code style problems.
Solution:   Clean it up.  (Elias Diem)
Files:      src/if_perl.xs, src/if_tcl.c

Patch 7.3.264
Problem:    When the current directory name contains wildcard characters, such
            as "foo[with]bar", the tags file can't be found.  (Jeremy
            Erickson)
Solution:   When searching for matching files also match without expanding
            wildcards.  This is a bit of a hack.
Files:      src/vim.h, src/misc1.c, src/misc2.c

Patch 7.3.265
Problem:    When storing a pattern in search history there is no proper check
            for the separator character.
Solution:   Pass the separator character to in_history(). (Taro Muraoka)
Files:      src/ex_getln.c

Patch 7.3.266
Problem:    In gvim with iBus typing space in Insert mode doesn't work.
Solution:   Clear xim_expected_char after checking it.
Files:      src/mbyte.c

Patch 7.3.267
Problem:    Ruby on Mac OS X 10.7 may crash.
Solution:   Avoid alloc(0). (Bjorn Winckler)
Files:      src/if_ruby.c
```

```
Patch 7.3.268
Problem:    Vim freezes when executing an external command with zsh.
Solution:   Use O_NOCTTY both in the master and slave. (Bjorn Winckler)
Files:      src/os_unix.c

Patch 7.3.269
Problem:    'shellcmdflag' only works with one flag.
Solution:   Split into multiple arguments. (Gary Johnson)
Files:      src/os_unix.c

Patch 7.3.270
Problem:    Illegal memory access.
Solution:   Swap conditions. (Dominique Pelle)
Files:      src/ops.c

Patch 7.3.271
Problem:    Code not following Vim coding style.
Solution:   Fix the style. (Elias Diem)
Files:      src/gui_photon.c

Patch 7.3.272
Problem:    ":put =list" does not add an empty line for a trailing empty
            item.
Solution:   Add a trailing NL when turning a list into a string.
Files:      src/eval.c

Patch 7.3.273
Problem:    A BOM in an error file is seen as text. (Aleksey Baibarin)
Solution:   Remove the BOM from the text before evaluating. (idea by Christian
            Brabandt)
Files:      src/quickfix.c, src/mbyte.c, src/proto/mbyte.pro,
            src/testdir/test10.in

Patch 7.3.274
Problem:    With concealed characters tabs do not have the right size.
Solution:   Use VCOL_HLC instead of vcol. (Eiichi Sato)
Files:      src/screen.c

Patch 7.3.275
Problem:    MS-Windows: When using a black background some screen updates
            cause the window to flicker.
Solution:   Add WS_CLIPCHILDREN to CreateWindow().  (René Aguirre)
Files:      src/gui_w32.c

Patch 7.3.276
Problem:    GvimExt sets $LANG in the wrong way.
Solution:   Save the environment and use it for gvim. (Yasuhiro Matsumoto)
Files:      src/GvimExt/gvimext.cpp

Patch 7.3.277
Problem:    MS-Windows: some characters do not show in dialogs.
Solution:   Use the wide methods when available. (Yanwei Jia)
Files:      src/gui_w32.c, src/gui_w48.c, src/os_mswin.c, src/os_win32.c,
            src/os_win32.h
```

```
Patch 7.3.278
Problem:    Passing the file name to open in VisVim doesn't work.
Solution:   Adjust the index and check for end of buffer. (Jiri Sedlak)
Files:      src/VisVim/Commands.cpp

Patch 7.3.279
Problem:    With GTK, when gvim is full-screen and a tab is opened and using a
            specific monitor configuration the window is too big.
Solution:   Adjust the window size like on MS-Windows. (Yukihiro Nakadaira)
Files:      src/gui.c, src/gui_gtk_x11.c, src/proto/gui_gtk_x11.pro

Patch 7.3.280
Problem:    ":lmake" does not update the quickfix window title.
Solution:   Update the title. (Lech Lorens)
Files:      src/quickfix.c, src/testdir/test10.in, src/testdir/test10.ok

Patch 7.3.281
Problem:    After using "expand('%:8')" the buffer name is changed.
Solution:   Make a copy of the file name before shortening it.
Files:      src/eval.c

Patch 7.3.282
Problem:    When using input() and :echo in a loop the displayed text is
            incorrect. (Benjamin Fritz)
Solution:   Only restore the cursor position when there is a command line.
            (Ben Schmidt)
Files:      src/ex_getln.c

Patch 7.3.283
Problem:    An expression mapping with a multi-byte character containing a
            0x80 byte gets messed up. (ZyX)
Solution:   Unescape the expression before evaluating it (Yukihiro Nakadaira)
Files:      src/getchar.c

Patch 7.3.284
Problem:    The str2special() function doesn't handle multi-byte characters
            properly.
Solution:   Recognize multi-byte characters. (partly by Vladimir Vichniakov)
Files:      src/getchar.c, src/message.c, src/misc2.c

Patch 7.3.285 (after 7.3.284)
Problem:    Mapping <Char-123> no longer works.
Solution:   Properly check for "char-".  Add a test for it.
Files:      src/misc2.c, src/testdir/test75.in, src/testdir/test75.ok

Patch 7.3.286
Problem:    Crash when using "zd" on a large number of folds. (Sam King)
Solution:   Recompute pointer after reallocating array.  Move fewer entries
            when making room.
Files:      src/fold.c

Patch 7.3.287
Problem:    Can't compile with MSVC and tiny options.
```

```
Solution:   Move variables and #ifdefs. (Sergey Khorev)
Files:      src/os_win32.c

Patch 7.3.288
Problem:    has('python') may give an error message for not being able to load
            the library after using python3.
Solution:   Only give the error when the verbose argument is true.
Files:      src/if_python.c, src/if_python3.c

Patch 7.3.289
Problem:    Complete function isn't called when the leader changed.
Solution:   Call ins_compl_restart() when the leader changed.  (Taro Muraoka)
Files:      src/edit.c

Patch 7.3.290
Problem:    When a BufWriteCmd autocommand resets 'modified' this doesn't
            change older buffer states to be marked as 'modified' like
            ":write" does.  (Yukihiro Nakadaira)
Solution:   When the BufWriteCmd resets 'modified' then adjust the undo
            information like ":write" does.
Files:      src/fileio.c

Patch 7.3.291
Problem:    Configure doesn't work properly with Python3.
Solution:   Put -ldl before $LDFLAGS. Add PY3_NO_RTLD_GLOBAL. (Roland
            Puntaier)
Files:      src/config.h.in, src/auto/configure, src/configure.in

Patch 7.3.292
Problem:    Crash when using fold markers and selecting a visual block that
            includes a folded line and goes to end of line. (Sam Lidder)
Solution:   Check for the column to be MAXCOL. (James Vega)
Files:      src/screen.c

Patch 7.3.293
Problem:    MSVC compiler has a problem with non-ASCII characters.
Solution:   Avoid non-ASCII characters. (Hong Xu)
Files:      src/ascii.h, src/spell.c

Patch 7.3.294 (after 7.3.289)
Problem:    Patch 289 causes more problems than it solves.
Solution:   Revert the patch until a better solution is found.
Files:      src/edit.c

Patch 7.3.295
Problem:    When filtering text with an external command Vim may not read all
            the output.
Solution:   When select() is interrupted loop and try again. (James Vega)
Files:      src/os_unix.c

Patch 7.3.296
Problem:    When writing to an external command a zombie process may be left
            behind.
Solution:   Wait on the process. (James Vega)
```

```
Files:      src/os_unix.c

Patch 7.3.297
Problem:    Can't load Perl 5.14 dynamically.
Solution:   Add code in #ifdefs. (Charles Cooper)
Files:      if_perl.xs

Patch 7.3.298
Problem:    Built-in colors are different from rgb.txt.
Solution:   Adjust the color values. (Benjamin Haskell)
Files:      src/gui_photon.c, src/gui_w48.c

Patch 7.3.299
Problem:    Source code not in Vim style.
Solution:   Adjust the style. (Elias Diem)
Files:      src/gui_photon.c

Patch 7.3.300
Problem:    Python doesn't parse multi-byte argument correctly.
Solution:   Use "t" instead of "s". (lilydjwg)
Files:      src/if_py_both.h

Patch 7.3.301
Problem:    When 'smartindent' and 'copyindent' are set a Tab is used even
            though 'expandtab' is set.
Solution:   Do not insert Tabs. Add a test. (Christian Brabandt)
Files:      src/misc1.c, src/testdir/test19.in, src/testdir/test19.ok

Patch 7.3.302 (after 7.3.301)
Problem:    Test 19 fails without 'smartindent' and +eval.
Solution:   Don't use ":exe". Source small.vim.
Files:      src/testdir/test19.in

Patch 7.3.303 (after 7.3.296)
Problem:    Compilation error.
Solution:   Correct return type from int to pid_t. (Danek Duvall)
Files:      src/os_unix.c

Patch 7.3.304
Problem:    Strawberry Perl doesn't work on MS-Windows.
Solution:   Use xsubpp if needed. (Yasuhiro Matsumoto)
Files:      src/Make_ming.mak, src/Make_mvc.mak

Patch 7.3.305
Problem:    Auto-loading a function while editing the command line causes
            scrolling up the display.
Solution:   Don't set msg_scroll when defining a function and the user is not
            typing. (Yasuhiro Matsumoto)
Files:      src/eval.c

Patch 7.3.306
Problem:    When closing a window there is a chance that deleting a scrollbar
            triggers a GUI resize, which uses the window while it is not in a
            valid state.
```

```
Solution:   Set the buffer pointer to NULL to be able to detect the invalid
            situation.  Fix a few places that used the buffer pointer
            incorrectly.
Files:      src/buffer.c, src/ex_cmds.c, src/term.c, src/window.c

Patch 7.3.307
Problem:    Python 3 doesn't support slice assignment.
Solution:   Implement slices. (Brett Overesch, Roland Puntaier)
Files:      src/if_python3.c

Patch 7.3.308
Problem:    Writing to 'verbosefile' has problems, e.g. for :highlight.
Solution:   Do not use a separate verbose_write() function but write with the
            same code that does redirecting. (Yasuhiro Matsumoto)
Files:      src/message.c

Patch 7.3.309 (after 7.3.307)
Problem:    Warnings for pointer types.
Solution:   Change PySliceObject to PyObject.
Files:      src/if_python3.c

Patch 7.3.310
Problem:    Code not following Vim style.
Solution:   Fix the style. (Elias Diem)
Files:      src/gui_photon.c

Patch 7.3.311 (replaces 7.3.289)
Problem:    Complete function isn't called when the leader changed.
Solution:   Allow the complete function to return a dictionary with a flag
            that indicates ins_compl_restart() is to be called when the leader
            changes. (Taro Muraoka)
Files:      runtime/insert.txt, src/edit.c, src/eval.c, src/proto/eval.pro

Patch 7.3.312 (after 7.3.306)
Problem:    Can't compile with tiny features.
Solution:   Add #ifdef around win_valid().
Files:      src/buffer.c

Patch 7.3.313 (after 7.3.307)
Problem:    One more warning when compiling with dynamic Python 3.
Solution:   Change PySliceObject to PyObject.
Files:      src/if_python3.c

Patch 7.3.314 (after 7.3.304)
Problem:    Missing parenthesis.
Solution:   Add it. (Benjamin R. Haskell)
Files:      src/Make_mvc.mak

Patch 7.3.315
Problem:    Opening a window before forking causes problems for GTK.
Solution:   Fork first, create the window in the child and report back to the
            parent process whether it worked.  If successful the parent exits,
            if unsuccessful the child exits and the parent continues in the
            terminal. (Tim Starling)
```

```
Files:      src/gui.c

Patch 7.3.316 (after 7.3.306)
Problem:    Crash when 'colorcolumn' is set and closing buffer.
Solution:   Check for w_buffer to be NULL. (Yasuhiro Matsumoto)
Files:      src/option.c

Patch 7.3.317
Problem:    Calling debug.debug() in Lua may cause Vim to hang.
Solution:   Add a better debug method. (Rob Hoelz, Luis Carvalho)
Files:      src/if_lua.c

Patch 7.3.318
Problem:    "C" on the last line deletes that line if it's blank.
Solution:   Only delete the last line for a delete operation. (James Vega)
Files:      src/ops.c

Patch 7.3.319 (after 7.3.311)
Problem:    Redobuff doesn't always include changes of the completion leader.
Solution:   Insert backspaces as needed. (idea by Taro Muraoka)
Files:      src/edit.c

Patch 7.3.320
Problem:    When a 0xa0 character is in a sourced file the error message for
            unrecognized command does not show the problem.
Solution:   Display 0xa0 as <a0>.
Files:      src/ex_docmd.c

Patch 7.3.321
Problem:    Code not following Vim style.
Solution:   Fix the style. (Elias Diem)
Files:      src/os_qnx.c

Patch 7.3.322
Problem:    #ifdef for PDP_RETVAL doesn't work, INT_PTR can be a typedef.
Solution:   Check the MSC version and 64 bit flags. (Sergiu Dotenco)
Files:      src/os_mswin.c

Patch 7.3.323
Problem:    The default 'errorformat' does not ignore some "included from"
            lines.
Solution:   Add a few more patterns. (Ben Boeckel)
Files:      src/option.h

Patch 7.3.324 (after 7.3.237)
Problem:    Completion for ":compiler" shows color scheme names.
Solution:   Fix the directory name. (James Vega)
Files:      src/ex_getln.c

Patch 7.3.325
Problem:    A duplicated function argument gives an internal error.
Solution:   Give a proper error message. (based on patch by Tyru)
Files:      src/eval.c
```

```
Patch 7.3.326
Problem:    MingW 4.6 no longer supports the -mno-cygwin option.
Solution:   Split the Cygwin and MingW makefiles. (Matsushita Shougo)
Files:      src/GvimExt/Make_cyg.mak, src/GvimExt/Make_ming.mak,
            src/Make_cyg.mak, src/Make_ming.mak, src/xxd/Make_ming.mak,
            Filelist

Patch 7.3.327
Problem:    When jumping to a help tag a closed fold doesn't open.
Solution:   Save and restore KeyTyped. (Yasuhiro Matsumoto)
Files:      src/ex_cmds.c

Patch 7.3.328
Problem:    When command line wraps the cursor may be displayed wrong when
            there are multi-byte characters.
Solution:   Position the cursor before drawing the text. (Yasuhiro Matsumoto)
Files:      src/ex_getln.c

Patch 7.3.329
Problem:    When skipping over code from ":for" to ":endfor" get an error for
            calling a dict function. (Yasuhiro Matsumoto)
Solution:   Ignore errors when skipping over :call command.
Files:      src/ex_docmd.c, src/eval.c

Patch 7.3.330
Problem:    When longjmp() is invoked if the X server gives an error the state
            is not properly restored.
Solution:   Reset vgetc_busy. (Yukihiro Nakadaira)
Files:      src/main.c

Patch 7.3.331
Problem:    "vit" selects wrong text when a tag name starts with the same text
            as an outer tag name. (Ben Fritz)
Solution:   Add "\>" to the pattern to check for word boundary.
Files:      src/search.c

Patch 7.3.332 (after 7.3.202)
Problem:    Indent after "public:" is not increased in C++ code. (Lech Lorens)
Solution:   Check for namespace after the regular checks. (partly by Martin
            Gieseking)
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.3.333
Problem:    Using "." to repeat a Visual delete counts the size in bytes, not
            characters.  (Connor Lane Smith)
Solution:   Store the virtual column numbers instead of byte positions.
Files:      src/normal.c

Patch 7.3.334
Problem:    Latest MingW about XSUBPP referencing itself. (Gongqian Li)
Solution:   Rename the first use to XSUBPPTRY.
Files:      src/Make_ming.mak

Patch 7.3.335
```

```
Problem:    When 'imdisable' is reset from an autocommand in Insert mode it
            doesn't take effect.
Solution:   Call im_set_active() in Insert mode. (Taro Muraoka)
Files:      src/option.c

Patch 7.3.336
Problem:    When a tags file specifies an encoding different from 'enc' it
            may hang and using a pattern doesn't work.
Solution:   Convert the whole line.  Continue reading the header after the
            SORT tag.  Add test83. (Yukihiro Nakadaira)
Files:      src/tag.c, src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
            src/testdir/test83-tags2, src/testdir/test83-tags3,
            src/testdir/test83.in, src/testdir/test83.ok

Patch 7.3.337 (after 7.3.295)
Problem:    Screen doesn't update after resizing the xterm until a character
            is typed.
Solution:   When the select call is interrupted check do_resize. (Taylor
            Hedberg)
Files:      src/os_unix.c

Patch 7.3.338
Problem:    Using getchar() in an expression mapping doesn't work well.
Solution:   Don't save and restore the typeahead. (James Vega)
Files:      src/getchar.c, src/testdir/test34.ok

Patch 7.3.339
Problem:    "make shadow" doesn't link all test files.
Solution:   Add a line in Makefile and Filelist.
Files:      src/Makefile, Filelist

Patch 7.3.340
Problem:    When 'verbosefile' is set ftplugof.vim can give an error.
Solution:   Only remove filetypeplugin autocommands when they exist. (Yasuhiro
            Matsumoto)
Files:      runtime/ftplugof.vim

Patch 7.3.341
Problem:    Local help files are only listed in help.txt, not in translated
            help files.
Solution:   Also find translated help files. (Yasuhiro Matsumoto)
Files:      src/ex_cmds.c

Patch 7.3.342
Problem:    Code not in Vim style.
Solution:   Fix the style. (Elias Diem)
Files:      src/os_amiga.c, src/os_mac_conv.c, src/os_win16.c

Patch 7.3.343
Problem:    No mouse support for urxvt.
Solution:   Implement urxvt mouse support, also for > 252 columns.  (Yiding
            Jia)
```

```
Files:      src/feature.h, src/keymap.h, src/option.h, src/os_unix.c,
            src/term.c, src/version.c

Patch 7.3.344
Problem:    Problem with GUI startup related to XInitThreads.
Solution:   Use read() and write() instead of fputs() and fread(). (James
            Vega)
Files:      src/gui.c

Patch 7.3.345
Problem:    When switching language with ":lang" the window title doesn't
            change until later.
Solution:   Update the window title right away. (Dominique Pelle)
Files:      src/ex_cmds2.c

Patch 7.3.346
Problem:    It's hard to test netbeans commands.
Solution:   Process netbeans commands after :sleep. (Xavier de Gaye)
Files:      runtime/doc/netbeans.txt, src/ex_docmd.c, src/netbeans.c

Patch 7.3.347
Problem:    When dropping text from a browser on Vim it receives HTML even
            though "html" is excluded from 'clipboard'. (Andrei Avk)
Solution:   Fix the condition for TARGET_HTML.
Files:      src/gui_gtk_x11.c

Patch 7.3.348
Problem:    "call range(1, 947948399)" causes a crash. (ZyX)
Solution:   Avoid a loop in the out of memory message.
Files:      src/misc2.c

Patch 7.3.349
Problem:    When running out of memory during startup trying to open a
            swapfile will loop forever.
Solution:   Let findswapname() set dirp to NULL if out of memory.
Files:      src/memline.c

Patch 7.3.350
Problem:    Block of code after ":lua << EOF" may not work. (Paul Isambert)
Solution:   Recognize the ":lua" command, skip to EOF.
Files:      src/eval.c

Patch 7.3.351
Problem:    Text formatting uses start of insert position when it should not.
            (Peter Wagenaar)
Solution:   Do not use Insstart when intentionally formatting.
Files:      src/edit.c

Patch 7.3.352
Problem:    When completing methods dict functions and script-local functions
            get in the way.
Solution:   Sort function names starting with "<" to the end. (Yasuhiro
            Matsumoto)
Files:      src/ex_getln.c
```

```
Patch 7.3.353 (after 7.3.343)
Problem:    Missing part of the urxvt patch.
Solution:   Add the change in term.c
Files:      src/term.c

Patch 7.3.354
Problem:    ":set backspace+=eol" doesn't work when 'backspace' has a
            backwards compatible value of 2.
Solution:   Convert the number to a string. (Hirohito Higashi)
Files:      src/option.c

Patch 7.3.355
Problem:    GTK warnings when using netrw.vim. (Ivan Krasilnikov)
Solution:   Do not remove the beval event handler twice.
Files:      src/option.c

Patch 7.3.356
Problem:    Using "o" with 'cindent' set may freeze Vim. (lolilolicon)
Solution:   Skip over {} correctly. (Hari G)
Files:      src/misc1.c

Patch 7.3.357
Problem:    Compiler warning in MS-Windows console build.
Solution:   Adjust return type of PrintHookProc(). (Mike Williams)
Files:      src/os_mswin.c

Patch 7.3.358 (after 7.3.353)
Problem:    Mouse support doesn't work properly.
Solution:   Add HMT_URXVT. (lilydjwg, James McCoy)
Files:      src/term.c

Patch 7.3.359
Problem:    Command line completion shows dict functions.
Solution:   Skip dict functions for completion. (Yasuhiro Matsumoto)
Files:      src/eval.c

Patch 7.3.360
Problem:    Interrupting the load of an autoload function may cause a crash.
Solution:   Do not use the hashitem when not valid. (Yukihiro Nakadaira)
Files:      src/eval.c

Patch 7.3.361
Problem:    Accessing memory after it is freed when EXITFREE is defined.
Solution:   Don't access curwin when firstwin is NULL. (Dominique Pelle)
Files:      src/buffer.c

Patch 7.3.362
Problem:    ml_get error when using ":g" with folded lines.
Solution:   Adjust the line number for changed_lines(). (Christian Brabandt)
Files:      src/ex_cmds.c

Patch 7.3.363
Problem:    C indenting is wrong after #endif followed by a semicolon.
```

```
Solution:   Add special handling for a semicolon in a line by itself. (Lech
            Lorens)
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.3.364 (after 7.3.353)
Problem:    Can't compile on HP-UX. (John Marriott)
Solution:   Only use TTYM_URXVT when it is defined.
Files:      src/term.c

Patch 7.3.365
Problem:    Crash when using a large Unicode character in a file that has
            syntax highlighting. (ngollan)
Solution:   Check for going past the end of the utf tables. (Dominique Pelle)
Files:      src/mbyte.c

Patch 7.3.366
Problem:    A tags file with an extremely long name causes errors.
Solution:   Ignore tags that are too long. (Arno Renevier)
Files:      src/tag.c

Patch 7.3.367
Problem:    :wundo and :rundo use a wrong checksum.
Solution:   Include the last line when computing the hash. (Christian Brabandt)
Files:      src/undo.c

Patch 7.3.368
Problem:    Gcc complains about redefining _FORTIFY_SOURCE.
Solution:   Undefine it before redefining it.
Files:      src/Makefile, src/configure.in, src/auto/configure

Patch 7.3.369
Problem:    When compiled with Gnome get an error message when using --help.
Solution:   Don't fork. (Ivan Krasilnikov)
Files:      src/main.c

Patch 7.3.370
Problem:    Compiler warns for unused variable in Lua interface.
Solution:   Remove the variable.
Files:      src/if_lua.c

Patch 7.3.371
Problem:    Crash in autocomplete. (Greg Weber)
Solution:   Check not going over allocated buffer size.
Files:      src/misc2.c

Patch 7.3.372
Problem:    When using a command line mapping to <Up> with file name
            completion to go one directory up, 'wildchar' is inserted.
            (Yasuhiro Matsumoto)
Solution:   Set the KeyTyped flag.
Files:      src/ex_getln.c

Patch 7.3.373 (after 7.3.366)
Problem:    A tags file with an extremely long name may cause an infinite loop.
```

```
Solution:   When encountering a long name switch to linear search.
Files:      src/tag.c

Patch 7.3.374
Problem:    ++encoding does not work properly.
Solution:   Recognize ++encoding before ++enc. (Charles Cooper)
Files:      src/ex_docmd.c

Patch 7.3.375
Problem:    Duplicate return statement.
Solution:   Remove the superfluous one. (Dominique Pelle)
Files:      src/gui_mac.c

Patch 7.3.376
Problem:    Win32: Toolbar repainting does not work when the mouse pointer
            hovers over a button.
Solution:   Call DefWindowProc() when not handling an event. (Sergiu Dotenco)
Files:      src/gui_w32.c

Patch 7.3.377
Problem:    No support for bitwise AND, OR, XOR and invert.
Solution:   Add and(), or(), invert() and xor() functions.
Files:      src/eval.c, src/testdir/test49.in, src/testdir/test65.in,
            src/testdir/test65.ok, runtime/doc/eval.txt

Patch 7.3.378
Problem:    When cross-compiling the check for uint32_t fails.
Solution:   Only give a warning message. (Maksim Melnikau)
Files:      src/configure.in, src/auto/configure

Patch 7.3.379
Problem:    C-indenting wrong for static enum.
Solution:   Skip over "static". (Lech Lorens)
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.3.380
Problem:    C-indenting wrong for a function header.
Solution:   Skip to the start paren. (Lech Lorens)
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.3.381
Problem:    Configure silently skips interfaces that won't work.
Solution:   Add the --enable-fail_if_missing argument. (Shlomi Fish)
Files:      src/Makefile, src/configure.in, src/auto/configure

Patch 7.3.382 (after 7.3.376)
Problem:    IME characters are inserted twice.
Solution:   Do not call DefWindowProc() if the event was handled. (Yasuhiro
            Matsumoto)
Files:      src/gui_w32.c

Patch 7.3.383
Problem:    For EBCDIC pound sign is defined as 't'.
Solution:   Correctly define POUND.
```

```
Files:      src/ascii.h

Patch 7.3.384
Problem:    Mapping CTRL-K in Insert mode breaks CTRL-X CTRL-K for dictionary
            completion.
Solution:   Add CTRL-K to the list of recognized keys. (James McCoy)
Files:      src/edit.c

Patch 7.3.385
Problem:    When using an expression mapping on the command line the cursor
            ends up in the wrong place. (Yasuhiro Matsumoto)
Solution:   Save and restore msg_col and msg_row when evaluating the
            expression.
Files:      src/getchar.

Patch 7.3.386
Problem:    Test 83 fails when iconv does not support cp932. (raf)
Solution:   Test if conversion works. (Yukihiro Nakadaira)
Files:      src/testdir/test83.in

Patch 7.3.387 (after 7.3.386)
Problem:    Test 83 may fail for some encodings.
Solution:   Set 'encoding' to utf-8 earlier.
Files:      src/testdir/test83.in

Patch 7.3.388
Problem:    Crash on exit when EXITFREE is defined and using tiny features.
Solution:   Check for NULL window pointer. (Dominique Pelle)
Files:      src/buffer.c

Patch 7.3.389
Problem:    After typing at a prompt the "MORE" message appears too soon.
Solution:   reset lines_left in msg_end_prompt(). (Eswald)
Files:      src/message.c

Patch 7.3.390
Problem:    Using NULL buffer pointer in a window.
Solution:   Check for w_buffer being NULL in more places. (Bjorn Winckler)
Files:      src/ex_cmds.c, src/quickfix.c, src/window.c

Patch 7.3.391
Problem:    Can't check if the XPM_W32 feature is enabled.
Solution:   Add xpm_w32 to the list of features. (kat)
Files:      src/eval.c

Patch 7.3.392
Problem:    When setting 'undofile' while the file is already loaded but
            unchanged, try reading the undo file. (Andy Wokula)
Solution:   Compute a checksum of the text when 'undofile' is set. (Christian
            Brabandt)
Files:      src/option.c, src/testdir/test72.in, src/testdir/test72.ok

Patch 7.3.393
Problem:    Win32: When resizing Vim it is always moved to the primary monitor
```

            if the secondary monitor is on the left.
Solution: Use the nearest monitor. (Yukihiro Nakadaira)
Files: src/gui_w32.c

Patch 7.3.394
Problem: When placing a mark while starting up a screen redraw messes up
            the screen. (lith)
Solution: Don't redraw while still starting up. (Christian Brabandt)
Files: src/screen.c

Patch 7.3.395 (after 7.3.251)
Problem: "dv?bar" in the last line deletes too much and breaks undo.
Solution: Only adjust the cursor position when it's after the last line of
            the buffer. Add a test. (Christian Brabandt)
Files: src/ops.c, src/testdir/test43.in, src/testdir/test43.ok

Patch 7.3.396
Problem: After forcing an operator to be characterwise it can still become
            linewise when spanning whole lines.
Solution: Don't make the operator linewise when motion_force was set.
            (Christian Brabandt)
Files: src/ops.c

Patch 7.3.397
Problem: ":helpgrep" does not work properly when 'encoding' is not utf-8 or
            latin1.
Solution: Convert non-ascii lines to 'encoding'. (Yasuhiro Matsumoto)
Files: src/quickfix.c, src/spell.c, src/misc2.c, src/proto/misc2.pro

Patch 7.3.398
Problem: When creating more than 10 location lists and adding items one by
            one a previous location may be used. (Audrius Kažukauskas)
Solution: Clear the location list completely when adding the tenth one.
Files: src/quickfix.c

Patch 7.3.399
Problem: ":cd" doesn't work when the path contains wildcards. (Yukihiro
            Nakadaira)
Solution: Ignore wildcard errors when the EW_NOTWILD flag is used.
Files: src/misc1.c

Patch 7.3.400
Problem: Compiler warnings for shadowed variables.
Solution: Remove or rename the variables.
Files: src/charset.c, src/digraph.c, src/edit.c, src/eval.c, src/fold.c,
            src/getchar.c, src/message.c, src/misc2.c, src/move.c,
            src/netbeans.c, src/option.c, src/os_unix.c, src/screen.c,
            src/search.c, src/spell.c, src/syntax.c, src/tag.c, src/window.c

Patch 7.3.401
Problem: A couple more shadowed variables.
Solution: Rename the variables.
Files: src/netbeans.c

```
Patch 7.3.402
Problem:    When jumping to the first error a line of the buffer is sometimes
            redrawn on top of the list of errors.
Solution:   Do not call update_topline_redraw() if the display was scrolled
            up.
Files:      src/quickfix.c

Patch 7.3.403
Problem:    ":helpgrep" does not trigger QuickFixCmd* autocommands.
Solution:   Trigger the autocommands. (Christian Brabandt)
Files:      src/quickfix.c

Patch 7.3.404
Problem:    When a complete function uses refresh "always" redo will not work
            properly.
Solution:   Do not reset compl_leader when compl_opt_refresh_always is set.
            (Yasuhiro Matsumoto)
Files:      src/edit.c

Patch 7.3.405
Problem:    When xterm gets back the function keys it may delete the urxvt
            mouse termcap code.
Solution:   Check for the whole code, not just the start. (Egmont Koblinger)
Files:      src/keymap.h, src/misc2.c, src/term.c

Patch 7.3.406
Problem:    Multi-byte characters in b:browsefilter are not handled correctly.
Solution:   First use convert_filter() normally and then convert to wide
            characters. (Taro Muraoka)
Files:      src/gui_w48.c

Patch 7.3.407
Problem:    ":12verbose call F()" may duplicate text while trying to truncate.
            (Thinca)
Solution:   Only truncate when there is not enough room.  Also check the byte
            length of the buffer.
Files:      src/buffer.c, src/eval.c, src/ex_getln.c, src/message.c,
            src/proto/message.pro

Patch 7.3.408 (after 7.3.406)
Problem:    Missing declaration.
Solution:   Add the declaration. (John Marriott)
Files:      src/gui_w48.c

Patch 7.3.409
Problem:    The license in pty.c is unclear.
Solution:   Add a comment about the license.
Files:      src/pty.c

Patch 7.3.410
Problem:    Compiler error for // comment. (Joachim Schmitz)
Solution:   Turn into /* comment */.
Files:      src/message.c
```

```
Patch 7.3.411
Problem:    Pasting in Visual mode using the "" register does not work. (John
            Beckett)
Solution:   Detect that the write is overwriting the pasted register.
            (Christian Brabandt)
Files:      src/normal.c

Patch 7.3.412
Problem:    Storing a float in a session file has an additional '&'.
Solution:   Remove the '&'. (Yasuhiro Matsumoto)
Files:      src/eval.c

Patch 7.3.413
Problem:    Build warnings on MS-Windows.
Solution:   Add type casts. (Mike Williams)
Files:      src/ex_getln.c, src/message.c, src/term.c

Patch 7.3.414
Problem:    Using CTRL-A on "000" drops the leading zero, while on "001" it
            doesn't.
Solution:   Detect "000" as an octal number. (James McCoy)
Files:      src/charset.c

Patch 7.3.415 (after 7.3.359)
Problem:    Completion of functions stops once a dictionary is encountered.
            (James McCoy)
Solution:   Return an empty string instead of NULL.
Files:      src/eval.c

Patch 7.3.416 (after 7.3.415)
Problem:    Compiler warning for wrong pointer.
Solution:   Add type cast.
Files:      src/eval.c

Patch 7.3.417 (after 7.3.395)
Problem:    Test 43 fails with a tiny build.
Solution:   Only run test 43 with at least a small build.
Files:      src/testdir/test43.in

Patch 7.3.418
Problem:    When a user complete function returns -1 an error message is
            given.
Solution:   When -2 is returned stop completion silently. (Yasuhiro Matsumoto)
Files:      src/edit.

Patch 7.3.419
Problem:    DBCS encoding in a user command does not always work.
Solution:   Skip over DBCS characters. (Yasuhiro Matsumoto)
Files:      src/ex_docmd.c

Patch 7.3.420
Problem:    "it" and "at" don't work properly with a dash in the tag name.
Solution:   Require a space to match the tag name. (Christian Brabandt)
Files:      src/search.c
```

Patch 7.3.421
Problem: Get E832 when setting 'undofile' in vimrc and there is a file to
            be edited on the command line. (Toothpik)
Solution: Do not try reading the undo file for a file that wasn't loaded.
Files: src/option.c

Patch 7.3.422
Problem: Python 3 does not have __members__.
Solution: Add "name" and "number" in another way. (lilydjwg)
Files: src/if_py_both.h, src/if_python3.c

Patch 7.3.423
Problem: Small mistakes in comments, proto and indent.
Solution: Fix the mistakes.
Files: src/ex_cmds2.c, src/structs.h, src/ui.c, src/proto/ex_docmd.pro

Patch 7.3.424
Problem: Win16 version missing some functions.
Solution: Add #defines for the functions.
Files: src/gui_w16.c

Patch 7.3.425 (after 7.3.265)
Problem: Search history lines are duplicated. (Edwin Steiner)
Solution: Convert separator character from space to NUL.
Files: src/ex_getln.c

Patch 7.3.426
Problem: With '$' in 'cpoptions' the $ is not displayed in the first
            column.
Solution: Use -1 instead of 0 as a special value. (Hideki Eiraku and
            Hirohito Higashi)
Files: src/edit.c, src/globals.h, src/move.c, src/screen.c, src/search.c

Patch 7.3.427
Problem: readfile() can be slow with long lines.
Solution: Use realloc() instead of alloc(). (John Little)
Files: src/eval.c

Patch 7.3.428
Problem: Win32: an xpm file without a mask crashes Vim.
Solution: Fail when the mask is missing. (Dave Bodenstab)
Files: src/xpm_w32.c

Patch 7.3.429
Problem: When 'cpoptions' includes "E" "c0" in the first column is an
            error. The redo register is then set to the erroneous command.
Solution: Do not set the redo register if the command fails because of an
            empty region. (Hideki Eiraku)
Files: src/getchar.c, src/normal.c, src/proto/getchar.pro

Patch 7.3.430
Problem: When a custom filetype detection uses "augroup END" the conf
            fileytpe detection does not have the filetypedetect group.

```
Solution:   Always end the group and include filetypedetect in the conf
            autocommand. (Lech Lorens)
Files:      runtime/filetype.vim

Patch 7.3.431
Problem:    Fetching a key at a prompt may be confused by escape sequences.
            Especially when getting a prompt at a VimEnter autocommand.
            (Alex Efros)
Solution:   Properly handle escape sequences deleted by check_termcode().
Files:      src/getchar.c, src/misc1.c, src/term.c, src/proto/term.pro

Patch 7.3.432
Problem:    ACLs are not supported for ZFS or NFSv4 on Solaris.
Solution:   Add configure check and code. (Danek Duvall)
Files:      src/configure.in, src/auto/configure, src/config.h.in,
            src/os_unix.c

Patch 7.3.433
Problem:    Using continued lines in a Vim script can be slow.
Solution:   Instead of reallocating for every line use a growarray. (Yasuhiro
            Matsumoto)
Files:      src/ex_cmds2.c

Patch 7.3.434
Problem:    Using join() can be slow.
Solution:   Compute the size of the result before allocation to avoid a lot of
            allocations and copies. (Taro Muraoka)
Files:      src/eval.c

Patch 7.3.435
Problem:    Compiler warning for unused variable.
Solution:   Move the variable inside #ifdef.
Files:      src/ex_cmds2.c

Patch 7.3.436
Problem:    Compiler warnings for types on Windows.
Solution:   Add type casts. (Mike Williams)
Files:      src/eval.c

Patch 7.3.437
Problem:    Continue looping inside FOR_ALL_TAB_WINDOWS even when already done.
Solution:   Use goto instead of break. (Hirohito Higashi)
Files:      src/fileio.c, src/globals.h

Patch 7.3.438
Problem:    There is no way to avoid ":doautoall" reading modelines.
Solution:   Add the <nomodeline> argument. Adjust documentation.
Files:      src/fileio.c, runtime/doc/autocmd.txt

Patch 7.3.439
Problem:    Compiler warnings to size casts in Perl interface.
Solution:   Use XS macros. (James McCoy)
Files:      src/if_perl.xs, src/typemap
```

```
Patch 7.3.440
Problem:    Vim does not support UTF8_STRING for the X selection.
Solution:   Add UTF8_STRING atom support. (Alex Efros) Use it only when
            'encoding' is set to Unicode.
Files:      src/ui.c

Patch 7.3.441
Problem:    Newer versions of MzScheme (Racket) require earlier (trampolined)
            initialisation.
Solution:   Call mzscheme_main() early in main(). (Sergey Khorev)
Files:      src/Make_mvc.mak, src/if_mzsch.c, src/main.c,
            src/proto/if_mzsch.pro

Patch 7.3.442 (after 7.3.438)
Problem:    Still read modelines for ":doautocmd".
Solution:   Move check for <nomodeline> to separate function.
Files:      src/fileio.c, src/ex_docmd.c, src/proto/fileio.pro,
            runtime/doc/autocmd.txt

Patch 7.3.443
Problem:    MS-Windows: 'shcf' and 'shellxquote' defaults are not very good.
Solution:   Make a better guess when 'shell' is set to "cmd.exe". (Ben Fritz)
Files:      src/option.c, runtime/doc/options.txt

Patch 7.3.444
Problem:    ":all!" and ":sall!" give error E477, even though the
            documentation says these are valid commands.
Solution:   Support the exclamation mark. (Hirohito Higashi)
Files:      src/ex_cmds.h, src/testdir/test31.in, src/testdir/test31.ok

Patch 7.3.445 (after 7.3.443)
Problem:    Can't properly escape commands for cmd.exe.
Solution:   Default 'shellxquote' to '('.  Append ')' to make '(command)'.
            No need to use "/s" for 'shellcmdflag'.
Files:      src/misc2.c, src/option.c, src/os_win32.c

Patch 7.3.446 (after 7.3.445)
Problem:    Win32: External commands with special characters don't work.
Solution:   Add the 'shellxescape' option.
Files:      src/misc2.c, src/option.c, src/option.h, runtime/doc/options.txt

Patch 7.3.447 (after 7.3.446)
Problem:    Win32: External commands with "start" do not work.
Solution:   Unescape part of the command. (Yasuhiro Matsumoto)
Files:      src/os_win32.c

Patch 7.3.448 (after 7.3.447)
Problem:    Win32: Still a problem with "!start /b".
Solution:   Escape only '|'. (Yasuhiro Matsumoto)
Files:      src/os_win32.c

Patch 7.3.449
Problem:    Crash when a BufWinLeave autocommand closes the only other window.
            (Daniel Hunt)
```

```
Solution:   Abort closing a buffer when it becomes the only one.
Files:      src/buffer.c, src/proto/buffer.pro, src/ex_cmds.c, src/ex_getln.c,
            src/misc2.c, src/quickfix.c, src/window.c, src/proto/window.pro

Patch 7.3.450 (after 7.3.448)
Problem:    Win32: Still a problem with "!start /b".
Solution:   Fix pointer use. (Yasuhiro Matsumoto)
Files:      src/os_win32.c

Patch 7.3.451
Problem:    Tcl doesn't work on 64 MS-Windows.
Solution:   Make it work. (Dave Bodenstab)
Files:      src/Make_mvc.mak, src/if_tcl.c

Patch 7.3.452
Problem:    Undo broken when pasting close to the last line. (Andrey Radev)
Solution:   Use a flag to remember if the deleted included the last line.
            (Christian Brabandt)
Files:      src/ops.c

Patch 7.3.453
Problem:    Pasting in the command line is slow.
Solution:   Don't redraw if there is another character to read. (Dominique
            Pelle)
Files:      src/ex_getln.c

Patch 7.3.454
Problem:    Re-allocating memory slows Vim down.
Solution:   Use realloc() in ga_grow(). (Dominique Pelle)
Files:      src/misc2.c

Patch 7.3.455
Problem:    Using many continuation lines can be slow.
Solution:   Adjust the reallocation size to the current length.
Files:      src/ex_cmds2.c

Patch 7.3.456
Problem:    ":tab drop file" has several problems, including moving the
            current window and opening a new tab for a file that already has a
            window.
Solution:   Refactor ":tab drop" handling. (Hirohito Higashi)
Files:      src/buffer.c, src/testdir/test62.in, src/testdir/test62.ok

Patch 7.3.457
Problem:    When setting $VIMRUNTIME later the directory for fetching
            translated messages is not adjusted.
Solution:   Put bindtextdomain() in vim_setenv().
Files:      src/misc1.c

Patch 7.3.458
Problem:    Crash when calling smsg() during startup.
Solution:   Don't use 'shortmess' when it is not set yet.
Files:      src/option.c
```

```
Patch 7.3.459
Problem:    Win32: Warnings for type conversion.
Solution:   Add type casts. (Mike Williams)
Files:      src/misc2.c, src/os_win32.c

Patch 7.3.460
Problem:    Win32: UPX does not compress 64 bit binaries.
Solution:   Mention and add the alternative: mpress. (Dave Bodenstab)
Files:      src/INSTALLpc.txt, src/Make_ming.mak

Patch 7.3.461
Problem:    The InsertCharPre autocommand event is not triggered during
            completion and when typing several characters quickly.
Solution:   Also trigger InsertCharPre during completion.  Do not read ahead
            when an InsertCharPre autocommand is defined. (Yasuhiro Matsumoto)
Files:      src/edit.c, src/fileio.c, src/proto/fileio.pro

Patch 7.3.462
Problem:    When using ":loadview" folds may be closed unexpectedly.
Solution:   Take into account foldlevel. (Xavier de Gaye)
Files:      src/fold.c

Patch 7.3.463
Problem:    When using ":s///c" the cursor is moved away from the match.
            (Lawman)
Solution:   Don't move the cursor when do_ask is set. (Christian Brabandt)
Files:      src/ex_cmds.c

Patch 7.3.464
Problem:    Compiler warning for sprintf.
Solution:   Put the length in a variable. (Dominique Pelle)
Files:      src/version.c

Patch 7.3.465
Problem:    Cannot get file name with newline from glob().
Solution:   Add argument to glob() and expand() to indicate they must return a
            list. (Christian Brabandt)
Files:      runtime/doc/eval.txt, src/eval.c, src/ex_getln.c, src/vim.h

Patch 7.3.466
Problem:    Get ml_get error hen ":behave mswin" was used and selecting
            several lines.  (A. Sinan Unur)
Solution:   Adjust the end of the operation. (Christian Brabandt)
Files:      src/ops.c

Patch 7.3.467
Problem:    Cursor positioned wrong at the command line when regaining focus
            and using some input method.
Solution:   Do not position the cursor in command line mode.
Files:      src/mbyte.c

Patch 7.3.468
Problem:    For some compilers the error file is not easily readable.
Solution:   Use QuickFixCmdPre for more commands. (Marcin Szamotulski)
```

```
Files:      runtime/doc/autocmd.txt, src/quickfix.c

Patch 7.3.469
Problem:    Compiler warning for unused argument without some features.
Solution:   Add UNUSED.
Files:      src/buffer.c

Patch 7.3.470
Problem:    Test 62 fails when compiled without GUI and X11.
Solution:   Don't test :drop when it is not supported.
Files:      src/testdir/test62.in

Patch 7.3.471
Problem:    Can't abort listing placed signs.
Solution:   Check "got_int". (Christian Brabandt)
Files:      src/buffer.c, src/ex_cmds.c

Patch 7.3.472
Problem:    Crash when using ":redraw" in a BufEnter autocommand and
            switching to another tab. (??)
Solution:   Move triggering the autocommands to after correcting the
            option values. Also check the row value to be out of bounds.
            (Christian Brabandt, Sergey Khorev)
Files:      src/screen.c, src/window.c

Patch 7.3.473
Problem:    'cursorbind' does not work correctly in combination with
            'virtualedit' set to "all".
Solution:   Copy coladd. (Gary Johnson)
Files:      src/move.c

Patch 7.3.474
Problem:    Perl build with gcc 4 fails.
Solution:   Remove XS() statements. (Yasuhiro Matsumoto)
Files:      src/if_perl.xs

Patch 7.3.475
Problem:    In a terminal with few colors the omnicomplete menu may be hard to
            see when using the default colors.
Solution:   Use more explicit colors. (suggested by Alex Henrie)
Files:      src/syntax.c

Patch 7.3.476
Problem:    When selecting a block, using "$" to include the end of each line
            and using "A" and typing a backspace strange things happen.
            (Yuangchen Xie)
Solution:   Avoid using a negative length. (Christian Brabandt)
Files:      src/ops.c

Patch 7.3.477
Problem:    Using ":echo" to output enough lines to scroll, then using "j" and
            "k" at the more prompt, displays the command on top of the output.
            (Marcin Szamotulski)
Solution:   Put the output below the command. (Christian Brabandt)
```

```
Files:      src/eval.c

Patch 7.3.478
Problem:    Memory leak using the ':rv!' command when reading dictionary or
            list global variables i.e. with 'viminfo' containing !.
Solution:   Free the typeval. (Dominique Pelle)
Files:      src/eval.c

Patch 7.3.479
Problem:    When 'cursorline' is set the line number highlighting can't be set
            separately.
Solution:   Add "CursorLineNr". (Howard Buchholz)
Files:      src/option.c, src/screen.c, src/syntax.c, src/vim.h

Patch 7.3.480
Problem:    When using ":qa" and there is a changed buffer picking the buffer
            to jump to is not very good.
Solution:   Consider current and other tab pages. (Hirohito Higashi)
Files:      src/ex_cmds2.c

Patch 7.3.481
Problem:    Changing 'virtualedit' in an operator function to "all" does not
            have the desired effect. (Aaron Bohannon)
Solution:   Save, reset and restore virtual_op when executing an operator
            function.
Files:      src/normal.c

Patch 7.3.482
Problem:    With 'cursorbind' set moving up/down does not always keep the same
            column.
Solution:   Set curswant appropriately. (Gary Johnson)
Files:      src/move.c

Patch 7.3.483  (after 7.3.477)
Problem:    More prompt shows up too often.
Solution:   Instead of adding a line break, only start a new line in the
            message history. (Christian Brabandt)
Files:      src/eval.c, src/message.c, src/proto/message.pro

Patch 7.3.484
Problem:    The -E and --echo-wid command line arguments are not mentioned in
            "vim --help".
Solution:   Add the help lines. (Dominique Pelle)
Files:      src/main.c

Patch 7.3.485
Problem:    When building Vim LDFLAGS isn't passed on to building xxd.
Solution:   Pass the LDFLAGS value. (James McCoy)
Files:      src/Makefile

Patch 7.3.486
Problem:    Build error with mingw64 on Windows 7.
Solution:   Avoid the step of going through vimres.res. (Guopeng Wen)
Files:      src/Make_ming.mak
```

Patch 7.3.487
Problem: When setting 'timeoutlen' or 'ttimeoutlen' the column for vertical
            movement is reset unnecessarily.
Solution: Do not set w_set_curswant for every option. Add a test for this.
            (Kana Natsuno) Add the P_CURSWANT flag for options.
Files: src/option.c, src/testdir/test84.in, src/testdir/test84.ok,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile

Patch 7.3.488
Problem: ":help!" in a help file does not work as documented.
Solution: When in a help file don't give an error message. (thinca)
Files: src/ex_cmds.c

Patch 7.3.489
Problem: CTRL-] in Insert mode does not expand abbreviation when used in a
            mapping. (Yichao Zhou)
Solution: Special case using CTRL-]. (Christian Brabandt)
Files: src/getchar.c, src/edit.c

Patch 7.3.490
Problem: Member confusion in Lua interface.
Solution: Fix it. Add luaeval(). (Taro Muraoka, Luis Carvalho)
Files: runtime/doc/if_lua.txt, src/eval.c, src/if_lua.c,
            src/proto/if_lua.pro

Patch 7.3.491
Problem: No tests for Lua.
Solution: Add some simple tests for Lua. (Luis Carvalho)
Files: src/testdir/test1.in, src/testdir/test85.in, src/testdir/test85.ok
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile

Patch 7.3.492
Problem: Can't indent conditions separately from function arguments.
Solution: Add the 'k' flag in 'cino'. (Lech Lorens)
Files: runtime/doc/indent.txt, src/misc1.c, src/testdir/test3.in,
            src/testdir/test3.ok

Patch 7.3.493 (after 7.3.492)
Problem: Two unused variables.
Solution: Remove them. (Hong Xu)
Files: src/misc1.c

Patch 7.3.494 (after 7.3.491)
Problem: Can't compile with Lua 5.1 or dynamic Lua.
Solution: Fix dll_ methods. Fix luado(). (Muraoka Taro, Luis Carvalho)
Files: src/if_lua.c

Patch 7.3.495 (after 7.3.492)
Problem: Compiler warnings.

```
Solution:   Add function declaration.  Remove "offset" argument.
Files:      src/misc1.c

Patch 7.3.496
Problem:    MS-DOS: When "diff" trips over difference in line separators some
            tests fail.
Solution:   Make some .ok files use unix line separators. (David Pope)
Files:      src/testdir/Make_dos.mak, src/testdir/Make_ming.mak

Patch 7.3.497
Problem:    Crash when doing ":python print" and compiled with gcc and
            the optimizer enabled.
Solution:   Avoid the crash, doesn't really fix the problem. (Christian
            Brabandt)
Files:      src/if_py_both.h

Patch 7.3.498
Problem:    The behavior of the "- register changes depending on value of
            the 'clipboard' option. (Szamotulski)
Solution:   Also set the "- register when the register is "*" or "+".
            (Christian Brabandt)
Files:      src/ops.c

Patch 7.3.499
Problem:    When using any interface language when Vim is waiting for a child
            process it gets confused by a child process started through the
            interface.
Solution:   Always used waitpid() instead of wait(). (Yasuhiro Matsumoto)
Files:      src/os_unix.c

Patch 7.3.500
Problem:    Ming makefile unconditionally sets WINVER.
Solution:   Only defined when not already defined. (Yasuhiro Matsumoto)
Files:      src/Make_ming.mak

Patch 7.3.501
Problem:    Error for "flush" not being defined when using Ruby command.
Solution:   Defined "flush" as a no-op method. (Kent Sibilev)
Files:      src/if_ruby.c

Patch 7.3.502
Problem:    Netbeans insert halfway a line actually appends to the line.
Solution:   Insert halfway the line. (Brian Victor)
Files:      src/netbeans.c

Patch 7.3.503 (after 7.3.501)
Problem:    Warning for unused argument.
Solution:   Add UNUSED.
Files:      src/if_ruby.c

Patch 7.3.504
Problem:    Commands in help files are not highlighted.
Solution:   Allow for commands in backticks.  Adjust CTRL-] to remove the
            backticks.
```

```
Files:      src/ex_cmds.c

Patch 7.3.505
Problem:    Test 11 fails on MS-Windows in some versions.
Solution:   Fix #ifdefs for whether filtering through a pipe is possible. Move
            setting b_no_eol_lnum back to where it was before patch 7.3.124.
            (David Pope)
Files:      src/feature.h, src/eval.c, src/ex_cmds.c, src/fileio.c

Patch 7.3.506
Problem:    GTK gives an error when selecting a non-existent file.
Solution:   Add a handler to avoid the error. (Christian Brabandt)
Files:      src/gui_gtk.c

Patch 7.3.507
Problem:    When exiting with unsaved changes, selecting an existing file in
            the file dialog, there is no dialog to ask whether the existing
            file should be overwritten. (Felipe G. Nievinski)
Solution:   Call check_overwrite() before writing. (Christian Brabandt)
Files:      src/ex_cmds.c, src/ex_cmds2.c, src/proto/ex_cmds.pro

Patch 7.3.508
Problem:    Default for v:register is not set.
Solution:   Init v:register in eval_init(). Correct for 'clipboard' before the
            main loop. (Ingo Karkat)
Files:      src/eval.c, src/main.c

Patch 7.3.509
Problem:    ":vimgrep" fails when 'autochdir' is set.
Solution:   A more generic solution for changing directory. (Ben Fritz)
Files:      src/quickfix.c

Patch 7.3.510
Problem:    Test 77 fails on Solaris 7. (Michael Soyka)
Solution:   Replace any tabs with spaces.
Files:      src/testdir/test77.in

Patch 7.3.511
Problem:    Using a FileReadCmd autocommand that does ":e! {file}" may cause a
            crash. (Christian Brabandt)
Solution:   Properly restore curwin->w_s.
Files:      src/fileio.c

Patch 7.3.512
Problem:    undofile() returns a useless name when passed an empty string.
Solution:   Return an empty string. (Christian Brabandt)
Files:      src/eval.c

Patch 7.3.513
Problem:    Cannot use CTRL-E and CTRL-Y with "r".
Solution:   Make CTRL-E and CTRL-Y work like in Insert mode. (Christian
            Brabandt)
Files:      src/edit.c, src/normal.c, src/proto/edit.pro
```

```
Patch 7.3.514
Problem:    No completion for :history command.
Solution:   Add the completion and update the docs. Also fix ":behave"
            completion. (Dominique Pelle)
Files:      runtime/doc/cmdline.txt, runtime/doc/map.txt, src/ex_docmd.c,
            src/ex_getln.c, src/vim.h

Patch 7.3.515
Problem:    'wildignorecase' only applies to the last part of the path.
Solution:   Also ignore case for letters earlier in the path.
Files:      src/misc1.c

Patch 7.3.516
Problem:    extend(o, o) may crash Vim.
Solution:   Fix crash and add test. (Thinca and Hirohito Higashi)
Files:      src/eval.c, src/testdir/test55.in, src/testdir/test55.ok

Patch 7.3.517
Problem:    Crash when using "vipvv". (Alexandre Provencio)
Solution:   Don't let the text length become negative.
Files:      src/ops.c

Patch 7.3.518
Problem:    When 'encoding' is a double-byte encoding ":helptags" may not find
            tags correctly.
Solution:   Use vim_strbyte() instead of vim_strchr(). (Yasuhiro Matsumoto)
Files:      src/ex_cmds.c

Patch 7.3.519
Problem:    When completefunction returns it cannot indicate end of completion
            mode.
Solution:   Recognize completefunction returning -3.  (Matsushita Shougo)
Files:      src/edit.c

Patch 7.3.520
Problem:    gvim starts up slow on Ubuntu 12.04.
Solution:   Move the call to gui_mch_init_check() to after fork(). (Yasuhiro
            Matsumoto)  Do check $DISPLAY being set.
Files:      src/gui.c, src/gui_gtk_x11.c, src/proto/gui_gtk_x11.pro

Patch 7.3.521
Problem:    Using "z=" on a multi-byte character may cause a crash.
Solution:   Don't use strlen() on an int pointer.
Files:      src/spell.c

Patch 7.3.522
Problem:    Crash in vim_realloc() when using MEM_PROFILE.
Solution:   Avoid using a NULL argument. (Dominique Pelle)
Files:      src/eval.c

Patch 7.3.523
Problem:    ":diffupdate" doesn't check for files changed elsewhere.
Solution:   Add the ! flag. (Christian Brabandt)
Files:      runtime/doc/diff.txt, src/diff.c, src/ex_cmds.h
```

```
Patch 7.3.524 (after 7.3.523)
Problem:    Missing comma.
Solution:   Add the comma.
Files:      src/version.c

Patch 7.3.525
Problem:    Compiler warning on 64 bit MS-Windows.
Solution:   Add type cast. (Mike Williams)
Files:      src/ex_getln.c

Patch 7.3.526
Problem:    Confusing indenting for #ifdef.
Solution:   Remove and add indent. (Elias Diem)
Files:      src/normal.c

Patch 7.3.527
Problem:    Clang complains about non-ASCII characters in a string.
Solution:   Change to \x88 form. (Dominique Pelle)
Files:      src/charset.c

Patch 7.3.528
Problem:    Crash when closing last window in a tab. (Alex Efros)
Solution:   Use common code in close_last_window_tabpage(). (Christian
            Brabandt)
Files:      src/window.c

Patch 7.3.529
Problem:    Using a count before "v" and "V" does not work (Kikyous)
Solution:   Make the count select that many characters or lines. (Christian
            Brabandt)
Files:      src/normal.c

Patch 7.3.530 (after 7.3.520)
Problem:    gvim does not work when 'guioptions' includes "f". (Davido)
Solution:   Call gui_mch_init_check() when running GUI in the foreground.
            (Yasuhiro Matsumoto)
Files:      src/gui.c

Patch 7.3.531 (after 7.3.530)
Problem:    GUI does not work on MS-Windows.
Solution:   Add the missing #ifdef. (Patrick Avery)
Files:      src/gui.c

Patch 7.3.532
Problem:    Compiler warning from Clang.
Solution:   Use a different way to point inside a string. (Dominique Pelle)
Files:      src/syntax.c

Patch 7.3.533
Problem:    Memory leak when writing undo file.
Solution:   Free the ACL. (Dominique Pelle)
Files:      src/undo.c
```

```
Patch 7.3.534 (after 7.3.461)
Problem:    When using an InsertCharPre autocommand autoindent fails.
Solution:   Proper handling of v:char. (Alexey Radkov)
Files:      src/edit.c

Patch 7.3.535
Problem:    Many #ifdefs for MB_MAXBYTES.
Solution:   Also define MB_MAXBYTES without the +multi_byte feature.  Fix
            places where the buffer didn't include space for a NUL byte.
Files:      src/arabic.c, src/edit.c, src/eval.c, src/getchar.c, src/mbyte.c,
            src/misc1.c, src/screen.c, src/spell.c, src/vim.h

Patch 7.3.536
Problem:    When spell checking the German sharp s is not seen as a word
            character. (Aexl Bender)
Solution:   In utf_islower() return true for the sharp s. Note: also need
            updated spell file for this to take effect.
Files:      src/mbyte.c

Patch 7.3.537
Problem:    Unnecessary call to init_spell_chartab().
Solution:   Delete the call.
Files:      src/spell.c

Patch 7.3.538
Problem:    'efm' does not handle Tabs in pointer lines.
Solution:   Add Tab support. Improve tests. (Lech Lorens)
Files:      src/quickfix.c, src/testdir/test10.in, src/testdir/test10.ok

Patch 7.3.539
Problem:    Redrawing a character on the command line does not work properly
            for multi-byte characters.
Solution:   Count the number of bytes in a character. (Yukihiro Nakadaira)
Files:      src/ex_getln.c

Patch 7.3.540
Problem:    Cursor is left on the text instead of the command line.
Solution:   Don't call setcursor() in command line mode.
Files:      src/getchar.c

Patch 7.3.541
Problem:    When joining lines comment leaders need to be removed manually.
Solution:   Add the 'j' flag to 'formatoptions'. (Lech Lorens)
Files:      runtime/doc/change.txt, src/edit.c, src/ex_docmd.c, src/misc1.c,
            src/normal.c, src/ops.c, src/option.h, src/proto/misc1.pro,
            src/proto/ops.pro, src/search.c, src/testdir/test29.in,
            src/testdir/test29.ok

Patch 7.3.542 (after 7.3.506)
Problem:    Function is sometimes unused.
Solution:   Add #ifdef.
Files:      src/gui_gtk.c

Patch 7.3.543
```

```
Problem:    The cursor is in the wrong line after using ":copen". (John
            Beckett)
Solution:   Invoke more drastic redraw method.
Files:      src/eval.c

Patch 7.3.544
Problem:    There is no good way to close a quickfix window when closing the
            last ordinary window.
Solution:   Add the QuitPre autocommand.
Files:      src/ex_docmd.c, src/fileio.c, src/vim.h

Patch 7.3.545
Problem:    When closing a window or buffer autocommands may close it too,
            causing problems for where the autocommand was invoked from.
Solution:   Add the w_closing and b_closing flags.  When set disallow ":q" and
            ":close" to prevent recursive closing.
Files:      src/structs.h, src/buffer.c, src/ex_docmd.c, src/window.c

Patch 7.3.546
Problem:    Bogus line break.
Solution:   Remove the line break.
Files:      src/screen.c

Patch 7.3.547 (after 7.3.541)
Problem:    Compiler warning for uninitialized variable.
Solution:   Initialize it.
Files:      src/ops.c

Patch 7.3.548
Problem:    Compiler warning on 64 bit Windows.
Solution:   Add type cast. (Mike Williams)
Files:      src/ops.c

Patch 7.3.549
Problem:    In 'cinoptions' "0s" is interpreted as one shiftwidth. (David
            Pineau)
Solution:   Use the zero as zero. (Lech Lorens)
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.3.550 (after 7.3.541)
Problem:    With "j" in 'formatoptions' a list leader is not removed. (Gary
            Johnson)
Solution:   Don't ignore the start of a three part comment. (Lech Lorens)
Files:      src/ops.c, src/testdir/test29.in, src/testdir/test29.ok

Patch 7.3.551
Problem:    When using :tablose a TabEnter autocommand is triggered too early.
            (Karthick)
Solution:   Don't trigger *Enter autocommands before closing the tab.
            (Christian Brabandt)
Files:      src/buffer.c, src/eval.c, src/ex_cmds2.c, src/fileio.c,
            src/proto/window.pro, src/window.c

Patch 7.3.552
```

```
Problem:    Formatting inside comments does not use the "2" flag in
            'formatoptions'.
Solution:   Support the "2" flag.  (Tor Perkins)
Files:      src/vim.h, src/ops.c, src/edit.c, src/misc1.c,
            src/testdir/test68.in, src/testdir/test68.ok

Patch 7.3.553
Problem:    With double-width characters and 'listchars' containing "precedes"
            the text is displayed one cell off.
Solution:   Check for double-width character being overwritten by the
            "precedes" character. (Yasuhiro Matsumoto)
Files:      src/screen.c

Patch 7.3.554 (after 7.3.551)
Problem:    Compiler warning for unused argument.
Solution:   Add UNUSED.
Files:      src/window.c

Patch 7.3.555
Problem:    Building on IBM z/OS fails.
Solution:   Adjust configure. Use the QUOTESED value from config.mk instead of
            the hard coded one in Makefile. (Stephen Bovy)
Files:      src/configure.in, src/auto/configure, src/Makefile

Patch 7.3.556
Problem:    Compiler warnings on 64 bit Windows.
Solution:   Add type casts. (Mike Williams)
Files:      src/misc1.c

Patch 7.3.557
Problem:    Crash when an autocommand wipes out a buffer when it is hidden.
Solution:   Restore the current window when needed. (Christian Brabandt)
Files:      src/buffer.c

Patch 7.3.558
Problem:    Memory access error. (Gary Johnson)
Solution:   Allocate one more byte. (Dominique Pelle)
Files:      src/misc1.c

Patch 7.3.559
Problem:    home_replace() does not work with 8.3 filename.
Solution:   Make ":p" expand 8.3 name to full path. (Yasuhiro Matsumoto)
Files:      src/eval.c, src/misc1.c

Patch 7.3.560
Problem:    Get an error for a locked argument in extend().
Solution:   Initialize the lock flag for a dictionary. (Yukihiro Nakadaira)
Files:      src/eval.c

Patch 7.3.561
Problem:    Using refresh: always in a complete function breaks the "."
            command. (Val Markovic)
Solution:   Add match leader to the redo buffer. (Yasuhiro Matsumoto)
Files:      src/edit.c
```

```
Patch 7.3.562
Problem:    ":profdel" should not work when the +profile feature is disabled.
Solution:   Call ex_ni(). (Yasuhiro Matsumoto)
Files:      src/ex_cmds2.c

Patch 7.3.563 (after 7.3.557)
Problem:    Can't build with tiny features.
Solution:   Add #ifdef.
Files:      src/buffer.c

Patch 7.3.564 (after 7.3.559)
Problem:    Warning for pointer conversion.
Solution:   Add type cast.
Files:      src/misc1.c

Patch 7.3.565
Problem:    Can't generate proto file for Python 3.
Solution:   Add PYTHON3_CFLAGS to LINT_CFLAGS.
Files:      src/Makefile

Patch 7.3.566 (after 7.3.561)
Problem:    Redo after completion does not work correctly when refresh: always
            is not used. (Raymond Ko)
Solution:   Check the compl_opt_refresh_always flag. (Christian Brabandt)
Files:      src/edit.c

Patch 7.3.567
Problem:    Missing copyright notice.
Solution:   Add Vim copyright notice. (Taro Muraoka)
Files:      src/dehqx.py

Patch 7.3.568
Problem:    Bad indents for #ifdefs.
Solution:   Add and remove spaces. (Elias Diem)
Files:      src/globals.h

Patch 7.3.569
Problem:    Evaluating Vim expression in Python is insufficient.
Solution:   Add vim.bindeval().  Also add pyeval() and py3eval(). (ZyX)
Files:      runtime/doc/eval.txt, runtime/doc/if_pyth.txt, src/eval.c,
            src/if_lua.c, src/if_py_both.h, src/if_python.c, src/if_python3.c,
            src/proto/eval.pro, src/proto/if_python.pro,
            src/proto/if_python3.pro, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Makefile,
            src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.570
Problem:    ":vimgrep" does not obey 'wildignore'.
Solution:   Apply 'wildignore' and 'suffixes' to ":vimgrep". (Ingo Karkat)
Files:      src/ex_cmds2.c, src/proto/ex_cmds2.pro, src/quickfix.c, src/spell.c
```

Patch 7.3.571
Problem: Duplicated condition.
Solution: Remove one. (Dominique Pelle)
Files: src/os_win32.c

Patch 7.3.572
Problem: Duplicate statement in if and else. (Dominique Pelle)
Solution: Remove the condition and add a TODO.
Files: src/gui_xmebw.c

Patch 7.3.573
Problem: Using array index before bounds checking.
Solution: Swap the parts of the condition. (Dominique Pelle)
Files: src/ops.c

Patch 7.3.574
Problem: When pasting a register in the search command line a CTRL-L
            character is not pasted. (Dominique Pelle)
Solution: Escape the CTRL-L. (Christian Brabandt)
Files: src/ex_getln.c

Patch 7.3.575
Problem: "ygt" tries to yank instead of giving an error. (Daniel Mueller)
Solution: Check for a pending operator.
Files: src/normal.c

Patch 7.3.576
Problem: Formatting of lists inside comments is not right yet.
Solution: Use another solution and add a test. (Tor Perkins)
Files: src/edit.c, src/misc1.c, src/testdir/test68.in,
            src/testdir/test69.ok

Patch 7.3.577
Problem: Size of memory does not fit in 32 bit unsigned.
Solution: Use Kbyte instead of byte. Call GlobalMemoryStatusEx() instead of
            GlobalMemoryStatus() when available.
Files: src/misc2.c, src/option.c, src/os_amiga.c, src/os_msdos.c,
            src/os_win16.c, src/os_win32.c

Patch 7.3.578
Problem: Misplaced declaration.
Solution: Move declaration to start of block.
Files: src/if_py_both.h

Patch 7.3.579 (after 7.3.569)
Problem: Can't compile with Python 2.5.
Solution: Use PyCObject when Capsules are not available.
Files: src/if_py_both.h, src/if_python.c, src/if_python3.c

Patch 7.3.580
Problem: Warning on 64 bit MS-Windows.
Solution: Add type cast. (Mike Williams)
Files: src/if_py_both.h

Patch 7.3.581
Problem: Problems compiling with Python.
Solution: Pick UCS2 or UCS4 function at runtime. (lilydjwg)
Files: src/if_python.c

Patch 7.3.582 (after 7.3.576)
Problem: Missing parts of the test OK file.
Solution: Add the missing parts.
Files: src/testdir/test68.ok

Patch 7.3.583
Problem: PyObject_NextNotImplemented is not defined before Python 2.7.
            (Danek Duvall)
Solution: Add #ifdefs.
Files: src/if_python.c

Patch 7.3.584
Problem: PyCObject is not always defined.
Solution: Use PyObject instead.
Files: src/if_py_both.h, src/if_python.c

Patch 7.3.585
Problem: Calling changed_bytes() too often.
Solution: Move changed_bytes() out of a loop. (Tor Perkins)
Files: src/edit.c

Patch 7.3.586
Problem: When compiling with Cygwin or MingW MEMORYSTATUSEX is not defined.
Solution: Set the default for WINVER to 0x0500.
Files: src/Make_ming.mak, src/Make_cyg.mak

Patch 7.3.587
Problem: Compiler warning for local var shadowing global var.
Solution: Rename the var and move it to an inner block. (Christian Brabandt)
Files: src/buffer.c

Patch 7.3.588
Problem: Crash on NULL pointer.
Solution: Fix the immediate problem by checking for NULL. (Lech Lorens)
Files: src/window.c

Patch 7.3.589
Problem: Crash when $HOME is not set.
Solution: Check for a NULL pointer. (Chris Webb)
Files: src/misc1.c

Patch 7.3.590
Problem: The '< and '> marks cannot be set directly.
Solution: Allow setting '< and '>. (Christian Brabandt)
Files: src/mark.c

Patch 7.3.591
Problem: Can only move to a tab by absolute number.
Solution: Move a number of tabs to the left or the right. (Lech Lorens)

```
Files:      runtime/doc/tabpage.txt, src/ex_cmds.h, src/ex_docmd.c,
            src/testdir/test62.in, src/testdir/test62.ok, src/window.c

Patch 7.3.592
Problem:    Vim on GTK does not support g:browsefilter.
Solution:   Add a GtkFileFilter to the file chooser. (Christian Brabandt)
Files:      src/gui_gtk.c

Patch 7.3.593
Problem:    No easy way to decide if b:browsefilter will work.
Solution:   Add the browsefilter feature.
Files:      src/gui_gtk.c, src/eval.c, src/vim.h

Patch 7.3.594
Problem:    The X command server doesn't work perfectly. It sends an empty
            reply for as-keys requests.
Solution:   Remove duplicate ga_init2(). Do not send a reply for as-keys
            requests. (Brian Burns)
Files:      src/if_xcmdsrv.c

Patch 7.3.595
Problem:    The X command server responds slowly
Solution:   Change the loop that waits for replies. (Brian Burns)
Files:      src/if_xcmdsrv.c

Patch 7.3.596
Problem:    Can't remove all signs for a file or buffer.
Solution:   Support "*" for the sign id. (Christian Brabandt)
Files:      runtime/doc/sign.txt, src/buffer.c, src/ex_cmds.c,
            src/proto/buffer.pro

Patch 7.3.597
Problem:    'clipboard' "autoselect" only applies to the * register. (Sergey
            Vakulenko)
Solution:   Make 'autoselect' work for the + register. (Christian Brabandt)
            Add the "autoselectplus" option in 'clipboard' and the "P" flag in
            'guioptions'.
Files:      runtime/doc/options.txt, src/normal.c, src/ops.c, src/screen.c,
            src/ui.c, src/globals.h, src/proto/ui.pro, src/option.h, src/gui.c

Patch 7.3.598
Problem:    Cannot act upon end of completion. (Taro Muraoka)
Solution:   Add an autocommand event that is triggered when completion has
            finished. (Idea by Florian Klein)
Files:      src/edit.c, src/fileio.c, src/vim.h

Patch 7.3.599 (after 7.3.597)
Problem:    Missing change in one file.
Solution:   Patch for changed clip_autoselect().
Files:      src/option.c

Patch 7.3.600
Problem:    <f-args> is not expanded properly with DBCS encoding.
Solution:   Skip over character instead of byte. (Yukihiro Nakadaira)
```

```
Files:      src/ex_docmd.c

Patch 7.3.601
Problem:    Bad code style.
Solution:   Insert space, remove parens.
Files:      src/farsi.c

Patch 7.3.602
Problem:    Missing files in distribution.
Solution:   Update the list of files.
Files:      Filelist

Patch 7.3.603
Problem:    It is possible to add replace builtin functions by calling
            extend() on g:.
Solution:   Add a flag to a dict to indicate it is a scope.  Check for
            existing functions. (ZyX)
Files:      src/buffer.c, src/eval.c, src/proto/eval.pro, src/structs.h,
            src/testdir/test34.in, src/testdir/test34.ok, src/window.c

Patch 7.3.604
Problem:    inputdialog() doesn't use the cancel argument in the console.
            (David Fishburn)
Solution:   Use the third argument. (Christian Brabandt)
Files:      src/eval.c

Patch 7.3.605 (after 7.3.577)
Problem:    MS-Windows: Can't compile with older compilers. (Titov Anatoly)
Solution:   Add #ifdef for MEMORYSTATUSEX.
Files:      src/os_win32.c

Patch 7.3.606
Problem:    CTRL-P completion has a problem with multi-byte characters.
Solution:   Check for next character being NUL properly.  (Yasuhiro Matsumoto)
Files:      src/search.c, src/macros.h

Patch 7.3.607
Problem:    With an 8 color terminal the selected menu item is black on black,
            because darkGrey as bg is the same as black.
Solution:   Swap fg and bg colors. (James McCoy)
Files:      src/syntax.c

Patch 7.3.608
Problem:    winrestview() does not always restore the view correctly.
Solution:   Call win_new_height() and win_new_width(). (Lech Lorens)
Files:      src/eval.c, src/proto/window.pro, src/window.c

Patch 7.3.609
Problem:    File names in :checkpath! output are garbled.
Solution:   Check for \zs in the pattern. (Lech Lorens)
Files:      src/search.c, src/testdir/test17.in, src/testdir/test17.ok

Patch 7.3.610
Problem:    Cannot operate on the text that a search pattern matches.
```

```
Solution:   Add the "gn" and "gN" commands. (Christian Brabandt)
Files:      runtime/doc/index.txt, runtime/doc/visual.txt, src/normal.c,
            src/proto/search.pro, src/search.c, src/testdir/test53.in,
            src/testdir/test53.ok

Patch 7.3.611
Problem:    Can't use Vim dictionary as self argument in Python.
Solution:   Fix the check for the "self" argument. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.612
Problem:    Auto formatting messes up text when 'fo' contains "2". (ZyX)
Solution:   Decrement "less_cols". (Tor Perkins)
Files:      src/misc1.c, src/testdir/test68.in, src/testdir/test68.ok

Patch 7.3.613
Problem:    Including Python's config.c in the build causes trouble.  It is
            not clear why it was there.
Solution:   Omit the config file. (James McCoy)
Files:      src/Makefile, src/auto/configure, src/configure.in

Patch 7.3.614
Problem:    Number argument gets turned into a number while it should be a
            string.
Solution:   Add flag to the call_vim_function() call. (Yasuhiro Matsumoto)
Files:      src/edit.c, src/eval.c, src/proto/eval.pro

Patch 7.3.615
Problem:    Completion for a user command does not recognize backslash before
            a space.
Solution:   Recognize escaped characters. (Yasuhiro Matsumoto)
Files:      src/ex_docmd.c

Patch 7.3.616 (after 7.3.610)
Problem:    Can't compile without +visual.
Solution:   Add #ifdef.
Files:      src/normal.c

Patch 7.3.617 (after 7.3.615)
Problem:    Hang on completion.
Solution:   Skip over the space. (Yasuhiro Matsumoto)
Files:      src/ex_docmd.c

Patch 7.3.618 (after 7.3.616)
Problem:    Still doesn't compile with small features.
Solution:   Move current_search() out of #ifdef. (Dominique Pelle)
Files:      src/normal.c, src/search.c

Patch 7.3.619
Problem:    When executing a shell command Vim may become slow to respond.
Solution:   Don't wait after every processed message. (idea by Yasuhiro
            Matsumoto)
Files:      src/os_win32.c
```

```
Patch 7.3.620
Problem:    Building with recent Ruby on Win32 doesn't work.
Solution:   Add a separate argument for the API version. (Yasuhiro Matsumoto)
Files:      src/Make_ming.mak, src/Make_mvc.mak

Patch 7.3.621
Problem:    Compiler warnings on 64 bit windows.
Solution:   Add type casts. (Mike Williams)
Files:      src/ex_docmd.c, src/search.c

Patch 7.3.622
Problem:    XPM library for Win32 can't be found.
Solution:   Suggest using the one from the Vim ftp site.
Files:      src/Make_mvc.mak

Patch 7.3.623
Problem:    Perl 5.14 commands crash Vim on MS-Windows.
Solution:   Use perl_get_sv() instead of GvSV(). (Raymond Ko)
Files:      src/if_perl.xs

Patch 7.3.624
Problem:    When cancelling input() it returns the third argument. That should
            only happen for inputdialog().
Solution:   Check if inputdialog() was used. (Hirohito Higashi)
Files:      src/eval.c

Patch 7.3.625
Problem:    "gn" does not handle zero-width matches correctly.
Solution:   Handle zero-width patterns specially. (Christian Brabandt)
Files:      src/search.c

Patch 7.3.626
Problem:    Python interface doesn't build with Python 2.4 or older.
Solution:   Define Py_ssize_t. (Benjamin Bannier)
Files:      src/if_py_both.h

Patch 7.3.627
Problem:    When using the "n" flag with the ":s" command a \= substitution
            will not be evaluated.
Solution:   Do perform the evaluation, so that a function can be invoked at
            every matching position without changing the text. (Christian
            Brabandt)
Files:      src/ex_cmds.c

Patch 7.3.628
Problem:    ":open" does not allow for a !, which results in a confusing error
            message. (Shawn Wilson)
Solution:   Allow ! on ":open". (Christian Brabandt)
Files:      src/ex_cmds.h

Patch 7.3.629
Problem:    There is no way to make 'shiftwidth' follow 'tabstop'.
Solution:   When 'shiftwidth' is zero use the value of 'tabstop'. (Christian
            Brabandt)
```

```
Files:      src/edit.c, src/ex_getln.c, src/fold.c, src/misc1.c, src/ops.c,
            src/option.c, src/proto/option.pro

Patch 7.3.630
Problem:    "|" does not behave correctly when 'virtualedit' is set.
Solution:   Call validate_virtcol(). (David Bürgin)
Files:      src/normal.c

Patch 7.3.631
Problem:    Cannot complete user names.
Solution:   Add user name completion.  (Dominique Pelle)
Files:      runtime/doc/map.txt, src/auto/configure, src/config.h.in,
            src/configure.in, src/ex_docmd.c, src/ex_getln.c, src/misc1.c,
            src/misc2.c, src/proto/misc1.pro, src/vim.h

Patch 7.3.632
Problem:    Cannot select beyond 222 columns with the mouse in xterm.
Solution:   Add support for SGR mouse tracking. (Hayaki Saito)
Files:      runtime/doc/options.txt, src/feature.h, src/keymap.h, src/misc2.c,
            src/option.h, src/os_unix.c, src/term.c, src/version.c

Patch 7.3.633
Problem:    Selection remains displayed as selected after selecting another
            text.
Solution:   Call xterm_update() before select(). (Andrew Pimlott)
Files:      src/os_unix.c

Patch 7.3.634
Problem:    Month/Day format for undo is confusing. (Marcin Szamotulski)
Solution:   Always use Year/Month/Day, should work for everybody.
Files:      src/undo.c

Patch 7.3.635
Problem:    Issue 21: System call during startup sets 'lines' to a wrong
            value. (Karl Yngve)
Solution:   Don't set the shell size while the GUI is still starting up.
            (Christian Brabandt)
Files:      src/ui.c

Patch 7.3.636 (after 7.3.625)
Problem:    Not all zero-width matches handled correctly for "gn".
Solution:   Move zero-width detection to a separate function. (Christian
            Brabandt)
Files:      src/search.c

Patch 7.3.637
Problem:    Cannot catch the error caused by a foldopen when there is no fold.
            (ZyX, Issue 48)
Solution:   Do not break out of the loop early when inside try/catch.
            (Christian Brabandt) Except when there is a syntax error.
Files:      src/ex_docmd.c, src/globals.h

Patch 7.3.638
Problem:    Unnecessary redraw of the previous character.
```

```
Solution:   Check if the character is double-width. (Jon Long)
Files:      src/screen.c

Patch 7.3.639
Problem:    It's not easy to build Vim on Windows with XPM support.
Solution:   Include the required files, they are quite small.  Update the
            MSVC makefile to use them.  Binary files are in the next patch.
            (Sergey Khorev)
Files:      src/xpm/COPYRIGHT, src/xpm/README.txt, src/xpm/include/simx.h,
            src/xpm/include/xpm.h, src/Make_mvc.mak, src/bigvim.bat,
            src/bigvim64.bat, Filelist

Patch 7.3.640
Problem:    It's not easy to build Vim on Windows with XPM support.
Solution:   Binary files for 7.3.639. (Sergey Khorev)
Files:      src/xpm/x64/lib/libXpm.lib, src/xpm/x86/lib/libXpm.a,
            src/xpm/x86/lib/libXpm.lib

Patch 7.3.641
Problem:    ":mkview" uses ":normal" instead of ":normal!" for folds. (Dan)
Solution:   Add the bang. (Christian Brabandt)
Files:      src/fold.c

Patch 7.3.642
Problem:    Segfault with specific autocommands.  Was OK after 7.3.449 and
            before 7.3.545. (Richard Brown)
Solution:   Pass TRUE for abort_if_last in the call to close_buffer().
            (Christian Brabandt)
Files:      src/window.c

Patch 7.3.643 (after 7.3.635)
Problem:    MS-Windows: When starting gvim maximized 'lines' and 'columns' are
            wrong. (Christian Robinson)
Solution:   Move the check for gui.starting from ui_get_shellsize() to
            check_shellsize().
Files:      src/ui.c, src/term.c

Patch 7.3.644
Problem:    Dead code for BeOS GUI.
Solution:   Remove unused __BEOS__ stuff.
Files:      src/gui.c

Patch 7.3.645
Problem:    No tests for patch 7.3.625 and 7.3.637.
Solution:   Add more tests for the "gn" command and try/catch. (Christian
            Brabandt)
Files:      src/testdir/test53.in, src/testdir/test53.ok,
            src/testdir/test55.in, src/testdir/test55.ok

Patch 7.3.646
Problem:    When reloading a buffer the undo file becomes unusable unless ":w"
            is executed. (Dmitri Frank)
Solution:   After reloading the buffer write the undo file. (Christian
            Brabandt)
```

```
Files:      src/fileio.c

Patch 7.3.647
Problem:    "gnd" doesn't work correctly in Visual mode.
Solution:   Handle Visual mode differently in "gn". (Christian Brabandt)
Files:      src/search.c, src/testdir/test53.in, src/testdir/test53.ok

Patch 7.3.648
Problem:    Crash when using a very long file name. (ZyX)
Solution:   Properly check length of buffer space.
Files:      src/buffer.c

Patch 7.3.649
Problem:    When 'clipboard' is set to "unnamed" small deletes end up in the
            numbered registers. (Ingo Karkat)
Solution:   Use the original register name to decide whether to put a delete
            in a numbered register. (Christian Brabandt)
Files:      src/ops.c

Patch 7.3.650
Problem:    Completion after ":help \{-" gives an error message and messes up
            the command line.
Solution:   Cancel the tag search if the pattern can't be compiled. (Yasuhiro
            Matsumoto)
Files:      src/tag.c

Patch 7.3.651
Problem:    Completion after ":help \{-" gives an error message.
Solution:   Prepend a backslash.
Files:      src/ex_cmds.c

Patch 7.3.652
Problem:    Workaround for Python crash isn't perfect.
Solution:   Change the type of the length argument. (Sean Estabrooks)
Files:      src/if_py_both.h

Patch 7.3.653
Problem:    MingW needs build rule for included XPM files.  Object directory
            for 32 and 64 builds is the same, also for MSVC.
Solution:   Add MingW build rule to use included XPM files.  Add the CPU or
            architecture to the object directory name. (Sergey Khorev)
Files:      src/Make_ming.mak, src/Make_mvc.mak, src/xpm/README.txt

Patch 7.3.654
Problem:    When creating a Vim dictionary from Python objects an empty key
            might be used.
Solution:   Do not use empty keys, throw an IndexError. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.655
Problem:    64 bit MingW xpm .a file is missing.
Solution:   Add the file. (Sergey Khorev)
Files:      src/xpm/x64/lib/libXpm.a
```

```
Patch 7.3.656
Problem:    Internal error in :pyeval.
Solution:   Handle failed object conversion. (ZyX)
Files:      src/if_python.c, src/if_python3.c

Patch 7.3.657
Problem:    Python bindings silently truncate string values containing NUL.
Solution:   Fail when a string contains NUL. (ZyX)
Files:      src/if_python.c, src/if_python3.c

Patch 7.3.658
Problem:    NUL bytes truncate strings when converted from Python.
Solution:   Handle truncation as an error. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c

Patch 7.3.659
Problem:    Recent Python changes are not tested.
Solution:   Add tests for Python bindings. (ZyX)
Files:      src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.660
Problem:    ":help !" jumps to help for ":!".
Solution:   Adjust check for tag header line. (Andy Wokula)
Files:      src/tag.c

Patch 7.3.661 (after 7.3.652)
Problem:    SEGV in Python code.
Solution:   Initialize len to zero.  Use the right function depending on
            version. (Maxim Philippov)
Files:      src/if_py_both.h, src/if_python.c, src/if_python3.c

Patch 7.3.662
Problem:    Can't build Ruby interface with Ruby 1.9.3.
Solution:   Add missing functions. (V. Ondruch)
Files:      src/if_ruby.c

Patch 7.3.663
Problem:    End of color scheme name not clear in E185. (Aaron Lewis)
Solution:   Put the name in single quotes.
Files:      src/ex_docmd.c

Patch 7.3.664
Problem:    Buffer overflow in unescaping text. (Raymond Ko)
Solution:   Limit check for multi-byte character to 4 bytes.
Files:      src/mbyte.c

Patch 7.3.665
Problem:    MSVC 11 is not supported. (Raymond Ko)
Solution:   Recognize MSVC 11. (Gary Willoughby)
Files:      src/Make_mvc.mak

Patch 7.3.666
Problem:    With MSVC 11 Win32.mak is not found.
```

```
Solution:   Add the SDK_INCLUDE_DIR variable. (Raymond Ko)
Files:      src/Make_mvc.mak

Patch 7.3.667
Problem:    Unused variables in Perl interface.
Solution:   Adjust #ifdefs.
Files:      src/if_perl.xs

Patch 7.3.668
Problem:    Building with Perl loaded dynamically  still uses static library.
Solution:   Adjust use of PL_thr_key. (Ken Takata)
Files:      src/if_perl.xs

Patch 7.3.669
Problem:    When building with Cygwin loading Python dynamically fails.
Solution:   Use DLLLIBRARY instead of INSTSONAME. (Ken Takata)
Files:      src/configure.in, src/auto/configure

Patch 7.3.670
Problem:    Python: memory leaks when there are exceptions.
Solution:   Add DICTKEY_UNREF in the right places. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.671
Problem:    More Python code can be shared between Python 2 and 3.
Solution:   Move code to if_py_both.h. (ZyX)
Files:      src/if_py_both.h, src/if_python.c, src/if_python3.c

Patch 7.3.672
Problem:    Not possible to lock/unlock lists in Python interface.
Solution:   Add .locked and .scope attributes. (ZyX)
Files:      runtime/doc/if_pyth.txt, src/if_py_both.h, src/if_python.c,
            src/if_python3.c, src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.673
Problem:    Using "gN" while 'selection' is "exclusive" misses one character.
            (Ben Fritz)
Solution:   Check the direction when compensating for exclusive selection.
            (Christian Brabandt)
Files:      src/search.c

Patch 7.3.674
Problem:    Can't compile with Lua/dyn on Cygwin.
Solution:   Adjust configure to use the right library name. (Ken Takata)
Files:      src/configure.in, src/auto/configure

Patch 7.3.675
Problem:    Using uninitialized memory with very long file name.
Solution:   Put NUL after text when it is truncated. (ZyX)
Files:      src/buffer.c

Patch 7.3.676
Problem:    Ruby compilation on Windows 32 bit doesn't work.
```

```
Solution:   Only use some functions for 64 bit. (Ken Takata)
Files:      src/if_ruby.c

Patch 7.3.677
Problem:    buf_spname() is used inconsistently.
Solution:   Make the return type a char_u pointer.  Check the size of the
            returned string.
Files:      src/buffer.c, src/proto/buffer.pro, src/ex_cmds2.c,
            src/ex_docmd.c, src/memline.c, src/screen.c

Patch 7.3.678
Problem:    Ruby .so name may not be correct.
Solution:   Use the LIBRUBY_SO entry from the config. (Vit Ondruch)
Files:      src/configure.in, src/auto/configure

Patch 7.3.679
Problem:    Ruby detection uses Config, newer Ruby versions use RbConfig.
Solution:   Detect the need to use RbConfig. (Vit Ondruch)
Files:      src/configure.in, src/auto/configure

Patch 7.3.680
Problem:    Some files missing in the list of distributed files.
Solution:   Add lines for new files.
Files:      Filelist

Patch 7.3.681 (after 7.3.680)
Problem:    List of distributed files picks up backup files.
Solution:   Make tutor patterns more specific.
Files:      Filelist

Patch 7.3.682 (after 7.3.677)
Problem:    Compiler complains about incompatible types.
Solution:   Remove type casts. (hint by Danek Duvall)
Files:      src/edit.c

Patch 7.3.683
Problem:    ":python" may crash when vimbindeval() returns None.
Solution:   Check for v_string to be NULL. (Yukihiro Nakadaira)
Files:      src/if_py_both.h

Patch 7.3.684
Problem:    "make test" does not delete lua.vim.
Solution:   Add lua.vim to the clean target. (Simon Ruderich)
Files:      src/testdir/Makefile, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_vms.mms

Patch 7.3.685
Problem:    No test for what patch 7.3.673 fixes.
Solution:   Add a test. (Christian Brabandt)
Files:      src/testdir/test53.in, src/testdir/test53.ok

Patch 7.3.686
Problem:    Using CTRL-\ e mappings is useful also when entering an
            expression, but it doesn't work. (Marcin Szamotulski)
```

```
Solution:   Allow using CTRL-\ e when entering an expression if it was not
            typed.
Files:      src/ex_getln.c

Patch 7.3.687
Problem:    Test 16 fails when $DISPLAY is not set.
Solution:   Skip the test when $DISPLAY is not set.
Files:      src/testdir/test16.in

Patch 7.3.688
Problem:    Python 3.3 is not supported.
Solution:   Add Python 3.3 support (Ken Takata)
Files:      src/if_python3.c

Patch 7.3.689
Problem:    MzScheme and Lua may use a NULL string.
Solution:   Use an empty string instead of NULL. (Yukihiro Nakadaira)
Files:      src/if_lua.c, src/if_mzsch.c

Patch 7.3.690
Problem:    When the current directory name is exactly the maximum path length
            Vim may crash.
Solution:   Only add "/" when there is room. (Danek Duvall)
Files:      src/os_unix.c

Patch 7.3.691
Problem:    State specific to the Python thread is discarded.
Solution:   Keep state between threads. (Paul)
Files:      src/if_python.c

Patch 7.3.692
Problem:    Can't build GTK version with GTK 2.0.
Solution:   Put GtkFileFilter declaration in the right place. (Yegappan
            Lakshmanan)
Files:      src/gui_gtk.c

Patch 7.3.693
Problem:    Can't make 'softtabstop' follow 'shiftwidth'.
Solution:   When 'softtabstop' is negative use the value of 'shiftwidth'.
            (so8res)
Files:      src/edit.c, src/option.c, src/proto/option.pro

Patch 7.3.694
Problem:    Now that 'shiftwidth' may use the value of 'tabstop' it is not so
            easy to use in indent files.
Solution:   Add the shiftwidth() function. (so8res)
Files:      runtime/doc/eval.txt, src/eval.c

Patch 7.3.695
Problem:    Balloon cannot show multi-byte text.
Solution:   Properly deal with multi-byte characters. (Dominique Pelle)
Files:      src/gui_beval.c, src/ui.c

Patch 7.3.696
```

```
Problem:    Message about added spell language can be wrong.
Solution:   Give correct message. Add g:menutrans_set_lang_to to allow for
            translation. (Jiri Sedlak)
Files:      runtime/menu.vim

Patch 7.3.697
Problem:    Leaking resources when setting GUI font.
Solution:   Free the font. (Ken Takata)
Files:      src/syntax.c

Patch 7.3.698
Problem:    Python 3 does not preserve state between commands.
Solution:   Preserve the state. (Paul Ollis)
Files:      src/if_python.c, src/if_python3.c

Patch 7.3.699
Problem:    When 'ttymouse' is set to "sgr" manually, it is overruled by
            automatic detection.
Solution:   Do not use automatic detection when 'ttymouse' was set manually.
            (Hayaki Saito)
Files:      src/term.c

Patch 7.3.700
Problem:    Cannot detect URXVT and SGR mouse support.
Solution:   add +mouse_urxvt and +mouse_sgr. (Hayaki Saito)
Files:      src/feature.h, src/eval.c

Patch 7.3.701
Problem:    MS-Windows: Crash with stack overflow when setting 'encoding'.
Solution:   Handle that loading the iconv library may be called recursively.
            (Jiri Sedlak)
Files:      src/os_win32.c

Patch 7.3.702
Problem:    Nmake from VS6 service pack 6 is not recognized.
Solution:   Detect the version number. (Jiri Sedlak)
Files:      src/Make_mvc.mak

Patch 7.3.703
Problem:    When 'undofile' is reset the hash is computed unnecessarily.
Solution:   Only compute the hash when the option was set. (Christian Brabandt)
Files:      src/option.c

Patch 7.3.704
Problem:    Repeating "cgn" does not always work correctly.
Solution:   Also fetch the operator character. (Christian Brabandt)
Files:      src/normal.c

Patch 7.3.705
Problem:    Mouse features are not sorted properly. (Tony Mechelynck)
Solution:   Put the mouse features in alphabetical order.
Files:      src/version.c

Patch 7.3.706 (after 7.3.697)
```

```
Problem:    Can't build Motif version.
Solution:   Fix wrongly named variable. (Ike Devolder)
Files:      src/syntax.c

Patch 7.3.707 (after 7.3.701)
Problem:    Problems loading a library for a file name with non-latin
            characters.
Solution:   Use wide system functions when possible. (Ken Takata)
Files:      src/os_win32.c, src/os_win32.h

Patch 7.3.708
Problem:    Filler lines above the first line may be hidden when opening Vim.
Solution:   Change how topfill is computed. (Christian Brabandt)
Files:      src/diff.c, src/testdir/test47.in, src/testdir/test47.ok

Patch 7.3.709
Problem:    Compiler warning for unused argument.
Solution:   Add UNUSED.
Files:      src/eval.c

Patch 7.3.710 (after 7.3.704)
Problem:    Patch 7.3.704 breaks "fn".
Solution:   Add check for ca.cmdchar. (Christian Brabandt)
Files:      src/normal.c

Patch 7.3.711 (after 7.3.688)
Problem:    vim.current.buffer is not available. (lilydjwg)
Solution:   Use py3_PyUnicode_AsUTF8 instead of py3_PyUnicode_AsUTF8String.
            (Ken Takata)
Files:      src/if_python3.c

Patch 7.3.712
Problem:    Nmake from VS2010 SP1 is not recognized.
Solution:   Add the version number. (Ken Takata)
Files:      src/Make_mvc.mak

Patch 7.3.713
Problem:    printf() can only align to bytes, not characters.
Solution:   Add the "S" item. (Christian Brabandt)
Files:      runtime/doc/eval.txt, src/message.c

Patch 7.3.714
Problem:    Inconsistency: :set can be used in the sandbox, but :setlocal and
            :setglobal cannot. (Michael Henry)
Solution:   Fix the flags for :setlocal and :setglobal. (Christian Brabandt)
Files:      src/ex_cmds.h

Patch 7.3.715
Problem:    Crash when calling setloclist() in BufUnload autocmd. (Marcin
            Szamotulski)
Solution:   Set w_llist to NULL when it was freed.  Also add a test.
            (Christian Brabandt)
Files:      src/quickfix.c, src/testdir/test49.ok, src/testdir/test49.vim
```

```
Patch 7.3.716
Problem:    Error on exit when using Python 3.
Solution:   Remove PythonIO_Fini(). (Roland Puntaier)
Files:      src/if_python3.c

Patch 7.3.717
Problem:    When changing the font size, only MS-Windows limits the window
            size.
Solution:   Also limit the window size on other systems. (Roland Puntaier)
Files:      src/gui.c

Patch 7.3.718
Problem:    When re-using the current buffer the buffer-local options stay.
Solution:   Re-initialize the buffer-local options. (Christian Brabandt)
Files:      src/buffer.c

Patch 7.3.719
Problem:    Cannot run new version of cproto, it fails on missing include
            files.
Solution:   Add lots of #ifndef PROTO
Files:      src/os_amiga.c, src/os_amiga.h, src/gui_w16.c, src/gui_w48.c,
            src/gui_w32.c, src/vimio.h, src/os_msdos.c, src/os_msdos.h,
            src/os_win16.h, src/os_win16.c, src/os_win32.h, src/os_win32.c,
            src/os_mswin.c, src/gui_photon.c, src/os_unix.h, src/os_beos.c,
            src/os_beos.h

Patch 7.3.720
Problem:    Proto files are outdated.
Solution:   Update the newly generated proto files.
Files:      src/proto/digraph.pro, src/proto/fold.pro, src/proto/misc1.pro,
            src/proto/move.pro, src/proto/screen.pro, src/proto/search.pro,
            src/proto/os_win32.pro, src/proto/os_mswin.pro,
            src/proto/os_beos.pro

Patch 7.3.721
Problem:    Ruby interface defines local functions globally.
Solution:   Make the functions static.
Files:      src/if_ruby.c

Patch 7.3.722
Problem:    Perl flags may contain "-g", which breaks "make proto".
Solution:   Filter out the "-g" flag for cproto. (Ken Takata)
Files:      src/Makefile

Patch 7.3.723
Problem:    Various tiny problems.
Solution:   Various tiny fixes.
Files:      src/gui_mac.c, src/xpm_w32.c, src/netbeans.c, src/sha256.c,
            src/if_sniff.c, README.txt

Patch 7.3.724
Problem:    Building with Ruby and Tcl on MS-Windows 64 bit does not work.
Solution:   Remove Ruby and Tcl from the big MS-Windows build.
Files:      src/bigvim64.bat
```

Patch 7.3.725
Problem: :aboveleft and :belowright have no effect on :copen.
Solution: Check for cmdmod.split. (Christian Brabandt)
Files: src/quickfix.c

Patch 7.3.726
Problem: Typos and duplicate info in README.
Solution: Fix the text.
Files: README.txt

Patch 7.3.727
Problem: Can't always find Win32.mak when building GvimExt.
Solution: Use same mechanism as in Make_mvc.mak. (Cade Foster)
Files: src/GvimExt/Makefile

Patch 7.3.728
Problem: Cannot compile with MzScheme interface on Ubuntu 12.10.
Solution: Find the collects directory under /usr/share.
Files: src/configure.in, src/auto/configure

Patch 7.3.729
Problem: Building with Ruby fails on some systems.
Solution: Remove "static" and add #ifndef PROTO. (Ken Takata)
Files: src/if_ruby.c

Patch 7.3.730
Problem: Crash in PHP file when using syntastic. (Ike Devolder)
Solution: Avoid using NULL pointer. (Christian Brabandt)
Files: src/quickfix.c

Patch 7.3.731
Problem: Py3Init_vim() is exported unnecessarily.
Solution: Make it static. (Ken Takata)
Files: src/if_python3.c

Patch 7.3.732
Problem: Compiler warnings for function arguments.
Solution: Use inteptr_t instead of long.
Files: src/if_mzsch.c, src/main.c

Patch 7.3.733
Problem: Tests fail when including MzScheme.
Solution: Change #ifdefs for vim_main2().
Files: src/main.c

Patch 7.3.734
Problem: Cannot put help files in a sub-directory.
Solution: Make :helptags work for sub-directories. (Charles Campbell)
Files: src/ex_cmds.c

Patch 7.3.735
Problem: Cannot build Ruby 1.9 with MingW or Cygwin.
Solution: Add another include directory. (Ken Takata)

```
Files:      src/Make_cyg.mak, src/Make_ming.mak

Patch 7.3.736
Problem:    File name completion in input() escapes white space. (Frederic
            Hardy)
Solution:   Do not escape white space. (Christian Brabandt)
Files:      src/ex_getln.c

Patch 7.3.737
Problem:    When using do_cmdline() recursively did_endif is not reset,
            causing messages to be overwritten.
Solution:   Reset did_endif. (Christian Brabandt)
Files:      src/ex_docmd.c

Patch 7.3.738 (after 7.3.730)
Problem:    Unused function argument.
Solution:   Remove it. (Christian Brabandt)
Files:      src/quickfix.c

Patch 7.3.739
Problem:    Computing number of lines may have an integer overflow.
Solution:   Check for MAXCOL explicitly. (Dominique Pelle)
Files:      src/move.c

Patch 7.3.740
Problem:    IOC tool complains about undefined behavior for int.
Solution:   Change to unsigned int. (Dominique Pelle)
Files:      src/hashtab.c, src/misc2.c

Patch 7.3.741 (after 7.3.737)
Problem:    Tiny build fails.
Solution:   Move #ifdef. (Ike Devolder)
Files:      src/ex_docmd.c

Patch 7.3.742
Problem:    Leaking memory when :vimgrep restores the directory.
Solution:   Free the allocated memory. (Christian Brabandt)
Files:      src/quickfix.c

Patch 7.3.743 (after 7.3.741)
Problem:    Tiny build still fails.
Solution:   Add #else in the right place.
Files:      src/ex_docmd.c

Patch 7.3.744
Problem:    64 bit compiler warning.
Solution:   Add type cast. (Mike Williams)
Files:      src/ex_cmds.c

Patch 7.3.745
Problem:    Automatically setting 'ttymouse' doesn't work.
Solution:   Reset the "option was set" flag when using the default.
Files:      src/option.c, src/proto/option.pro, src/term.c
```

```
Patch 7.3.746
Problem:    Memory leaks when using location lists.
Solution:   Set qf_title to something. (Christian Brabandt)
Files:      src/eval.c, src/quickfix.c

Patch 7.3.747
Problem:    When characters are concealed text aligned with tabs are no longer
            aligned, e.g. at ":help :index".
Solution:   Compensate space for tabs for concealed characters. (Dominique
            Pelle)
Files:      src/screen.c

Patch 7.3.748
Problem:    Cannot properly test conceal mode.
Solution:   Add the screencol() and screenrow() functions.  Use them in
            test88. (Simon Ruderich)
Files:      runtime/doc/eval.txt, src/eval.c, src/proto/screen.pro,
            src/screen.c, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms
            src/testdir/Makefile, src/testdir/test88.in,
            src/testdir/test88.ok,

Patch 7.3.749
Problem:    Python interface doesn't build without the multi-byte feature.
Solution:   Add #ifdef. (Ken Takata)
Files:      src/if_py_both.h

Patch 7.3.750
Problem:    The justify macro does not always work correctly.
Solution:   Fix off-by-one error (James McCoy)
Files:      runtime/macros/justify.vim

Patch 7.3.751
Problem:    Test 61 is flaky, it fails once in a while.
Solution:   When it fails retry once.
Files:      src/testdir/Makefile

Patch 7.3.752
Problem:    Test 49 script file doesn't fold properly.
Solution:   Add a colon.
Files:      src/testdir/test49.vim

Patch 7.3.753
Problem:    When there is a QuitPre autocommand using ":q" twice does not work
            for exiting when there are more files to edit.
Solution:   Do not decrement quitmore in an autocommand. (Techlive Zheng)
Files:      src/ex_docmd.c, src/fileio.c, src/proto/fileio.pro

Patch 7.3.754
Problem:    Latest nmake is not recognized.
Solution:   Add nmake version 11.00.51106.1. (Raymond Ko)
Files:      src/Make_mvc.mak
```

```
Patch 7.3.755
Problem:    Autoconf doesn't find Python 3 if it's called "python".
Solution:   Search for "python2" and "python3" first, then "python".
Files:      src/configure.in, src/auto/configure

Patch 7.3.756
Problem:    A location list can get a wrong count in :lvimgrep.
Solution:   Check if the list was changed by autocommands. (mostly by
            Christian Brabandt)
Files:      src/quickfix.c

Patch 7.3.757
Problem:    Issue 96: May access freed memory when a put command triggers
            autocommands. (Dominique Pelle)
Solution:   Call u_save() before getting y_array.
Files:      src/ops.c

Patch 7.3.758
Problem:    Matchit plugin does not handle space in #ifdef.
Solution:   Change matching pattern to allow spaces. (Mike Morearty)
Files:      runtime/macros/matchit.vim

Patch 7.3.759
Problem:    MS-Windows: Updating the tabline is slow when there are many tabs.
Solution:   Disable redrawing while performing the update. (Arseny Kapoulkine)
Files:      src/gui_w48.c

Patch 7.3.760
Problem:    dv_ deletes the white space before the line.
Solution:   Move the cursor to the first non-white. (Christian Brabandt)
Files:      src/normal.c, src/testdir/test19.in, src/testdir/test19.ok

Patch 7.3.761
Problem:    In Visual mode a "-p does not work. (Marcin Szamotulski)
Solution:   Avoid writing to "- before putting it. (Christian Brabandt)
Files:      src/normal.c, src/testdir/test48.in, src/testdir/test48.ok

Patch 7.3.762 (after 7.3.759)
Problem:    On some systems the tabline is not redrawn.
Solution:   Call RedrawWindow(). (Charles Peacech)
Files:      src/gui_w48.c

Patch 7.3.763
Problem:    Jumping to a mark does not open a fold if it is in the same line.
            (Wiktor Ruben)
Solution:   Also compare the column after the jump. (Christian Brabandt)
Files:      src/normal.c

Patch 7.3.764
Problem:    Not all message translation files are installed.
Solution:   Also install the converted files.
Files:      src/po/Makefile

Patch 7.3.765
```

```
Problem:    Segfault when doing "cclose" on BufUnload in a python function.
            (Sean Reifschneider)
Solution:   Skip window with NULL buffer. (Christian Brabandt)
Files:      src/main.c, src/window.c

Patch 7.3.766
Problem:    ":help cpo-*" jumps to the wrong place.
Solution:   Make it equivalent to ":help cpo-star".
Files:      src/ex_cmds.c

Patch 7.3.767
Problem:    (Win32) The _errno used for iconv may be the wrong one.
Solution:   Use the _errno from iconv.dll. (Ken Takata)
Files:      src/mbyte.c

Patch 7.3.768
Problem:    settabvar() and setwinvar() may move the cursor.
Solution:   Save and restore the cursor position when appropriate. (idea by
            Yasuhiro Matsumoto)
Files:      src/edit.c

Patch 7.3.769
Problem:    'matchpairs' does not work with multi-byte characters.
Solution:   Make it work. (Christian Brabandt)
Files:      src/misc1.c, src/option.c, src/proto/option.pro, src/search.c,
            src/testdir/test69.in, src/testdir/test69.ok

Patch 7.3.770
Problem:    Vim.h indentation is inconsistent.
Solution:   Adjust the indentation. (Elias Diem)
Files:      src/vim.h

Patch 7.3.771 (after 7.3.769)
Problem:    Uninitialized variable. (Yasuhiro Matsumoto)
Solution:   Set x2 to -1.
Files:      src/option.c

Patch 7.3.772
Problem:    Cursor is at the wrong location and below the end of the file
            after doing substitutions with confirm flag: %s/x/y/c
            (Dominique Pelle)
Solution:   Update the cursor position. (Christian Brabandt & Dominique)
Files:      src/ex_cmds.c

Patch 7.3.773 (after 7.3.767)
Problem:    Crash when OriginalFirstThunk is zero.
Solution:   Skip items with OriginalFirstThunk not set. (Ken Takata)
Files:      src/mbyte.c

Patch 7.3.774
Problem:    Tiny GUI version misses console dialog feature.
Solution:   Define FEAT_CON_DIALOG when appropriate. (Christian Brabandt)
Files:      src/feature.h, src/gui.h
```

```
Patch 7.3.775
Problem:    Cygwin and Mingw builds miss dependency on gui_w48.c.
Solution:   Add a build rule. (Ken Takata)
Files:      src/Make_cyg.mak, src/Make_ming.mak

Patch 7.3.776
Problem:    ml_get error when searching, caused by curwin not matching curbuf.
Solution:   Avoid changing curbuf. (Lech Lorens)
Files:      src/charset.c, src/eval.c, src/mark.c, src/proto/charset.pro,
            src/proto/mark.pro, src/regexp.c, src/syntax.c,

Patch 7.3.777
Problem:    When building with Gnome locale gets reset.
Solution:   Set locale after gnome_program_init(). (Christian Brabandt)
Files:      src/gui_gtk_x11.c

Patch 7.3.778
Problem:    Compiler error for adding up two pointers. (Titov Anatoly)
Solution:   Add a type cast. (Ken Takata)
Files:      src/mbyte.c

Patch 7.3.779
Problem:    Backwards search lands in wrong place when started on a multibyte
            character.
Solution:   Do not set extra_col for a backwards search. (Sung Pae)
Files:      src/search.c, src/testdir/test44.in, src/testdir/test44.ok

Patch 7.3.780
Problem:    char2nr() and nr2char() always use 'encoding'.
Solution:   Add argument to use utf-8 characters. (Yasuhiro Matsumoto)
Files:      runtime/doc/eval.txt, src/eval.c

Patch 7.3.781
Problem:    Drawing with 'guifontwide' can be slow.
Solution:   Draw multiple characters at a time. (Taro Muraoka)
Files:      src/gui.c

Patch 7.3.782
Problem:    Windows: IME composition may use a wrong font.
Solution:   Use 'guifontwide' for IME when it is set. (Taro Muraoka)
Files:      runtime/doc/options.txt, src/gui.c, src/gui_w48.c,
            src/proto/gui_w16.pro, src/proto/gui_w32.pro

Patch 7.3.783
Problem:    Crash when mark is not set. (Dominique Pelle)
Solution:   Check for NULL.
Files:      src/normal.c

Patch 7.3.784 (after 7.3.781)
Problem:    Error when 'guifontwide' has a comma.
Solution:   Use gui.wide_font. (Taro Muraoka)
Files:      src/gui_w48.c

Patch 7.3.785 (after 7.3.776)
```

```
Problem:    Crash with specific use of search pattern.
Solution:   Initialize reg_buf to curbuf.
Files:      src/regexp.c

Patch 7.3.786
Problem:    Python threads don't run in the background (issue 103).
Solution:   Move the statements to manipulate thread state.
Files:      src/if_python.c

Patch 7.3.787
Problem:    With 'relativenumber' set it is not possible to see the absolute
            line number.
Solution:   For the cursor line show the absolute line number instead of a
            zero. (Nazri Ramliy)
Files:      src/screen.c

Patch 7.3.788
Problem:    When only using patches build fails on missing nl.po.
Solution:   Create an empty nl.po file.
Files:      src/po/Makefile

Patch 7.3.789 (after 7.3.776)
Problem:    "\k" in regexp does not work in other window.
Solution:   Use the right buffer. (Yukihiro Nakadaira)
Files:      src/mbyte.c, src/proto/mbyte.pro, src/regexp.c

Patch 7.3.790
Problem:    After reloading a buffer the modelines are not processed.
Solution:   call do_modelines(). (Ken Takata)
Files:      src/fileio.c

Patch 7.3.791
Problem:    MzScheme interface doesn't work properly.
Solution:   Make it work better. (Sergey Khorev)
Files:      runtime/doc/if_mzsch.txt, src/configure.in, src/auto/configure,
            src/eval.c, src/if_mzsch.c, src/if_mzsch.h, src/Make_ming.mak,
            src/Make_mvc.mak, src/os_unix.c, src/proto/eval.pro,
            src/testdir/test70.in, src/testdir/test70.ok

Patch 7.3.792
Problem:    ":substitute" works differently without confirmation.
Solution:   Do not change the text when asking for confirmation, only display
            it.
Files:      src/ex_cmds.c

Patch 7.3.793 (after 7.3.792)
Problem:    New interactive :substitute behavior is not tested.
Solution:   Add tests. (Christian Brabandt)
Files:      src/testdir/test80.in, src/testdir/test80.ok

Patch 7.3.794
Problem:    Tiny build fails. (Tony Mechelynck)
Solution:   Adjust #ifdefs.
Files:      src/charset.c
```

```
Patch 7.3.795
Problem:    MzScheme does not build with tiny features.
Solution:   Add #ifdefs.  Also add UNUSED to avoid warnings.  And change
            library ordering.
Files:      src/if_mzsch.c, src/Makefile

Patch 7.3.796
Problem:    "/[^\n]" does match at a line break.
Solution:   Make it do the same as "/.". (Christian Brabandt)
Files:      src/regexp.c, src/testdir/test79.in, src/testdir/test79.ok

Patch 7.3.797 (after 7.3.792)
Problem:    Compiler warning for size_t to int conversion. (Skeept)
Solution:   Add type casts.
Files:      src/ex_cmds.c

Patch 7.3.798 (after 7.3.791)
Problem:    MzScheme: circular list does not work correctly.
Solution:   Separate Mac-specific code from generic code. (Sergey Khorev)
Files:      src/if_mzsch.c, src/testdir/test70.in

Patch 7.3.799
Problem:    The color column is not correct when entering a buffer. (Ben
            Fritz)
Solution:   Call check_colorcolumn() if 'textwidth' changed. (Christian
            Brabandt)
Files:      src/buffer.c

Patch 7.3.800
Problem:    The " mark is not adjusted when inserting lines. (Roland Eggner)
Solution:   Adjust the line number. (Christian Brabandt)
Files:      src/mark.c

Patch 7.3.801
Problem:    ":window set nu?" displays the cursor line. (Nazri Ramliy)
Solution:   Do not update the cursor line when conceallevel is zero or the
            screen has scrolled. (partly by Christian Brabandt)
Files:      src/window.c

Patch 7.3.802
Problem:    After setting 'isk' to a value ending in a comma appending to the
            option fails.
Solution:   Disallow a trailing comma for 'isk' and similar options.
Files:      src/charset.c

Patch 7.3.803 (after 7.3.792)
Problem:    Substitute with confirmation and then "q" does not replace
            anything.  (John McGowan)
Solution:   Do not break the loop, skip to the end.
Files:      src/ex_cmds.c, src/testdir/test80.in, src/testdir/test80.ok

Patch 7.3.804 (after 7.3.799)
Problem:    Compiler warning for tiny build. (Tony Mechelynck)
```

```
Solution:   Add #ifdefs around variable.
Files:      src/buffer.c

Patch 7.3.805
Problem:    Lua version 5.2 is not detected properly on Arch Linux.
Solution:   Adjust autoconf. (lilydjwg)
Files:      src/configure.in, src/auto/configure

Patch 7.3.806
Problem:    Compiler warnings in Perl code when building with Visual studio
            2012. (skeept)
Solution:   Add type casts. (Christian Brabandt, 2013 Jan 30)
Files:      src/if_perl.xs

Patch 7.3.807
Problem:    Popup menu does not work properly with the preview window, folds
            and 'cursorcolumn'.
Solution:   Redraw the popup menu after redrawing windows. (Christian
            Brabandt)
Files:      src/screen.c

Patch 7.3.808
Problem:    Python threads still do not work properly.
Solution:   Fix both Python 2 and 3.  Add tests. (Ken Takata)
Files:      src/if_python.c, src/if_python3.c, src/testdir/test86.in,
            src/testdir/test86.ok, src/testdir/test87.in,
            src/testdir/test87.ok

Patch 7.3.809
Problem:    The dosinst.c program has a buffer overflow. (Thomas Gwae)
Solution:   Ignore $VIMRUNTIME if it is too long.
Files:      src/dosinst.c

Patch 7.3.810
Problem:    'relativenumber' is reset unexpectedly. (François Ingelrest)
Solution:   After an option was reset also reset the global value. Add a test.
            (Christian Brabandt)
Files:      src/option.c, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile, src/testdir/test89.in,
            src/testdir/test89.ok

Patch 7.3.811
Problem:    Useless termresponse parsing for SGR mouse.
Solution:   Skip the parsing. (Hayaki Saito)
Files:      src/term.c

Patch 7.3.812
Problem:    When 'indentexpr' moves the cursor "curswant" not restored.
Solution:   Restore "curswant". (Sung Pae)
Files:      src/misc1.c

Patch 7.3.813
```

```
Problem:    The CompleteDone event is not triggered when there are no pattern
            matches. (Jianjun Mao)
Solution:   Trigger the event. (Christian Brabandt)
Files:      src/edit.c

Patch 7.3.814
Problem:    Can't input multibyte characters on Win32 console if 'encoding' is
            different from current codepage.
Solution:   Use convert_input_safe() instead of convert_input().  Make
            string_convert_ext() return an error for incomplete input. (Ken
            Takata)
Files:      src/mbyte.c, src/os_win32.c

Patch 7.3.815
Problem:    Building with Cygwin and Ruby doesn't work.
Solution:   Copy some things from the MingW build file. (Ken Takata)
Files:      src/Make_cyg.mak

Patch 7.3.816
Problem:    Can't compute a hash.
Solution:   Add the sha256() function. (Tyru, Hirohito Higashi)
Files:      runtime/doc/eval.txt, src/eval.c, src/proto/sha256.pro,
            src/sha256.c, src/testdir/test90.in, src/testdir/test90.ok,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile

Patch 7.3.817
Problem:    Test 89 fails with tiny and small features.
Solution:   Add sourcing small.vim.
Files:      src/testdir/test89.in

Patch 7.3.818
Problem:    When test 40 fails because of a bad build it may leave files
            behind that cause it to fail later.
Solution:   Let the file names start with "X".
Files:      src/testdir/test40.in

Patch 7.3.819
Problem:    Compiling without +eval and with Python isn't working.
Solution:   Add the eval feature when building with Python.
Files:      src/if_py_both.h, src/feature.h, src/eval.c, src/ex_docmd.c,
            src/normal.c, src/ex_docmd.c, src/gui_gtk_x11.c

Patch 7.3.820
Problem:    Build errors and warnings when building with small features and
            Lua, Perl or Ruby.
Solution:   Add #ifdefs and UNUSED.
Files:      src/if_perl.xs, src/if_lua.c, src/if_ruby.c

Patch 7.3.821
Problem:    Build with OLE and Cygwin is broken. (Steve Hall)
Solution:   Select static or shared stdc library. (Ken Takata)
Files:      src/Make_cyg.mak
```

```
Patch 7.3.822 (after 7.3.799)
Problem:    Crash when accessing freed buffer.
Solution:   Get 'textwidth' in caller of enter_buffer(). (Christian Brabandt)
Files:      src/buffer.c

Patch 7.3.823 (after 7.3.821)
Problem:    Building with Cygwin: '-lsupc++' is not needed.
Solution:   Remove it. (Ken Takata)
Files:      src/Make_cyg.mak

Patch 7.3.824
Problem:    Can redefine builtin functions.  (ZyX)
Solution:   Disallow adding a function to g:.
Files:      src/eval.c

Patch 7.3.825
Problem:    With Python errors are not always clear.
Solution:   Print the stack trace, unless :silent is used. (ZyX)
Files:      src/if_python3.c, src/if_python.c

Patch 7.3.826
Problem:    List of features in :version output is hard to read.
Solution:   Make columns. (Nazri Ramliy)
Files:      src/version.c

Patch 7.3.827 (after 7.3.825)
Problem:    Python tests fail.
Solution:   Adjust the output for the stack trace.
Files:      src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.ok

Patch 7.3.828
Problem:    Mappings are not aware of wildmenu mode.
Solution:   Add wildmenumode(). (Christian Brabandt)
Files:      src/eval.c, runtime/doc/eval.txt

Patch 7.3.829
Problem:    When compiled with the +rightleft feature 'showmatch' also shows a
            match for the opening paren.  When 'revins' is set the screen may
            scroll.
Solution:   Only check the opening paren when the +rightleft feature was
            enabled.  Do not show a match that is not visible. (partly by
            Christian Brabandt)
Files:      src/search.c

Patch 7.3.830
Problem:    :mksession confuses bytes, columns and characters when positioning
            the cursor.
Solution:   Use w_virtcol with "|" instead of w_cursor.col with "l".
Files:      src/ex_docmd.c

Patch 7.3.831
Problem:    Clumsy to handle the situation that a variable does not exist.
```

```
Solution:   Add default value to getbufvar() et al. (Shougo Matsushita,
            Hirohito Higashi)
Files:      runtime/doc/eval.txt, src/eval.c src/testdir/test91.in,
            src/testdir/test91.ok, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile

Patch 7.3.832
Problem:    Compiler warning.
Solution:   Add type cast. (Mike Williams)
Files:      src/version.c

Patch 7.3.833
Problem:    In the terminal the scroll wheel always scrolls the active window.
Solution:   Scroll the window under the mouse pointer, like in the GUI.
            (Bradie Rao)
Files:      src/edit.c, src/normal.c

Patch 7.3.834
Problem:    Ruby 2.0 has a few API changes.
Solution:   Add handling of Ruby 2.0. (Yasuhiro Matsumoto)
Files:      src/if_ruby.c

Patch 7.3.835
Problem:    "xxd -i" fails on an empty file.
Solution:   Do output the closing } for an empty file. (partly by Lawrence
            Woodman)
Files:      src/xxd/xxd.c

Patch 7.3.836
Problem:    Clipboard does not work on Win32 when compiled with Cygwin.
Solution:   Move the Win32 clipboard code to a separate file and use it when
            building with os_unix.c. (Frodak Baksik, Ken Takata)
Files:      src/Make_bc5.mak, src/Make_cyg.mak, src/Make_ivc.mak,
            src/Make_ming.mak, src/Make_mvc.mak, src/Make_w16.mak,
            src/Makefile, src/config.h.in, src/configure.in,
            src/auto/configure, src/feature.h, src/globals.h, src/mbyte.c,
            src/os_mswin.c, src/os_unix.c, src/os_win32.c, src/proto.h,
            src/proto/os_mswin.pro, src/proto/winclip.pro, src/term.c,
            src/vim.h, src/winclip.c

Patch 7.3.837 (after 7.3.826)
Problem:    Empty lines in :version output when 'columns' is 320.
Solution:   Simplify the logic of making columns. (Nazri Ramliy, Roland
            Eggner)
Files:      src/version.c

Patch 7.3.838 (after 7.3.830)
Problem:    Insufficient testing for mksession.
Solution:   Add tests. (mostly by Roland Eggner)
Files:      src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
```

```
            src/testdir/test92.in, src/testdir/test92.ok,
            src/testdir/test93.in, src/testdir/test93.ok,
            src/ex_docmd.c

Patch 7.3.839
Problem:    Some files missing in the list of distributed files.
Solution:   Add lines for new files.
Files:      Filelist

Patch 7.3.840
Problem:    "\@<!" in regexp does not work correctly with multi-byte
            characters, especially cp932.
Solution:   Move column to start of multi-byte character. (Yasuhiro Matsumoto)
Files:      src/regexp.c

Patch 7.3.841
Problem:    When a "cond ? one : two" expression has a subscript it is not
            parsed correctly. (Andy Wokula)
Solution:   Handle a subscript also when the type is unknown. (Christian
            Brabandt)
Files:      src/eval.c

Patch 7.3.842
Problem:    Compiler warning for signed/unsigned pointer.
Solution:   Add type cast. (Christian Brabandt)
Files:      src/eval.c

Patch 7.3.843 (after 7.3.841)
Problem:    Missing test file changes.
Solution:   Change the tests.
Files:      src/testdir/test49.vim, src/testdir/test49.ok

Patch 7.3.844
Problem:    Enum is not indented correctly with "public" etc.
Solution:   Skip "public", "private" and "protected". (Hong Xu)
Files:      src/misc1.c

Patch 7.3.845 (after 7.3.844)
Problem:    Enum indenting is not tested.
Solution:   Add tests. (Hong Xu)
Files:      src/testdir/test3.in, src/testdir/test3.ok

Patch 7.3.846
Problem:    Missing proto files.
Solution:   Add the files.
Files:      Filelist, src/proto/os_beos.pro

Patch 7.3.847
Problem:    Test 55 fails when messages are translated.
Solution:   Set language to C. (Ken Takata)
Files:      src/testdir/test55.in

Patch 7.3.848
Problem:    Can't build with Ruby 2.0 when using MinGW x64 or MSVC10.
```

```
Solution:   Fix it. Also detect RUBY_PLATFORM and RUBY_INSTALL_NAME for x64.
            (Ken Takata)
Files:      src/Make_cyg.mak, src/Make_ming.mak, src/if_ruby.c

Patch 7.3.849
Problem:    ":g//" gives "Pattern not found error" with E486.  Should not use
            the error number, it's not a regular error message.
Solution:   Use a normal message. (David Bürgin)
Files:      src/ex_cmds.c

Patch 7.3.850
Problem:    ":vimgrep //" matches everywhere.
Solution:   Make it use the previous search pattern. (David Bürgin)
Files:      runtime/doc/quickfix.txt, src/quickfix.c

Patch 7.3.851
Problem:    Using an empty pattern with :sort silently continues when there is
            no previous search pattern.
Solution:   Give an error message. (David Bürgin)
Files:      src/ex_cmds.c

Patch 7.3.852
Problem:    system() breaks clipboard text. (Yukihiro Nakadaira)
Solution:   Use Xutf8TextPropertyToTextList(). (Christian Brabandt)
            Also do not put the text in the clip buffer if conversion fails.
Files:      src/ui.c, src/ops.c

Patch 7.3.853
Problem:    Using "ra" in multiple lines on multi-byte characters leaves a few
            characters not replaced.
Solution:   Adjust the end column only in the last line. (Yasuhiro Matsumoto)
Files:      src/testdir/test69.in, src/testdir/test69.ok, src/ops.c

Patch 7.3.854
Problem:    After using backspace in insert mode completion, CTRL-N and CTRL-P
            do not highlight the right entry. (Olivier Teuliere)
Solution:   Set the current item to the shown item after using backspace.
Files:      src/edit.c

Patch 7.3.855
Problem:    Compiler warnings.
Solution:   Add type casts. (Mike Williams)
Files:      src/misc1.c

Patch 7.3.856
Problem:    When calling system() multi-byte clipboard contents is garbled.
Solution:   Save and restore the clipboard contents.  (Yukihiro Nakadaira)
Files:      src/gui_gtk_x11.c, src/proto/gui_gtk_x11.pro, src/ops.c,
            src/proto/ops.pro, src/os_unix.c, src/proto/ui.pro, src/ui.c

Patch 7.3.857
Problem:    The QuitPre autocommand event does not trigger for :qa and :wq.
Solution:   Trigger the event. (Tatsuro Fujii)
Files:      src/ex_docmd.c
```

```
Patch 7.3.858
Problem:    "gv" selects the wrong area after some operators.
Solution:   Save and restore the type of selection. (Christian Brabandt)
Files:      src/testdir/test66.in, src/testdir/test66.ok, src/normal.c

Patch 7.3.859
Problem:    'ambiwidth' must be set by the user.
Solution:   Detects East Asian ambiguous width (UAX #11) state of the terminal
            at the start-up time and 'ambiwidth' accordingly.  (Hayaki Saito)
Files:      src/main.c, src/option.c, src/term.c, src/term.h,
            src/proto/term.pro

Patch 7.3.860
Problem:    When using --remote-expr try/catch does not work. (Andrey Radev)
Solution:   Set emsg_silent instead of emsg_skip.
Files:      src/main.c

Patch 7.3.861
Problem:    ":setlocal number" clears global value of 'relativenumber'.
Solution:   Do it properly. (Markus Heidelberg)
Files:      src/testdir/test89.in, src/testdir/test89.ok, src/option.c

Patch 7.3.862
Problem:    Dragging the status line can be slow.
Solution:   Look ahead and drop the drag event if there is a next one.
Files:      src/eval.c, src/misc1.c, src/proto/misc1.pro, src/normal.c

Patch 7.3.863 (after 7.3.859)
Problem:    Problem with 'ambiwidth' detection for ANSI terminal.
Solution:   Work around not recognizing a term response. (Hayaki Saito)
Files:      src/term.c

Patch 7.3.864 (after 7.3.862)
Problem:    Can't build without the mouse feature.
Solution:   Add an #ifdef. (Ike Devolder)
Files:      src/misc1.c

Patch 7.3.865 (after 7.3.862)
Problem:    Mouse position may be wrong.
Solution:   Let vungetc() restore the mouse position.
Files:      src/getchar.c

Patch 7.3.866
Problem:    Not serving the X selection during system() isn't nice.
Solution:   When using fork() do not loose the selection, keep serving it.
            Add a loop similar to handling I/O. (Yukihiro Nakadaira)
Files:      src/os_unix.c

Patch 7.3.867
Problem:    Matchparen does not update match when using auto-indenting.
            (Marc Aldorasi)
Solution:   Add the TextChanged and TextChangedI autocommand events.
Files:      runtime/plugin/matchparen.vim, src/main.c, src/edit.c,
```

```
            src/globals.h, src/vim.h, src/fileio.c, src/proto/fileio.pro,
            runtime/doc/autocmd.txt

Patch 7.3.868
Problem:    When at the hit-return prompt and using "k" while no text has
            scrolled off screen, then using "j", an empty line is displayed.
Solution:   Only act on "k" when text scrolled off screen.  Also accept
            page-up and page-down.  (cptstubing)
Files:      src/message.c

Patch 7.3.869
Problem:    bufwinnr() matches buffers in other tabs.
Solution:   For bufwinnr() and ? only match buffers in the current tab.
            (Alexey Radkov)
Files:      src/buffer.c, src/diff.c, src/eval.c, src/ex_docmd.c,
            src/if_perl.xs, src/proto/buffer.pro

Patch 7.3.870
Problem:    Compiler warnings when using MingW 4.5.3.
Solution:   Do not use MAKEINTRESOURCE. Adjust #if. (Ken Takata)
Files:      src/gui_w32.c, src/gui_w48.c, src/os_mswin.c, src/os_win32.c,
            src/os_win32.h

Patch 7.3.871
Problem:    search('^$', 'c') does not use the empty match under the cursor.
Solution:   Special handling of the 'c' flag. (Christian Brabandt)
            Add tests.
Files:      src/search.c, src/testdir/test14.in, src/testdir/test14.ok

Patch 7.3.872
Problem:    On some systems case of file names is always ignored, on others
            never.
Solution:   Add the 'fileignorecase' option to control this at runtime.
            Implies 'wildignorecase'.
Files:      src/buffer.c, src/edit.c, src/ex_cmds2.c, src/ex_getln.c,
            src/fileio.c, src/misc1.c, src/misc2.c, src/option.c,
            src/option.h, src/vim.h, runtime/doc/options.txt

Patch 7.3.873
Problem:    Cannot easily use :s to make title case.
Solution:   Have "\L\u" result in title case. (James McCoy)
Files:      src/regexp.c, src/testdir/test79.in, src/testdir/test79.ok,
            src/testdir/test80.in, src/testdir/test80.ok

Patch 7.3.874
Problem:    Comparing file names does not handle multi-byte characters
            properly.
Solution:   Implement multi-byte handling.
Files:      src/misc1.c, src/misc2.c

Patch 7.3.875 (after 7.3.866)
Problem:    Build problem with some combination of features.
Solution:   Use FEAT_XCLIPBOARD instead of FEAT_CLIPBOARD.
Files:      src/os_unix.c
```

Patch 7.3.876
Problem: #if indents are off.
Solution: Insert a space where appropriate. (Taro Muraoka)
Files: src/gui.c

Patch 7.3.877 (after 7.3.871)
Problem: Forward searching with search() is broken.
Solution: Fix it and add tests. (Sung Pae)
Files: src/search.c, src/testdir/test14.in, src/testdir/test14.ok

Patch 7.3.878
Problem: 'fileignorecase' is missing in options window and quickref.
Solution: Add the option.
Files: runtime/optwin.vim, runtime/doc/quickref.txt

Patch 7.3.879
Problem: When using an ex command in operator pending mode, using Esc to
            abort the command still executes the operator. (David Bürgin)
Solution: Clear the operator when the ex command fails. (Christian Brabandt)
Files: src/normal.c

Patch 7.3.880
Problem: When writing viminfo, old history lines may replace lines written
            more recently by another Vim instance.
Solution: Mark history entries that were read from viminfo and overwrite
            them when merging with the current viminfo.
Files: src/ex_getln.c

Patch 7.3.881
Problem: Python list does not work correctly.
Solution: Fix it and add a test. (Yukihiro Nakadaira)
Files: src/testdir/test86.in, src/testdir/test86.ok, src/if_py_both.h

Patch 7.3.882
Problem: CursorHold may trigger after receiving the termresponse.
Solution: Set the did_cursorhold flag. (Hayaki Saito)
Files: src/term.c

Patch 7.3.883 (after 7.3.880)
Problem: Can't build with some combination of features.
Solution: Adjust #ifdefs.
Files: src/ex_getln.c

Patch 7.3.884
Problem: Compiler warning for variable shadowing another. (John Little)
Solution: Rename the variable. (Christian Brabandt)
Files: src/term.c

Patch 7.3.885
Problem: Double free for list and dict in Lua. (Shougo Matsu)
Solution: Do not unref list and dict. (Yasuhiro Matsumoto)
Files: src/if_lua.c

```
Patch 7.3.886
Problem:    Can't build with multi-byte on Solaris 10.
Solution:   Add #ifdef X_HAVE_UTF8_STRING. (Laurent Blume)
Files:      src/ui.c

Patch 7.3.887
Problem:    No tests for Visual mode operators, what 7.3.879 fixes.
Solution:   Add a new test file. (David Bürgin)
Files:      src/testdir/test94.in, src/testdir/test94.ok,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile

Patch 7.3.888
Problem:    Filename completion with 'fileignorecase' does not work for
            multi-byte characters.
Solution:   Make 'fileignorecase' work properly. (Hirohito Higashi)
Files:      src/misc2.c

Patch 7.3.889
Problem:    Can't build with Ruby 2.0 on a 64 bit system.
Solution:   Define rb_fix2int and rb_num2int. (Kohei Suzuki)
Files:      src/if_ruby.c

Patch 7.3.890
Problem:    Test 79 fails on Windows. (Michael Soyka)
Solution:   Add comment below line causing an error.
Files:      src/testdir/test79.in

Patch 7.3.891
Problem:    Merging viminfo history doesn't work well.
Solution:   Don't stop when one type of history is empty. Don't merge history
            when writing viminfo.
Files:      src/ex_getln.c

Patch 7.3.892 (after 7.3.891)
Problem:    Still merging problems for viminfo history.
Solution:   Do not merge lines when writing, don't write old viminfo lines.
Files:      src/ex_getln.c, src/ex_cmds.c, src/proto/ex_getln.pro

Patch 7.3.893
Problem:    Crash when using b:, w: or t: after closing the buffer, window or
            tabpage.
Solution:   Allocate the dictionary instead of having it part of the
            buffer/window/tabpage struct. (Yukihiro Nakadaira)
Files:      src/buffer.c, src/eval.c, src/fileio.c, src/structs.h,
            src/window.c, src/proto/eval.pro

Patch 7.3.894
Problem:    Using wrong RUBY_VER causing Ruby build to break.
Solution:   Correct the RUBY_VER value. (Yongwei Wu)
Files:      src/bigvim.bat

Patch 7.3.895
```

```
Problem:    Valgrind error in test 91. (Issue 128)
Solution:   Pass scope name to find_var_in_ht().
Files:      src/eval.c

Patch 7.3.896
Problem:    Memory leaks in Lua interface.
Solution:   Fix the leaks, add tests. (Yukihiro Nakadaira)
Files:      src/testdir/test85.in, src/testdir/test85.ok, src/if_lua.c

Patch 7.3.897
Problem:    Configure doesn't always find the shared library.
Solution:   Change the configure script. (Ken Takata)
Files:      src/configure.in, src/auto/configure

Patch 7.3.898
Problem:    Memory leak reported by valgrind in test 91.
Solution:   Only use default argument when needed.
Files:      src/eval.c, src/testdir/test91.in, src/testdir/test91.ok

Patch 7.3.899
Problem:    #if indents are off.
Solution:   Fix the indents.
Files:      src/os_unix.c

Patch 7.3.900
Problem:    Not obvious that some mouse features are mutual-exclusive.
Solution:   Add a comment.
Files:      src/feature.h

Patch 7.3.901
Problem:    Outdated comment, ugly condition.
Solution:   Update a few comments, break line.
Files:      src/getchar.c, src/misc1.c, src/undo.c

Patch 7.3.902
Problem:    When deleting last buffer in other tab the tabline is not updated.
Solution:   Set the redraw_tabline flag. (Yukihiro Nakadaira)
Files:      src/window.c

Patch 7.3.903 (after 7.3.892)
Problem:    Crash on exit writing viminfo. (Ron Aaron)
Solution:   Check for the history to be empty.
Files:      src/ex_getln.c

Patch 7.3.904 (after 7.3.893)
Problem:    Using memory freed by the garbage collector.
Solution:   Mark items in aucmd_win as used.
Files:      src/eval.c

Patch 7.3.905 (after 7.3.903)
Problem:    Crash when writing viminfo. (Ron Aaron)
Solution:   Prevent freed history info to be used.
Files:      src/ex_getln.c
```

```
Patch 7.3.906
Problem:    The "sleep .2" for running tests does not work on Solaris.
Solution:   Fall back to using "sleep 1". (Laurent Blume)
Files:      src/testdir/Makefile

Patch 7.3.907
Problem:    Python uses IndexError when a dict key is not found.
Solution:   Use KeyError instead. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c,
            src/testdir/test86.ok, src/testdir/test87.ok

Patch 7.3.908
Problem:    Possible crash when using a list in Python.
Solution:   Return early if the list is NULL. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.909
Problem:    Duplicate Python code.
Solution:   Move more items to if_py_both.h. (ZyX)  Also avoid compiler
            warnings for missing initializers.
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c

Patch 7.3.910
Problem:    Python code in #ifdef branches with only minor differences.
Solution:   Merge the #ifdef branches. (ZyX)
Files:      src/if_py_both.h, src/if_python.c

Patch 7.3.911
Problem:    Python: Access to Vim variables is not so easy.
Solution:   Define vim.vars and vim.vvars. (ZyX)
Files:      runtime/doc/if_pyth.txt, src/eval.c, src/globals.h,
            src/if_py_both.h, src/if_python3.c, src/if_python.c,
            src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.912
Problem:    Typing a ":" command at the hit-enter dialog does not work if the
            "file changed" dialog happens next.
Solution:   Check for changed files before giving the hit-enter dialog.
Files:      src/message.c

Patch 7.3.913 (after 7.3.905)
Problem:    Still a crash when writing viminfo.
Solution:   Add checks for NULL pointers. (Ron Aaron)
Files:      src/ex_getln.c

Patch 7.3.914
Problem:    ~/.viminfo is messed up when running tests.
Solution:   Set the viminfo filename.
Files:      src/testdir/test89.in, src/testdir/test94.in

Patch 7.3.915
Problem:    When reading a file with encoding conversion fails at the end the
            next encoding in 'fencs' is not used.
```

```
Solution:   Retry with another encoding when possible. (Taro Muraoka)
Files:      src/fileio.c

Patch 7.3.916
Problem:    Using freed memory when pasting with the mouse (Issue 130).
Solution:   Get the byte value early. (hint by Dominique Pelle)
Files:      src/buffer.c

Patch 7.3.917
Problem:    When a path ends in a backslash appending a comma has the wrong
            effect.
Solution:   Replace a trailing backslash with a slash. (Nazri Ramliy)
Files:      src/misc1.c, src/testdir/test73.in, src/testdir/test73.ok

Patch 7.3.918
Problem:    Repeating an Ex command after using a Visual motion does not work.
Solution:   Check for an Ex command being used. (David Bürgin)
Files:      src/normal.c

Patch 7.3.919 (after 7.3.788)
Problem:    An empty nl.po file does not work with an old msgfmt.
Solution:   Put a single # in the file. (Laurent Blume)
Files:      src/po/Makefile

Patch 7.3.920
Problem:    Compiler warning for size_t to int.
Solution:   Add a type cast. (Mike Williams)
Files:      src/misc1.c

Patch 7.3.921 (after 7.3.697)
Problem:    Trying to create a fontset handle when 'guifontset' is not set.
Solution:   Add curly braces around the code block. (Max Kirillov)
Files:      src/syntax.c

Patch 7.3.922
Problem:    No test for what 7.3.918 fixes.
Solution:   Add a test. (David Bürgin)
Files:      src/testdir/test94.in, src/testdir/test94.ok

Patch 7.3.923
Problem:    Check for X11 header files fails on Solaris.
Solution:   Only use -Werror for gcc. (Laurent Blume)
Files:      src/configure.in, src/auto/configure

Patch 7.3.924
Problem:    Python interface can't easily access options.
Solution:   Add vim.options, vim.window.options and vim.buffer.options. (ZyX)
Files:      runtime/doc/if_pyth.txt, src/eval.c, src/if_py_both.h,
            src/if_python.c, src/if_python3.c, src/option.c,
            src/proto/eval.pro, src/proto/option.pro, src/testdir/test86.in,
            src/testdir/test86.ok, src/testdir/test87.in,
            src/testdir/test87.ok, src/vim.h

Patch 7.3.925
```

Problem: Typos in source files.
Solution: Fix the typos. (Ken Takata)
Files: runtime/plugin/matchparen.vim, runtime/tools/vim_vs_net.cmd,
            src/GvimExt/gvimext.cpp, src/INSTALLvms.txt, src/Make_cyg.mak,
            src/Make_mvc.mak, src/Make_sas.mak, src/Make_vms.mms,
            src/Make_w16.mak, src/Makefile, src/VisVim/OleAut.cpp,
            src/VisVim/README_VisVim.txt, src/auto/configure, src/buffer.c,
            src/configure.in, src/diff.c, src/dosinst.c, src/edit.c,
            src/eval.c, src/ex_cmds2.c, src/ex_docmd.c, src/ex_eval.c,
            src/farsi.c, src/feature.h, src/fileio.c, src/glbl_ime.cpp,
            src/gui.c, src/gui_athena.c, src/gui_beval.c, src/gui_gtk_x11.c,
            src/gui_mac.c, src/gui_motif.c, src/gui_photon.c, src/gui_w16.c,
            src/gui_w32.c, src/gui_w48.c, src/gui_xmebw.c, src/gui_xmebwp.h,
            src/hardcopy.c, src/if_cscope.c, src/if_mzsch.c, src/if_ole.cpp,
            src/if_perl.xs, src/if_py_both.h, src/if_python.c,
            src/if_python3.c, src/if_ruby.c, src/main.aap, src/mbyte.c,
            src/memfile.c, src/memline.c, src/misc1.c, src/misc2.c,
            src/nbdebug.c, src/normal.c, src/ops.c, src/os_amiga.c,
            src/os_mac.h, src/os_msdos.c, src/os_mswin.c, src/os_win16.h,
            src/os_win32.c, src/os_win32.h, src/quickfix.c, src/screen.c,
            src/search.c, src/spell.c, src/structs.h, src/syntax.c,
            src/window.c, vimtutor.com

Patch 7.3.926
Problem: Autocommands are triggered by setwinvar() et al. Missing BufEnter
            on :tabclose. Duplicate WinEnter on :tabclose. Wrong order of
            events for :tablose and :tabnew.
Solution: Fix these autocommand events. (ZyX)
Files: runtime/doc/eval.txt, src/buffer.c, src/eval.c, src/ex_cmds2.c,
            src/fileio.c, src/proto/window.pro, src/testdir/test62.in,
            src/testdir/test62.ok, src/window.c

Patch 7.3.927
Problem: Missing combining characters when putting text in a register.
Solution: Include combining characters. (David Bürgin)
Files: src/getchar.c, src/testdir/test44.in, src/testdir/test44.ok

Patch 7.3.928 (after 7.3.924)
Problem: Can't build with strict C compiler.
Solution: Move declaration to start of block. (Taro Muraoka)
Files: src/if_py_both.h

Patch 7.3.929 (after 7.3.924)
Problem: Compiler warning for unused variable. Not freeing unused string.
Solution: Remove the variable. Clear the options.
Files: src/option.c

Patch 7.3.930
Problem: MSVC 2012 update is not recognized.
Solution: Update the version in the makefile. (Raymond Ko)
Files: src/Make_mvc.mak

Patch 7.3.931

Problem: No completion for :xmap and :smap. (Yukihiro Nakadaira)
Solution: Add the case statements. (Christian Brabandt)
Files: src/ex_docmd.c

Patch 7.3.932
Problem: Compiler warning for uninitialized variable. (Tony Mechelynck)
Solution: Initialize the variable.
Files: src/option.c

Patch 7.3.933
Problem: Ruby on Mac crashes due to GC failure.
Solution: Init the stack from main(). (Hiroshi Shirosaki)
Files: src/main.c, src/if_ruby.c, src/proto/if_ruby.pro

Patch 7.3.934
Problem: E381 and E380 make the user think nothing happened.
Solution: Display the message indicating what error list is now active.
            (Christian Brabandt)
Files: src/quickfix.c

Patch 7.3.935 (after 7.3.933)
Problem: Ruby: Init stack works differently on 64 bit systems.
Solution: Handle 64 bit systems and also static library. (Yukihiro
            Nakadaira)
Files: src/if_ruby.c

Patch 7.3.936 (after 7.3.935)
Problem: Ruby 1.8: Missing piece for static linking on 64 bit systems.
Solution: Define ruby_init_stack() (Hiroshi Shirosaki)
            Also fix preprocessor indents.
Files: src/if_ruby.c

Patch 7.3.937
Problem: More can be shared between Python 2 and 3.
Solution: Move code to if_py_both.h. (ZyX)
Files: src/if_python.c, src/if_python3.c, src/if_py_both.h

Patch 7.3.938
Problem: Python: not easy to get to window number.
Solution: Add vim.window.number. (ZyX)
Files: runtime/doc/if_pyth.txt, src/if_py_both.h, src/proto/window.pro,
            src/window.c

Patch 7.3.939
Problem: Using Py_BuildValue is inefficient sometimes.
Solution: Use PyLong_FromLong(). (ZyX)
Files: src/if_py_both.h

Patch 7.3.940
Problem: Python: Can't get position of window.
Solution: Add window.row and window.col. (ZyX)
Files: runtime/doc/if_pyth.txt, src/if_py_both.h

Patch 7.3.941

```
Problem:    Stuff in if_py_both.h is ordered badly.
Solution:   Reorder by type. (ZyX)
Files:      src/if_py_both.h, src/if_python.c

Patch 7.3.942
Problem:    Python: SEGV in Buffer functions.
Solution:   Call CheckBuffer() at the right time. (ZyX)
Files:      src/if_py_both.h, src/if_python.c, src/if_python3.c

Patch 7.3.943
Problem:    Python: Negative indices were failing.
Solution:   Fix negative indices. Add tests. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/testdir/test86.in,
            src/testdir/test86.ok, src/testdir/test87.in,
            src/testdir/test87.ok

Patch 7.3.944
Problem:    External program receives the termresponse.
Solution:   Insert a delay and discard input. (Hayaki Saito)
Files:      src/term.c

Patch 7.3.945
Problem:    Python: List of buffers is not very useful.
Solution:   Make vim.buffers a map. No iterator yet. (ZyX)
Files:      runtime/doc/if_pyth.txt, src/if_py_both.h, src/if_python3.c,
            src/if_python.c, src/testdir/test86.ok, src/testdir/test87.ok

Patch 7.3.946
Problem:    Sometimes get stuck in waiting for cursor position report,
            resulting in keys starting with <Esc>[ not working.
Solution:   Only wait for more characters after <Esc>[ if followed by '?', '>'
            or a digit.
Files:      src/term.c

Patch 7.3.947
Problem:    Python: No iterator for vim.list and vim.bufferlist.
Solution:   Add the iterators. Also fix name of FunctionType. Add tests for
            vim.buffers.  (ZyX)
Files:      runtime/doc/if_pyth.txt, src/eval.c, src/if_py_both.h,
            src/if_python3.c, src/if_python.c, src/proto/eval.pro,
            src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.948
Problem:    Cannot build with Python 2.2
Solution:   Make Python interface work with Python 2.2
            Make 2.2 the first supported version. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c,
            src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.ok, src/configure.in, src/auto/configure

Patch 7.3.949
Problem:    Python: no easy access to tabpages.
Solution:   Add vim.tabpages and vim.current.tabpage. (ZyX)
```

```
Files:      runtime/doc/if_pyth.txt, src/if_py_both.h, src/if_python3.c,
            src/if_python.c, src/proto/if_python3.pro,
            src/proto/if_python.pro, src/proto/window.pro, src/structs.h,
            src/window.c

Patch 7.3.950
Problem:    Python: Stack trace printer can't handle messages.
Solution:   Make KeyErrors use PyErr_SetObject. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c

Patch 7.3.951
Problem:    Python exceptions have problems.
Solution:   Change some IndexErrors to TypeErrors. Make “line number out of
            range” an IndexError.  Make “unable to get option value” a
            RuntimeError. Make all PyErr_SetString messages start with
            lowercase letter and use _(). (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c,
            src/testdir/test86.ok, src/testdir/test87.ok

Patch 7.3.952
Problem:    Python: It's not easy to change window/buffer/tabpage.
Solution:   Add ability to assign to vim.current.{tabpage,buffer,window}.
            (ZyX)
Files:      runtime/doc/if_pyth.txt, src/if_py_both.h

Patch 7.3.953
Problem:    Python: string exceptions are deprecated.
Solution:   Make vim.error an Exception subclass. (ZyX)
Files:      src/if_python.c, src/if_python3.c

Patch 7.3.954
Problem:    No check if PyObject_IsTrue fails.
Solution:   Add a check for -1 value. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.955
Problem:    Python: Not enough tests.
Solution:   Add tests for vim.{current,window*,tabpage*}. (ZyX)
Files:      src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.956
Problem:    Python vim.bindeval() causes SIGABRT.
Solution:   Make pygilstate a local variable. (Yukihiro Nakadaira)
Files:      src/if_py_both.h, src/if_python.c, src/if_python3.c

Patch 7.3.957
Problem:    Python does not have a "do" command like Perl or Lua.
Solution:   Add the ":py3do" command. (Lilydjwg)
Files:      runtime/doc/if_pyth.txt, src/ex_cmds.h, src/ex_docmd.c,
            src/if_python3.c, src/proto/if_python3.pro

Patch 7.3.958
Problem:    Python: Iteration destructor not set.
```

```
Solution:   Put IterDestructor to use. (ZyX)
Files:      src/if_py_both.c

Patch 7.3.959 (after 7.3.957)
Problem:    Missing error number.
Solution:   Assign an error number.
Files:      src/if_python3.c

Patch 7.3.960
Problem:    Compiler warning for unused variable.
Solution:   Put declaration in #ifdef.
Files:      src/window.c

Patch 7.3.961
Problem:    Tests 86 and 87 fail when using another language than English.
Solution:   Set the language to C in the test. (Dominique Pelle)
Files:      src/testdir/test86.in, src/testdir/test87.in,
            src/testdir/test87.ok

Patch 7.3.962
Problem:    Python tests are not portable.
Solution:   Use shiftwidth instead of iminsert. (ZyX)
Files:      src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.963
Problem:    Setting curbuf without curwin causes trouble.
Solution:   Add switch_buffer() and restore_buffer().  Block autocommands to
            avoid trouble.
Files:      src/eval.c, src/proto/eval.pro, src/proto/window.pro,
            src/if_py_both.h, src/window.c, src/testdir/test86.ok

Patch 7.3.964
Problem:    Python: not so easy to access tab pages.
Solution:   Add window.tabpage, make window.number work with non-current tab
            pages. (ZyX)
Files:      runtime/doc/if_pyth.txt, src/if_py_both.h, src/if_python3.c,
            src/if_python.c, src/testdir/test86.ok, src/testdir/test87.ok

Patch 7.3.965
Problem:    Python garbage collection not working properly.
Solution:   Add support for garbage collection. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.966
Problem:    There is ":py3do" but no ":pydo".
Solution:   Add the ":pydo" command. (Lilydjwg)
Files:      runtime/doc/if_pyth.txt, src/ex_cmds.h, src/ex_docmd.c,
            src/if_py_both.h, src/if_python.c, src/if_python3.c,
            src/proto/if_python.pro

Patch 7.3.967 (after 7.3.965)
Problem:    Build fails on Mac OSX. (Greg Novack)
Solution:   Undefine clear().
```

```
Files:      src/if_py_both.h

Patch 7.3.968
Problem:    Multi-byte support is only available when compiled with "big"
            features.
Solution:   Include multi-byte by default, with "normal" features.
Files:      src/feature.h

Patch 7.3.969
Problem:    Can't build with Python 3 and without Python 2.
Solution:   Adjust #ifdef. (Xavier de Gaye)
Files:      src/window.c

Patch 7.3.970
Problem:    Syntax highlighting can be slow.
Solution:   Include the NFA regexp engine.  Add the 'regexpengine' option to
            select which one is used. (various authors, including Ken Takata,
            Andrei Aiordachioaie, Russ Cox, Xiaozhou Liua, Ian Young)
Files:      src/Make_cyg.mak, src/Make_ming.mak, src/Make_mvc.mak,
            src/Makefile, src/regexp.c, src/regexp.h, src/regexp_nfa.c,
            src/structs.h, src/testdir/Makefile, src/testdir/test64.in,
            src/testdir/test64.ok, Filelist, runtime/doc/pattern.txt,
            runtime/doc/option.txt, src/option.c, src/option.h,
            src/testdir/test95.in, src/testdir/test95.ok,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile

Patch 7.3.971
Problem:    No support for VS2012 static code analysis.
Solution:   Add the ANALYZE option. (Mike Williams)
Files:      src/Make_mvc.mak

Patch 7.3.972
Problem:    Cursor not restored after InsertEnter autocommand if it moved to
            another line.
Solution:   Also restore if the saved line number is still valid.  Allow
            setting v:char to skip restoring.
Files:      src/edit.c, runtime/doc/autocmd.txt

Patch 7.3.973
Problem:    Compiler warnings. Crash on startup. (Tony Mechelynck)
Solution:   Change EMSG2 to EMSGN. Make array one character longer.
Files:      src/regexp_nfa.c

Patch 7.3.974
Problem:    Can't build with ruby 1.8.5.
Solution:   Only use ruby_init_stack() when RUBY_INIT_STACK is defined.
            (Yukihiro Nakadaira)
Files:      src/if_ruby.c

Patch 7.3.975
Problem:    Crash in regexp parsing.
Solution:   Correctly compute the end of allocated memory.
```

```
Files:      src/regexp_nfa.c

Patch 7.3.976
Problem:    Can't build on HP-UX.
Solution:   Remove modern initialization. (John Marriott)
Files:      src/regexp_nfa.c

Patch 7.3.977
Problem:    Compiler warnings on 64 bit Windows.
Solution:   Add type casts. (Mike Williams)  Also fix some white space and
            uncomment what was commented-out for testing.
Files:      src/regexp_nfa.c

Patch 7.3.978
Problem:    Regexp debug logs don't have a good name.
Solution:   Use clear names and make it possible to write logs for the old and
            new engines separately. (Taro Muraoka)
Files:      src/regexp.c, src/regexp_nfa.c

Patch 7.3.979
Problem:    Complex NFA regexp doesn't work.
Solution:   Set actual state stack end instead of using an arbitrary number.
            (Yasuhiro Matsumoto)
Files:      src/regexp_nfa.c

Patch 7.3.980
Problem:    Regexp logs may contain garbage. Character classes don't work
            correctly for multi-byte characters.
Solution:   Check for end of post list.  Only use "is" functions for
            characters up to 255. (Ken Takata)
Files:      src/regexp_nfa.c

Patch 7.3.981
Problem:    In the old regexp engine \i, \I, \f and \F don't work on
            multi-byte characters.
Solution:   Dereference pointer properly.
Files:      src/regexp.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.982
Problem:    In the new regexp engine \p does not work on multi-byte
            characters.
Solution:   Don't point to an integer but the characters.
Files:      src/regexp_nfa.c, src/testdir/test95.in, src/testdir/test95.ok

Patch 7.3.983
Problem:    Unnecessary temp variable.
Solution:   Remove the variable.
Files:      src/regexp_nfa.c

Patch 7.3.984
Problem:    A Visual mapping that uses CTRL-G works differently when started
            from Insert mode. (Ein Brown)
Solution:   Reset old_mapped_len when handling typed text in Select mode.
Files:      src/normal.c
```

```
Patch 7.3.985
Problem:    GTK vim not started as gvim doesn't set WM_CLASS property to a
            useful value.
Solution:   Call g_set_prgname() on startup. (James McCoy)
Files:      src/gui_gtk_x11.c

Patch 7.3.986
Problem:    Test 95 doesn't pass when 'encoding' isn't utf-8. (Yasuhiro
            Matsumoto)
Solution:   Force 'encoding' to be utf-8.
Files:      src/testdir/test95.in

Patch 7.3.987
Problem:    No easy to run an individual test.  Tests 64 fails when
            'encoding' is not utf-8.
Solution:   Add individual test targets to the Makefile.  Move some lines from
            test 64 to 95.
Files:      src/Makefile, src/testdir/test64.in, src/testdir/test64.ok,
            src/testdir/test95.in, src/testdir/test95.ok

Patch 7.3.988
Problem:    New regexp engine is slow.
Solution:   Break out of the loop when the state list is empty.
Files:      src/regexp_nfa.c

Patch 7.3.989
Problem:    New regexp engine compares negative numbers to character.
Solution:   Add missing case statements.
Files:      src/regexp_nfa.c

Patch 7.3.990
Problem:    Memory leak in new regexp engine.
Solution:   Jump to end of function to free memory. (Dominique Pelle)
Files:      src/regexp_nfa.c

Patch 7.3.991
Problem:    More can be shared by Python 2 and 3.
Solution:   Move more stuff to if_py_both. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c,
            src/testdir/test87.ok

Patch 7.3.992
Problem:    Python: Too many type casts.
Solution:   Change argument types. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c

Patch 7.3.993
Problem:    Python: Later patch does things slightly differently.
Solution:   Adjusted argument type changes. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c

Patch 7.3.994
Problem:    Python: using magic constants.
```

```
Solution:   Use descriptive values for ml_flags. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c

Patch 7.3.995
Problem:    Python: Module initialization is duplicated.
Solution:   Move to shared file. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c

Patch 7.3.996
Problem:    Python: Can't check types of what is returned by bindeval().
Solution:   Add vim.List, vim.Dictionary and vim.Function types. (ZyX)
Files:      runtime/doc/if_pyth.txt, src/if_py_both.h, src/testdir/test86.in,
            src/testdir/test86.ok, src/testdir/test87.in,
            src/testdir/test87.ok

Patch 7.3.997
Problem:    Vim and Python exceptions are different.
Solution:   Make Vim exceptions be Python exceptions. (ZyX)
Files:      src/if_py_both.h, src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.998
Problem:    Python: garbage collection issues.
Solution:   Fix the GC issues: Use proper DESTRUCTOR_FINISH: avoids negative
            refcounts, use PyObject_GC_* for objects with tp_traverse and
            tp_clear, add RangeTraverse and RangeClear, use Py_XDECREF in some
            places. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c

Patch 7.3.999
Problem:    New regexp engine sets curbuf temporarily.
Solution:   Use reg_buf instead, like the old engine.
Files:      src/regexp_nfa.c

Patch 7.3.1000 (whoa!)
Problem:    Typo in char value causes out of bounds access.
Solution:   Fix character value.  (Klemens Baum)
Files:      src/regexp.c

Patch 7.3.1001
Problem:    Duplicate condition in if.
Solution:   Remove one condition.
Files:      src/regexp_nfa.c

Patch 7.3.1002
Problem:    Valgrind errors for Python interface.
Solution:   Fix memory leaks when running tests. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1003
Problem:    Python interface does not compile with Python 2.2
Solution:   Fix thread issues and True/False. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c,
            src/testdir/test86.in, src/testdir/test86.ok,
```

```
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.1004
Problem:    No error when option could not be set.
Solution:   Report an error. (ZyX)
Files:      src/if_py_both.h, src/option.c, src/proto/option.pro,
            src/testdir/test86.ok, src/testdir/test87.ok

Patch 7.3.1005
Problem:    Get stuck on regexp "\n*" and on "%s/^\n\+/\r".
Solution:   Fix handling of matching a line break. (idea by Hirohito Higashi)
Files:      src/regexp_nfa.c

Patch 7.3.1006
Problem:    NFA engine not used for "\_[0-9]".
Solution:   Enable this, fixed in patch 1005.
Files:      src/regexp_nfa.c

Patch 7.3.1007
Problem:    Can't build on Minix 3.2.1.
Solution:   Add a condition to an #ifdef. (Gautam Tirumala)
Files:      src/memfile.c

Patch 7.3.1008
Problem:    Test 95 fails on MS-Windows.
Solution:   Set 'nomore'. Change \i to \f.  Change multi-byte character to
            something that is not matching \i. (Ken Takata)
Files:      src/testdir/test95.in, src/testdir/test95.ok

Patch 7.3.1009
Problem:    Compiler warning for ambiguous else.
Solution:   Add curly braces.
Files:      src/if_py_both.h

Patch 7.3.1010
Problem:    New regexp: adding \Z makes every character match.
Solution:   Only apply ireg_icombine for composing characters.
            Also add missing change from patch 1008. (Ken Takata)
Files:      src/regexp_nfa.c, src/testdir/test95.in, src/testdir/test95.ok

Patch 7.3.1011
Problem:    New regexp engine is inefficient with multi-byte characters.
Solution:   Handle a character at a time instead of a byte at a time.  Also
            make \Z partly work.
Files:      src/regexp_nfa.c, src/testdir/test95.in, src/testdir/test95.ok

Patch 7.3.1012
Problem:    \Z does not work properly with the new regexp engine.
Solution:   Make \Z work.  Add tests.
Files:      src/regexp_nfa.c, src/testdir/test95.in, src/testdir/test95.ok

Patch 7.3.1013
Problem:    New regexp logging is a bit messy.
Solution:   Consistently use #defines, add explanatory comment. (Taro Muraoka)
```

```
Files:      src/regexp_nfa.c

Patch 7.3.1014
Problem:    New regexp state dump is hard to read.
Solution:   Make the state dump more pretty. (Taro Muraoka)
Files:      src/regexp_nfa.c

Patch 7.3.1015
Problem:    New regexp engine: Matching composing characters is wrong.
Solution:   Fix matching composing characters.
Files:      src/regexp_nfa.c, src/testdir/test95.in, src/testdir/test95.ok

Patch 7.3.1016
Problem:    Unused field in nfa_state.
Solution:   Remove lastthread.
Files:      src/regexp.h, src/regexp_nfa.c

Patch 7.3.1017
Problem:    Zero width match changes length of match.
Solution:   For a zero width match put new states in the current position in
            the state list.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok,
            src/regexp.h

Patch 7.3.1018
Problem:    New regexp engine wastes memory.
Solution:   Allocate prog with actual number of states, not estimated maximum
            number of sates.
Files:      src/regexp_nfa.c

Patch 7.3.1019
Problem:    These do not work with the new regexp engine: \%o123, \%x123,
            \%d123, \%u123 and \%U123.
Solution:   Implement these items.
Files:      src/regexp_nfa.c

Patch 7.3.1020
Problem:    Not all patterns are tested with auto / old / new engine.
Solution:   Test patterns with three values of 'regexpengine'.
Files:      src/testdir/test64.in, src/testdir/test64.ok,
            src/testdir/test95.in, src/testdir/test95.ok

Patch 7.3.1021
Problem:    New regexp engine does not ignore order of composing chars.
Solution:   Ignore composing chars order.
Files:      src/regexp_nfa.c, src/testdir/test95.in, src/testdir/test95.ok

Patch 7.3.1022
Problem:    Compiler warning for shadowed variable. (John Little)
Solution:   Move declaration, rename variables.
Files:      src/regexp_nfa.c

Patch 7.3.1023
Problem:    Searching for composing char only and using \Z has different
```

```
            results.
Solution:   Make it match the composing char, matching everything is not
            useful.
Files:      src/regexp_nfa.c, src/testdir/test95.in, src/testdir/test95.ok

Patch 7.3.1024
Problem:    New regexp: End of matching pattern not set correctly. (Cesar
            Romani)
Solution:   Quit the loop after finding the match.  Store nfa_has_zend in the
            program.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok,
            src/regexp.h

Patch 7.3.1025
Problem:    New regexp: not matching newline in string. (Marc Weber)
Solution:   Check for "\n" character.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1026
Problem:    New regexp: pattern that includes a new-line matches too early.
            (John McGowan)
Solution:   Do not start searching in the second line.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1027
Problem:    New regexp performance: Calling no_Magic() very often.
Solution:   Remove magicness inline.
Files:      src/regexp_nfa.c

Patch 7.3.1028
Problem:    New regexp performance: Copying a lot of position state.
Solution:   Only copy the sub-expressions that are being used.
Files:      src/regexp_nfa.c, src/regexp.h

Patch 7.3.1029
Problem:    New regexp performance: Unused position state being copied.
Solution:   Keep track of which positions are actually valid.
Files:      src/regexp_nfa.c

Patch 7.3.1030 (after 7.3.1028)
Problem:    Can't build for debugging.
Solution:   Fix struct member names.
Files:      src/regexp_nfa.c

Patch 7.3.1031
Problem:    Compiler warnings for shadowed variable. (John Little)
Solution:   Move the variable declarations to the scope where they are used.
Files:      src/regexp_nfa.c

Patch 7.3.1032
Problem:    "\ze" is not supported by the new regexp engine.
Solution:   Make "\ze" work.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok
```

```
Patch 7.3.1033
Problem:    "\1" .. "\9" are not supported in the new regexp engine.
Solution:   Implement them.  Add a few more tests.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok,
            src/regexp.h

Patch 7.3.1034
Problem:    New regexp code using strange multi-byte code.
Solution:   Use the normal code to advance and backup pointers.
Files:      src/regexp_nfa.c

Patch 7.3.1035
Problem:    Compiler warning on 64 bit windows.
Solution:   Add type cast. (Mike Williams)
Files:      src/if_py_both.h

Patch 7.3.1036
Problem:    Can't build on HP-UX.
Solution:   Give the union a name. (John Marriott)
Files:      src/regexp_nfa.c

Patch 7.3.1037
Problem:    Look-behind matching is very slow on long lines.
Solution:   Add a byte limit to how far back an attempt is made.
Files:      src/regexp.c, src/regexp_nfa.c, src/testdir/test64.in,
            src/testdir/test64.ok

Patch 7.3.1038
Problem:    Crash when using Cscope.
Solution:   Avoid negative argument to vim_strncpy(). (Narendran
            Gopalakrishnan)
Files:      src/if_cscope.c

Patch 7.3.1039
Problem:    New regexp engine does not support \%23c, \%<23c and the like.
Solution:   Implement them. (partly by Yasuhiro Matsumoto)
Files:      src/regexp.h, src/regexp_nfa.c, src/testdir/test64.in,
            src/testdir/test64.ok

Patch 7.3.1040
Problem:    Python: Problems with debugging dynamic build.
Solution:   Python patch 1. (ZyX)
Files:      src/if_python.c, src/if_python3.c

Patch 7.3.1041
Problem:    Python: Invalid read valgrind errors.
Solution:   Python patch 2: defer DICTKEY_UNREF until key is no longer needed.
            (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1042
Problem:    Python: can't assign to vim.Buffer.name.
Solution:   Python patch 3. (ZyX)
Files:      runtime/doc/if_pyth.txt, src/ex_cmds.c, src/if_py_both.h,
```

```
            src/if_python3.c, src/if_python.c, src/proto/ex_cmds.pro,
            src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.1043
Problem:    Python: Dynamic compilation with 2.3 fails.
Solution:   Python patch 4. (ZyX)
Files:      src/if_python.c

Patch 7.3.1044
Problem:    Python: No {Buffer,TabPage,Window}.valid attributes.
Solution:   Python patch 5: add .valid (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c,
            src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.1045
Problem:    Python: No error handling for VimToPython function.
Solution:   Python patch 6. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1046
Problem:    Python: Using Py_BuildValue for building strings.
Solution:   Python patch 7 and 7.5: Replace Py_BuildValue with
            PyString_FromString. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1047
Problem:    Python: dir() does not work properly.
Solution:   Python patch 8.  Add __dir__ method to all objects with custom
            tp_getattr supplemented by __members__ attribute for at least
            python-2* versions.  __members__ is not mentioned in python-3*
            dir() output even if it is accessible. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c,
            src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.1048
Problem:    Python: no consistent naming.
Solution:   Python patch 9: Rename d to dict and lookupDict to lookup_dict.
            (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1049
Problem:    Python: no consistent naming
Solution:   Python patch 10: Rename DICTKEY_GET_NOTEMPTY to DICTKEY_GET. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1050
Problem:    Python: Typo in pyiter_to_tv.
Solution:   Python patch 11. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1051
```

```
Problem:    Python: possible memory leaks.
Solution:   Python patch 12: fix the leaks (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1052
Problem:    Python: possible SEGV and negative refcount.
Solution:   Python patch 13: Fix IterIter function. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1053
Problem:    Python: no flag for types with tp_traverse+tp_clear.
Solution:   Python patch 14: Add Py_TPFLAGS_HAVE_GC. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1054 (after 7.3.1042)
Problem:    Can't build without the +autocmd feature. (Elimar Riesebieter)
Solution:   Fix use of buf and curbuf.
Files:      src/ex_cmds.c, src/testdir/test86.ok, src/testdir/test87.ok

Patch 7.3.1055
Problem:    Negated collection does not match newline.
Solution:   Handle newline differently. (Hiroshi Shirosaki)
Files:      src/regexp_nfa.c, src/testdir/test64.ok, src/testdir/test64.in

Patch 7.3.1056
Problem:    Python: possible memory leaks.
Solution:   Python patch 15. (ZyX) Fix will follow later.
Files:      src/eval.c, src/if_py_both.h, src/proto/eval.pro

Patch 7.3.1057
Problem:    Python: not enough compatibility.
Solution:   Python patch 16: Make OutputWritelines support any sequence object
            (ZyX) Note: tests fail
Files:      src/if_py_both.h, src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.1058
Problem:    Call of funcref does not succeed in other script.
Solution:   Python patch 17: add get_expanded_name(). (ZyX)
Files:      src/eval.c, src/proto/eval.pro

Patch 7.3.1059
Problem:    Python: Using fixed size buffers.
Solution:   Python patch 18: Use python's own formatter. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c

Patch 7.3.1060
Problem:    Python: can't repr() a function.
Solution:   Python patch 19: add FunctionRepr(). (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1061
Problem:    Python: Dictionary is not standard.
Solution:   Python patch 20: Add standard methods and fields. (ZyX)
```

```
Files:      runtime/doc/if_pyth.txt, src/eval.c, src/if_py_both.h,
            src/if_python3.c, src/if_python.c, src/proto/eval.pro,
            src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.1062
Problem:    Python: List is not standard.
Solution:   Python patch 21: Add standard methods and fields. (ZyX)
Files:      src/if_py_both.h, src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.1063
Problem:    Python: Function is not standard.
Solution:   Python patch 22: make Function subclassable. (ZyX)
Files:      src/eval.c, src/if_py_both.h, src/proto/eval.pro,
            src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.1064
Problem:    Python: insufficient error checking.
Solution:   Python patch 23. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1065
Problem:    Python: key mapping is not standard.
Solution:   Python patch 24: use PyMapping_Keys. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c

Patch 7.3.1066
Problem:    Python: Insufficient exception and error testing.
Solution:   Python patch 25. (ZyX)
Files:      src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.1067
Problem:    Python: documentation lags behind.
Solution:   Python patch 26. (ZyX)
Files:      runtime/doc/if_pyth.txt

Patch 7.3.1068
Problem:    Python: Script is auto-loaded on function creation.
Solution:   Python patch 27. (ZyX)
Files:      src/eval.c, src/if_py_both.h, src/proto/eval.pro,
            src/testdir/test86.ok, src/testdir/test87.ok, src/vim.h

Patch 7.3.1069
Problem:    Python: memory leaks.
Solution:   Python patch 28: Purge out DICTKEY_CHECK_EMPTY macros. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1070
Problem:    Vim crashes in Python tests. Compiler warning for unused function.
Solution:   Disable the tests for now. Move the function.
Files:      src/if_py_both.h, src/if_python.c, src/testdir/test86.in,
```

```
            src/testdir/test87.in

Patch 7.3.1071
Problem:    New regexp engine: backreferences don't work correctly.
Solution:   Add every possible start/end position on the state stack.
Files:      src/regexp_nfa.c, src/regexp.h, src/testdir/test64.in,
            src/testdir/test64.ok

Patch 7.3.1072
Problem:    Compiler warning for uninitialized variable.
Solution:   Initialize it.
Files:      src/regexp_nfa.c

Patch 7.3.1073
Problem:    New regexp engine may run out of states.
Solution:   Allocate states dynamically.  Also make the test report errors.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok,
            src/testdir/test95.in

Patch 7.3.1074
Problem:    Compiler warning for printf format. (Manuel Ortega)
Solution:   Add type casts.
Files:      src/if_py_both.h

Patch 7.3.1075
Problem:    Compiler warning for storing a long_u in an int.
Solution:   Declare the number as an int. (Mike Williams)
Files:      src/regexp_nfa.c

Patch 7.3.1076
Problem:    New regexp engine: \@= and \& don't work.
Solution:   Make these items work.  Add column info to logging.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1077
Problem:    Python: Allocating dict the wrong way, causing a crash.
Solution:   Use py_dict_alloc(). Fix some exception problems. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1078
Problem:    New regexp engine: \@! doesn't work.
Solution:   Implement the negated version of \@=.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1079
Problem:    Test 87 fails.
Solution:   Fix the test for Python 3.3. (ZyX)  Make it pass on 32 bit systems.
Files:      src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.1080
Problem:    Test 86 fails.
Solution:   Comment out the parts that don't work.  Make it pass on 32 bit
            systems.
Files:      src/testdir/test86.in, src/testdir/test86.ok
```

```
Patch 7.3.1081
Problem:    Compiler warnings on 64-bit Windows.
Solution:   Change variable types. (Mike Williams)
Files:      src/if_py_both.h, src/regexp_nfa.c

Patch 7.3.1082
Problem:    New regexp engine: Problem with \@= matching.
Solution:   Save and restore nfa_match.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1083
Problem:    New regexp engine: Does not support \%^ and \%$.
Solution:   Support matching start and end of file.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1084
Problem:    New regexp engine: only accepts up to \{,10}.
Solution:   Remove upper limit.  Remove dead code with NFA_PLUS.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1085
Problem:    New regexp engine: Non-greedy multi doesn't work.
Solution:   Implement \{-}.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1086
Problem:    Old regexp engine accepts illegal range, new one doesn't.
Solution:   Also accept the illegal range with the new engine.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1087
Problem:    A leading star is not seen as a normal char when \{} follows.
Solution:   Save and restore the parse state properly.
Files:      src/regexp.c, src/regexp_nfa.c, src/testdir/test64.in,
            src/testdir/test64.ok

Patch 7.3.1088
Problem:    New regexp engine: \@<= and \@<! are not implemented.
Solution:   Implement look-behind matching.  Fix off-by-one error in old
            regexp engine.
Files:      src/regexp.c, src/regexp_nfa.c, src/testdir/test64.in,
            src/testdir/test64.ok

Patch 7.3.1089
Problem:    Tests 86 and 87 fail on MS-Windows. (Ken Takata)
Solution:   Fix platform-specific stuff. (ZyX)
Files:      src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.1090
Problem:    New regexp engine does not support \z1 .. \z9 and \z(.
Solution:   Implement the syntax submatches.
Files:      src/regexp.h, src/regexp_nfa.c
```

```
Patch 7.3.1091
Problem:    New regexp engine: no error when using \z1 or \z( where it does
            not work.
Solution:   Give an error message.
Files:      src/regexp.c, src/regexp_nfa.c

Patch 7.3.1092
Problem:    Can't build with regexp debugging.  NFA debug output shows wrong
            pattern.
Solution:   Fix debugging code for recent changes.  Add the pattern to the
            program.
Files:      src/regexp_nfa.c, src/regexp.h

Patch 7.3.1093
Problem:    New regexp engine: When a sub expression is empty \1 skips a
            character.
Solution:   Make \1 try the current position when the match is empty.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1094
Problem:    New regexp engine: Attempts to match "^" at every character.
Solution:   Only try "^" at the start of a line.
Files:      src/regexp_nfa.c

Patch 7.3.1095
Problem:    Compiler warnings for shadowed variables. (Christian Brabandt)
Solution:   Rename new_state() to alloc_state().  Remove unnecessary
            declaration.
Files:      src/regexp_nfa.c

Patch 7.3.1096
Problem:    Python: popitem() was not defined in a standard way.
Solution:   Remove the argument from popitem(). (ZyX)
Files:      runtime/doc/if_pyth.txt, src/if_py_both.h, src/testdir/test86.in,
            src/testdir/test86.ok, src/testdir/test87.in,
            src/testdir/test87.ok

Patch 7.3.1097
Problem:    Python: a few recently added items are not documented.
Solution:   Update the documentation. (ZyX)
Files:      runtime/doc/if_pyth.txt

Patch 7.3.1098
Problem:    Python: Possible memory leaks
Solution:   Add Py_XDECREF() calls. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1099
Problem:    Python: Changing directory with os.chdir() causes problems for
            Vim's notion of directories.
Solution:   Add vim.chdir() and vim.fchdir(). (ZyX)
Files:      runtime/doc/if_pyth.txt, src/ex_docmd.c, src/if_py_both.h,
            src/if_python3.c, src/if_python.c, src/proto/ex_docmd.pro,
```

```
            src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.1100
Problem:    Python: a few more memory problems.
Solution:   Add and remove Py_XDECREF(). (ZyX)
Files:      src/if_py_both.h, src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.1101
Problem:    Configure doesn't find Python 3 on Ubuntu 13.04.
Solution:   First try distutils.sysconfig. Also fix some indents.  (Ken
            Takata)
Files:      src/configure.in, src/auto/configure

Patch 7.3.1102
Problem:    Completion of ":py3do" and ":py3file" does not work after ":py3".
Solution:   Make completion work. (Taro Muraoka)
Files:      src/ex_docmd.c

Patch 7.3.1103
Problem:    New regexp engine: overhead in saving and restoring.
Solution:   Make saving and restoring list IDs faster.  Don't copy or check \z
            subexpressions when they are not used.
Files:      src/regexp_nfa.c

Patch 7.3.1104
Problem:    New regexp engine does not handle "~".
Solution:   Add support for "~".
Files:      src/regexp_nfa.c, src/testdir/test24.in, src/testdir/test24.ok

Patch 7.3.1105
Problem:    New regexp engine: too much code in one function.  Dead code.
Solution:   Move the recursive nfa_regmatch call to a separate function.
            Remove the dead code.
Files:      src/regexp_nfa.c

Patch 7.3.1106
Problem:    New regexp engine: saving and restoring lastlist in the states
            takes a lot of time.
Solution:   Use a second lastlist value for the first recursive call.
Files:      src/regexp.h, src/regexp_nfa.c

Patch 7.3.1107
Problem:    Compiler warnings for unused variables.
Solution:   Put the variables inside #ifdef.
Files:      src/regexp.c, src/regexp_nfa.c

Patch 7.3.1108
Problem:    Error message for os.fchdir() (Charles Peacech)
Solution:   Clear the error. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1109
```

```
Problem:    Building on MS-Windows doesn't see changes in if_py_both.h.
Solution:   Add a dependency. (Ken Takata)
Files:      src/Make_bc5.mak, src/Make_cyg.mak, src/Make_ming.mak,
            src/Make_mvc.mak

Patch 7.3.1110
Problem:    New regexp matching: Using \@= and the like can be slow.
Solution:   Decide whether to first try matching the zero-width part or what
            follows, whatever is more likely to fail.
Files:      src/regexp_nfa.c

Patch 7.3.1111
Problem:    nfa_recognize_char_class() implementation is inefficient.
Solution:   Use bits in an int instead of chars in a string. (Dominique Pelle)
Files:      src/regexp_nfa.c, src/testdir/test36.in, src/testdir/test36.ok

Patch 7.3.1112
Problem:    New regexp engine: \%V not supported.
Solution:   Implement \%V.  Add tests.
Files:      src/regexp.c, src/regexp_nfa.c, src/testdir/test64.in,
            src/testdir/test64.ok

Patch 7.3.1113
Problem:    New regexp engine: \%'m not supported.
Solution:   Implement \%'m.  Add tests.
Files:      src/regexp.c, src/regexp_nfa.c, src/testdir/test64.in,
            src/testdir/test64.ok

Patch 7.3.1114 (after 7.3.1110)
Problem:    Can't build without the syntax feature.
Solution:   Add #ifdefs. (Erik Falor)
Files:      src/regexp_nfa.c

Patch 7.3.1115
Problem:    Many users don't like the cursor line number when 'relativenumber'
            is set.
Solution:   Have four combinations with 'number' and 'relativenumber'.
            (Christian Brabandt)
Files:      runtime/doc/options.txt, src/option.c, src/screen.c,
            src/testdir/test89.in, src/testdir/test89.ok

Patch 7.3.1116
Problem:    Can't build without Visual mode.
Solution:   Add #ifdefs.
Files:      src/regexp_nfa.c

Patch 7.3.1117
Problem:    New regexp engine: \%[abc] not supported.
Solution:   Implement \%[abc].  Add tests.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1118
Problem:    Match failure rate is not very specific.
Solution:   Tune the failure rate for match items.
```

```
Files:      src/regexp_nfa.c

Patch 7.3.1119
Problem:    Flags in 'cpo' are search for several times.
Solution:   Store the result and re-use the flags.
Files:      src/regexp.c, src/regexp_nfa.c

Patch 7.3.1120
Problem:    Crash when regexp logging is enabled.
Solution:   Avoid using NULL pointers. Advance over count argument.
Files:      src/regexp.c, src/regexp_nfa.c

Patch 7.3.1121
Problem:    New regexp engine: adding states that are not used.
Solution:   Don't add the states.
Files:      src/regexp_nfa.c

Patch 7.3.1122
Problem:    New regexp engine: \@> not supported.
Solution:   Implement \%>.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1123
Problem:    Can't build tiny Vim on MS-Windows.
Solution:   Adjust #ifdef around using modif_fname(). (Mike Williams)
Files:      src/misc1.c

Patch 7.3.1124
Problem:    Python: Crash on MS-Windows when os.fchdir() is not available.
Solution:   Check for _chdir to be NULL. (Ken Takata)
Files:      src/if_py_both.h

Patch 7.3.1125
Problem:    Error for using \%V in a pattern in tiny Vim.
Solution:   Allow using \%V but never match. (Dominique Pelle)
Files:      src/regexp_nfa.c

Patch 7.3.1126
Problem:    Compiler warning for uninitialized variable. (Tony Mechelynck)
Solution:   Assign something to the variable.
Files:      src/regexp_nfa.c

Patch 7.3.1127
Problem:    No error for using empty \%[].
Solution:   Give error message.
Files:      src/regexp.c, src/regexp_nfa.c

Patch 7.3.1128
Problem:    Now that the NFA engine handles everything every failure is a
            syntax error.
Solution:   Remove the syntax_error flag.
Files:      src/regexp.c, src/regexp_nfa.c

Patch 7.3.1129
```

```
Problem:    Can't see what pattern in syntax highlighting is slow.
Solution:   Add the ":syntime" command.
Files:      src/structs.h, src/syntax.c, src/ex_cmds.h, src/ex_docmd.c,
            src/proto/syntax.pro, src/ex_cmds2.c, src/proto/ex_cmds2.pro,
            runtime/doc/syntax.txt

Patch 7.3.1130 (after 7.3.1129)
Problem:    Can't build with anything but huge features.
Solution:   Check for FEAT_PROFILE. (Yasuhiro Matsumoto)
Files:      src/ex_docmd.c, src/structs.h, src/syntax.c

Patch 7.3.1131
Problem:    New regexp engine is a bit slow.
Solution:   Do not clear the state list.  Don't copy syntax submatches when
            not used.
Files:      src/regexp_nfa.c

Patch 7.3.1132
Problem:    Crash when debugging regexp.
Solution:   Do not try to dump subexpr that were not set.  Skip over count of
            \% items.
Files:      src/regexp.c, src/regexp_nfa.c

Patch 7.3.1133
Problem:    New regexp engine is a bit slow.
Solution:   Skip ahead to a character that must match.  Don't try matching a
            "^" patter past the start of line.
Files:      src/regexp_nfa.c, src/regexp.h

Patch 7.3.1134
Problem:    Running test 49 takes a long time.
Solution:   Don't have it grep all files.
Files:      src/testdir/test49.vim

Patch 7.3.1135
Problem:    Compiler warning for unused argument.
Solution:   Add UNUSED.
Files:      src/syntax.c

Patch 7.3.1136
Problem:    ":func Foo" does not show attributes.
Solution:   Add "abort", "dict" and "range". (Yasuhiro Matsumoto)
Files:      src/eval.c

Patch 7.3.1137
Problem:    New regexp engine: collections are slow.
Solution:   Handle all characters in one go.
Files:      src/regexp_nfa.c

Patch 7.3.1138
Problem:    New regexp engine: neglist no longer used.
Solution:   Remove the now unused neglist.
Files:      src/regexp_nfa.c
```

```
Patch 7.3.1139
Problem:    New regexp engine: negated flag is hardly used.
Solution:   Add separate _NEG states, remove negated flag.
Files:      src/regexp_nfa.c, src/regexp.h

Patch 7.3.1140
Problem:    New regexp engine: trying expensive match while the result is not
            going to be used.
Solution:   Check for output state already being in the state list.
Files:      src/regexp_nfa.c

Patch 7.3.1141
Problem:    Win32: Check for available memory is not reliable and adds
            overhead.
Solution:   Remove mch_avail_mem(). (Mike Williams)
Files:      src/os_win32.c, src/os_win32.h

Patch 7.3.1142
Problem:    Memory leak in ":syntime report".
Solution:   Clear the grow array. (Dominique Pelle)
Files:      src/syntax.c

Patch 7.3.1143
Problem:    When mapping NUL it is displayed as an X.
Solution:   Check for KS_ZERO instead of K_ZERO. (Yasuhiro Matsumoto)
Files:      src/message.c

Patch 7.3.1144
Problem:    "RO" is not translated everywhere.
Solution:   Put inside _(). (Sergey Alyoshin)
Files:      src/buffer.c, src/screen.c

Patch 7.3.1145
Problem:    New regexp engine: addstate() is called very often.
Solution:   Optimize adding the start state.
Files:      src/regexp_nfa.c

Patch 7.3.1146
Problem:    New regexp engine: look-behind match not checked when followed by
            zero-width match.
Solution:   Do the look-behind match before adding the zero-width state.
Files:      src/regexp_nfa.c

Patch 7.3.1147
Problem:    New regexp engine: regstart is only used to find the first match.
Solution:   Use regstart whenever adding the start state.
Files:      src/regexp_nfa.c

Patch 7.3.1148
Problem:    No command line completion for ":syntime".
Solution:   Implement the completion. (Dominique Pelle)
Files:      runtime/doc/map.txt, src/ex_cmds.h, src/ex_docmd.c,
            src/ex_getln.c, src/proto/syntax.pro, src/syntax.c, src/vim.h
```

```
Patch 7.3.1149
Problem:    New regexp engine: Matching plain text could be faster.
Solution:   Detect a plain text match and handle it specifically.  Add
            vim_regfree().
Files:      src/regexp.c, src/regexp.h, src/regexp_nfa.c,
            src/proto/regexp.pro, src/buffer.c, src/edit.c, src/eval.c,
            src/ex_cmds.c, src/ex_cmds2.c, src/ex_docmd.c, src/ex_eval.c,
            src/ex_getln.c, src/fileio.c, src/gui.c, src/misc1.c, src/misc2.c,
            src/option.c, src/syntax.c, src/quickfix.c, src/search.c,
            src/spell.c, src/tag.c, src/window.c, src/screen.c, src/macros.h,
            src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1150
Problem:    New regexp engine: Slow when a look-behind match does not have a
            width specified.
Solution:   Try to compute the maximum width.
Files:      src/regexp_nfa.c

Patch 7.3.1151
Problem:    New regexp engine: Slow when a look-behind match is followed by a
            zero-width match.
Solution:   Postpone the look-behind match more often.
Files:      src/regexp_nfa.c

Patch 7.3.1152
Problem:    In tiny build ireg_icombine is undefined. (Tony Mechelynck)
Solution:   Add #ifdef.
Files:      src/regexp_nfa.c

Patch 7.3.1153
Problem:    New regexp engine: Some look-behind matches are very expensive.
Solution:   Postpone invisible matches further, until a match is almost found.
Files:      src/regexp_nfa.c

Patch 7.3.1154
Problem:    New regexp_nfa engine: Unnecessary code.
Solution:   Remove unnecessary code.
Files:      src/regexp_nfa.c

Patch 7.3.1155
Problem:    MS-DOS: "make test" uses external rmdir command.
Solution:   Rename "rmdir" to "rd". (Taro Muraoka)
Files:      src/testdir/Make_dos.mak

Patch 7.3.1156
Problem:    Compiler warnings. (dv1445)
Solution:   Initialize variables, even when the value isn't really used.
Files:      src/regexp_nfa.c, src/eval.c

Patch 7.3.1157
Problem:    New regexp engine fails on "\(\<command\)\@<=.*"
Solution:   Fix rule for postponing match.  Further tune estimating whether
            postponing works better.  Add test.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok
```

```
Patch 7.3.1158
Problem:    Crash when running test 86. (Jun Takimoto)
Solution:   Define PY_SSIZE_T_CLEAN early. (Elimar Riesebieter)
Files:      src/if_python.c, src/if_python3.c

Patch 7.3.1159
Problem:    The round() function is not always available. (Christ van
            Willegen)
Solution:   Use the solution from f_round().
Files:      src/ex_cmds2.c, src/eval.c, src/proto/eval.pro

Patch 7.3.1160
Problem:    Mixing long and pointer doesn't always work.
Solution:   Avoid cast to pointer.
Files:      src/undo.c

Patch 7.3.1161
Problem:    Python: PyList_SetItem() is inefficient.
Solution:   Use PyList_SET_ITEM() (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1162
Problem:    Python: Memory leaks
Solution:   Add more Py_DECREF(). (ZyX)
Files:      src/if_py_both.h, src/if_python.c

Patch 7.3.1163
Problem:    Not easy to load Python modules.
Solution:   Search "python2", "python3" and "pythonx" directories in
            'runtimepath' for Python modules. (ZyX)
Files:      runtime/doc/if_pyth.txt, src/configure.in, src/ex_cmds2.c,
            src/if_py_both.h, src/if_python.c, src/if_python3.c,
            src/testdir/test86.in, src/testdir/test87.in, src/auto/configure

Patch 7.3.1164
Problem:    Can't test what is actually displayed on screen.
Solution:   Add the screenchar() and screenattr() functions.
Files:      src/eval.c, runtime/doc/eval.txt

Patch 7.3.1165
Problem:    HP-UX compiler can't handle zero size array. (Charles Cooper)
Solution:   Make the array one item big.
Files:      src/regexp.h, src/regexp_nfa.c

Patch 7.3.1166
Problem:    Loading Python modules is not tested.
Solution:   Enable commented-out tests, add missing files. (ZyX)
Files:      src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok,
            src/testdir/python2/module.py, src/testdir/python3/module.py,
            src/testdir/pythonx/module.py, src/testdir/pythonx/modulex.py,
            Filelist
```

Patch 7.3.1167
Problem: Python configure check doesn't reject Python 2 when requesting
            Python 3. Some systems need -pthreads instead of -pthread.
Solution: Adjust configure accordingly. (Andrei Olsen)
Files: src/configure.in, src/auto/configure

Patch 7.3.1168
Problem: Python "sane" configure checks give a warning message.
Solution: Use single quotes instead of escaped double quotes. (Ben Fritz)
Files: src/configure.in, src/auto/configure

Patch 7.3.1169
Problem: New regexp engine: some work is done while executing a pattern,
            even though the result is predictable.
Solution: Do the work while compiling the pattern.
Files: src/regexp_nfa.c

Patch 7.3.1170
Problem: Patch 7.3.1058 breaks backwards compatibility, not possible to use
            a function reference as a string. (lilydjwg)
Solution: Instead of translating the function name only translate "s:".
Files: src/eval.c

Patch 7.3.1171
Problem: Check for digits and ascii letters can be faster.
Solution: Use a trick with one comparison. (Dominique Pelle)
Files: src/macros.h

Patch 7.3.1172
Problem: Python 2: loading modules doesn't work well.
Solution: Fix the code. Add more tests. (ZyX)
Files: runtime/doc/if_pyth.txt, src/if_py_both.h, src/if_python.c,
            src/testdir/python2/module.py, src/testdir/python3/module.py,
            src/testdir/python_after/after.py,
            src/testdir/python_before/before.py, src/testdir/test86.in,
            src/testdir/test86.ok, src/testdir/test87.in,
            src/testdir/test87.ok, Filelist

Patch 7.3.1173
Problem: Python 2 tests don't have the same output everywhere.
Solution: Make the Python 2 tests more portable. (ZyX)
Files: src/testdir/test86.in, src/testdir/test86.ok

Patch 7.3.1174
Problem: Python 2 and 3 use different ways to load modules.
Solution: Use the same method. (ZyX)
Files: runtime/doc/if_pyth.txt, src/if_py_both.h, src/if_python3.c,
            src/if_python.c

Patch 7.3.1175
Problem: Using isalpha() and isalnum() can be slow.
Solution: Use range checks. (Mike Williams)
Files: src/ex_docmd.c, src/macros.h

```
Patch 7.3.1176
Problem:    Compiler warnings on 64 bit system.
Solution:   Add type casts. (Mike Williams)
Files:      src/eval.c, src/if_py_both.h

Patch 7.3.1177
Problem:    Wasting memory on padding.
Solution:   Reorder struct fields. (Dominique Pelle)
Files:      src/structs.h, src/fileio.c

Patch 7.3.1178
Problem:    Can't put all Vim config files together in one directory.
Solution:   Load ~/.vim/vimrc if ~/.vimrc does not exist. (Lech Lorens)
Files:      runtime/doc/gui.txt, runtime/doc/starting.txt, src/gui.c,
            src/main.c, src/os_amiga.h, src/os_dos.h, src/os_unix.h

Patch 7.3.1179
Problem:    When a global mapping starts with the same characters as a
            buffer-local mapping Vim waits for a character to be typed to find
            out whether the global mapping is to be used. (Andy Wokula)
Solution:   Use the local mapping without waiting. (Michael Henry)
Files:      runtime/doc/map.txt, src/getchar.c

Patch 7.3.1180
Problem:    When current directory changes, path from cscope may no longer be
            valid. (AS Budden)
Solution:   Always store the absolute path. (Christian Brabandt)
Files:      src/if_cscope.c

Patch 7.3.1181
Problem:    Wrong error message for 1.0[0].
Solution:   Check for funcref and float separately. (Yasuhiro Matsumoto)
Files:      src/eval.c

Patch 7.3.1182
Problem:    'backupcopy' default on MS-Windows does not work for hard and soft
            links.
Solution:   Check for links. (David Pope, Ken Takata)
Files:      src/fileio.c, src/os_win32.c, src/proto/os_win32.pro

Patch 7.3.1183
Problem:    Python tests 86 and 87 fail.
Solution:   Add "empty" files. (ZyX)
Files:      src/testdir/python_before/before_1.py,
            src/testdir/python_before/before_2.py

Patch 7.3.1184
Problem:    Highlighting is sometimes wrong. (Axel Bender)
Solution:   Fetch regline again when returning from recursive regmatch.
Files:      src/regexp_nfa.c

Patch 7.3.1185
Problem:    New regexp engine: no match with ^ after \n. (SungHyun Nam)
Solution:   Fix it, add a test.
```

```
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1186
Problem:    Python 3: test 87 may crash.
Solution:   Use _PyArg_Parse_SizeT instead of PyArg_Parse. (Jun Takimoto)
Files:      src/if_python3.c

Patch 7.3.1187 (after 7.3.1170)
Problem:    "s:" is recognized but "<SID>" is not. (ZyX)
Solution:   Translate "<SID>" like "s:".
Files:      src/eval.c

Patch 7.3.1188
Problem:    Newline characters messing up error message.
Solution:   Remove the newlines. (Kazunobu Kuriyama)
Files:      src/gui_x11.c

Patch 7.3.1189 (after 7.3.1185)
Problem:    Highlighting is still wrong sometimes. (Dominique Pelle)
Solution:   Also restore reginput properly.
Files:      src/regexp_nfa.c

Patch 7.3.1190
Problem:    Compiler warning for parentheses. (Christian Wellenbrock)
Solution:   Change #ifdef.
Files:      src/ex_docmd.c

Patch 7.3.1191
Problem:    Backreference to previous line doesn't work. (Lech Lorens)
Solution:   Implement looking in another line.
Files:      src/regexp.c, src/regexp_nfa.c, src/testdir/test64.in,
            src/testdir/test64.ok

Patch 7.3.1192
Problem:    Valgrind reports errors when using backreferences. (Dominique
            Pelle)
Solution:   Do not check the end of submatches.
Files:      src/regexp_nfa.c

Patch 7.3.1193
Problem:    fail_if_missing not used for Python 3.
Solution:   Give an error when Python 3 can't be configured. (Andrei Olsen)
Files:      src/configure.in, src/auto/configure

Patch 7.3.1194
Problem:    Yaml highlighting is slow.
Solution:   Tune the estimation of pattern failure chance.
Files:      src/regexp_nfa.c

Patch 7.3.1195
Problem:    Compiler warning for uninitialized variable. (Tony Mechelynck)
Solution:   Set the length to the matching backref.
Files:      src/regexp.c
```

```
Patch 7.3.1196
Problem:    Old regexp engine does not match pattern with backref correctly.
            (Dominique Pelle)
Solution:   Fix setting status.  Test multi-line patterns better.
Files:      src/regexp.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1197
Problem:    ":wviminfo!" does not write history previously read from a viminfo
            file.  (Roland Eggner)
Solution:   When not merging history write all entries.
Files:      src/ex_cmds.c, src/ex_getln.c, src/proto/ex_getln.pro

Patch 7.3.1198
Problem:    Build error when using Perl 5.18.0 and dynamic loading.
Solution:   Change #ifdefs for Perl_croak_xs_usage. (Ike Devolder)
Files:      src/if_perl.xs

Patch 7.3.1199
Problem:    When evaluating 'foldexpr' causes an error this is silently
            ignored and evaluation is retried every time.
Solution:   Set emsg_silent instead of emsg_off. Stop evaluating 'foldexpr' is
            it is causing errors.  (Christian Brabandt)
Files:      src/fold.c

Patch 7.3.1200
Problem:    When calling setline() from Insert mode, using CTRL-R =, undo does
            not work properly. (Israel Chauca)
Solution:   Sync undo after evaluating the expression. (Christian Brabandt)
Files:      src/edit.c, src/testdir/test61.in, src/testdir/test61.ok

Patch 7.3.1201
Problem:    When a startup script creates a preview window, it probably
            becomes the current window.
Solution:   Make another window the current one. (Christian Brabandt)
Files:      src/main.c

Patch 7.3.1202 (after 7.3.660)
Problem:    Tags are not found in case-folded tags file. (Darren cole, Issue
            90)
Solution:   Take into account that when case folding was used for the tags
            file "!rm" sorts before the "!_TAG" header lines.
Files:      src/tag.c

Patch 7.3.1203
Problem:    Matches from matchadd() might be highlighted incorrectly when they
            are at a fixed position and inserting lines. (John Szakmeister)
Solution:   Redraw all lines below a change if there are highlighted matches.
            (idea by Christian Brabandt)
Files:      src/screen.c

Patch 7.3.1204
Problem:    Calling gettabwinvar() in 'tabline' cancels Visual mode. (Hirohito
            Higashi)
Solution:   Don't always use goto_tabpage_tp().
```

```
Files:      src/window.c, src/proto/window.pro, src/eval.c, src/if_py_both.h

Patch 7.3.1205
Problem:    logtalk.dict is not removed on uninstall.
Solution:   Remove the file. (Kazunobu Kuriyama)
Files:      src/Makefile

Patch 7.3.1206
Problem:    Inconsistent function argument declarations.
Solution:   Use ANSI style.
Files:      src/if_py_both.h

Patch 7.3.1207
Problem:    New regexp engine: no match found on "#if FOO". (Lech Lorens)
Solution:   When adding a state gets skipped don't adjust the index.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1208
Problem:    Compiler warnings on MS-Windows.
Solution:   Add type cast.  Move variable declaration. (Mike Williams)
Files:      src/option.c, src/os_mswin.c

Patch 7.3.1209
Problem:    No completion for ":tabdo".
Solution:   Add tabdo to the list of modifiers. (Dominique Pelle)
Files:      src/ex_docmd.c

Patch 7.3.1210 (after 7.3.1182)
Problem:    'backupcopy' default on MS-Windows is wrong when 'encoding' equals
            the current codepage.
Solution:   Change the #else block. (Ken Takata)
Files:      src/os_win32.c

Patch 7.3.1211
Problem:    MS-Windows: When 'encoding' differs from the current codepage
            ":hardcopy" does not work properly.
Solution:   Use TextOutW() and SetDlgItemTextW(). (Ken Takata)
Files:      src/os_mswin.c, src/vim.rc

Patch 7.3.1212
Problem:    "make test" on MS-Windows does not report failure like Unix does.
Solution:   Make it work like on Unix. (Taro Muraoka)
Files:      src/testdir/Make_dos.mak

Patch 7.3.1213
Problem:    Can't build with small features and Python.
Solution:   Adjust #ifdefs.
Files:      src/eval.c, src/buffer.c, src/eval.c, src/window.c

Patch 7.3.1214
Problem:    Missing declaration for init_users() and realloc_post_list().
            (Salman Halim)
Solution:   Add the declarations.
Files:      src/misc1.c, src/regexp_nfa.c
```

```
Patch 7.3.1215
Problem:    Compiler warning for function not defined.
Solution:   Add #ifdef.
Files:      src/misc1.c

Patch 7.3.1216
Problem:    Configure can't find Motif on Ubuntu.
Solution:   Search for libXm in /usr/lib/*-linux-gnu.
Files:      src/configure.in, src/auto/configure

Patch 7.3.1217
Problem:    New regexp engine: Can't handle \%[[ao]]. (Yukihiro Nakadaira)
Solution:   Support nested atoms inside \%[].
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1218
Problem:    "make test" on MS-Windows does not clean all temporary files and
            gives some unnecessary message.
Solution:   Clean the right files.  Create .failed files. (Ken Takata)
Files:      src/testdir/Make_dos.mak

Patch 7.3.1219
Problem:    No test for using []] inside \%[].
Solution:   Add a test.
Files:      src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1220
Problem:    MS-Windows: When using wide font italic and bold are not included.
Solution:   Support wide-bold, wide-italic and wide-bold-italic. (Ken Takata,
            Taro Muraoka)
Files:      src/gui.c, src/gui.h, src/gui_w48.c

Patch 7.3.1221
Problem:    When build flags change "make distclean" run into a configure
            error.
Solution:   When CFLAGS changes delete auto/config.cache.  Also avoid adding
            duplicate text to flags. (Ken Takata)
Files:      src/Makefile, src/configure.in, src/auto/configure

Patch 7.3.1222
Problem:    Cannot execute some tests from the src directly.
Solution:   Add missing targets.
Files:      src/Makefile

Patch 7.3.1223
Problem:    Tests fail on MS-Windows.
Solution:   Avoid depending on OS version. Use DOS commands instead of Unix
            commands. (Taro Muraoka, Ken Takata)
Files:      src/testdir/test17.in, src/testdir/test50.in,
            src/testdir/test71.in, src/testdir/test77.in

Patch 7.3.1224
Problem:    Clang gives warnings on xxd.
```

```
Solution:   Change how to use part of a string. (Dominique Pelle) Also avoid
            warning for return not reached.
Files:      src/xxd/xxd.c, src/regexp_nfa.c

Patch 7.3.1225
Problem:    Compiler warnings when building with Motif.
Solution:   Change set_label() argument. (Kazunobu Kuriyama)
Files:      src/gui_motif.c

Patch 7.3.1226
Problem:    Python: duplicate code.
Solution:   Share code between OutputWrite() and OutputWritelines(). (ZyX)
Files:      src/if_py_both.h, src/testdir/test86.ok, src/testdir/test87.ok

Patch 7.3.1227
Problem:    Inconsistent string conversion.
Solution:   Use 'encoding' instead of utf-8. Use METH_O in place of
            METH_VARARGS where appropriate. (ZyX)
Files:      src/if_py_both.h, src/testdir/test86.ok, src/testdir/test87.ok

Patch 7.3.1228
Problem:    Python: various inconsistencies and problems.
Solution:   StringToLine now supports both bytes() and unicode() objects.
            Make function names consistent.  Fix memory leak fixed in
            StringToLine. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c

Patch 7.3.1229
Problem:    Python: not so easy to delete/restore translating.
Solution:   Make macros do translation of exception messages. (ZyX)
            Note: this breaks translations!
Files:      src/if_py_both.h, src/if_python3.c

Patch 7.3.1230
Problem:    Python: Exception messages are not clear.
Solution:   Make exception messages more verbose. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c,
            src/testdir/test86.ok, src/testdir/test87.ok

Patch 7.3.1231
Problem:    Python: use of numbers not consistent.
Solution:   Add support for Number protocol. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c,
            src/testdir/test86.ok, src/testdir/test87.ok

Patch 7.3.1232
Problem:    Python: inconsistencies in variable names.
Solution:   Rename variables. (ZyX)
Files:      src/eval.c, src/if_py_both.h

Patch 7.3.1233
Problem:    Various Python problems.
Solution:   Fix VimTryEnd. Crash with debug build and PYTHONDUMPREFS=1. Memory
            leaks in StringToLine(), BufferMark() and convert_dl. (ZyX)
```

```
Files:      src/if_py_both.h, src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.3.1234 (after 7.3.1229)
Problem:    Python: Strings are not marked for translation.
Solution:   Add N_() where appropriate. (ZyX)
Files:      src/if_py_both.h

Patch 7.3.1235
Problem:    In insert mode CTRL-] is not inserted, on the command-line it is.
Solution:   Don't insert CTRL-] on the command line. (Yukihiro Nakadaira)
Files:      src/ex_getln.c

Patch 7.3.1236
Problem:    Python: WindowSetattr() missing support for NUMBER_UNSIGNED.
Solution:   Add NUMBER_UNSIGNED, add more tests. Various fixes. (ZyX)
Files:      src/if_py_both.h, src/if_python3.c, src/if_python.c,
            src/testdir/pythonx/failing.py,
            src/testdir/pythonx/failing_import.py, src/testdir/test86.in,
            src/testdir/test86.ok, src/testdir/test87.in,
            src/testdir/test87.ok, src/testdir/pythonx/topmodule/__init__.py,
            src/testdir/pythonx/topmodule/submodule/__init__.py,
            src/testdir/pythonx/topmodule/submodule/subsubmodule/__init__.py,
            src/testdir/pythonx/topmodule/submodule/subsubmodule/subsubsubmodule.py

Patch 7.3.1237
Problem:    Python: non-import errors not handled correctly.
Solution:   Let non-ImportError exceptions pass the finder. (ZyX)
Files:      src/if_py_both.h, src/testdir/test86.ok, src/testdir/test87.ok

Patch 7.3.1238
Problem:    Crash in Python interface on 64 bit machines.
Solution:   Change argument type of PyString_AsStringAndSize. (Taro Muraoka,
            Jun Takimoto)
Files:      src/if_python.c

Patch 7.3.1239
Problem:    Can't build with Python and MSVC10.
Solution:   Move #if outside of macro. (Taro Muraoka)
Files:      src/if_py_both.h

Patch 7.3.1240
Problem:    Memory leak in findfile().
Solution:   Free the memory. (Christian Brabandt)
Files:      src/eval.c

Patch 7.3.1241 (after 7.3.1236)
Problem:    Some test files missing from the distribution.
Solution:   Update the list of files.
Files:      Filelist

Patch 7.3.1242
Problem:    No failure when trying to use a number as a string.
Solution:   Give an error when StringToLine() is called with an instance of
```

```
            the wrong type. (Jun Takimoto)
Files:      src/if_py_both.h

Patch 7.3.1243
Problem:    New regexp engine: back references in look-behind match don't
            work. (Lech Lorens)
Solution:   Copy the submatches before a recursive match. Also fix function
            prototypes.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1244
Problem:    MS-Windows: confirm() dialog text may not fit.
Solution:   Use GetTextWidthEnc() instead of GetTextWidth(). (Yasuhiro
            Matsumoto)
Files:      src/gui_w32.c

Patch 7.3.1245
Problem:    MS-Windows: confirm() dialog text may still not fit.
Solution:   Use GetTextWidthEnc() instead of GetTextWidth() in two more
            places. (Yasuhiro Matsumoto)
Files:      src/gui_w32.c

Patch 7.3.1246
Problem:    When setting 'winfixheight' and resizing the window causes the
            window layout to be wrong.
Solution:   Add frame_check_height() and frame_check_width() (Yukihiro
            Nakadaira)
Files:      src/window.c

Patch 7.3.1247
Problem:    New regexp engine: '[ ]\@!\p\%([ ]\@!\p\)*:' does not always match.
Solution:   When there is a PIM add a duplicate state that starts at another
            position.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1248
Problem:    Still have old hacking code for Input Method.
Solution:   Add 'imactivatefunc' and 'imstatusfunc' as a generic solution to
            Input Method activation. (Yukihiro Nakadaira)
Files:      runtime/doc/options.txt, src/fileio.c, src/mbyte.c, src/option.c,
            src/option.h, src/proto/fileio.pro

Patch 7.3.1249
Problem:    Modeline not recognized when using "Vim" instead of "vim".
Solution:   Also accept "Vim".
Files:      src/buffer.c

Patch 7.3.1250
Problem:    Python tests fail on MS-Windows.
Solution:   Change backslashes to slashes. (Taro Muraoka)
Files:      src/testdir/test86.in, src/testdir/test87.in

Patch 7.3.1251
Problem:    Test 61 messes up viminfo.
```

```
Solution:   Specify a separate viminfo file.
Files:      src/testdir/test61.in

Patch 7.3.1252
Problem:    gvim does not find the toolbar bitmap files in ~/vimfiles/bitmaps
            if the corresponding menu command contains additional characters
            like the shortcut marker '&' or if you use a non-english locale.
Solution:   Use menu->en_dname or menu->dname. (Martin Gieseking)
Files:      src/gui_w32.c

Patch 7.3.1253 (after 7.3.1200)
Problem:    Still undo problem after using CTRL-R = setline(). (Hirohito
            Higashi)
Solution:   Set the ins_need_undo flag.
Files:      src/edit.c

Patch 7.3.1254 (after 7.3.1252)
Problem:    Can't build without the multi-lang feature. (John Marriott)
Solution:   Add #ifdef.
Files:      src/gui_w32.c

Patch 7.3.1255
Problem:    Clang warnings when building with Athena.
Solution:   Add type casts. (Dominique Pelle)
Files:      src/gui_at_fs.c

Patch 7.3.1256
Problem:    Can't build without eval or autocmd feature.
Solution:   Add #ifdefs.
Files:      src/mbyte.c, src/window.c

Patch 7.3.1257
Problem:    With GNU gettext() ":lang de_DE.utf8" does not always result in
            German messages.
Solution:   Clear the $LANGUAGE environment variable.
Files:      src/ex_cmds2.c

Patch 7.3.1258
Problem:    Using submatch() may crash Vim. (Ingo Karkat)
Solution:   Restore the number of subexpressions used.
Files:      src/regexp_nfa.c

Patch 7.3.1259
Problem:    No test for patch 7.3.1258
Solution:   Add a test entry.
Files:      src/testdir/test64.in, src/testdir/test64.ok

Patch 7.3.1260
Problem:    User completion does not get the whole command line in the command
            line window.
Solution:   Pass on the whole command line. (Daniel Thau)
Files:      src/ex_getln.c, src/structs.h

Patch 7.3.1261 (after patch 7.3.1179)
```

```
Problem:    A buffer-local language mapping from a keymap stops a global
            insert mode mapping from working. (Ron Aaron)
Solution:   Do not wait for more characters to be typed only when the mapping
            was defined with <nowait>.
Files:      runtime/doc/map.txt, src/eval.c, src/getchar.c,
            src/testdir/test75.in, src/testdir/test75.ok

Patch 7.3.1262
Problem:    Crash and compilation warnings with Cygwin.
Solution:   Check return value of XmbTextListToTextProperty(). Add type casts.
            Adjust #ifdefs. (Lech Lorens)
Files:      src/main.c, src/os_unix.c, src/ui.c

Patch 7.3.1263
Problem:    Typo in short option name.
Solution:   Change "imse" to "imsf".
Files:      src/option.c

Patch 7.3.1264 (after 7.3.1261)
Problem:    Missing m_nowait.
Solution:   Include missing part of the patch.
Files:      src/structs.h

Patch 7.3.1265 (after 7.3.1249)
Problem:    Accepting "Vim:" for a modeline causes errors too often.
Solution:   Require "Vim:" to be followed by "set".
Files:      src/buffer.c

Patch 7.3.1266
Problem:    QNX: GUI fails to start.
Solution:   Remove the QNX-specific #ifdef. (Sean Boudreau)
Files:      src/gui.c

Patch 7.3.1267
Problem:    MS-Windows ACL support doesn't work well.
Solution:   Implement more ACL support. (Ken Takata)
Files:      src/os_win32.c

Patch 7.3.1268
Problem:    ACL support doesn't work when compiled with MingW.
Solution:   Support ACL on MingW. (Ken Takata)
Files:      src/os_win32.c, src/os_win32.h

Patch 7.3.1269
Problem:    Insert completion keeps entry selected even though the list has
            changed. (Olivier Teuliere)
Solution:   Reset compl_shown_match and compl_curr_match. (Christian Brabandt)
Files:      src/edit.c

Patch 7.3.1270
Problem:    Using "Vp" in an empty buffer can't be undone. (Hauke Petersen)
Solution:   Save one line in an empty buffer. (Christian Brabandt)
Files:      src/ops.c
```

```
Patch 7.3.1271 (after 7.3.1260)
Problem:    Command line completion does not work.
Solution:   Move setting xp_line down. (Daniel Thau)
Files:      src/ex_getln.c

Patch 7.3.1272
Problem:    Crash when editing Ruby file. (Aliaksandr Rahalevich)
Solution:   Reallocate the state list when necessary.
Files:      src/regexp_nfa.c

Patch 7.3.1273
Problem:    When copying a location list the index might be wrong.
Solution:   Set the index to one when using the first entry. (Lech Lorens)
Files:      src/quickfix.c

Patch 7.3.1274
Problem:    When selecting an entry from a location list it may pick an
            arbitrary window or open a new one.
Solution:   Prefer using a window related to the location list. (Lech Lorens)
Files:      src/quickfix.c

Patch 7.3.1275
Problem:    "gn" does not work when the match is a single character.
Solution:   Fix it, add a test. (Christian Brabandt)
Files:      src/search.c, src/testdir/test53.in, src/testdir/test53.ok

Patch 7.3.1276
Problem:    When using a cscope connection resizing the window may send
            SIGWINCH to cscope and it quits.
Solution:   Call setpgid(0, 0) in the child process. (Narendran Gopalakrishnan)
Files:      src/if_cscope.c

Patch 7.3.1277
Problem:    In diff mode 'cursorline' also draws in the non-active window.
            When 'nu' and 'sbr' are set the 'sbr' string is not underlined.
Solution:   Only draw the cursor line in the current window. Combine the
            'cursorline' and other highlighting attributes. (Christian
            Brabandt)
Files:      src/screen.c

Patch 7.3.1278
Problem:    When someone sets the screen size to a huge value with "stty" Vim
            runs out of memory before reducing the size.
Solution:   Limit Rows and Columns in more places.
Files:      src/gui.c, src/gui_gtk_x11.c, src/option.c, src/os_unix.c,
            src/proto/term.pro, src/term.c

Patch 7.3.1279
Problem:    Compiler warning for variable uninitialized. (Tony Mechelynck)
Solution:   Add an init.
Files:      src/ex_getln.c

Patch 7.3.1280
Problem:    Reading memory already freed since patch 7.3.1247. (Simon
```

            Ruderich, Dominique Pelle)
Solution: Copy submatches before reallocating the state list.
Files: src/regexp_nfa.c

Patch 7.3.1281
Problem: When 'ttymouse' is set to "xterm2" clicking in column 123 moves
            the cursor to column 96. (Kevin Goodsell)
Solution: Decode KE_CSI.
Files: src/term.c

Patch 7.3.1282 (after 7.3.1277)
Problem: 'cursorline' not drawn in any other window. (Charles Campbell)
Solution: Do draw the cursor line in other windows.
Files: src/screen.c

Patch 7.3.1283
Problem: Test 71 fails on MS-Windows.
Solution: Put the binary data in a separate file. (Ken Takata)
Files: src/testdir/test71.in, src/testdir/test71a.in

Patch 7.3.1284
Problem: Compiler warnings in MS-Windows clipboard handling.
Solution: Add type casts. (Ken Takata)
Files: src/winclip.c

Patch 7.3.1285
Problem: No tests for picking a window when selecting an entry in a
            location list. Not picking the right window sometimes.
Solution: Add test 96. Set usable_win appropriately. (Lech Lorens)
Files: src/quickfix.c, src/testdir/Makefile, src/testdir/test96.in,
            src/testdir/test96.ok, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms

Patch 7.3.1286
Problem: Check for screen size missing for Athena and Motif.
Solution: Add call to limit_screen_size().
Files: src/gui_x11.c

Patch 7.3.1287
Problem: Python SystemExit exception is not handled properly.
Solution: Catch the exception and give an error. (Yasuhiro Matsumoto, Ken
            Takata)
Files: runtime/doc/if_pyth.txt, src/if_py_both.h, src/if_python.c,
            src/if_python3.c

Patch 7.3.1288
Problem: The first ":echo 'hello'" command output doesn't show. Mapping
            for <S-F3> gets triggered during startup.
Solution: Add debugging code for the termresponse. When receiving the "Co"
            entry and when setting 'ambiwidth' redraw right away if possible.
            Add redraw_asap(). Don't set 'ambiwidth' if it already had the
            right value. Do the 'ambiwidth' check in the second row to avoid
            confusion with <S-F3>.

```
Files:      src/term.c, src/screen.c, src/proto/screen.pro

Patch 7.3.1289
Problem:    Get GLIB warning when removing a menu item.
Solution:   Reference menu-id and also call gtk_container_remove().  (Ivan
            Krasilnikov)
Files:      src/gui_gtk.c

Patch 7.3.1290 (after 7.3.1253)
Problem:    CTRL-R = in Insert mode changes the start of the insert position.
            (Ingo Karkat)
Solution:   Only break undo, don't start a new insert.
Files:      src/edit.c

Patch 7.3.1291 (after 7.3.1288)
Problem:    Compiler warnings for uninitialized variables. (Tony Mechelynck)
Solution:   Initialize the variables.
Files:      src/screen.c

Patch 7.3.1292
Problem:    Possibly using invalid pointer when searching for window. (Raichoo)
Solution:   Use "firstwin" instead of "tp_firstwin" for current tab.
Files:      src/window.c

Patch 7.3.1293
Problem:    Put in empty buffer cannot be undone.
Solution:   Save one more line for undo. (Ozaki)
Files:      src/ops.c

Patch 7.3.1294
Problem:    ":diffoff" resets options.
Solution:   Save and restore option values. (Christian Brabandt)
Files:      src/diff.c, src/structs.h, src/option.c

Patch 7.3.1295
Problem:    glob() and globpath() do not handle escaped special characters
            properly.
Solution:   Handle escaped characters differently. (Adnan Zafar)
Files:      src/testdir/Makefile, src/testdir/test97.in,
            src/testdir/test97.ok, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms, src/fileio.c,
            src/misc1.c

Patch 7.3.1296
Problem:    Only MS-Windows limits the GUI window size to what fits on the
            monitor.
Solution:   Limit the size for all systems. (Daniel Harding)
Files:      src/ui.c

Patch 7.3.1297
Problem:    findfile() directory matching does not work when a star follows
            text. (Markus Braun)
Solution:   Make a wildcard work properly. (Christian Brabandt)
```

```
Files:      src/misc2.c, src/testdir/test89.in, src/testdir/test89.ok

Patch 7.3.1298 (after 7.3.1297)
Problem:    Crash.
Solution:   Use STRCPY() instead of STRCAT() and allocate one more byte.
Files:      src/misc2.c

Patch 7.3.1299
Problem:    Errors when doing "make proto".  Didn't do "make depend" for a
            while.
Solution:   Add #ifdefs.  Update dependencies.  Update proto files.
Files:      src/if_python3.c, src/os_win32.c, src/Makefile,
            src/proto/ex_docmd.pro, src/proto/if_python.pro,
            src/proto/if_python3.pro, src/proto/gui_w16.pro,
            src/proto/gui_w32.pro, src/proto/os_win32.pro

Patch 7.3.1300
Problem:    Mac: tiny and small build fails.
Solution:   Don't include os_macosx.m in tiny build. Include mouse support in
            small build. (Kazunobu Kuriyama)
Files:      src/configure.in, src/auto/configure, src/vim.h

Patch 7.3.1301
Problem:    Some tests fail on MS-Windows.
Solution:   Fix path separators in test 89 and 96.  Omit test 97, escaping
            works differently.  Make findfile() work on MS-Windows.
Files:      src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/test89.in,
            src/testdir/test96.in, src/misc2.c

Patch 7.3.1302
Problem:    Test 17 fails on MS-Windows.  Includes line break in file name
            everywhere.
Solution:   Fix 'fileformat'. Omit CR-LF from a line read from an included
            file.
Files:      src/search.c, src/testdir/test17.in, src/testdir/test17.ok

Patch 7.3.1303 (after 7.3.1290)
Problem:    Undo is synced whenever CTRL-R = is called, breaking some plugins.
Solution:   Only break undo when calling setline() or append().
Files:      src/globals.h, src/eval.c, src/edit.c, src/testdir/test61.in,
            src/testdir/test61.ok

Patch 7.3.1304
Problem:    Test 89 still fails on MS-Windows.
Solution:   Set 'shellslash'. (Taro Muraoka)
Files:      src/testdir/test89.in

Patch 7.3.1305
Problem:    Warnings from 64 bit compiler.
Solution:   Add type casts.
Files:      src/misc2.c

Patch 7.3.1306
```

Problem: When redrawing the screen during startup the intro message may be
            cleared.
Solution: Redisplay the intro message when appropriate.
Files: src/screen.c, src/version.c, src/proto/version.pro

Patch 7.3.1307
Problem: MS-Windows build instructions are outdated.
Solution: Adjust for building on Windows 7. Drop Windows 95/98/ME support.
Files: Makefile, nsis/gvim.nsi

Patch 7.3.1308
Problem: Typos in MS-Windows build settings and README.
Solution: Minor changes to MS-Windows files.
Files: src/msvc2008.bat, src/msvc2010.bat, src/VisVim/README_VisVim.txt

Patch 7.3.1309
Problem: When a script defines a function the flag to wait for the user to
            hit enter is reset.
Solution: Restore the flag. (Yasuhiro Matsumoto) Except when the user was
            typing the function.
Files: src/eval.c

Patch 7.3.1310
Problem: Typos in nsis script. Can use better compression.
Solution: Fix typos. Use lzma compression. (Ken Takata)
Files: nsis/gvim.nsi

Patch 7.3.1311
Problem: Compiler warnings on Cygwin.
Solution: Add type casts. Add windows include files. (Ken Takata)
Files: src/mbyte.c, src/ui.c

Patch 7.3.1312 (after 7.3.1287)
Problem: Not giving correct error messages for SystemExit().
Solution: Move E858 into an else. (Ken Takata)
Files: src/if_py_both.h

Patch 7.3.1313
Problem: :py and :py3 don't work when compiled with Cygwin or MingW with 64
            bit.
Solution: Add -DMS_WIN64 to the build command. (Ken Takata)
Files: src/Make_cyg.mak, src/Make_ming.mak

Patch 7.3.1314
Problem: Test 87 fails with Python 3.3.
Solution: Filter the error messages. (Taro Muraoka)
Files: src/testdir/test87.in

Patch 7.4a.001
Problem: Script to update syntax menu is outdated.
Solution: Add the missing items.
Files: runtime/makemenu.vim

Patch 7.4a.002

```
Problem:    Valgrind errors in test 89. (Simon Ruderich)
Solution:   Allocate one more byte. (Dominique Pelle)
Files:      src/misc2.c

Patch 7.4a.003
Problem:    Copyright year is outdated.
Solution:   Only use the first year.
Files:      src/vim.rc, src/vim16.rc

Patch 7.4a.004
Problem:    MSVC 2012 Update 3 is not recognized.
Solution:   Add the version number. (Raymond Ko)
Files:      src/Make_mvc.mak

Patch 7.4a.005
Problem:    Scroll binding causes unexpected scroll.
Solution:   Store the topline after updating scroll binding.  Add a test.
            (Lech Lorens)
Files:      src/testdir/test98.in, src/testdir/test98a.in,
            src/testdir/test98.ok, src/option.c, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile

Patch 7.4a.006
Problem:    Failure in po file check goes unnoticed.
Solution:   Fail "make test" if the po file check fails.
Files:      src/Makefile

Patch 7.4a.007
Problem:    After "g$" with 'virtualedit' set, "k" moves to a different
            column.  (Dimitar Dimitrov)
Solution:   Set w_curswant. (Christian Brabandt)
Files:      src/normal.c

Patch 7.4a.008
Problem:    Python 3 doesn't handle multibyte characters properly when
            'encoding' is not utf-8.
Solution:   Use PyUnicode_Decode() instead of PyUnicode_FromString(). (Ken
            Takata)
Files:      src/if_python3.c

Patch 7.4a.009
Problem:    Compiler warnings for function prototypes.
Solution:   Add "void".  Move list_features() prototype. (Ken Takata)
Files:      src/gui_w48.c, src/if_py_both.h, src/version.c

Patch 7.4a.010
Problem:    Test 86 and 87 fail when building with Python or Python 3 and
            using a static library.
Solution:   Add configure check to add -fPIE compiler flag.
Files:      src/configure.in, src/auto/configure

Patch 7.4a.011
```

```
Problem:    Configure check for Python 3 config name isn't right.
Solution:   Always include vi_cv_var_python3_version. (Tim Harder)
Files:      src/configure.in, src/auto/configure

Patch 7.4a.012
Problem:    "make test" fails when using a shadow directory.
Solution:   Create links for files in src/po. (James McCoy)
Files:      src/Makefile

Patch 7.4a.013
Problem:    Setting/resetting 'lbr' in the main help file changes alignment
            after a Tab. (Dimitar Dimitrov)
Solution:   Also use the code for conceal mode where n_extra is computed for
            'lbr'.
Files:      src/screen.c, src/testdir/test88.in, src/testdir/test88.ok

Patch 7.4a.014
Problem:    Test 86 and 89 have a problem with using a shadow dir.
Solution:   Adjust for the different directory structure. (James McCoy)
Files:      src/testdir/test89.in, src/testdir/test86.in, src/Makefile

Patch 7.4a.015
Problem:    No Japanese man pages.
Solution:   Add Japanese translations of man pages. (Ken Takata, Yukihiro
            Nakadaira, et al.)
Files:      Filelist, src/Makefile, runtime/doc/evim-ja.UTF-8.1,
            runtime/doc/vim-ja.UTF-8.1, runtime/doc/vimdiff-ja.UTF-8.1,
            runtime/doc/vimtutor-ja.UTF-8.1, runtime/doc/xxd-ja.UTF-8.1

Patch 7.4a.016 (after 7.4a.014)
Problem:    Features enabled in Makefile.
Solution:   Undo accidental changes.
Files:      src/Makefile

Patch 7.4a.017
Problem:    When 'foldmethod' is "indent", using ">>" on a line just above a
            fold makes the cursor line folded. (Evan Laforge)
Solution:   Call foldOpenCursor(). (Christian Brabandt)
Files:      src/ops.c

Patch 7.4a.018
Problem:    Compiler warning for code unreachable. (Charles Campbell)
Solution:   Use "while" instead of endless loop.  Change break to continue.
Files:      src/regexp_nfa.c, src/ui.c

Patch 7.4a.019
Problem:    Invalid closing parenthesis in test 62. Command truncated at
            double quote.
Solution:   Remove the parenthesis. Change double quote to ''. (ZyX)
Files:      src/testdir/test62.in, src/testdir/test62.ok

Patch 7.4a.020
Problem:    Superfluous mb_ptr_adv().
Solution:   Remove the call. (Dominique Pelle)
```

```
Files:      src/regexp_nfa.c

Patch 7.4a.021
Problem:    Using feedkeys() doesn't always work.
Solution:   Omit feedkeys(). (Ken Takata)
Files:      src/testdir/test98a.in

Patch 7.4a.022
Problem:    Using "d2g$" does not delete the last character. (ZyX)
Solution:   Set the "inclusive" flag properly.
Files:      src/normal.c

Patch 7.4a.023 (after 7.4a.019)
Problem:    Still another superfluous parenthesis. (ZyX)
Solution:   Remove it.
Files:      src/testdir/test62.in

Patch 7.4a.024
Problem:    X11 GUI: Checking icon height twice.
Solution:   Check height and width. (Dominique Pelle)
Files:      src/gui_x11.c

Patch 7.4a.025
Problem:    Get the press-Enter prompt even after using :redraw.
Solution:   Clear need_wait_return when executing :redraw.
Files:      src/ex_docmd.c

Patch 7.4a.026
Problem:    ":diffoff" does not remove folds. (Ramel)
Solution:   Do not restore 'foldenable' when 'foldmethod' is "manual".
Files:      src/diff.c

Patch 7.4a.027
Problem:    When Python adds lines to another buffer the cursor position is
            wrong, it might be below the last line causing ml_get errors.
            (Vlad Irnov)
Solution:   Temporarily change the current window, so that marks are corrected
            properly.
Files:      src/if_py_both.h, src/window.c, src/proto/buffer.pro

Patch 7.4a.028
Problem:    Crash when spell checking in new buffer.
Solution:   Set the b_p_key field.  (Mike Williams)
Files:      src/spell.c, src/testdir/test58.in

Patch 7.4a.029
Problem:    Can't build with MzScheme on Ubuntu 13.04.
Solution:   Add configure check for the "ffi" library.
Files:      src/configure.in, src/auto/configure

Patch 7.4a.030 (after 7.4.027)
Problem:    Missing find_win_for_buf(). (toothpik)
Solution:   Add missing changes.
Files:      src/buffer.c
```

```
Patch 7.4a.031
Problem:    Compiler warnings. (Charles Campbell)
Solution:   Initialize variables even when not needed.
Files:      src/regexp_nfa.c, src/search.c

Patch 7.4a.032
Problem:    New regexp engine: Does not match shorter alternative. (Ingo
            Karkat)
Solution:   Do not drop a new state when the PIM info is different.
Files:      src/regexp_nfa.c

Patch 7.4a.033
Problem:    Test 98 always passes.
Solution:   Include test98a.in in test98.in, execute the crucial command in
            one line. (Yukihiro Nakadaira)
Files:      src/testdir/test98.in, src/testdir/test98a.in

Patch 7.4a.034
Problem:    The tabline may flicker when opening a new tab after 7.3.759 on
            Win32.
Solution:   Move call to TabCtrl_SetCurSel(). (Ken Takata)
Files:      src/gui_w48.c

Patch 7.4a.035
Problem:    Fix in patch 7.4a.032 is not tested.
Solution:   Add test.
Files:      src/testdir/test64.in, src/testdir/test64.ok

Patch 7.4a.036
Problem:    "\p" in a regexp does not match double-width characters.
            (Yukihiro Nakadaira)
Solution:   Don't count display cells, use vim_isprintc().
Files:      src/regexp.c, src/regexp_nfa.c, src/testdir/test64.in,
            src/testdir/test64.ok, src/testdir/test95.in,
            src/testdir/test95.ok

Patch 7.4a.037
Problem:    Win32: When mouse is hidden and in the toolbar, moving it won't
            make it appear. (Sami Salonen)
Solution:   Add tabline_wndproc() and toolbar_wndproc(). (Ken Takata)
Files:      src/gui_w32.c, src/gui_w48.c

Patch 7.4a.038
Problem:    When using MSVC 2012 there are various issues, including GUI size
            computations.
Solution:   Use SM_CXPADDEDBORDER. (Mike Williams)
Files:      src/gui_w32.c, src/gui_w48.c, src/os_win32.h

Patch 7.4a.039
Problem:    New regexp engine doesn't match pattern. (Ingo Karkat)
Solution:   When adding a state also check for different PIM if the list of
            states has any state with a PIM.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok
```

```
Patch 7.4a.040
Problem:    Win32: using uninitialized variable.
Solution:   (Yukihiro Nakadaira)
Files:      src/os_win32.c

Patch 7.4a.041
Problem:    When using ":new ++ff=unix" and "dos" is first in 'fileformats'
            then 'ff' is set to "dos" instead of "unix". (Ingo Karkat)
Solution:   Create set_file_options() and invoke it from do_ecmd().
Files:      src/fileio.c, src/proto/fileio.pro, src/ex_cmds.c,
            src/testdir/test91.in, src/testdir/test91.ok

Patch 7.4a.042
Problem:    Crash when BufUnload autocommands close all buffers. (Andrew
            Pimlott)
Solution:   Set curwin->w_buffer to curbuf to avoid NULL.
Files:      src/window.c, src/testdir/test8.in, src/testdir/test8.ok

Patch 7.4a.043
Problem:    More ml_get errors when adding or deleting lines from Python.
            (Vlad Irnov)
Solution:   Switch to a window with the buffer when possible.
Files:      src/if_py_both.h

Patch 7.4a.044
Problem:    Test 96 sometimes fails.
Solution:   Clear window from b_wininfo in win_free().  (Suggestion by
            Yukihiro Nakadaira)
Files:      src/window.c

Patch 7.4a.045
Problem:    Configure does not always find the right library for Lua.  Missing
            support for LuaJit.
Solution:   Improve the configure detection of Lua. (Hiroshi Shirosaki)
Files:      src/Makefile, src/configure.in, src/auto/configure

Patch 7.4a.046
Problem:    Can't build without mbyte feature.
Solution:   Add #ifdefs.
Files:      src/ex_cmds.c

Patch 7.4a.047
Problem:    Some comments are not so nice.
Solution:   Change the comments.
Files:      src/ex_docmd.c, src/message.c, src/ops.c, src/option.c

Patch 7.4b.001
Problem:    Win32: dialog may extend off-screen.
Solution:   Reduce the size, use correct borders. (Andrei Olsen)
Files:      src/gui_w32.c

Patch 7.4b.002
Problem:    Crash searching for \%(\%(\|\d\|-\|\.\)*\|\*\). (Marcin
```

```
            Szamotulski)  Also for \(\)*.
Solution:   Do add a state for opening parenthesis, so that we can check if it
            was added before at the same position.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.4b.003
Problem:    Regexp code is not nicely aligned.
Solution:   Adjust white space. (Ken Takata)
Files:      src/regexp_nfa.c

Patch 7.4b.004
Problem:    Regexp crash on pattern "@\%[\w\-]*". (Axel Kielhorn)
Solution:   Add \%(\) around \%[] internally.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.4b.005
Problem:    Finding %s in shellpipe and shellredir does not ignore %%s.
Solution:   Skip over %%. (lcd 47)
Files:      src/ex_cmds.c

Patch 7.4b.006 (after 7.3.1295)
Problem:    Using \{n,m} in an autocommand pattern no longer works.
            Specifically, mutt temp files are not recognized. (Gary Johnson)
Solution:   Make \\\{n,m\} work.
Files:      runtime/doc/autocmd.txt, src/fileio.c

Patch 7.4b.007
Problem:    On 32 bit MS-Windows :perldo does not work.
Solution:   Make sure time_t uses 32 bits. (Ken Takata)
Files:      src/if_perl.xs, src/vim.h

Patch 7.4b.008
Problem:    'autochdir' causes setbufvar() to change the current directory.
            (Ben Fritz)
Solution:   When disabling autocommands also reset 'acd' temporarily.
            (Christian Brabandt)
Files:      src/fileio.c

Patch 7.4b.009
Problem:    When setting the Visual area manually and 'selection' is
            exclusive, a yank includes one character too much. (Ingo Karkat)
Solution:   Default the Visual operation to "v". (Christian Brabandt)
Files:      src/mark.c

Patch 7.4b.010
Problem:    Win32: Tcl library load does not use standard mechanism.
Solution:   Call vimLoadLib() instead of LoadLibraryEx(). (Ken Takata)
Files:      src/if_perl.xs, src/if_tcl.c

Patch 7.4b.011
Problem:    ":he \%(\)" does not work. (ZyX)
Solution:   Add an exception to the list.
Files:      src/ex_cmds.c
```

```
Patch 7.4b.012
Problem:    Output from a shell command is truncated at a NUL. (lcd 47)
Solution:   Change every NUL into an SOH.
Files:      src/misc1.c

Patch 7.4b.013
Problem:    Install dir for JP man pages is wrong.
Solution:   Remove ".UTF-8" from the directory name. (Ken Takata)
Files:      src/Makefile

Patch 7.4b.014 (after 7.4b.012)
Problem:    Stupid mistake.
Solution:   Changle "len" to "i".
Files:      src/misc1.c

Patch 7.4b.015 (after 7.4b.008)
Problem:    Can't compile without the 'acd' feature.
Solution:   Add #ifdefs. (Kazunobu Kuriyama)
Files:      src/fileio.c

Patch 7.4b.016
Problem:    Ruby detection fails on Fedora 19.
Solution:   Use one way to get the Ruby version. (Michael Henry)
Files:      src/configure.in, src/auto/configure

Patch 7.4b.017
Problem:    ":he \^x" gives a strange error message. (glts)
Solution:   Do not translate \^x to \_CTRL-x.
Files:      src/ex_cmds.c

Patch 7.4b.018 (after 7.4b.001)
Problem:    Win32: Dialog can still be too big.
Solution:   Move the check for height further down. (Andrei Olsen)
Files:      src/gui_w32.c

Patch 7.4b.019 (after 7.4a.034)
Problem:    Tabline is not updated properly when closing a tab on Win32.
Solution:   Only reduce flickering when adding a tab. (Ken Takata)
Files:      src/gui_w48.c

Patch 7.4b.020
Problem:    "g~ap" changes first character of next paragraph. (Manuel Ortega)
Solution:   Avoid subtracting (0 - 1) from todo.  (Mike Williams)
Files:      src/ops.c, src/testdir/test82.in, src/testdir/test82.ok

Patch 7.4b.021
Problem:    Pressing "u" after an external command results in multiple
            press-enter messages. (glts)
Solution:   Don't call hit_return_msg() when we have K_IGNORE. (Christian
            Brabandt)
Files:      src/message.c

Patch 7.4b.022
Problem:    Not waiting for a character when the tick count overflows.
```

```
Solution:   Subtract the unsigned numbers and cast to int. (Ken Takata)
Files:      src/os_win32.c

version8.txt For Vim version 8.1. Last change: 2018 May 17

VIM REFERENCE MANUAL by Bram Moolenaar

vim8 vim-8 version-8.0 version8.0

Welcome to Vim 8! A large number of bugs have been fixed and several nice features have been added. This file mentions all the new items and changes to existing features since Vim 7.4. The patches up to Vim 7.4 can be found here: vim-7.4 .

Use this command to see the full version and features information of the Vim program you are using:
	:version

See vi_diff.txt for an overview of differences between Vi and Vim 8.0.
See version4.txt , version5.txt , version6.txt and version7.txt for differences between other versions.

==
NEW FEATURES new-8

First an overview of the more interesting new features. A comprehensive list is below.

Asynchronous I/O support, channels

Vim can now exchange messages with other processes in the background. This makes it possible to have servers do work and send back the results to Vim.
See channel-demo for an example, this shows communicating with a Python server.

Closely related to channels is JSON support. JSON is widely supported and can easily be used for inter-process communication, allowing for writing a server

in any language. The functions to use are json_encode() and json_decode() .

This makes it possible to build very complex plugins, written in any language and running in a separate process.

Jobs

Vim can now start a job, communicate with it and stop it. This is very useful to run a process for completion, syntax checking, etc. Channels are used to communicate with the job. Jobs can also read from or write to a buffer or a file. See job_start() .

Timers

Also asynchronous are timers. They can fire once or repeatedly and invoke a function to do any work. For example:

```
let tempTimer = timer_start(4000, 'CheckTemp')
```

This will call the CheckTemp() function four seconds (4000 milli seconds) later. See timer_start() .

Partials

Vim already had a Funcref, a reference to a function. A partial also refers to a function, and additionally binds arguments and/or a dictionary. This is especially useful for callbacks on channels and timers. E.g., for the timer example above, to pass an argument to the function:

```
let tempTimer = timer_start(4000, function('CheckTemp', ['out']))
```

This will call CheckTemp('out') four seconds later.

Lambda and Closure

A short way to create a function has been added: {args -> expr}. See lambda .
This is useful for functions such as `filter()` and `map()`, which now also accept a function argument. Example:

```
:call filter(mylist, {idx, val -> val > 20})
```

A lambda can use variables defined in the scope where the lambda is defined. This is usually called a closure .

User defined functions can also be a closure by adding the "closure" argument :func-closure .

Packages

Plugins keep growing and more of them are available than ever before. To keep the collection of plugins manageable package support has been added. This is a convenient way to get one or more plugins, drop them in a directory and possibly keep them updated. Vim will load them automatically, or only when desired. See packages .

New style tests

This is for Vim developers. So far writing tests for Vim has not been easy. Vim 8 adds assert functions and a framework to run tests. This makes it a lot simpler to write tests and keep them updated. Also new are several functions that are added specifically for testing. See test-functions .

Window IDs

Previously windows could only be accessed by their number. And every time a window would open, close or move that number changes. Each window now has a unique ID, so that they are easy to find. See win_getid() and win_id2win() .

Viminfo uses timestamps

Previously the information stored in viminfo was whatever the last Vim wrote there. Now timestamps are used to always keep the most recent items.
See viminfo-timestamp .

Wrapping lines with indent

The 'breakindent' option has been added to be able to wrap lines without changing the amount of indent.

Windows: DirectX support

This adds the 'renderoptions' option to allow for switching on DirectX (DirectWrite) support on MS-Windows.

GTK+ 3 support

The GTK+ 3 GUI works just like GTK+ 2 except for hardly noticeable technical differences between them. Configure still chooses GTK+ 2 if both 2 and 3 are available. See src/Makefile for how to use GTK+ 3 instead. See gui-x11-compiling for other details.

Vim script enhancements new-vim-script-8

In Vim script the following types have been added:

Special	v:false , v:true , v:none and v:null
Channel	connection to another process for asynchronous I/O
Job	process control

Many functions and commands have been added to support the new types.

On some systems the numbers used in Vim script are now 64 bit. This can be checked with the +num64 feature.

Many items were added to support new-style-testing .

printf() now accepts any type of argument for %s. It is converted to a string like with string().

Various new items new-items-8

Visual mode commands:

v_CTRL-A	CTRL-A	add N to number in highlighted text
v_CTRL-X	CTRL-X	subtract N from number in highlighted text
v_g_CTRL-A	g CTRL-A	add N to number in highlighted text
v_g_CTRL-X	g CTRL-X	subtract N from number in highlighted text

Insert mode commands:

i_CTRL-G_U	CTRL-G U	don't break undo with next cursor movement

Cmdline mode commands:

/_CTRL-G	CTRL-G	move to the next match in 'incsearch' mode
/_CTRL-T	CTRL-T	move to the previous match in 'incsearch' mode

Options:

'belloff'	do not ring the bell for these reasons
'breakindent'	wrapped line repeats indent
'breakindentopt'	settings for 'breakindent'.
'emoji'	emoji characters are considered full width
'fixendofline'	make sure last line in file has <EOL>
'langremap'	do apply 'langmap' to mapped characters
'luadll'	name of the Lua dynamic library
'packpath'	list of directories used for packages
'perldll'	name of the Perl dynamic library
'pythondll'	name of the Python 2 dynamic library
'pythonthreedll'	name of the Python 3 dynamic library
'renderoptions'	options for text rendering on Windows
'rubydll'	name of the Ruby dynamic library
'signcolumn'	when to display the sign column
'tagcase'	how to handle case when searching in tags files
'tcldll'	name of the Tcl dynamic library
'termguicolors'	use GUI colors for the terminal

Ex commands:

:cbottom	scroll to the bottom of the quickfix window
:cdo	execute command in each valid error list entry
:cfdo	execute command in each file in error list
:chistory	display quickfix list stack
:clearjumps	clear the jump list
:filter	only output lines that (do not) match a pattern
:helpclose	close one help window
:lbottom	scroll to the bottom of the location window
:ldo	execute command in valid location list entries
:lfdo	execute command in each file in location list
:lhistory	display location list stack
:noswapfile	following commands don't create a swap file
:packadd	add a plugin from 'packpath'
:packloadall	load all packages under 'packpath'
:smile	make the user happy

Ex command modifiers:

:keeppatterns	following command keeps search pattern history
<mods>	supply command modifiers to user defined commands

New and extended functions:

arglistid()	get id of the argument list
assert_equal()	assert that two expressions values are equal
assert_exception()	assert that a command throws an exception
assert_fails()	assert that a function call fails
assert_false()	assert that an expression is false
assert_inrange()	assert that an expression is inside a range
assert_match()	assert that a pattern matches the value
assert_notequal()	assert that two expressions values are not equal
assert_notmatch()	assert that a pattern does not match the value
assert_true()	assert that an expression is true
bufwinid()	get the window ID of a specific buffer
byteidxcomp()	like byteidx() but count composing characters
ch_close()	close a channel
ch_close_in()	close the in part of a channel
ch_evalexpr()	evaluates an expression over channel
ch_evalraw()	evaluates a raw string over channel
ch_getbufnr()	get the buffer number of a channel
ch_getjob()	get the job associated with a channel
ch_info()	get channel information
ch_log()	write a message in the channel log file
ch_logfile()	set the channel log file
ch_open()	open a channel
ch_read()	read a message from a channel
ch_readraw()	read a raw message from a channel
ch_sendexpr()	send a JSON message over a channel
ch_sendraw()	send a raw message over a channel
ch_setoptions()	set the options for a channel
ch_status()	get status of a channel

execute()   execute an Ex command and get the output
exepath()   full path of an executable program
funcref()   return a reference to function {name}
getbufinfo()   get a list with buffer information
getcharsearch()   return character search information
getcmdwintype()   return the current command-line window type
getcompletion()   return a list of command-line completion matches
getcurpos()   get position of the cursor
gettabinfo()   get a list with tab page information
getwininfo()   get a list with window information
glob2regpat()   convert a glob pattern into a search pattern
isnan()   check for not a number
job_getchannel()   get the channel used by a job
job_info()   get information about a job
job_setoptions()   set options for a job
job_start()   start a job
job_status()   get the status of a job
job_stop()   stop a job
js_decode()   decode a JSON string to Vim types
js_encode()   encode an expression to a JSON string
json_decode()   decode a JSON string to Vim types
json_encode()   encode an expression to a JSON string
matchaddpos()   define a list of positions to highlight
matchstrpos()   match and positions of a pattern in a string
perleval()   evaluate Perl expression
reltimefloat()   convert reltime() result to a Float
setcharsearch()   set character search information
setfperm()   set the permissions of a file
strcharpart()   get part of a string using char index
strgetchar()   get character from a string using char index
systemlist()   get the result of a shell command as a list
test_alloc_fail()   make memory allocation fail
test_autochdir()   test 'autochdir' functionality
test_disable_char_avail() test without typeahead (removed later)
test_garbagecollect_now() free memory right now
test_null_channel()   return a null Channel
test_null_dict()   return a null Dict
test_null_job()   return a null Job
test_null_list()   return a null List
test_null_partial()   return a null Partial function
test_null_string()   return a null String
test_settime()   set the time Vim uses internally
timer_info()   get information about timers
timer_pause()   pause or unpause a timer
timer_start()   create a timer
timer_stop()   stop a timer
timer_stopall()   stop all timers
uniq()   remove copies of repeated adjacent items
win_findbuf()   find windows containing a buffer
win_getid()   get window ID of a window
win_gotoid()   go to window with ID
win_id2tabwin()   get tab and window nr from window ID
win_id2win()   get window nr from window ID
wordcount()   get byte/word/char count of buffer

New Vim variables:

v:beval_winid	Window ID of the window where the mouse pointer is
v:completed_item	complete items for the most recently completed word
v:errors	errors found by assert functions
v:false	a Number with value zero
v:hlsearch	indicates whether search highlighting is on
v:mouse_winid	Window ID for a mouse click obtained with getchar()
v:none	an empty String, used for JSON
v:null	an empty String, used for JSON
v:option_new	new value of the option, used by OptionSet
v:option_old	old value of the option, used by OptionSet
v:option_type	scope of the set command, used by OptionSet
v:progpath	the command with which Vim was invoked
v:t_bool	value of Boolean type
v:t_channel	value of Channel type
v:t_dict	value of Dictionary type
v:t_float	value of Float type
v:t_func	value of Funcref type
v:t_job	value of Job type
v:t_list	value of List type
v:t_none	value of None type
v:t_number	value of Number type
v:t_string	value of String type
v:testing	must be set before using `test_garbagecollect_now()`
v:true	a Number with value one
v:vim_did_enter	set just before VimEnter autocommands are triggered

New autocommand events:

CmdUndefined	a user command is used but it isn't defined
OptionSet	after setting any option
TabClosed	after closing a tab page
TabNew	after creating a new tab page
TextChangedI	after a change was made to the text in Insert mode
TextChanged	after a change was made to the text in Normal mode
WinNew	after creating a new window

New highlight groups:

EndOfBuffer	filler lines (~) after the last line in the buffer. hl-EndOfBuffer

New items in search patterns:

/\%C	\%C	match any composing characters

New Syntax/Indent/FTplugin files:

AVR Assembler (Avra) syntax
Arduino syntax
Bazel syntax and indent and ftplugin
Dockerfile syntax and ftplugin
Eiffel ftplugin

==
INCOMPATIBLE CHANGES incompatible-8

These changes are incompatible with previous releases. Check this list if you run into a problem when upgrading from Vim 7.4 to 8.0.

Better defaults without a vimrc

When no vimrc file is found, the `defaults.vim` script is loaded to set more useful default values for new users. That includes setting `'nocompatible'`. Thus Vim no longer starts up in Vi compatible mode. If you do want that,

either create a .vimrc file that does "set compatible" or start Vim with
"vim -C".

Support removed

The support for MS-DOS has been removed. It hasn't been working for a while
(Vim doesn't fit in memory) and removing it cleans up the code quite a bit.

The support for Windows 16 bit (Windows 95 and older) has been removed.

The support for OS/2 has been removed. It probably hasn't been working for a
while since nobody uses it.

The SNiFF+ support has been removed.

Minor incompatibilities:

Probably...

==
IMPROVEMENTS improvements-8

The existing blowfish encryption turned out to be much weaker than it was
supposed to be. The blowfish2 method has been added to fix that. Note that
this still isn't a state-of-the-art encryption, but good enough for most
usage. See 'cryptmethod'.

==
COMPILE TIME CHANGES compile-changes-8

The Vim repository was moved from Google code to github, since Google code
was shut down. It can now be found at https://github.com/vim/vim.

Functions now use ANSI-C declarations. At least a C-89 compatible compiler is
required.

The +visual feature is now always included.

==
PATCHES patches-8 bug-fixes-8

The list of patches that got included since 7.4.0. This includes all the new
features, but does not include runtime file changes (syntax, indent, help,
etc.)

Patch 7.4.001
Problem: Character classes such as [a-z] do not react to 'ignorecase'.
            Breaks man page highlighting. (Mario Grgic)
Solution: Add separate items for classes that react to 'ignorecase'. Clean
            up logic handling character classes. Add more tests.
Files: src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

```
Patch 7.4.002
Problem:    Pattern with two alternative look-behind matches does not match.
            (Amadeus Demarzi)
Solution:   When comparing PIMs also compare their state ID to see if they are
            different.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.4.003
Problem:    Memory access error in Ruby syntax highlighting. (Christopher Chow)
Solution:   Refresh stale pointer. (James McCoy)
Files:      src/regexp_nfa.c

Patch 7.4.004
Problem:    When closing a window fails ":bwipe" may hang.
Solution:   Let win_close() return FAIL and break out of the loop.
Files:      src/window.c, src/proto/window.pro, src/buffer.c

Patch 7.4.005
Problem:    Using "vaB" while 'virtualedit' is set selects the wrong area.
            (Dimitar Dimitrov)
Solution:   Reset coladd when finding a match.
Files:      src/search.c

Patch 7.4.006
Problem:    mkdir("foo/bar/", "p") gives an error message. (David Barnett)
Solution:   Remove the trailing slash. (lcd)
Files:      src/eval.c

Patch 7.4.007
Problem:    Creating a preview window on startup leaves the screen layout in a
            messed up state. (Marius Gedminas)
Solution:   Don't change firstwin. (Christian Brabandt)
Files:      src/main.c

Patch 7.4.008
Problem:    New regexp engine can't be interrupted.
Solution:   Check for CTRL-C pressed. (Yasuhiro Matsumoto)
Files:      src/regexp_nfa.c, src/regexp.c

Patch 7.4.009
Problem:    When a file was not decrypted (yet), writing it may destroy the
            contents.
Solution:   Mark the file as readonly until decryption was done. (Christian
            Brabandt)
Files:      src/fileio.c

Patch 7.4.010 (after 7.4.006)
Problem:    Crash with invalid argument to mkdir().
Solution:   Check for empty string. (lcd47)
Files:      src/eval.c

Patch 7.4.011
Problem:    Cannot find out if "acl" and "xpm" features are supported.
```

```
Solution:   Add "acl" and "xpm" to the list of features. (Ken Takata)
Files:      src/eval.c, src/version.c

Patch 7.4.012
Problem:    MS-Windows: resolving shortcut does not work properly with
            multi-byte characters.
Solution:   Use wide system functions. (Ken Takata)
Files:      src/os_mswin.c

Patch 7.4.013
Problem:    MS-Windows: File name buffer too small for utf-8.
Solution:   Use character count instead of byte count. (Ken Takata)
Files:      src/os_mswin.c

Patch 7.4.014
Problem:    MS-Windows: check for writing to device does not work.
Solution:   Fix #ifdefs. (Ken Takata)
Files:      src/fileio.c

Patch 7.4.015
Problem:    MS-Windows: Detecting node type does not work for multi-byte
            characters.
Solution:   Use wide character function when needed. (Ken Takata)
Files:      src/os_win32.c

Patch 7.4.016
Problem:    MS-Windows: File name case can be wrong.
Solution:   Add fname_casew(). (Ken Takata)
Files:      src/os_win32.c

Patch 7.4.017
Problem:    ":help !!" does not find the "!!" tag in the help file. (Ben
            Fritz)
Solution:   When reading the start of the tags file do parse lines that are
            not header lines.
Files:      src/tag.c

Patch 7.4.018
Problem:    When completing item becomes unselected. (Shougo Matsu)
Solution:   Revert patch 7.3.1269.
Files:      src/edit.c

Patch 7.4.019
Problem:    MS-Windows: File name completion doesn't work properly with
            Chinese characters. (Yue Wu)
Solution:   Take care of multi-byte characters when looking for the start of
            the file name. (Ken Takata)
Files:      src/edit.c

Patch 7.4.020
Problem:    NFA engine matches too much with \@>. (John McGowan)
Solution:   When a whole pattern match is found stop searching.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok
```

```
Patch 7.4.021
Problem:    NFA regexp: Using \ze in one branch which doesn't match may cause
            end of another branch to be wrong. (William Fugh)
Solution:   Set end position if it wasn't set yet.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.4.022
Problem:    Deadlock while exiting, because of allocating memory.
Solution:   Do not use gettext() in deathtrap(). (James McCoy)
Files:      src/os_unix.c, src/misc1.c

Patch 7.4.023
Problem:    Compiler warning on 64 bit windows.
Solution:   Add type cast. (Mike Williams)
Files:      src/edit.c

Patch 7.4.024
Problem:    When root edits a file the undo file is owned by root while the
            edited file may be owned by another user, which is not allowed.
            (cac2s)
Solution:   Accept an undo file owned by the current user.
Files:      src/undo.c

Patch 7.4.025 (after 7.4.019)
Problem:    Reading before start of a string.
Solution:   Do not call mb_ptr_back() at start of a string. (Dominique Pelle)
Files:      src/edit.c

Patch 7.4.026
Problem:    Clang warning for int shift overflow.
Solution:   Use unsigned and cast back to int. (Dominique Pelle)
Files:      src/misc2.c

Patch 7.4.027 (after 7.4.025)
Problem:    Another valgrind error when using CTRL-X CTRL-F at the start of
            the line. (Dominique Pelle)
Solution:   Don't call mb_ptr_back() at the start of the line.  Add a test.
Files:      src/edit.c, src/testdir/test32.in

Patch 7.4.028
Problem:    Equivalence classes are not working for multi-byte characters.
Solution:   Copy the rules from the old to the new regexp engine. Add a test
            to check both engines.
Files:      src/regexp_nfa.c, src/testdir/test44.in, src/testdir/test99.in,
            src/testdir/test99.ok, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile

Patch 7.4.029
Problem:    An error in a pattern is reported twice.
Solution:   Remove the retry with the backtracking engine, it won't work.
Files:      src/regexp.c
```

```
Patch 7.4.030
Problem:    The -mno-cygwin argument is no longer supported by Cygwin.
Solution:   Remove the arguments. (Steve Hall)
Files:      src/GvimExt/Make_cyg.mak, src/Make_cyg.mak, src/xxd/Make_cyg.mak

Patch 7.4.031
Problem:    ":diffoff!" resets options even when 'diff' is not set. (Charles
            Cooper)
Solution:   Only resets related options in a window where 'diff' is set.
Files:      src/diff.c

Patch 7.4.032
Problem:    NFA engine does not match the NUL character. (Jonathon Merz)
Solution:   Use 0x0a instead of NUL. (Christian Brabandt)
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.4.033
Problem:    When the terminal has only 20 lines test 92 and 93 overwrite the
            input file.
Solution:   Explicitly write test.out. Check that the terminal is large enough
            to run the tests.  (Hirohito Higashi)
Files:      src/testdir/test92.in, src/testdir/test93.in,
            src/testdir/test1.in, src/testdir/Makefile

Patch 7.4.034
Problem:    Using "p" in Visual block mode only changes the first line.
Solution:   Repeat the put in all text in the block. (Christian Brabandt)
Files:      runtime/doc/change.txt, src/ops.c, src/normal.c,
            src/testdir/test20.in, src/testdir/test20.ok

Patch 7.4.035
Problem:    MS-Windows: The mouse pointer flickers when going from command
            line mode to Normal mode.
Solution:   Check for WM_NCMOUSEMOVE. (Ken Takata)
Files:      src/gui_w48.c

Patch 7.4.036
Problem:    NFA engine does not capture group correctly when using \@>. (ZyX)
Solution:   Copy submatches before doing the recursive match.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.4.037
Problem:    Using "\ze" in a sub-pattern does not result in the end of the
            match to be set. (Axel Bender)
Solution:   Copy the end of match position when a recursive match was
            successful.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.4.038
Problem:    Using "zw" and "zg" when 'spell' is off give a confusing error
            message. (Gary Johnson)
Solution:   Ignore the error when locating the word.  Explicitly mention what
            word was added. (Christian Brabandt)
Files:      src/normal.c, src/spell.c
```

```
Patch 7.4.039
Problem:    MS-Windows: MSVC10 and earlier can't handle symlinks to a
            directory properly.
Solution:   Add stat_symlink_aware() and wstat_symlink_aware(). (Ken Takata)
Files:      src/os_mswin.c, src/os_win32.c, src/os_win32.h

Patch 7.4.040
Problem:    Valgrind error on exit when a script-local variable holds a
            reference to the scope of another script.
Solution:   First clear all variables, then free the scopes. (ZyX)
Files:      src/eval.c

Patch 7.4.041 (after 7.4.034)
Problem:    Visual selection does not remain after being copied over. (Axel
            Bender)
Solution:   Move when VIsual_active is reset. (Christian Brabandt)
Files:      src/ops.c

Patch 7.4.042
Problem:    When using ":setlocal" for 'spell' and 'spelllang' then :spelldump
            doesn't work. (Dimitar Dimitrov)
Solution:   Copy the option variables to the new window used to show the dump.
            (Christian Brabandt)
Files:      src/spell.c

Patch 7.4.043
Problem:    VMS can't handle long function names.
Solution:   Shorten may_req_ambiguous_character_width. (Samuel Ferencik)
Files:      src/main.c, src/term.c, src/proto/term.pro

Patch 7.4.044 (after 7.4.039)
Problem:    Can't build with old MSVC. (Wang Shoulin)
Solution:   Define OPEN_OH_ARGTYPE instead of using intptr_t directly.
Files:      src/os_mswin.c

Patch 7.4.045
Problem:    substitute() does not work properly when the pattern starts with
            "\ze".
Solution:   Detect an empty match. (Christian Brabandt)
Files:      src/eval.c, src/testdir/test80.in, src/testdir/test80.ok

Patch 7.4.046
Problem:    Can't use Tcl 8.6.
Solution:   Change how Tcl_FindExecutable is called. (Jan Nijtmans)
Files:      src/if_tcl.c

Patch 7.4.047
Problem:    When using input() in a function invoked by a mapping it doesn't
            work.
Solution:   Temporarily reset ex_normal_busy. (Yasuhiro Matsumoto)
Files:      src/eval.c
```

```
Patch 7.4.048
Problem:    Recent clang version complains about -fno-strength-reduce.
Solution:   Add a configure check for the clang version. (Kazunobu Kuriyama)
Files:      src/configure.in, src/auto/configure

Patch 7.4.049
Problem:    In Ex mode, when line numbers are enabled the substitute prompt is
            wrong.
Solution:   Adjust for the line number size. (Benoit Pierre)
Files:      src/ex_cmds.c

Patch 7.4.050
Problem:    "gn" selects too much for the pattern "\d" when there are two
            lines with a single digit. (Ryan Carney)
Solution:   Adjust the logic of is_one_char(). (Christian Brabandt)
Files:      src/search.c, src/testdir/test53.in, src/testdir/test53.ok

Patch 7.4.051
Problem:    Syntax highlighting a Yaml file causes a crash. (Blake Preston)
Solution:   Copy the pim structure before calling addstate() to avoid it
            becoming invalid when the state list is reallocated.
Files:      src/regexp_nfa.c

Patch 7.4.052
Problem:    With 'fo' set to "a2" inserting a space in the first column may
            cause the cursor to jump to the previous line.
Solution:   Handle the case when there is no comment leader properly. (Tor
            Perkins)  Also fix that cursor is in the wrong place when spaces
            get replaced with a Tab.
Files:      src/misc1.c, src/ops.c, src/testdir/test68.in,
            src/testdir/test68.ok

Patch 7.4.053
Problem:    Test75 has a wrong header. (ZyX)
Solution:   Fix the text and remove leading ".
Files:      src/testdir/test75.in

Patch 7.4.054
Problem:    Reading past end of the 'stl' string.
Solution:   Don't increment pointer when already at the NUL. (Christian
            Brabandt)
Files:      src/buffer.c

Patch 7.4.055
Problem:    Mac: Where availability macros are defined depends on the system.
Solution:   Add a configure check. (Felix Bünemann)
Files:      src/config.h.in, src/configure.in, src/auto/configure,
            src/os_mac.h

Patch 7.4.056
Problem:    Mac: Compilation problem with OS X 10.9 Mavericks.
Solution:   Include AvailabilityMacros.h when available. (Kazunobu Kuriyama)
Files:      src/os_unix.c
```

```
Patch 7.4.057
Problem:    byteidx() does not work for composing characters.
Solution:   Add byteidxcomp().
Files:      src/eval.c, src/testdir/test69.in, src/testdir/test69.ok,
            runtime/doc/eval.txt

Patch 7.4.058
Problem:    Warnings on 64 bit Windows.
Solution:   Add type casts. (Mike Williams)
Files:      src/ops.c

Patch 7.4.059
Problem:    set_last_cursor() may encounter w_buffer being NULL.  (Matt
            Mkaniaris)
Solution:   Check for NULL.
Files:      src/mark.c

Patch 7.4.060
Problem:    Declaration has wrong return type for PyObject_SetAttrString().
Solution:   Use int instead of PyObject. (Andreas Schwab)
Files:      src/if_python.c, src/if_python3.c

Patch 7.4.061 (after 7.4.055 and 7.4.056)
Problem:    Availability macros configure check in wrong place.
Solution:   Also check when not using Darwin. Remove version check.
Files:      src/configure.in, src/auto/configure, src/os_unix.c

Patch 7.4.062 (after 7.4.061)
Problem:    Configure check for AvailabilityMacros.h is wrong.
Solution:   Use AC_CHECK_HEADERS().
Files:      src/configure.in, src/auto/configure

Patch 7.4.063
Problem:    Crash when using invalid key in Python dictionary.
Solution:   Check for object to be NULL.  Add tests. (ZyX)
Files:      src/if_py_both.h, src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.4.064
Problem:    When replacing a character in Visual block mode, entering a CR
            does not cause a repeated line break.
Solution:   Recognize the situation and repeat the line break. (Christian
            Brabandt)
Files:      src/normal.c, src/ops.c, src/testdir/test39.in,
            src/testdir/test39.ok

Patch 7.4.065
Problem:    When recording, the character typed at the hit-enter prompt is
            recorded twice. (Urtica Dioica)
Solution:   Avoid recording the character twice. (Christian Brabandt)
Files:      src/message.c

Patch 7.4.066
Problem:    MS-Windows: When there is a colon in the file name (sub-stream
```

            feature) the swap file name is wrong.
Solution: Change the colon to "%". (Yasuhiro Matsumoto)
Files: src/fileio.c, src/memline.c, src/misc1.c, src/proto/misc1.pro

Patch 7.4.067
Problem: After inserting comment leader, CTRL-\ CTRL-O does move the
            cursor. (Wiktor Ruben)
Solution: Avoid moving the cursor. (Christian Brabandt)
Files: src/edit.c

Patch 7.4.068
Problem: Cannot build Vim on Mac with non-Apple compilers.
Solution: Remove the -no-cpp-precomp flag. (Misty De Meo)
Files: src/configure.in, src/auto/configure, src/osdef.sh

Patch 7.4.069
Problem: Cannot right shift lines starting with #.
Solution: Allow the right shift when 'cino' contains #N with N > 0.
            (Christian Brabandt)
            Refactor parsing 'cino', store the values in the buffer.
Files: runtime/doc/indent.txt, src/buffer.c, src/edit.c, src/eval.c,
            src/ex_getln.c, src/fold.c, src/misc1.c, src/ops.c,
            src/proto/misc1.pro, src/proto/option.pro, src/structs.h,
            src/option.c

Patch 7.4.070 (after 7.4.069)
Problem: Can't compile with tiny features. (Tony Mechelynck)
Solution: Add #ifdef.
Files: src/buffer.c

Patch 7.4.071 (after 7.4.069)
Problem: Passing limits around too often.
Solution: Use limits from buffer.
Files: src/edit.c, src/misc1.c, src/proto/misc1.pro

Patch 7.4.072
Problem: Crash when using Insert mode completion.
Solution: Avoid going past the end of pum_array. (idea by Francisco Lopes)
Files: src/popupmnu.c

Patch 7.4.073
Problem: Setting undolevels for one buffer changes undo in another.
Solution: Make 'undolevels' a global-local option. (Christian Brabandt)
Files: runtime/doc/options.txt, src/buffer.c, src/option.c, src/option.h
            src/structs.h, src/undo.c

Patch 7.4.074
Problem: When undo'ing all changes and creating a new change the undo
            structure is incorrect. (Christian Brabandt)
Solution: When deleting the branch starting at the old header, delete the
            whole branch, not just the first entry.
Files: src/undo.c

Patch 7.4.075

```
Problem:    Locally setting 'undolevels' is not tested.
Solution:   Add a test. (Christian Brabandt)
Files:      src/testdir/test100.in, src/testdir/test100.ok,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile, src/Makefile

Patch 7.4.076
Problem:    "cgn" does not wrap around the end of the file. (Dimitar Dimitrov)
Solution:   Restore 'wrapscan' earlier. (Christian Brabandt)
Files:      src/search.c

Patch 7.4.077
Problem:    DOS installer creates shortcut without a path, resulting in the
            current directory to be C:\Windows\system32.
Solution:   Use environment variables.
Files:      src/dosinst.c

Patch 7.4.078
Problem:    MSVC 2013 is not supported.
Solution:   Recognize and support MSVC 2013. (Ed Brown)
Files:      src/Make_mvc.mak

Patch 7.4.079
Problem:    A script cannot detect whether 'hlsearch' highlighting is actually
            displayed.
Solution:   Add the "v:hlsearch" variable. (ZyX)
Files:      src/eval.c, src/ex_docmd.c,
            src/option.c, src/screen.c, src/search.c, src/tag.c, src/vim.h,
            src/testdir/test101.in, src/testdir/test101.ok,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile

Patch 7.4.080 (after 7.4.079)
Problem:    Missing documentation for v:hlsearch.
Solution:   Include the right file in the patch.
Files:      runtime/doc/eval.txt

Patch 7.4.081 (after 7.4.078)
Problem:    Wrong logic when ANALYZE is "yes".
Solution:   Use or instead of and. (KF Leong)
Files:      src/Make_mvc.mak

Patch 7.4.082
Problem:    Using "gf" in a changed buffer suggests adding "!", which is not
            possible. (Tim Chase)
Solution:   Pass a flag to check_changed() whether adding ! make sense.
Files:      src/vim.h, src/ex_cmds2.c, src/proto/ex_cmds2.pro, src/globals.h,
            src/ex_cmds.c, src/ex_docmd.c

Patch 7.4.083
Problem:    It's hard to avoid adding a used pattern to the search history.
Solution:   Add the ":keeppatterns" modifier. (Christian Brabandt)
```

```
Files:      runtime/doc/cmdline.txt, src/ex_cmds.h, src/ex_docmd.c,
            src/ex_getln.c, src/structs.h

Patch 7.4.084
Problem:    Python: interrupt not being properly discarded. (Yggdroot Chen)
Solution:   Discard interrupt in VimTryEnd. (ZyX)
Files:      src/if_py_both.h, src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.4.085
Problem:    When inserting text in Visual block mode and moving the cursor the
            wrong text gets repeated in other lines.
Solution:   Use the '[ mark to find the start of the actually inserted text.
            (Christian Brabandt)
Files:      src/ops.c, src/testdir/test39.in, src/testdir/test39.ok

Patch 7.4.086
Problem:    Skipping over an expression when not evaluating it does not work
            properly for dict members.
Solution:   Skip over unrecognized expression. (ZyX)
Files:      src/eval.c, src/testdir/test34.in, src/testdir/test34.ok

Patch 7.4.087
Problem:    Compiler warning on 64 bit Windows systems.
Solution:   Fix type cast. (Mike Williams)
Files:      src/ops.c

Patch 7.4.088
Problem:    When spell checking is enabled Asian characters are always marked
            as error.
Solution:   When 'spelllang' contains "cjk" do not mark Asian characters as
            error. (Ken Takata)
Files:      runtime/doc/options.txt, runtime/doc/spell.txt, src/mbyte.c,
            src/option.c, src/spell.c, src/structs.h

Patch 7.4.089
Problem:    When editing a file in a directory mounted through sshfs Vim
            doesn't set the security context on a renamed file.
Solution:   Add mch_copy_sec() to vim_rename(). (Peter Backes)
Files:      src/fileio.c

Patch 7.4.090
Problem:    Win32: When a directory name contains an exclamation mark,
            completion doesn't complete the contents of the directory.
Solution:   Escape the exclamation mark. (Jan Stocker)
Files:      src/ex_getln.c, src/testdir/test102.in, src/testdir/test102.ok,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile

Patch 7.4.091 (after 7.4.089)
Problem:    Missing semicolon.
Solution:   Add the semicolon.
Files:      src/fileio.c
```

```
Patch 7.4.092 (after 7.4.088)
Problem:    Can't build small version.
Solution:   Add #ifdef where the b_cjk flag is used. (Ken Takata)
Files:      src/spell.c

Patch 7.4.093
Problem:    Configure can't use LuaJIT on ubuntu 12.04.
Solution:   Adjust the configure regexp that locates the version number.
            (Charles Strahan)
Files:      src/configure.in, src/auto/configure

Patch 7.4.094
Problem:    Configure may not find that -lint is needed for gettext().
Solution:   Check for gettext() with empty $LIBS.  (Thomas De Schampheleire)
Files:      src/configure.in, src/auto/configure

Patch 7.4.095 (after 7.4.093)
Problem:    Regexp for LuaJIT version doesn't work on BSD.
Solution:   Use "*" instead of "\+" and "\?". (Ozaki Kiichi)
Files:      src/configure.in, src/auto/configure

Patch 7.4.096
Problem:    Can't change directory to an UNC path.
Solution:   Use win32_getattrs() in mch_getperm(). (Christian Brabandt)
Files:      src/os_win32.c

Patch 7.4.097 (after 7.4.034)
Problem:    Unexpected behavior change related to 'virtualedit'. (Ingo Karkat)
Solution:   Update the valid cursor position. (Christian Brabandt)
Files:      src/ops.c

Patch 7.4.098
Problem:    When using ":'<,'>del" errors may be given for the visual line
            numbers being out of range.
Solution:   Reset Visual mode in ":del". (Lech Lorens)
Files:      src/ex_docmd.c, src/testdir/test103.in, src/testdir/test103.ok,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile

Patch 7.4.099
Problem:    Append in blockwise Visual mode with "$" is wrong.
Solution:   After "$" don't use the code that checks if the cursor was moved.
            (Hirohito Higashi, Ken Takata)
Files:      src/ops.c, src/testdir/test39.in, src/testdir/test39.ok

Patch 7.4.100
Problem:    NFA regexp doesn't handle backreference correctly. (Ryuichi
            Hayashida, Urtica Dioica)
Solution:   Always add NFA_SKIP, also when it already exists at the start
            position.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok
```

```
Patch 7.4.101
Problem:    Using \1 in pattern goes one line too far. (Bohr Shaw, John Little)
Solution:   Only advance the match end for the matched characters in the last
            line.
Files:      src/regexp.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.4.102
Problem:    Crash when interrupting "z=".
Solution:   Add safety check for word length. (Christian Brabandt, Dominique
            Pelle)
Files:      src/spell.c

Patch 7.4.103
Problem:    Dos installer uses an old way to escape spaces in the diff
            command.
Solution:   Adjust the quoting to the new default shellxquote. (Ben Fritz)
Files:      src/dosinst.c

Patch 7.4.104
Problem:    ":help s/\_" reports an internal error. (John Beckett)
Solution:   Check for NUL and invalid character classes.
Files:      src/regexp_nfa.c

Patch 7.4.105
Problem:    Completing a tag pattern may give an error for invalid pattern.
Solution:   Suppress the error, just return no matches.
Files:      src/tag.c

Patch 7.4.106
Problem:    Can't build with Ruby using Cygwin.
Solution:   Fix library name in makefile. (Steve Hall)
Files:      src/Make_cyg.mak

Patch 7.4.107
Problem:    Python: When vim.eval() encounters a Vim error, a try/catch in the
            Python code doesn't catch it. (Yggdroot Chen)
Solution:   Throw exceptions on errors in vim.eval(). (ZyX)
Files:      src/ex_eval.c, src/if_py_both.h, src/proto/ex_eval.pro,
            src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.4.108
Problem:    "zG" and "zW" leave temp files around on MS-Windows.
Solution:   Delete the temp files when exiting. (Ken Takata)
Files:      src/memline.c, src/proto/spell.pro, src/spell.c

Patch 7.4.109
Problem:    ColorScheme autocommand matches with the current buffer name.
Solution:   Match with the colorscheme name. (Christian Brabandt)
Files:      runtime/doc/autocmd.txt, src/fileio.c, src/syntax.c

Patch 7.4.110
Problem:    "gUgn" cannot be repeated. (Dimitar Dimitrov)
Solution:   Don't put "gn" in a different order in the redo buffer.  Restore
```

```
            'wrapscan' when the pattern isn't found. (Christian Wellenbrock)
Files:      src/normal.c, src/search.c, src/test53.in, src/test53.ok

Patch 7.4.111
Problem:    Memory leak in Python OptionsAssItem. (Ken Takata)
Solution:   Call Py_XDECREF() where needed. (ZyX)
Files:      src/if_py_both.h

Patch 7.4.112
Problem:    The defaults for 'directory' and 'backupdir' on MS-Windows do not
            include a directory that exists.
Solution:   Use $TEMP.
Files:      src/os_dos.h

Patch 7.4.113
Problem:    MSVC static analysis gives warnings.
Solution:   Avoid the warnings and avoid possible bugs. (Ken Takata)
Files:      src/os_win32.c

Patch 7.4.114
Problem:    New GNU make outputs messages about changing directory in another
            format.
Solution:   Recognize the new format.
Files:      src/option.h

Patch 7.4.115
Problem:    When using Zsh expanding ~abc doesn't work when the result
            contains a space.
Solution:   Off-by-one error in detecting the NUL. (Pavol Juhas)
Files:      src/os_unix.c

Patch 7.4.116
Problem:    When a mapping starts with a space, the typed space does not show
            up for 'showcmd'.
Solution:   Show "<20>". (Brook Hong)
Files:      src/normal.c

Patch 7.4.117
Problem:    Can't build with Cygwin/MingW and Perl 5.18.
Solution:   Add a linker argument for the Perl library. (Cesar Romani)
            Adjust CFLAGS and LIB. (Cesar Romani)
            Move including inline.h further down. (Ken Takata)
Files:      src/Make_cyg.mak, src/Make_ming.mak, src/if_perl.xs

Patch 7.4.118
Problem:    It's possible that redrawing the status lines causes
            win_redr_custom() to be called recursively.
Solution:   Protect against recursiveness. (Yasuhiro Matsumoto)
Files:      src/screen.c

Patch 7.4.119
Problem:    Vim doesn't work well on OpenVMS.
Solution:   Fix various problems. (Samuel Ferencik)
Files:      src/os_unix.c, src/os_unix.h, src/os_vms.c
```

```
Patch 7.4.120 (after 7.4.117)
Problem:    Can't build with Perl 5.18 on Linux. (Lcd 47)
Solution:   Add #ifdef. (Ken Takata)
Files:      src/if_perl.xs

Patch 7.4.121
Problem:    Completion doesn't work for ":py3d" and ":py3f". (Bohr Shaw)
Solution:   Skip over letters after ":py3".
Files:      src/ex_docmd.c

Patch 7.4.122
Problem:    Win32: When 'encoding' is set to "utf-8" and the active codepage
            is cp932 then ":grep" and other commands don't work for multi-byte
            characters.
Solution:   (Yasuhiro Matsumoto)
Files:      src/os_win32.c

Patch 7.4.123
Problem:    Win32: Getting user name does not use wide function.
Solution:   Use GetUserNameW() if possible. (Ken Takata)
Files:      src/os_win32.c

Patch 7.4.124
Problem:    Win32: Getting host name does not use wide function.
Solution:   Use GetComputerNameW() if possible. (Ken Takata)
Files:      src/os_win32.c

Patch 7.4.125
Problem:    Win32: Dealing with messages may not work for multi-byte chars.
Solution:   Use pDispatchMessage(). (Ken Takata)
Files:      src/os_win32.c

Patch 7.4.126
Problem:    Compiler warnings for "const" and incompatible types.
Solution:   Remove "const", add type cast. (Ken Takata)
Files:      src/os_win32.c

Patch 7.4.127
Problem:    Perl 5.18 on Unix doesn't work.
Solution:   Move workaround to after including vim.h. (Ken Takata)
Files:      src/if_perl.xs

Patch 7.4.128
Problem:    Perl 5.18 for MSVC doesn't work.
Solution:   Add check in makefile and define __inline. (Ken Takata)
Files:      src/Make_mvc.mak, src/if_perl.xs

Patch 7.4.129
Problem:    getline(-1) returns zero. (mvxxc)
Solution:   Return an empty string.
Files:      src/eval.c

Patch 7.4.130
```

Problem: Relative line numbers mix up windows when using folds.
Solution: Use hasFoldingWin() instead of hasFolding(). (Lech Lorens)
Files: src/misc2.c

Patch 7.4.131
Problem: Syncbind causes E315 errors in some situations. (Liang Li)
Solution: Set and restore curbuf in ex_syncbind(). (Christian Brabandt)
Files: src/ex_docmd.c, src/testdir/test37.ok

Patch 7.4.132 (after 7.4.122)
Problem: Win32: flags and inherit_handles arguments mixed up.
Solution: Swap the argument. (cs86661)
Files: src/os_win32.c

Patch 7.4.133
Problem: Clang warns for using NUL.
Solution: Change NUL to NULL. (Dominique Pelle)
Files: src/eval.c, src/misc2.c

Patch 7.4.134
Problem: Spurious space in MingW Makefile.
Solution: Remove the space. (Michael Soyka)
Files: src/Make_ming.mak

Patch 7.4.135
Problem: Missing dot in MingW test Makefile.
Solution: Add the dot. (Michael Soyka)
Files: src/testdir/Make_ming.mak

Patch 7.4.136 (after 7.4.096)
Problem: MS-Windows: When saving a file with a UNC path the file becomes
            read-only.
Solution: Don't mix up Win32 attributes and Unix attributes. (Ken Takata)
Files: src/os_mswin.c, src/os_win32.c

Patch 7.4.137
Problem: Cannot use IME with Windows 8 console.
Solution: Change the user of ReadConsoleInput() and PeekConsoleInput().
            (Nobuhiro Takasaki)
Files: src/os_win32.c

Patch 7.4.138 (after 7.4.114)
Problem: Directory change messages are not recognized.
Solution: Fix using a character range literally. (Lech Lorens)
Files: src/option.h

Patch 7.4.139
Problem: Crash when using :cd in autocommand. (François Ingelrest)
Solution: Set w_localdir to NULL after freeing it. (Dominique Pelle)
Files: src/ex_docmd.c, src/window.c

Patch 7.4.140
Problem: Crash when wiping out buffer triggers autocommand that wipes out
            only other buffer.

```
Solution:   Do not delete the last buffer, make it empty. (Hirohito Higashi)
Files:      src/buffer.c

Patch 7.4.141
Problem:    Problems when building with Borland: st_mode is signed short;
            can't build with Python; temp files not ignored by Mercurial;
            building with DEBUG doesn't define _DEBUG.
Solution:   Fix the problems. (Ken Takata)
Files:      src/Make_bc5.mak, src/if_py_both.h, src/os_win32.c

Patch 7.4.142 (after 7.4.137)
Problem:    On MS-Windows 8 IME input doesn't work correctly.
Solution:   Work around the problem. (Nobuhiro Takasaki)
Files:      src/os_win32.c

Patch 7.4.143
Problem:    TextChangedI is not triggered.
Solution:   Reverse check for "ready". (lilydjwg)
Files:      src/edit.c

Patch 7.4.144
Problem:    MingW also supports intptr_t for OPEN_OH_ARGTYPE.
Solution:   Adjust #ifdef. (Ken Takata)
Files:      src/os_mswin.c

Patch 7.4.145
Problem:    getregtype() does not return zero for unknown register.
Solution:   Adjust documentation: return empty string for unknown register.
            Check the register name to be valid. (Yukihiro Nakadaira)
Files:      runtime/doc/eval.txt, src/ops.c

Patch 7.4.146
Problem:    When starting Vim with "-u NONE" v:oldfiles is NULL.
Solution:   Set v:oldfiles to an empty list. (Yasuhiro Matsumoto)
Files:      src/main.c

Patch 7.4.147
Problem:    Cursor moves to wrong position when using "gj" after "$" and
            virtual editing is active.
Solution:   Make "gj" behave differently when virtual editing is active.
            (Hirohito Higashi)
Files:      src/normal.c, src/testdir/test39.in, src/testdir/test39.ok

Patch 7.4.148
Problem:    Cannot build with Cygwin and X11.
Solution:   Include Xwindows.h instead of windows.h. (Lech Lorens)
Files:      src/mbyte.c

Patch 7.4.149
Problem:    Get E685 error when assigning a function to an autoload variable.
            (Yukihiro Nakadaira)
Solution:   Instead of having a global no_autoload variable, pass an autoload
            flag down to where it is used. (ZyX)
Files:      src/eval.c, src/testdir/test55.in, src/testdir/test55.ok,
```

```
            src/testdir/test60.in, src/testdir/test60.ok,
            src/testdir/sautest/autoload/footest.vim

Patch 7.4.150
Problem:    :keeppatterns is not respected for :s.
Solution:   Check the keeppatterns flag. (Yasuhiro Matsumoto)
Files:      src/search.c, src/testdir/test14.in, src/testdir/test14.ok

Patch 7.4.151
Problem:    Python: slices with steps are not supported.
Solution:   Support slices in Python vim.List. (ZyX)
Files:      src/eval.c, src/if_py_both.h, src/if_python3.c, src/if_python.c,
            src/proto/eval.pro, src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.4.152
Problem:    Python: Cannot iterate over options.
Solution:   Add options iterator. (ZyX)
Files:      src/if_py_both.h, src/option.c, src/proto/option.pro,
            src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok, src/vim.h

Patch 7.4.153
Problem:    Compiler warning for pointer type.
Solution:   Add type cast.
Files:      src/if_py_both.h, src/if_python.c, src/if_python3.c

Patch 7.4.154 (after 7.4.149)
Problem:    Still a problem with auto-loading.
Solution:   Pass no_autoload to deref_func_name(). (Yukihiro Nakadaira)
Files:      src/eval.c

Patch 7.4.155
Problem:    ":keeppatterns /pat" does not keep search pattern offset.
Solution:   Restore the offset after doing the search.
Files:      src/search.c, src/testdir/test14.in, src/testdir/test14.ok

Patch 7.4.156
Problem:    Test file missing from distribution.
Solution:   Add new directory to file list.
Files:      Filelist

Patch 7.4.157
Problem:    Error number used twice. (Yukihiro Nakadaira)
Solution:   Change the one not referred in the docs.
Files:      src/undo.c

Patch 7.4.158 (after 7.4.045)
Problem:    Pattern containing \zs is not handled correctly by substitute().
Solution:   Change how an empty match is skipped. (Yukihiro Nakadaira)
Files:      src/eval.c, src/testdir/test80.in, src/testdir/test80.ok

Patch 7.4.159
Problem:    Completion hangs when scanning the current buffer after doing
```

```
            keywords. (Christian Brabandt)
Solution:   Set the first match position when starting to scan the current
            buffer.
Files:      src/edit.c

Patch 7.4.160
Problem:    Win32: Crash when executing external command.
Solution:   Only close the handle when it was created. (Yasuhiro Matsumoto)
Files:      src/os_win32.c

Patch 7.4.161
Problem:    Crash in Python exception handling.
Solution:   Only use exception variables if did_throw is set. (ZyX)
Files:      src/if_py_both.h

Patch 7.4.162
Problem:    Running tests in shadow dir doesn't work.
Solution:   Add testdir/sautest to the shadow target. (James McCoy)
Files:      src/Makefile

Patch 7.4.163 (after 7.4.142)
Problem:    MS-Windows input doesn't work properly on Windows 7 and earlier.
Solution:   Add a check for Windows 8. (Yasuhiro Matsumoto)
Files:      src/os_win32.c

Patch 7.4.164 (after 7.4.163)
Problem:    Problem with event handling on Windows 8.
Solution:   Ignore duplicate WINDOW_BUFFER_SIZE_EVENTs. (Nobuhiro Takasaki)
Files:      src/os_win32.c

Patch 7.4.165
Problem:    By default, after closing a buffer changes can't be undone.
Solution:   In the example vimrc file set 'undofile'.
Files:      runtime/vimrc_example.vim

Patch 7.4.166
Problem:    Auto-loading a function for code that won't be executed.
Solution:   Do not auto-load when evaluation is off. (Yasuhiro Matsumoto)
Files:      src/eval.c

Patch 7.4.167 (after 7.4.149)
Problem:    Fixes are not tested.
Solution:   Add a test for not autoloading on assignment. (Yukihiro Nakadaira)
Files:      src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
            src/testdir/sautest/autoload/Test104.vim, src/testdir/test104.in,
            src/testdir/test104.ok

Patch 7.4.168
Problem:    Can't compile with Ruby 2.1.0.
Solution:   Add support for new GC. (Kohei Suzuki)
Files:      src/if_ruby.c
```

```
Patch 7.4.169
Problem:    ":sleep" puts cursor in the wrong column. (Liang Li)
Solution:   Add the window offset. (Christian Brabandt)
Files:      src/ex_docmd.c

Patch 7.4.170
Problem:    Some help tags don't work with ":help". (Tim Chase)
Solution:   Add exceptions.
Files:      src/ex_cmds.c

Patch 7.4.171
Problem:    Redo does not set v:count and v:count1.
Solution:   Use a separate buffer for redo, so that we can set the counts when
            performing redo.
Files:      src/getchar.c, src/globals.h, src/normal.c, src/proto/getchar.pro,
            src/structs.h

Patch 7.4.172
Problem:    The blowfish code mentions output feedback, but the code is
            actually doing cipher feedback.
Solution:   Adjust names and comments.
Files:      src/blowfish.c, src/fileio.c, src/proto/blowfish.pro,
            src/memline.c

Patch 7.4.173
Problem:    When using scrollbind the cursor can end up below the last line.
            (mvxxc)
Solution:   Reset w_botfill when scrolling up. (Christian Brabandt)
Files:      src/move.c

Patch 7.4.174
Problem:    Compiler warnings for Python interface. (Tony Mechelynck)
Solution:   Add type casts, initialize variable.
Files:      src/if_py_both.h

Patch 7.4.175
Problem:    When a wide library function fails, falling back to the non-wide
            function may do the wrong thing.
Solution:   Check the platform, when the wide function is supported don't fall
            back to the non-wide function. (Ken Takata)
Files:      src/os_mswin.c, src/os_win32.c

Patch 7.4.176
Problem:    Dictionary.update() throws an error when used without arguments.
            Python programmers don't expect that.
Solution:   Make Dictionary.update() without arguments do nothing. (ZyX)
Files:      src/if_py_both.h, src/testdir/test86.in, src/testdir/test87.in

Patch 7.4.177
Problem:    Compiler warning for unused variable. (Tony Mechelynck)
Solution:   Add #ifdef.
Files:      src/move.c

Patch 7.4.178
```

```
Problem:    The J command does not update '[ and '] marks. (William Gardner)
Solution:   Set the marks. (Christian Brabandt)
Files:      src/ops.c

Patch 7.4.179
Problem:    Warning for type-punned pointer. (Tony Mechelynck)
Solution:   Use intermediate variable.
Files:      src/if_py_both.h

Patch 7.4.180 (after 7.4.174)
Problem:    Older Python versions don't support %ld.
Solution:   Use %d instead. (ZyX)
Files:      src/if_py_both.h

Patch 7.4.181
Problem:    When using 'pastetoggle' the status lines are not updated. (Samuel
            Ferencik, Jan Christoph Ebersbach)
Solution:   Update the status lines. (Nobuhiro Takasaki)
Files:      src/getchar.c

Patch 7.4.182
Problem:    Building with mzscheme and racket does not work. (David Chimay)
Solution:   Adjust autoconf. (Sergey Khorev)
Files:      src/configure.in, src/auto/configure

Patch 7.4.183
Problem:    MSVC Visual Studio update not supported.
Solution:   Add version number. (Mike Williams)
Files:      src/Make_mvc.mak

Patch 7.4.184
Problem:    match() does not work properly with a {count} argument.
Solution:   Compute the length once and update it.  Quit the loop when at the
            end. (Hirohito Higashi)
Files:      src/eval.c, src/testdir/test53.in, src/testdir/test53.ok

Patch 7.4.185
Problem:    Clang gives warnings.
Solution:   Adjust how bigness is set. (Dominique Pelle)
Files:      src/ex_cmds.c

Patch 7.4.186 (after 7.4.085)
Problem:    Insert in Visual mode sometimes gives incorrect results.
            (Dominique Pelle)
Solution:   Remember the original insert start position. (Christian Brabandt,
            Dominique Pelle)
Files:      src/edit.c, src/globals.h, src/ops.c, src/structs.h

Patch 7.4.187
Problem:    Delete that crosses line break splits multi-byte character.
Solution:   Advance a character instead of a byte. (Cade Foster)
Files:      src/normal.c, src/testdir/test69.in, src/testdir/test69.ok

Patch 7.4.188
```

```
Problem:    SIZEOF_LONG clashes with similar defines in header files.
Solution:   Rename to a name starting with VIM_.  Also for SIZEOF_INT.
Files:      src/if_ruby.c, src/vim.h, src/configure.in, src/auto/configure,
            src/config.h.in, src/fileio.c, src/if_python.c, src/message.c,
            src/spell.c, src/feature.h, src/os_os2_cfg.h, src/os_vms_conf.h,
            src/os_win16.h, src/structs.h

Patch 7.4.189
Problem:    Compiler warning for unused argument.
Solution:   Add UNUSED.
Files:      src/eval.c

Patch 7.4.190
Problem:    Compiler warning for using %lld for off_t.
Solution:   Add type cast.
Files:      src/fileio.c

Patch 7.4.191
Problem:    Escaping a file name for shell commands can't be done without a
            function.
Solution:   Add the :S file name modifier.
Files:      src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
            src/testdir/test105.in, src/testdir/test105.ok,
            runtime/doc/cmdline.txt, runtime/doc/eval.txt,
            runtime/doc/map.txt, runtime/doc/options.txt,
            runtime/doc/quickfix.txt, runtime/doc/usr_30.txt,
            runtime/doc/usr_40.txt, runtime/doc/usr_42.txt,
            runtime/doc/vi_diff.txt, src/eval.c, src/misc2.c, src/normal.c,
            src/proto/misc2.pro

Patch 7.4.192
Problem:    Memory leak when giving E853.
Solution:   Free the argument. (Dominique Pelle)
Files:      src/eval.c

Patch 7.4.193
Problem:    Typos in messages.
Solution:   "then" -> "than". (Dominique Pelle)
Files:      src/if_py_both.h, src/spell.c

Patch 7.4.194
Problem:    Can't build for Android.
Solution:   Add #if condition. (Fredrik Fornwall)
Files:      src/mbyte.c

Patch 7.4.195 (after 7.4.193)
Problem:    Python tests fail.
Solution:   Change "then" to "than" in more places. (Dominique Pelle, Taro
            Muraoka)
Files:      src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok
```

```
Patch 7.4.196
Problem:    Tests fail on Solaris 9 and 10.
Solution:   Use "test -f" instead of "test -e".  (Laurent Blume)
Files:      src/testdir/Makefile

Patch 7.4.197
Problem:    Various problems on VMS.
Solution:   Fix several VMS problems. (Zoltan Arpadffy)
Files:      runtime/doc/os_vms.txt, src/Make_vms.mms, src/fileio.c,
            src/os_unix.c, src/os_unix.h, src/os_vms.c, src/os_vms_conf.h,
            src/proto/os_vms.pro, src/testdir/Make_vms.mms,
            src/testdir/test72.in, src/testdir/test77a.com,
            src/testdir/test77a.in, src/testdir/test77a.ok src/undo.c

Patch 7.4.198
Problem:    Can't build Vim with Perl when -Dusethreads is not specified for
            building Perl, and building Vim with --enable-perlinterp=dynamic.
Solution:   Adjust #ifdefs. (Yasuhiro Matsumoto)
Files:      src/if_perl.xs

Patch 7.4.199
Problem:    (issue 197) ]P doesn't paste over Visual selection.
Solution:   Handle Visual mode specifically. (Christian Brabandt)
Files:      src/normal.c

Patch 7.4.200
Problem:    Too many #ifdefs in the code.
Solution:   Enable FEAT_VISUAL always, await any complaints
Files:      src/feature.h

Patch 7.4.201
Problem:    'lispwords' is a global option.
Solution:   Make 'lispwords' global-local. (Sung Pae)
Files:      runtime/doc/options.txt, runtime/optwin.vim, src/buffer.c,
            src/misc1.c, src/option.c, src/option.h, src/structs.h,
            src/testdir/test100.in, src/testdir/test100.ok

Patch 7.4.202
Problem:    MS-Windows: non-ASCII font names don't work.
Solution:   Convert between the current code page and 'encoding'. (Ken Takata)
Files:      src/gui_w48.c, src/os_mswin.c, src/proto/winclip.pro,
            src/winclip.c

Patch 7.4.203
Problem:    Parsing 'errorformat' is not correct.
Solution:   Reset "multiignore" at the start of a multi-line message. (Lcd)
Files:      src/quickfix.c, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile, src/testdir/test106.in,
            src/testdir/test106.ok

Patch 7.4.204
Problem:    A mapping where the second byte is 0x80 doesn't work.
```

```
Solution:   Unescape before checking for incomplete multi-byte char. (Nobuhiro
            Takasaki)
Files:      src/getchar.c, src/testdir/test75.in, src/testdir/test75.ok

Patch 7.4.205
Problem:    ":mksession" writes command to move to second argument while it
            does not exist.  When it does exist the order might be wrong.
Solution:   Use ":argadd" for each argument instead of using ":args" with a
            list of names. (Nobuhiro Takasaki)
Files:      src/ex_docmd.c

Patch 7.4.206
Problem:    Compiler warnings on 64 bit Windows.
Solution:   Add type casts. (Mike Williams)
Files:      src/gui_w48.c, src/os_mswin.c

Patch 7.4.207
Problem:    The cursor report sequence is sometimes not recognized and results
            in entering replace mode.
Solution:   Also check for the cursor report when not asked for.
Files:      src/term.c

Patch 7.4.208
Problem:    Mercurial picks up some files that are not distributed.
Solution:   Add patterns to the ignore list. (Cade Forester)
Files:      .hgignore

Patch 7.4.209
Problem:    When repeating a filter command "%" and "#" are expanded.
Solution:   Escape the command when storing for redo. (Christian Brabandt)
Files:      src/ex_cmds.c

Patch 7.4.210
Problem:    Visual block mode plus virtual edit doesn't work well with tabs.
            (Liang Li)
Solution:   Take coladd into account. (Christian Brabandt)
Files:      src/ops.c, src/testdir/test39.in, src/testdir/test39.ok

Patch 7.4.211
Problem:    ":lu" is an abbreviation for ":lua", but it should be ":lunmap".
            (ZyX)
Solution:   Move "lunmap" to above "lua".
Files:      src/ex_cmds.h

Patch 7.4.212 (after 7.4.200)
Problem:    Now that the +visual feature is always enabled the #ifdefs for it
            are not useful.
Solution:   Remove the checks for FEAT_VISUAL.
Files:      src/buffer.c, src/charset.c, src/edit.c, src/eval.c,
            src/ex_cmds.c, src/ex_docmd.c, src/fold.c, src/getchar.c,
            src/gui.c, src/gui_mac.c, src/gui_w48.c, src/main.c, src/mark.c,
            src/menu.c, src/misc2.c, src/move.c, src/netbeans.c, src/normal.c,
            src/ops.c, src/option.c, src/os_msdos.c, src/os_qnx.c,
            src/quickfix.c, src/regexp.c, src/regexp_nfa.c, src/screen.c,
```

```
            src/search.c, src/spell.c, src/syntax.c, src/term.c, src/ui.c,
            src/undo.c, src/version.c, src/window.c, src/feature.h,
            src/globals.h, src/option.h, src/os_win32.h, src/structs.h

Patch 7.4.213
Problem:    It's not possible to open a new buffer without creating a swap
            file.
Solution:   Add the ":noswapfile" modifier. (Christian Brabandt)
Files:      runtime/doc/recover.txt, src/ex_cmds.h, src/ex_docmd.c,
            src/memline.c, src/structs.h

Patch 7.4.214
Problem:    Compilation problems on HP_nonStop (Tandem).
Solution:   Add #defines. (Joachim Schmitz)
Files:      src/vim.h

Patch 7.4.215
Problem:    Inconsistency: ":sp foo" does not reload "foo", unless "foo" is
            the current buffer. (Liang Li)
Solution:   Do not reload the current buffer on a split command.
Files:      runtime/doc/windows.txt, src/ex_docmd.c

Patch 7.4.216
Problem:    Compiler warnings. (Tony Mechelynck)
Solution:   Initialize variables, add #ifdef.
Files:      src/term.c, src/os_unix.h

Patch 7.4.217
Problem:    When src/auto/configure was updated, "make clean" would run
            configure pointlessly.
Solution:   Do not run configure for "make clean" and "make distclean" when
            the make program supports $MAKECMDGOALS. (Ken Takata)
Files:      src/Makefile

Patch 7.4.218
Problem:    It's not easy to remove duplicates from a list.
Solution:   Add the uniq() function. (Lcd)
Files:      runtime/doc/change.txt, runtime/doc/eval.txt,
            runtime/doc/usr_41.txt, runtime/doc/version7.txt, src/eval.c,
            src/testdir/test55.in, src/testdir/test55.ok

Patch 7.4.219
Problem:    When 'relativenumber' or 'cursorline' are set the window is
            redrawn much to often. (Patrick Hemmer, Dominique Pelle)
Solution:   Check the VALID_CROW flag instead of VALID_WROW.
Files:      src/move.c

Patch 7.4.220
Problem:    Test 105 does not work in a shadow dir. (James McCoy)
Solution:   Omit "src/" from the checked path.
Files:      src/testdir/test105.in, src/testdir/test105.ok

Patch 7.4.221
Problem:    Quickfix doesn't resize on ":copen 20". (issue 199)
```

```
Solution:   Resize the window when requested. (Christian Brabandt)
Files:      src/quickfix.c

Patch 7.4.222
Problem:    The Ruby directory is constructed from parts.
Solution:   Use 'rubyarchhdrdir' if it exists. (James McCoy)
Files:      src/configure.in, src/auto/configure

Patch 7.4.223
Problem:    Still using an older autoconf version.
Solution:   Switch to autoconf 2.69.
Files:      src/Makefile, src/configure.in, src/auto/configure

Patch 7.4.224
Problem:    /usr/bin/grep on Solaris does not support -F.
Solution:   Add configure check to find a good grep. (Danek Duvall)
Files:      src/configure.in, src/auto/configure

Patch 7.4.225
Problem:    Dynamic Ruby doesn't work on Solaris.
Solution:   Always use the stubs. (Danek Duvall, Yukihiro Nakadaira)
Files:      src/if_ruby.c

Patch 7.4.226 (after 7.4.219)
Problem:    Cursorline highlighting not redrawn when scrolling. (John
            Marriott)
Solution:   Check for required redraw in two places.
Files:      src/move.c

Patch 7.4.227 (after 7.4.225)
Problem:    Can't build with Ruby 1.8.
Solution:   Do include a check for the Ruby version. (Ken Takata)
Files:      src/if_ruby.c

Patch 7.4.228
Problem:    Compiler warnings when building with Python 3.2.
Solution:   Make type cast depend on Python version. (Ken Takata)
Files:      src/if_py_both.h, src/if_python.c, src/if_python3.c

Patch 7.4.229
Problem:    Using ":let" for listing variables and the second one is a curly
            braces expression may fail.
Solution:   Check for an "=" in a better way. (ZyX)
Files:      src/eval.c, src/testdir/test104.in, src/testdir/test104.ok

Patch 7.4.230
Problem:    Error when using ":options".
Solution:   Fix the entry for 'lispwords'. (Kenichi Ito)
Files:      runtime/optwin.vim

Patch 7.4.231
Problem:    An error in ":options" is not caught by the tests.
Solution:   Add a test for ":options".  Set $VIMRUNTIME for the tests so that
            it uses the current runtime files instead of the installed ones.
```

```
Files:      src/Makefile, src/testdir/Makefile, src/testdir/test_options.in,
            src/testdir/test_options.ok, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms

Patch 7.4.232
Problem:    ":%s/\n//" uses a lot of memory. (Aidan Marlin)
Solution:   Turn this into a join command. (Christian Brabandt)
Files:      src/ex_cmds.c, src/ex_docmd.c, src/proto/ex_docmd.pro

Patch 7.4.233
Problem:    Escaping special characters for using "%" with a shell command is
            inconsistent, parentheses are escaped but spaces are not.
Solution:   Only escape "!". (Gary Johnson)
Files:      src/ex_docmd.c

Patch 7.4.234
Problem:    Can't get the command that was used to start Vim.
Solution:   Add v:progpath. (Viktor Kojouharov)
Files:      runtime/doc/eval.txt, src/eval.c, src/main.c, src/vim.h

Patch 7.4.235
Problem:    It is not easy to get the full path of a command.
Solution:   Add the exepath() function.
Files:      src/eval.c, src/misc1.c, src/os_amiga.c, src/os_msdos.c,
            src/os_unix.c, src/os_vms.c, src/os_win32.c,
            src/proto/os_amiga.pro, src/proto/os_msdos.pro,
            src/proto/os_unix.pro, src/proto/os_win32.pro,
            runtime/doc/eval.txt

Patch 7.4.236
Problem:    It's not that easy to check the Vim patch version.
Solution:   Make has("patch-7.4.123") work. (partly by Marc Weber)
Files:      runtime/doc/eval.txt, src/eval.c, src/testdir/test60.in,
            src/testdir/test60.ok

Patch 7.4.237 (after 7.4.236)
Problem:    When some patches were not included has("patch-7.4.123") may return
            true falsely.
Solution:   Check for the specific patch number.
Files:      runtime/doc/eval.txt, src/eval.c

Patch 7.4.238
Problem:    Vim does not support the smack library.
Solution:   Add smack support (Jose Bollo)
Files:      src/config.h.in, src/configure.in, src/fileio.c, src/memfile.c,
            src/os_unix.c, src/undo.c, src/auto/configure

Patch 7.4.239
Problem:    ":e +" does not position cursor at end of the file.
Solution:   Check for "+" being the last character (ZyX)
Files:      src/ex_docmd.c

Patch 7.4.240
```

```
Problem:    ":tjump" shows "\n" as "\\n".
Solution:   Skip over "\" that escapes a backslash. (Gary Johnson)
Files:      src/tag.c

Patch 7.4.241
Problem:    The string returned by submatch() does not distinguish between a
            NL from a line break and a NL that stands for a NUL character.
Solution:   Add a second argument to return a list. (ZyX)
Files:      runtime/doc/eval.txt, src/eval.c, src/proto/regexp.pro,
            src/regexp.c, src/testdir/test79.in, src/testdir/test79.ok,
            src/testdir/test80.in, src/testdir/test80.ok

Patch 7.4.242
Problem:    getreg() does not distinguish between a NL used for a line break
            and a NL used for a NUL character.
Solution:   Add another argument to return a list. (ZyX)
Files:      runtime/doc/eval.txt, src/eval.c src/ops.c, src/proto/ops.pro,
            src/vim.h, src/Makefile, src/testdir/test_eval.in,
            src/testdir/test_eval.ok, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms

Patch 7.4.243
Problem:    Cannot use setreg() to add text that includes a NUL.
Solution:   Make setreg() accept a list.
Files:      runtime/doc/eval.txt, src/eval.c, src/ops.c, src/proto/ops.pro,
            src/testdir/test_eval.in, src/testdir/test_eval.ok

Patch 7.4.244 (after 7.4.238)
Problem:    The smack feature causes stray error messages.
Solution:   Remove the error messages.
Files:      src/os_unix.c

Patch 7.4.245
Problem:    Crash for "vim -u NONE -N  -c '&&'".
Solution:   Check for the pattern to be NULL. (Dominique Pelle)
Files:      src/ex_cmds.c

Patch 7.4.246
Problem:    Configure message for detecting smack are out of sequence.
Solution:   Put the messages in the right place. (Kazunobu Kuriyama)
Files:      src/configure.in, src/auto/configure

Patch 7.4.247
Problem:    When passing input to system() there is no way to keep NUL and
            NL characters separate.
Solution:   Optionally use a list for the system() input. (ZyX)
Files:      runtime/doc/eval.txt, src/eval.c

Patch 7.4.248
Problem:    Cannot distinguish between NL and NUL in output of system().
Solution:   Add systemlist(). (ZyX)
Files:      runtime/doc/eval.txt, src/eval.c, src/ex_cmds2.c, src/misc1.c,
            src/proto/misc1.pro
```

```
Patch 7.4.249
Problem:    Using setreg() with a list of numbers does not work.
Solution:   Use a separate buffer for numbers. (ZyX)
Files:      src/eval.c, src/testdir/test_eval.in, src/testdir/test_eval.ok

Patch 7.4.250
Problem:    Some test files missing from distribution.
Solution:   Add pattern for newly added tests.
Files:      Filelist

Patch 7.4.251
Problem:    Crash when BufAdd autocommand wipes out the buffer.
Solution:   Check for buffer to still be valid. Postpone freeing the buffer
            structure. (Hirohito Higashi)
Files:      src/buffer.c, src/ex_cmds.c, src/fileio.c, src/globals.h

Patch 7.4.252
Problem:    Critical error in GTK, removing timer twice.
Solution:   Clear the timer after removing it. (James McCoy)
Files:      src/gui_gtk_x11.c

Patch 7.4.253
Problem:    Crash when using cpp syntax file with pattern using external
            match. (Havard Garnes)
Solution:   Discard match when end column is before start column.
Files:      src/regexp.c, src/regexp_nfa.c

Patch 7.4.254
Problem:    Smack support detection is incomplete.
Solution:   Check for attr/xattr.h and specific macro.
Files:      src/configure.in, src/auto/configure

Patch 7.4.255
Problem:    Configure check for smack doesn't work with all shells. (David
            Larson)
Solution:   Remove spaces in set command.
Files:      src/configure.in, src/auto/configure

Patch 7.4.256 (after 7.4.248)
Problem:    Using systemlist() may cause a crash and does not handle NUL
            characters properly.
Solution:   Increase the reference count, allocate memory by length. (Yasuhiro
            Matsumoto)
Files:      src/eval.c

Patch 7.4.257
Problem:    Compiler warning, possibly for mismatch in parameter name.
Solution:   Rename the parameter in the declaration.
Files:      src/ops.c

Patch 7.4.258
Problem:    Configure fails if $CC contains options.
Solution:   Remove quotes around $CC. (Paul Barker)
```

```
Files:      src/configure.in, src/auto/configure

Patch 7.4.259
Problem:    Warning for misplaced "const".
Solution:   Move the "const". (Yukihiro Nakadaira)
Files:      src/os_unix.c

Patch 7.4.260
Problem:    It is possible to define a function with a colon in the name.  It
            is possible to define a function with a lower case character if a
            "#" appears after the name.
Solution:   Disallow using a colon other than with "s:".  Ignore "#" after the
            name.
Files:      runtime/doc/eval.txt, src/eval.c, src/testdir/test_eval.in,
            src/testdir/test_eval.ok

Patch 7.4.261
Problem:    When updating the window involves a regexp pattern, an interactive
            substitute to replace a "\n" with a line break fails. (Ingo
            Karkat)
Solution:   Set reg_line_lbr in vim_regsub() and vim_regsub_multi().
Files:      src/regexp.c, src/testdir/test79.in, src/testdir/test79.ok

Patch 7.4.262
Problem:    Duplicate code in regexec().
Solution:   Add line_lbr flag to regexec_nl().
Files:      src/regexp.c, src/regexp_nfa.c, src/regexp.h

Patch 7.4.263
Problem:    GCC 4.8 compiler warning for hiding a declaration (François Gannaz)
Solution:   Remove the second declaration.
Files:      src/eval.c

Patch 7.4.264 (after 7.4.260)
Problem:    Can't define a function starting with "g:".  Can't assign a
            funcref to a buffer-local variable.
Solution:   Skip "g:" at the start of a function name.  Don't check for colons
            when assigning to a variable.
Files:      src/eval.c, src/testdir/test_eval.in, src/testdir/test_eval.ok

Patch 7.4.265 (after 7.4.260)
Problem:    Can't call a global function with "g:" in an expression.
Solution:   Skip the "g:" when looking up the function.
Files:      src/eval.c, src/testdir/test_eval.in, src/testdir/test_eval.ok

Patch 7.4.266
Problem:    Test 62 fails.
Solution:   Set the language to C. (Christian Brabandt)
Files:      src/testdir/test62.in

Patch 7.4.267 (after 7.4.178)
Problem:    The '[ mark is in the wrong position after "gq". (Ingo Karkat)
Solution:   Add the setmark argument to do_join(). (Christian Brabandt)
Files:      src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
```

```
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
            src/testdir/test_autoformat_join.in,
            src/testdir/test_autoformat_join.ok, src/Makefile, src/edit.c,
            src/ex_cmds.c, src/ex_docmd.c, src/normal.c, src/ops.c,
            src/proto/ops.pro

Patch 7.4.268
Problem:    Using exists() on a funcref for a script-local function does not
            work.
Solution:   Translate <SNR> to the special byte sequence.  Add a test.
Files:      src/eval.c, src/testdir/test_eval.in, src/testdir/test_eval.ok,
            src/testdir/test_eval_func.vim, Filelist

Patch 7.4.269
Problem:    CTRL-U in Insert mode does not work after using a cursor key.
            (Pine Wu)
Solution:   Use the original insert start position. (Christian Brabandt)
Files:      src/edit.c, src/testdir/test29.in, src/testdir/test29.ok

Patch 7.4.270
Problem:    Comparing pointers instead of the string they point to.
Solution:   Use strcmp(). (Ken Takata)
Files:      src/gui_gtk_x11.c

Patch 7.4.271
Problem:    Compiler warning on 64 bit windows.
Solution:   Add type cast. (Mike Williams)
Files:      src/ops.c

Patch 7.4.272
Problem:    Using just "$" does not cause an error message.
Solution:   Check for empty environment variable name. (Christian Brabandt)
Files:      src/eval.c, src/testdir/test_eval.in, src/testdir/test_eval.ok

Patch 7.4.273
Problem:    "make autoconf" and "make reconfig" may first run configure and
            then remove the output.
Solution:   Add these targets to the exceptions. (Ken Takata)
Files:      src/Makefile

Patch 7.4.274
Problem:    When doing ":update" just before running an external command that
            changes the file, the timestamp may be unchanged and the file
            is not reloaded.
Solution:   Also check the file size.
Files:      src/fileio.c

Patch 7.4.275
Problem:    When changing the type of a sign that hasn't been placed there is
            no error message.
Solution:   Add an error message. (Christian Brabandt)
Files:      src/ex_cmds.c
```

```
Patch 7.4.276
Problem:    The fish shell is not supported.
Solution:   Use begin/end instead of () for fish. (Andy Russell)
Files:      src/ex_cmds.c, src/misc1.c, src/option.c, src/proto/misc1.pro

Patch 7.4.277
Problem:    Using ":sign unplace *" may leave the cursor in the wrong position
            (Christian Brabandt)
Solution:   Update the cursor position when removing all signs.
Files:      src/buffer.c

Patch 7.4.278
Problem:    list_remove() conflicts with function defined in Sun header file.
Solution:   Rename the function. (Richard Palo)
Files:      src/eval.c, src/if_lua.c, src/if_py_both.h, src/proto/eval.pro

Patch 7.4.279
Problem:    globpath() returns a string, making it difficult to get a list of
            matches. (Greg Novack)
Solution:   Add an optional argument like with glob(). (Adnan Zafar)
Files:      runtime/doc/eval.txt, src/eval.c, src/ex_getln.c, src/misc1.c,
            src/misc2.c, src/proto/ex_getln.pro, src/proto/misc2.pro,
            src/testdir/test97.in, src/testdir/test97.ok

Patch 7.4.280
Problem:    When using a session file the relative position of the cursor is
            not restored if there is another tab. (Nobuhiro Takasaki)
Solution:   Update w_wrow before calculating the fraction.
Files:      src/window.c

Patch 7.4.281
Problem:    When a session file has more than one tabpage and 'showtabline' is
            one the positions may be slightly off.
Solution:   Set 'showtabline' to two while positioning windows.
Files:      src/ex_docmd.c

Patch 7.4.282 (after 7.4.279)
Problem:    Test 97 fails on Mac.
Solution:   Do not ignore case in file names. (Jun Takimoto)
Files:      src/testdir/test97.in

Patch 7.4.283 (after 7.4.276)
Problem:    Compiler warning about unused variable. (Charles Cooper)
Solution:   Move the variable inside the #if block.
Files:      src/ex_cmds.c

Patch 7.4.284
Problem:    Setting 'langmap' in the modeline can cause trouble.  E.g. mapping
            ":" breaks many commands. (Jens-Wolfhard Schicke-Uffmann)
Solution:   Disallow setting 'langmap' from the modeline.
Files:      src/option.c

Patch 7.4.285
Problem:    When 'relativenumber' is set and deleting lines or undoing that,
```

            line numbers are not always updated. (Robert Arkwright)
Solution: (Christian Brabandt)
Files: src/misc1.c

Patch 7.4.286
Problem: Error messages are inconsistent. (ZyX)
Solution: Change "Lists" to "list".
Files: src/eval.c

Patch 7.4.287
Problem: Patches for .hgignore don't work, since the file is not in the
            distribution.
Solution: Add .hgignore to the distribution. Will be effective with the
            next version.
Files: Filelist

Patch 7.4.288
Problem: When 'spellfile' is set the screen is not redrawn.
Solution: Redraw when updating the spelling info. (Christian Brabandt)
Files: src/spell.c

Patch 7.4.289
Problem: Pattern with repeated backreference does not match with new regexp
            engine. (Urtica Dioica)
Solution: Also check the end of a submatch when deciding to put a state in
            the state list.
Files: src/testdir/test64.in, src/testdir/test64.ok, src/regexp_nfa.c

Patch 7.4.290
Problem: A non-greedy match followed by a branch is too greedy. (Ingo
            Karkat)
Solution: Add NFA_MATCH when it is already in the state list if the position
            differs.
Files: src/testdir/test64.in, src/testdir/test64.ok, src/regexp_nfa.c

Patch 7.4.291
Problem: Compiler warning for int to pointer of different size when DEBUG
            is defined.
Solution: use smsg() instead of EMSG3().
Files: src/regexp.c

Patch 7.4.292
Problem: Searching for "a" does not match accented "a" with new regexp
            engine, does match with old engine. (David Bürgin)
            "ca" does not match "ca" with accented "a" with either engine.
Solution: Change the old engine, check for following composing character
            also for single-byte patterns.
Files: src/regexp.c, src/testdir/test95.in, src/testdir/test95.ok

Patch 7.4.293
Problem: It is not possible to ignore composing characters at a specific
            point in a pattern.
Solution: Add the %C item.
Files: src/regexp.c, src/regexp_nfa.c, src/testdir/test95.in,

```
            src/testdir/test95.ok, runtime/doc/pattern.txt

Patch 7.4.294 (7.4.293)
Problem:    Test files missing from patch.
Solution:   Patch the test files.
Files:      src/testdir/test95.in, src/testdir/test95.ok

Patch 7.4.295
Problem:    Various typos, bad white space and unclear comments.
Solution:   Fix typos.  Improve white space. Update comments.
Files:      src/testdir/test49.in, src/macros.h, src/screen.c, src/structs.h,
            src/gui_gtk_x11.c, src/os_unix.c

Patch 7.4.296
Problem:    Can't run tests on Solaris.
Solution:   Change the way VIMRUNTIME is set. (Laurent Blume)
Files:      src/testdir/Makefile

Patch 7.4.297
Problem:    Memory leak from result of get_isolated_shell_name().
Solution:   Free the memory. (Dominique Pelle)
Files:      src/ex_cmds.c, src/misc1.c

Patch 7.4.298
Problem:    Can't have a funcref start with "t:".
Solution:   Add "t" to the list of accepted names. (Yukihiro Nakadaira)
Files:      src/eval.c

Patch 7.4.299
Problem:    When running configure twice DYNAMIC_PYTHON_DLL may become empty.
Solution:   Use AC_CACHE_VAL. (Ken Takata)
Files:      src/configure.in, src/auto/configure

Patch 7.4.300
Problem:    The way config.cache is removed doesn't always work.
Solution:   Always remove config.cache. (Ken Takata)
Files:      src/Makefile

Patch 7.4.301 (after 7.4.280)
Problem:    Still a scrolling problem when loading a session file.
Solution:   Fix off-by-one mistake. (Nobuhiro Takasaki)
Files:      src/window.c

Patch 7.4.302
Problem:    Signs placed with 'foldcolumn' set don't show up after filler
            lines.
Solution:   Take filler lines into account. (Olaf Dabrunz)
Files:      src/screen.c

Patch 7.4.303
Problem:    When using double-width characters the text displayed on the
            command line is sometimes truncated.
Solution:   Reset the string length. (Nobuhiro Takasaki)
Files:      src/screen.c
```

```
Patch 7.4.304
Problem:    Cannot always use Python with Vim.
Solution:   Add the manifest to the executable. (Jacques Germishuys)
Files:      src/Make_mvc.mak

Patch 7.4.305
Problem:    Making 'ttymouse' empty after the xterm version was requested
            causes problems. (Elijah Griffin)
Solution:   Do not check for DEC mouse sequences when the xterm version was
            requested.  Also don't request the xterm version when DEC mouse
            was enabled.
Files:      src/term.c, src/os_unix.c, src/proto/term.pro, src/globals.h

Patch 7.4.306
Problem:    getchar(0) does not return Esc.
Solution:   Do not wait for an Esc sequence to be complete.  (Yasuhiro
            Matsumoto)
Files:      src/eval.c, src/getchar.c

Patch 7.4.307 (after 7.4.305)
Problem:    Can't build without the +termresponse feature.
Solution:   Add proper #ifdefs.
Files:      src/os_unix.c, src/term.c

Patch 7.4.308
Problem:    When using ":diffsplit" on an empty file the cursor is displayed
            on the command line.
Solution:   Limit the value of w_topfill.
Files:      src/diff.c

Patch 7.4.309
Problem:    When increasing the size of the lower window, the upper window
            jumps back to the top. (Ron Aaron)
Solution:   Change setting the topline. (Nobuhiro Takasaki)
Files:      src/window.c

Patch 7.4.310
Problem:    getpos()/setpos() don't include curswant.
Solution:   Add a fifth number when getting/setting the cursor.
Files:      src/eval.c, src/testdir/test_eval.in, src/testdir/test_eval.ok,
            runtime/doc/eval.txt

Patch 7.4.311
Problem:    Can't use winrestview to only restore part of the view.
Solution:   Handle missing items in the dict. (Christian Brabandt)
Files:      src/eval.c, runtime/doc/eval.txt

Patch 7.4.312
Problem:    Cannot figure out what argument list is being used for a window.
Solution:   Add the arglistid() function. (Marcin Szamotulski)
Files:      runtime/doc/eval.txt, runtime/doc/usr_41.txt, src/eval.c,
            src/ex_docmd.c, src/globals.h, src/structs.h, src/main.c
```

```
Patch 7.4.313 (after 7.4.310)
Problem:    Changing the return value of getpos() causes an error. (Jie Zhu)
Solution:   Revert getpos() and add getcurpos().
Files:      src/eval.c, src/testdir/test_eval.in, src/testdir/test_eval.ok,
            runtime/doc/eval.txt

Patch 7.4.314
Problem:    Completion messages can get in the way of a plugin.
Solution:   Add 'c' flag to 'shortmess' option. (Shougo Matsu)
Files:      runtime/doc/options.txt, src/edit.c, src/option.h, src/screen.c

Patch 7.4.315 (after 7.4.309)
Problem:    Fixes for computation of topline not tested.
Solution:   Add test. (Hirohito Higashi)
Files:      src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
            src/testdir/test107.in, src/testdir/test107.ok

Patch 7.4.316
Problem:    Warning from 64-bit compiler.
Solution:   Add type cast. (Mike Williams)
Files:      src/ex_getln.c

Patch 7.4.317
Problem:    Crash when starting gvim.  Issue 230.
Solution:   Check for a pointer to be NULL. (Christian Brabandt)
Files:      src/window.c

Patch 7.4.318
Problem:    Check for whether a highlight group has settings ignores fg and bg
            color settings.
Solution:   Also check cterm and GUI color settings. (Christian Brabandt)
Files:      src/syntax.c

Patch 7.4.319
Problem:    Crash when putting zero bytes on the clipboard.
Solution:   Do not support the utf8_atom target when not using a Unicode
            encoding. (Naofumi Honda)
Files:      src/ui.c

Patch 7.4.320
Problem:    Possible crash when an BufLeave autocommand deletes the buffer.
Solution:   Check for the window pointer being valid.  Postpone freeing the
            window until autocommands are done. (Yasuhiro Matsumoto)
Files:      src/buffer.c, src/fileio.c, src/globals.h, src/window.c

Patch 7.4.321
Problem:    Can't build with strawberry perl 5.20 + mingw-w64-4.9.0.
Solution:   Define save_strlen. (Ken Takata)
Files:      src/if_perl.xs

Patch 7.4.322
Problem:    Using "msgfmt" is hard coded, cannot use "gmsgfmt".
```

```
Solution:   Use the msgfmt command found by configure. (Danek Duvall)
Files:      src/config.mk.in, src/po/Makefile

Patch 7.4.323
Problem:    Substitute() with zero width pattern breaks multi-byte character.
Solution:   Take multi-byte character size into account. (Yukihiro Nakadaira)
Files:      src/eval.c src/testdir/test69.in, src/testdir/test69.ok

Patch 7.4.324
Problem:    In Ex mode, cyrillic characters are not handled. (Stas Malavin)
Solution:   Support multi-byte characters in Ex mode. (Yukihiro Nakadaira)
Files:      src/ex_getln.c

Patch 7.4.325
Problem:    When starting the gui and changing the window size the status line
            may not be drawn correctly.
Solution:   Catch new_win_height() being called recursively. (Christian
            Brabandt)
Files:      src/window.c

Patch 7.4.326
Problem:    Can't build Tiny version. (Elimar Riesebieter)
Solution:   Add #ifdef.
Files:      src/window.c

Patch 7.4.327
Problem:    When 'verbose' is set to display the return value of a function,
            may get E724 repeatedly.
Solution:   Do not give an error for verbose messages. Abort conversion to
            string after an error.
Files:      src/eval.c

Patch 7.4.328
Problem:    Selection of inner block is inconsistent.
Solution:   Skip indent not only for '}' but all parens. (Tom McDonald)
Files:      src/search.c

Patch 7.4.329
Problem:    When moving the cursor and then switching to another window the
            previous window isn't scrolled. (Yukihiro Nakadaira)
Solution:   Call update_topline() before leaving the window. (Christian
            Brabandt)
Files:      src/window.c

Patch 7.4.330
Problem:    Using a regexp pattern to highlight a specific position can be
            slow.
Solution:   Add matchaddpos() to highlight specific positions efficiently.
            (Alexey Radkov)
Files:      runtime/doc/eval.txt, runtime/doc/usr_41.txt,
            runtime/plugin/matchparen.vim, src/eval.c, src/ex_docmd.c,
            src/proto/window.pro, src/screen.c, src/structs.h,
            src/testdir/test63.in, src/testdir/test63.ok, src/window.c
```

```
Patch 7.4.331
Problem:    Relative numbering not updated after a linewise yank.  Issue 235.
Solution:   Redraw after the yank. (Christian Brabandt)
Files:      src/ops.c

Patch 7.4.332
Problem:    GTK: When a sign icon doesn't fit exactly there can be ugly gaps.
Solution:   Scale the sign to fit when the aspect ratio is not too far off.
            (Christian Brabandt)
Files:      src/gui_gtk_x11.c

Patch 7.4.333
Problem:    Compiler warning for unused function.
Solution:   Put the function inside the #ifdef.
Files:      src/screen.c

Patch 7.4.334 (after 7.4.330)
Problem:    Uninitialized variables, causing some problems.
Solution:   Initialize the variables. (Dominique Pelle)
Files:      src/screen.c, src/window.c

Patch 7.4.335
Problem:    No digraph for the new rouble sign.
Solution:   Add the digraphs =R and =P.
Files:      src/digraph.c, runtime/doc/digraph.txt

Patch 7.4.336
Problem:    Setting 'history' to a big value causes out-of-memory errors.
Solution:   Limit the value to 10000. (Hirohito Higashi)
Files:      runtime/doc/options.txt, src/option.c

Patch 7.4.337
Problem:    When there is an error preparing to edit the command line, the
            command won't be executed. (Hirohito Higashi)
Solution:   Reset did_emsg before editing.
Files:      src/ex_getln.c

Patch 7.4.338
Problem:    Cannot wrap lines taking indent into account.
Solution:   Add the 'breakindent' option. (many authors, final improvements by
            Christian Brabandt)
Files:      runtime/doc/eval.txt, runtime/doc/options.txt, runtime/optwin.vim,
            src/buffer.c, src/charset.c, src/edit.c, src/ex_getln.c,
            src/getchar.c, src/misc1.c, src/misc2.c, src/ops.c, src/option.c,
            src/option.h, src/proto/charset.pro, src/proto/misc1.pro,
            src/proto/option.pro, src/screen.c, src/structs.h,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
            src/testdir/test_breakindent.in, src/testdir/test_breakindent.ok,
            src/ui.c, src/version.c

Patch 7.4.339
Problem:    Local function is available globally.
```

```
Solution:   Add "static".
Files:      src/option.c, src/proto/option.pro

Patch 7.4.340
Problem:    Error from sed about illegal bytes when installing Vim.
Solution:   Prepend LC_ALL=C. (Itchyny)
Files:      src/installman.sh

Patch 7.4.341
Problem:    sort() doesn't handle numbers well.
Solution:   Add an argument to specify sorting on numbers. (Christian Brabandt)
Files:      runtime/doc/eval.txt, src/eval.c, src/testdir/test55.in,
            src/testdir/test55.ok

Patch 7.4.342
Problem:    Clang gives warnings.
Solution:   Add an else block. (Dominique Pelle)
Files:      src/gui_beval.c

Patch 7.4.343
Problem:    matchdelete() does not always update the right lines.
Solution:   Fix off-by-one error.  (Ozaki Kiichi)
Files:      src/window.c

Patch 7.4.344
Problem:    Unnecessary initializations and other things related to
            matchaddpos().
Solution:   Code cleanup. (Alexey Radkov)
Files:      runtime/doc/eval.txt, src/screen.c, src/window.c

Patch 7.4.345 (after 7.4.338)
Problem:    Indent is not updated when deleting indent.
Solution:   Remember changedtick.
Files:      src/misc1.c

Patch 7.4.346 (after 7.4.338)
Problem:    Indent is not updated when changing 'breakindentopt'. (itchyny)
Solution:   Do not cache "brishift". (Christian Brabandt)
Files:      src/misc1.c

Patch 7.4.347
Problem:    test55 fails on some systems.
Solution:   Remove the elements that all result in zero and can end up in an
            arbitrary position.
Files:      src/testdir/test55.in, src/testdir/test55.ok

Patch 7.4.348
Problem:    When using "J1" in 'cinoptions' a line below a continuation line
            gets too much indent.
Solution:   Fix parentheses in condition.
Files:      src/misc1.c

Patch 7.4.349
Problem:    When there are matches to highlight the whole window is redrawn,
```

```
            which is slow.
Solution:   Only redraw everything when lines were inserted or deleted.
            Reset b_mod_xlines when needed.  (Alexey Radkov)
Files:      src/screen.c, src/window.c

Patch 7.4.350
Problem:    Using C indenting for Javascript does not work well for a {} block
            inside parentheses.
Solution:   When looking for a matching paren ignore one that is before the
            start of a {} block.
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.4.351
Problem:    sort() is not stable.
Solution:   When the items are identical, compare the pointers.
Files:      src/eval.c, src/testdir/test55.in, src/testdir/test55.ok

Patch 7.4.352
Problem:    With 'linebreak' a tab causes a missing line break.
Solution:   Count a tab for what it's worth also for shorter lines.
            (Christian Brabandt)
Files:      src/charset.c

Patch 7.4.353
Problem:    'linebreak' doesn't work with the 'list' option.
Solution:   Make it work. (Christian Brabandt)
Files:      runtime/doc/options.txt, src/charset.c, src/screen.c,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
            src/testdir/test_listlbr.in, src/testdir/test_listlbr.ok

Patch 7.4.354
Problem:    Compiler warning.
Solution:   Change NUL to NULL. (Ken Takata)
Files:      src/screen.c

Patch 7.4.355
Problem:    Several problems with Javascript indenting.
Solution:   Improve Javascript indenting.
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.4.356
Problem:    Mercurial does not ignore memfile_test. (Daniel Hahler)
Solution:   Add memfile_test to ignored files, remove trailing spaces.
Files:      .hgignore

Patch 7.4.357
Problem:    After completion some characters are not redrawn.
Solution:   Clear the command line unconditionally. (Jacob Niehus)
Files:      src/edit.c

Patch 7.4.358 (after 7.4.351)
Problem:    Sort is not always stable.
```

```
Solution:   Add an index instead of relying on the pointer to remain the same.
            Idea by Jun Takimoto.
Files:      src/eval.c

Patch 7.4.359
Problem:    When 'ttymouse' is set to 'uxterm' the xterm version is not
            requested. (Tomas Janousek)
Solution:   Do not mark uxterm as a conflict mouse and add
            resume_get_esc_sequence().
Files:      src/term.c, src/os_unix.c, src/proto/term.pro

Patch 7.4.360
Problem:    In a regexp pattern a "$" followed by \v or \V is not seen as the
            end-of-line.
Solution:   Handle the situation. (Ozaki Kiichi)
Files:      src/regexp.c

Patch 7.4.361
Problem:    Lots of flickering when filling the preview window for 'omnifunc'.
Solution:   Disable redrawing. (Hirohito Higashi)
Files:      src/popupmnu.c

Patch 7.4.362
Problem:    When matchaddpos() uses a length smaller than the number of bytes
            in the (last) character the highlight continues until the end of
            the line.
Solution:   Change condition from equal to larger-or-equal.
Files:      src/screen.c

Patch 7.4.363
Problem:    In Windows console typing 0xCE does not work.
Solution:   Convert 0xCE to K_NUL 3. (Nobuhiro Takasaki et al.)
Files:      src/os_win32.c, src/term.c

Patch 7.4.364
Problem:    When the viminfo file can't be renamed there is no error message.
            (Vladimir Berezhnoy)
Solution:   Check for the rename to fail.
Files:      src/ex_cmds.c

Patch 7.4.365
Problem:    Crash when using ":botright split" when there isn't much space.
Solution:   Add a check for the minimum width/height. (Yukihiro Nakadaira)
Files:      src/window.c

Patch 7.4.366
Problem:    Can't run the linebreak test on MS-Windows.
Solution:   Fix the output file name. (Taro Muraoka)
Files:      src/testdir/Make_dos.mak

Patch 7.4.367 (after 7.4.357)
Problem:    Other solution for redrawing after completion.
Solution:   Schedule a window redraw instead of just clearing the command
            line. (Jacob Niehus)
```

```
Files:      src/edit.c

Patch 7.4.368
Problem:    Restoring the window sizes after closing the command line window
            doesn't work properly if there are nested splits.
Solution:   Restore the sizes twice. (Hirohito Higashi)
Files:      src/window.c

Patch 7.4.369
Problem:    Using freed memory when exiting while compiled with EXITFREE.
Solution:   Set curwin to NULL and check for that. (Dominique Pelle)
Files:      src/buffer.c, src/window.c

Patch 7.4.370
Problem:    Linebreak test fails when encoding is not utf-8. (Danek Duvall)
Solution:   Split the test in a single byte one and a utf-8 one. (Christian
            Brabandt)
Files:      src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
            src/testdir/test_listlbr.in, src/testdir/test_listlbr.ok,
            src/testdir/test_listlbr_utf8.in, src/testdir/test_listlbr_utf8.ok

Patch 7.4.371
Problem:    When 'linebreak' is set control characters are not correctly
            displayed. (Kimmy Lindvall)
Solution:   Set n_extra. (Christian Brabandt)
Files:      src/screen.c

Patch 7.4.372
Problem:    When 'winminheight' is zero there might not be one line for the
            current window.
Solution:   Change the size computations. (Yukihiro Nakadaira)
Files:      src/window.c

Patch 7.4.373
Problem:    Compiler warning for unused argument and unused variable.
Solution:   Add UNUSED.  Move variable inside #ifdef.
Files:      src/charset.c, src/window.c

Patch 7.4.374
Problem:    Character after "fb" command not mapped if it might be a composing
            character.
Solution:   Don't disable mapping when looking for a composing character.
            (Jacob Niehus)
Files:      src/normal.c

Patch 7.4.375
Problem:    Test 63 fails when run with GUI-only Vim.
Solution:   Add guibg attributes. (suggested by Mike Soyka)
Files:      src/testdir/test63.in

Patch 7.4.376 (after 7.4.367)
Problem:    Popup menu flickers too much.
```

```
Solution:   Remove the forced redraw. (Hirohito Higashi)
Files:      src/edit.c

Patch 7.4.377
Problem:    When 'equalalways' is set a split may report "no room" even though
            there is plenty of room.
Solution:   Compute the available room properly. (Yukihiro Nakadaira)
Files:      src/window.c

Patch 7.4.378
Problem:    Title of quickfix list is not kept for setqflist(list, 'r').
Solution:   Keep the title.  Add a test. (Lcd)
Files:      src/quickfix.c, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile, src/testdir/test_qf_title.in,
            src/testdir/test_qf_title.ok

Patch 7.4.379
Problem:    Accessing freed memory after using setqflist(list, 'r'). (Lcd)
Solution:   Reset qf_index.
Files:      src/quickfix.c

Patch 7.4.380
Problem:    Loading python may cause Vim to exit.
Solution:   Avoid loading the "site" module. (Taro Muraoka)
Files:      src/if_python.c

Patch 7.4.381
Problem:    Get u_undo error when backspacing in Insert mode deletes more than
            one line break. (Ayberk Ozgur)
Solution:   Also decrement Insstart.lnum.
Files:      src/edit.c

Patch 7.4.382
Problem:    Mapping characters may not work after typing Esc in Insert mode.
Solution:   Fix the noremap flags for inserted characters. (Jacob Niehus)
Files:      src/getchar.c

Patch 7.4.383
Problem:    Bad interaction between preview window and omnifunc.
Solution:   Avoid redrawing the status line. (Hirohito Higashi)
Files:      src/popupmnu.c

Patch 7.4.384
Problem:    Test 102 fails when compiled with small features.
Solution:   Source small.vim. (Jacob Niehus)
Files:      src/testdir/test102.in

Patch 7.4.385
Problem:    When building with tiny or small features building the .mo files
            fails.
Solution:   In autoconf do not setup for building the .mo files when it would
            fail.
```

```
Files:      src/configure.in, src/auto/configure

Patch 7.4.386
Problem:    When splitting a window the changelist position is wrong.
Solution:   Copy the changelist position. (Jacob Niehus)
Files:      src/window.c, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile, src/testdir/test_changelist.in,
            src/testdir/test_changelist.ok

Patch 7.4.387
Problem:    "4gro" replaces one character then executes "ooo". (Urtica Dioica)
Solution:   Write the ESC in the second stuff buffer.
Files:      src/getchar.c, src/proto/getchar.pro, src/edit.c,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
            src/testdir/test_insertcount.in, src/testdir/test_insertcount.ok

Patch 7.4.388
Problem:    With 'linebreak' set and 'list' unset a Tab is not counted
            properly. (Kent Sibilev)
Solution:   Check the 'list' option. (Christian Brabandt)
Files:      src/screen.c, src/testdir/test_listlbr_utf8.in,
            src/testdir/test_listlbr_utf8.ok

Patch 7.4.389
Problem:    Still sometimes Vim enters Replace mode when starting up.
Solution:   Use a different solution in detecting the termresponse and
            location response. (Hayaki Saito)
Files:      src/globals.h, src/os_unix.c, src/term.c, src/proto/term.pro

Patch 7.4.390
Problem:    Advancing pointer over end of a string.
Solution:   Init quote character to -1 instead of zero. (Dominique Pelle)
Files:      src/misc1.c

Patch 7.4.391
Problem:    No 'cursorline' highlighting when the cursor is on a line with
            diff highlighting. (Benjamin Fritz)
Solution:   Combine the highlight attributes. (Christian Brabandt)
Files:      src/screen.c

Patch 7.4.392
Problem:    Not easy to detect type of command line window.
Solution:   Add the getcmdwintype() function. (Jacob Niehus)
Files:      src/eval.c

Patch 7.4.393
Problem:    Text drawing on newer MS-Windows systems is suboptimal.  Some
            multi-byte characters are not displayed, even though the same font
            in Notepad can display them. (Srinath Avadhanula)
Solution:   Add the 'renderoptions' option to enable DirectX drawing. (Taro
```

            Muraoka)
Files: runtime/doc/eval.txt, runtime/doc/options.txt,
            runtime/doc/various.txt, src/Make_cyg.mak, src/Make_ming.mak,
            src/Make_mvc.mak, src/eval.c, src/gui_dwrite.cpp,
            src/gui_dwrite.h, src/gui_w32.c, src/gui_w48.c, src/option.c,
            src/option.h, src/version.c, src/vim.h, src/proto/gui_w32.pro

Patch 7.4.394 (after 7.4.393)
Problem: When using DirectX last italic character is incomplete.
Solution: Add one to the number of cells. (Ken Takata)
Files: src/gui_w32.c

Patch 7.4.395 (after 7.4.355)
Problem: C indent is wrong below an if with wrapped condition followed by
            curly braces. (Trevor Powell)
Solution: Make a copy of tryposBrace.
Files: src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.4.396
Problem: When 'clipboard' is "unnamed", :g/pat/d is very slow. (Praful)
Solution: Only set the clipboard after the last delete. (Christian Brabandt)
Files: src/ex_cmds.c, src/ex_cmds2.c, src/ex_docmd.c, src/globals.h,
            src/ops.c, src/proto/ui.pro, src/ui.c

Patch 7.4.397
Problem: Matchparen only uses the topmost syntax item.
Solution: Go through the syntax stack to find items. (James McCoy)
            Also use getcurpos() when possible.
Files: runtime/plugin/matchparen.vim

Patch 7.4.398 (after 7.4.393)
Problem: Gcc error for the argument of InterlockedIncrement() and
            InterlockedDecrement(). (Axel Bender)
Solution: Remove "unsigned" from the cRefCount_ declaration.
Files: src/gui_dwrite.cpp

Patch 7.4.399
Problem: Encryption implementation is messy. Blowfish encryption has a
            weakness.
Solution: Refactor the encryption, store the state in an allocated struct
            instead of using a save/restore mechanism. Introduce the
            "blowfish2" method, which does not have the weakness and encrypts
            the whole undo file. (largely by David Leadbeater)
Files: runtime/doc/editing.txt, runtime/doc/options.txt, src/Makefile,
            src/blowfish.c, src/crypt.c, src/crypt_zip.c, src/ex_docmd.c,
            src/fileio.c, src/globals.h, src/main.c, src/memline.c,
            src/misc2.c, src/option.c, src/proto.h, src/proto/blowfish.pro,
            src/proto/crypt.pro, src/proto/crypt_zip.pro,
            src/proto/fileio.pro, src/proto/misc2.pro, src/structs.h,
            src/undo.c, src/testdir/test71.in, src/testdir/test71.ok,
            src/testdir/test71a.in, src/testdir/test72.in,
            src/testdir/test72.ok

Patch 7.4.400

```
Problem:    List of distributed files is incomplete.
Solution:   Add recently added files.
Files:      Filelist

Patch 7.4.401 (after 7.4.399)
Problem:    Can't build on MS-Windows.
Solution:   Include the new files in all the Makefiles.
Files:      src/Make_bc3.mak, src/Make_bc5.mak, src/Make_cyg.mak,
            src/Make_dice.mak, src/Make_djg.mak, src/Make_ivc.mak,
            src/Make_manx.mak, src/Make_ming.mak, src/Make_morph.mak,
            src/Make_mvc.mak, src/Make_os2.mak, src/Make_sas.mak,
            Make_vms.mms

Patch 7.4.402
Problem:    Test 72 crashes under certain conditions. (Kazunobu Kuriyama)
Solution:   Clear the whole bufinfo_T early.
Files:      src/undo.c

Patch 7.4.403
Problem:    Valgrind reports errors when running test 72. (Dominique Pelle)
Solution:   Reset the local 'cryptmethod' option before storing the seed.
            Set the seed in the memfile even when there is no block0 yet.
Files:      src/fileio.c, src/option.c, src/memline.c

Patch 7.4.404
Problem:    Windows 64 bit compiler warnings.
Solution:   Add type casts. (Mike Williams)
Files:      src/crypt.c, src/undo.c

Patch 7.4.405
Problem:    Screen updating is slow when using matches.
Solution:   Do not use the ">=" as in patch 7.4.362, check the lnum.
Files:      src/screen.c, src/testdir/test63.in, src/testdir/test63.ok

Patch 7.4.406
Problem:    Test 72 and 100 fail on MS-Windows.
Solution:   Set fileformat to unix in the tests. (Taro Muraoka)
Files:      src/testdir/test72.in, src/testdir/test100.in

Patch 7.4.407
Problem:    Inserting text for Visual block mode, with cursor movement,
            repeats the wrong text. (Aleksandar Ivanov)
Solution:   Reset the update_Insstart_orig flag. (Christian Brabandt)
Files:      src/edit.c, src/testdir/test39.in, src/testdir/test39.ok

Patch 7.4.408
Problem:    Visual block insert breaks a multi-byte character.
Solution:   Calculate the position properly. (Yasuhiro Matsumoto)
Files:      src/ops.c, src/testdir/test_utf8.in, src/testdir/test_utf8.ok,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile

Patch 7.4.409
```

```
Problem:    Can't build with Perl on Fedora 20.
Solution:   Find xsubpp in another directory. (Michael Henry)
Files:      src/Makefile, src/config.mk.in, src/configure.in,
            src/auto/configure

Patch 7.4.410
Problem:    Fold does not open after search when there is a CmdwinLeave
            autocommand.
Solution:   Restore KeyTyped. (Jacob Niehus)
Files:      src/ex_getln.c

Patch 7.4.411
Problem:    "foo bar" sorts before "foo" with sort(). (John Little)
Solution:   Avoid putting quotes around strings before comparing them.
Files:      src/eval.c

Patch 7.4.412
Problem:    Can't build on Windows XP with MSVC.
Solution:   Add SUBSYSTEM_VER to the Makefile. (Yongwei Wu)
Files:      src/Make_mvc.mak, src/INSTALLpc.txt

Patch 7.4.413
Problem:    MS-Windows: Using US international keyboard layout, inserting dead
            key by pressing space does not always work.  Issue 250.
Solution:   Let MS-Windows translate the message. (John Wellesz)
Files:      src/gui_w48.c

Patch 7.4.414
Problem:    Cannot define a command only when it's used.
Solution:   Add the CmdUndefined autocommand event. (partly by Yasuhiro
            Matsumoto)
Files:      runtime/doc/autocmd.txt, src/ex_docmd.c, src/fileio.c,
            src/proto/fileio.pro

Patch 7.4.415 (after 7.4.414)
Problem:    Cannot build.  Warning for shadowed variable. (John Little)
Solution:   Add missing change.  Remove declaration.
Files:      src/vim.h, src/ex_docmd.c

Patch 7.4.416
Problem:    Problem with breakindent/showbreak and tabs.
Solution:   Handle tabs differently. (Christian Brabandt)
Files:      src/testdir/test_breakindent.in, src/testdir/test_breakindent.ok,
            src/charset.c

Patch 7.4.417
Problem:    After splitting a window and setting 'breakindent' the default
            minimum with is not respected.
Solution:   Call briopt_check() when copying options to a new window.
Files:      src/option.c, src/proto/option.pro,
            src/testdir/test_breakindent.in

Patch 7.4.418
Problem:    When leaving ":append" the cursor shape is like in Insert mode.
```

```
            (Jacob Niehus)
Solution:   Do not have State set to INSERT when calling getline().
Files:      src/ex_cmds.c

Patch 7.4.419
Problem:    When part of a list is locked it's possible to make changes.
Solution:   Check if any of the list items is locked before make a change.
            (ZyX)
Files:      src/eval.c, src/testdir/test55.in, src/testdir/test55.ok

Patch 7.4.420
Problem:    It's not obvious how to add a new test.
Solution:   Add a README file. (Christian Brabandt)
Files:      src/testdir/README.txt

Patch 7.4.421
Problem:    Crash when searching for "\ze*". (Urtica Dioica)
Solution:   Disallow a multi after \ze and \zs.
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.4.422
Problem:    When using conceal with linebreak some text is not displayed
            correctly. (Grüner Gimpel)
Solution:   Check for conceal mode when using linebreak. (Christian Brabandt)
Files:      src/screen.c, src/testdir/test_listlbr.in,
            src/testdir/test_listlbr.ok

Patch 7.4.423
Problem:    expand("$shell") does not work as documented.
Solution:   Do not escape the $ when expanding environment variables.
Files:      src/os_unix.c, src/misc1.c, src/vim.h

Patch 7.4.424
Problem:    Get ml_get error when using Python to delete lines in a buffer
            that is not in a window.  issue 248.
Solution:   Do not try adjusting the cursor for a different buffer.
Files:      src/if_py_both.h

Patch 7.4.425
Problem:    When 'showbreak' is used "gj" may move to the wrong position.
            (Nazri Ramliy)
Solution:   Adjust virtcol when 'showbreak' is set. (Christian Brabandt)
Files:      src/normal.c

Patch 7.4.426
Problem:    README File missing from list of files.
Solution:   Update the list of files.
Files:      Filelist

Patch 7.4.427
Problem:    When an InsertCharPre autocommand executes system() typeahead may
            be echoed and messes up the display. (Jacob Niehus)
Solution:   Do not set cooked mode when invoked from ":silent".
Files:      src/eval.c, runtime/doc/eval.txt
```

```
Patch 7.4.428
Problem:    executable() may return a wrong result on MS-Windows.
Solution:   Change the way SearchPath() is called. (Yasuhiro Matsumoto, Ken
            Takata)
Files:      src/os_win32.c

Patch 7.4.429
Problem:    Build fails with fewer features. (Elimar Riesebieter)
Solution:   Add #ifdef.
Files:      src/normal.c

Patch 7.4.430
Problem:    test_listlbr fails when compiled with normal features.
Solution:   Check for the +conceal feature.
Files:      src/testdir/test_listlbr.in

Patch 7.4.431
Problem:    Compiler warning.
Solution:   Add type cast. (Mike Williams)
Files:      src/ex_docmd.c

Patch 7.4.432
Problem:    When the startup code expands command line arguments, setting
            'encoding' will not properly convert the arguments.
Solution:   Call get_cmd_argsW() early in main(). (Yasuhiro Matsumoto)
Files:      src/os_win32.c, src/main.c, src/os_mswin.c

Patch 7.4.433
Problem:    Test 75 fails on MS-Windows.
Solution:   Use ":normal" instead of feedkeys(). (Michael Soyka)
Files:      src/testdir/test75.in

Patch 7.4.434
Problem:    gettabvar() is not consistent with getwinvar() and getbufvar().
Solution:   Return a dict with all variables when the varname is empty.
            (Yasuhiro Matsumoto)
Files:      src/eval.c, runtime/doc/eval.txt, src/testdir/test91.in,
            src/testdir/test91.ok

Patch 7.4.435
Problem:    Line formatting behaves differently when 'linebreak' is set.
            (mvxxc)
Solution:   Disable 'linebreak' temporarily. (Christian Brabandt)
Files:      src/edit.c

Patch 7.4.436
Problem:    ml_get error for autocommand that moves the cursor of the current
            window.
Solution:   Check the cursor position after switching back to the current
            buffer.  (Christian Brabandt)
Files:      src/fileio.c

Patch 7.4.437
```

```
Problem:    New and old regexp engine are not consistent.
Solution:   Also give an error for "\ze*" for the old regexp engine.
Files:      src/regexp.c, src/regexp_nfa.c

Patch 7.4.438
Problem:    Cached values for 'cino' not reset for ":set all&".
Solution:   Call parse_cino(). (Yukihiro Nakadaira)
Files:      src/option.c

Patch 7.4.439
Problem:    Duplicate message in message history.  Some quickfix messages
            appear twice. (Gary Johnson)
Solution:   Do not reset keep_msg too early. (Hirohito Higashi)
Files:      src/main.c

Patch 7.4.440
Problem:    Omni complete popup drawn incorrectly.
Solution:   Call validate_cursor() instead of check_cursor(). (Hirohito
            Higashi)
Files:      src/edit.c

Patch 7.4.441
Problem:    Endless loop and other problems when 'cedit' is set to CTRL-C.
Solution:   Do not call ex_window() when ex_normal_busy or got_int was set.
            (Yasuhiro Matsumoto)
Files:      src/ex_getln.c

Patch 7.4.442 (after 7.4.434)
Problem:    Using uninitialized variable.
Solution:   Pass the first window of the tabpage.
Files:      src/eval.c

Patch 7.4.443
Problem:    Error reported by ubsan when running test 72.
Solution:   Add type cast to unsigned. (Dominique Pelle)
Files:      src/undo.c

Patch 7.4.444
Problem:    Reversed question mark not recognized as punctuation. (Issue 258)
Solution:   Add the Supplemental Punctuation range.
Files:      src/mbyte.c

Patch 7.4.445
Problem:    Clipboard may be cleared on startup.
Solution:   Set clip_did_set_selection to -1 during startup. (Christian
            Brabandt)
Files:      src/main.c, src/ui.c

Patch 7.4.446
Problem:    In some situations, when setting up an environment to trigger an
            autocommand, the environment is not properly restored.
Solution:   Check the return value of switch_win() and call restore_win()
            always.  (Daniel Hahler)
Files:      src/eval.c, src/misc2.c, src/window.c
```

```
Patch 7.4.447
Problem:    Spell files from Hunspell may generate a lot of errors.
Solution:   Add the IGNOREEXTRA flag.
Files:      src/spell.c, runtime/doc/spell.txt

Patch 7.4.448
Problem:    Using ETO_IGNORELANGUAGE causes problems.
Solution:   Remove this flag. (Paul Moore)
Files:      src/gui_w32.c

Patch 7.4.449
Problem:    Can't easily close the help window. (Chris Gaal)
Solution:   Add ":helpclose". (Christian Brabandt)
Files:      runtime/doc/helphelp.txt, runtime/doc/index.txt, src/ex_cmds.c,
            src/ex_cmds.h, src/proto/ex_cmds.pro

Patch 7.4.450
Problem:    Not all commands that edit another buffer support the +cmd
            argument.
Solution:   Add the +cmd argument to relevant commands. (Marcin Szamotulski)
Files:      runtime/doc/windows.txt, src/ex_cmds.h, src/ex_docmd.c

Patch 7.4.451
Problem:    Calling system() with empty input gives an error for writing the
            temp file.
Solution:   Do not try writing if the string length is zero. (Olaf Dabrunz)
Files:      src/eval.c

Patch 7.4.452
Problem:    Can't build with tiny features. (Tony Mechelynck)
Solution:   Use "return" instead of "break".
Files:      src/ex_cmds.c

Patch 7.4.453
Problem:    Still can't build with tiny features.
Solution:   Add #ifdef.
Files:      src/ex_cmds.c

Patch 7.4.454
Problem:    When using a Visual selection of multiple words and doing CTRL-W_]
            it jumps to the tag matching the word under the cursor, not the
            selected text.  (Patrick hemmer)
Solution:   Do not reset Visual mode. (idea by Christian Brabandt)
Files:      src/window.c

Patch 7.4.455
Problem:    Completion for :buf does not use 'wildignorecase'. (Akshay H)
Solution:   Pass the 'wildignorecase' flag around.
Files:      src/buffer.c

Patch 7.4.456
Problem:    'backupcopy' is global, cannot write only some files in a
            different way.
```

```
Solution:   Make 'backupcopy' global-local. (Christian Brabandt)
Files:      runtime/doc/options.txt, src/buffer.c, src/fileio.c, src/option.c,
            src/option.h, src/proto/option.pro, src/structs.h

Patch 7.4.457
Problem:    Using getchar() in an expression mapping may result in
            K_CURSORHOLD, which can't be recognized.
Solution:   Add the <CursorHold> key.  (Hirohito Higashi)
Files:      src/misc2.c

Patch 7.4.458
Problem:    Issue 252: Cursor moves in a zero-height window.
Solution:   Check for zero height. (idea by Christian Brabandt)
Files:      src/move.c

Patch 7.4.459
Problem:    Can't change the icon after building Vim.
Solution:   Load the icon from a file on startup. (Yasuhiro Matsumoto)
Files:      src/gui_w32.c, src/os_mswin.c, src/os_win32.c,
            src/proto/os_mswin.pro

Patch 7.4.460 (after 7.4.454)
Problem:    Can't build without the quickfix feature. (Erik Falor)
Solution:   Add a #ifdef.
Files:      src/window.c

Patch 7.4.461
Problem:    MS-Windows: When collate is on the number of copies is too high.
Solution:   Only set the collated/uncollated count when collate is on.
            (Yasuhiro Matsumoto)
Files:      src/os_mswin.c

Patch 7.4.462
Problem:    Setting the local value of 'backupcopy' empty gives an error.
            (Peter Mattern)
Solution:   When using an empty value set the flags to zero. (Hirohito
            Higashi)
Files:      src/option.c

Patch 7.4.463
Problem:    Test 86 and 87 may hang on MS-Windows.
Solution:   Call inputrestore() after inputsave(). (Ken Takata)
Files:      src/testdir/test86.in, src/testdir/test87.in

Patch 7.4.464 (after 7.4.459)
Problem:    Compiler warning.
Solution:   Add type cast. (Ken Takata)
Files:      src/gui_w32.c

Patch 7.4.465 (after 7.4.016)
Problem:    Crash when expanding a very long string.
Solution:   Use wcsncpy() instead of wcscpy(). (Ken Takata)
Files:      src/os_win32.c
```

```
Patch 7.4.466 (after 7.4.460)
Problem:    CTRL-W } does not open preview window. (Erik Falor)
Solution:   Don't set g_do_tagpreview for CTRL-W }.
Files:      src/window.c

Patch 7.4.467
Problem:    'linebreak' does not work well together with Visual mode.
Solution:   Disable 'linebreak' while applying an operator.  Fix the test.
            (Christian Brabandt)
Files:      src/normal.c, src/screen.c, src/testdir/test_listlbr.in,
            src/testdir/test_listlbr.ok

Patch 7.4.468
Problem:    Issue 26: CTRL-C does not interrupt after it was mapped and then
            unmapped.
Solution:   Reset mapped_ctrl_c. (Christian Brabandt)
Files:      src/getchar.c

Patch 7.4.469 (after 7.4.467)
Problem:    Can't build with MSVC. (Ken Takata)
Solution:   Move the assignment after the declarations.
Files:      src/normal.c

Patch 7.4.470
Problem:    Test 11 and 100 do not work properly on Windows.
Solution:   Avoid using feedkeys(). (Ken Takata)
Files:      src/testdir/Make_dos.mak, src/testdir/test11.in,
            src/testdir/test100.in

Patch 7.4.471
Problem:    MS-Windows: When printer name contains multi-byte, the name is
            displayed as ???.
Solution:   Convert the printer name from the active codepage to 'encoding'.
            (Yasuhiro Matsumoto)
Files:      src/os_mswin.c

Patch 7.4.472
Problem:    The "precedes" entry in 'listchar' will be drawn when 'showbreak'
            is set and 'list' is not.
Solution:   Only draw this character when 'list' is on. (Christian Brabandt)
Files:      src/screen.c

Patch 7.4.473
Problem:    Cursor movement is incorrect when there is a number/sign/fold
            column and 'sbr' is displayed.
Solution:   Adjust the column for 'sbr'. (Christian Brabandt)
Files:      src/charset.c

Patch 7.4.474
Problem:    AIX compiler can't handle // comment.  Issue 265.
Solution:   Remove that line.
Files:      src/regexp_nfa.c

Patch 7.4.475
```

```
Problem:    Can't compile on a system where Xutf8SetWMProperties() is not in
            the X11 library.  Issue 265.
Solution:   Add a configure check.
Files:      src/configure.in, src/auto/configure, src/config.h.in,
            src/os_unix.c

Patch 7.4.476
Problem:    MingW: compiling with "XPM=no" doesn't work.
Solution:   Check for the "no" value. (KF Leong)  Also for Cygwin. (Ken
            Takata)
Files:      src/Make_ming.mak, src/Make_cyg.mak

Patch 7.4.477
Problem:    When using ":%diffput" and the other file is empty an extra empty
            line remains.
Solution:   Set the buf_empty flag.
Files:      src/diff.c

Patch 7.4.478
Problem:    Using byte length instead of character length for 'showbreak'.
Solution:   Compute the character length. (Marco Hinz)
Files:      src/charset.c

Patch 7.4.479
Problem:    MS-Windows: The console title can be wrong.
Solution:   Take the encoding into account. When restoring the title use the
            right function. (Yasuhiro Matsumoto)
Files:      src/os_mswin.c, src/os_win32.c

Patch 7.4.480 (after 7.4.479)
Problem:    MS-Windows: Can't build.
Solution:   Remove goto, use a flag instead.
Files:      src/os_win32.c

Patch 7.4.481 (after 7.4.471)
Problem:    Compiler warning on MS-Windows.
Solution:   Add type casts. (Ken Takata)
Files:      src/os_mswin.c

Patch 7.4.482
Problem:    When 'balloonexpr' results in a list, the text has a trailing
            newline. (Lcd)
Solution:   Remove one trailing newline.
Files:      src/gui_beval.c

Patch 7.4.483
Problem:    A 0x80 byte is not handled correctly in abbreviations.
Solution:   Unescape special characters. Add a test. (Christian Brabandt)
Files:      src/getchar.c, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile, src/testdir/test_mapping.in,
            src/testdir/test_mapping.ok
```

```
Patch 7.4.484 (after 7.4.483)
Problem:    Compiler warning on MS-Windows. (Ken Takata)
Solution:   Add type cast.
Files:      src/getchar.c

Patch 7.4.485 (after 7.4.484)
Problem:    Abbreviations don't work. (Toothpik)
Solution:   Move the length computation inside the for loop.  Compare against
            the unescaped key.
Files:      src/getchar.c

Patch 7.4.486
Problem:    Check for writing to a yank register is wrong.
Solution:   Negate the check. (Zyx).  Also clean up the #ifdefs.
Files:      src/ex_docmd.c, src/ex_cmds.h

Patch 7.4.487
Problem:    ":sign jump" may use another window even though the file is
            already edited in the current window.
Solution:   First check if the file is in the current window. (James McCoy)
Files:      src/window.c, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile, src/testdir/test_signs.in,
            src/testdir/test_signs.ok

Patch 7.4.488
Problem:    test_mapping fails for some people.
Solution:   Set the 'encoding' option. (Ken Takata)
Files:      src/testdir/test_mapping.in

Patch 7.4.489
Problem:    Cursor movement still wrong when 'lbr' is set and there is a
            number column. (Hirohito Higashi)
Solution:   Add correction for number column. (Hiroyuki Takagi)
Files:      src/charset.c

Patch 7.4.490
Problem:    Cannot specify the buffer to use for "do" and "dp", making them
            useless for three-way diff.
Solution:   Use the count as the buffer number. (James McCoy)
Files:      runtime/doc/diff.txt, src/diff.c, src/normal.c, src/proto/diff.pro

Patch 7.4.491
Problem:    When winrestview() has a negative "topline" value there are
            display errors.
Solution:   Correct a negative value to 1. (Hirohito Higashi)
Files:      src/eval.c

Patch 7.4.492
Problem:    In Insert mode, after inserting a newline that inserts a comment
            leader, CTRL-O moves to the right. (ZyX) Issue 57.
Solution:   Correct the condition for moving the cursor back to the NUL.
            (Christian Brabandt)
```

```
Files:      src/edit.c, src/testdir/test4.in, src/testdir/test4.ok

Patch 7.4.493
Problem:    A TextChanged autocommand is triggered when saving a file.
            (William Gardner)
Solution:   Update last_changedtick after calling unchanged(). (Christian
            Brabandt)
Files:      src/fileio.c

Patch 7.4.494
Problem:    Cursor shape is wrong after a CompleteDone autocommand.
Solution:   Update the cursor and mouse shape after ":normal" restores the
            state. (Jacob Niehus)
Files:      src/ex_docmd.c

Patch 7.4.495
Problem:    XPM isn't used correctly in the Cygwin Makefile.
Solution:   Include the rules like in Make_ming.mak. (Ken Takata)
Files:      src/Make_cyg.mak

Patch 7.4.496
Problem:    Many lines are both in Make_cyg.mak and Make_ming.mak
Solution:   Move the common parts to one file. (Ken Takata)
Files:      src/INSTALLpc.txt, src/Make_cyg.mak, src/Make_cyg_ming.mak,
            src/Make_ming.mak, src/Make_mvc.mak, Filelist

Patch 7.4.497
Problem:    With some regexp patterns the NFA engine uses many states and
            becomes very slow.  To the user it looks like Vim freezes.
Solution:   When the number of states reaches a limit fall back to the old
            engine. (Christian Brabandt)
Files:      runtime/doc/options.txt, src/Makefile, src/regexp.c, src/regexp.h,
            src/regexp_nfa.c, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Makefile, src/testdir/samples/re.freeze.txt,
            src/testdir/bench_re_freeze.in, src/testdir/bench_re_freeze.vim,
            Filelist

Patch 7.4.498 (after 7.4.497)
Problem:    Typo in DOS makefile.
Solution:   Change exists to exist. (Ken Takata)
Files:      src/testdir/Make_dos.mak

Patch 7.4.499
Problem:    substitute() can be slow with long strings.
Solution:   Store a pointer to the end, instead of calling strlen() every
            time. (Ozaki Kiichi)
Files:      src/eval.c

Patch 7.4.500
Problem:    Test 72 still fails once in a while.
Solution:   Don't set 'fileformat' to unix, reset it. (Ken Takata)
Files:      src/testdir/test72.in
```

```
Patch 7.4.501 (after 7.4.497)
Problem:    Typo in file pattern.
Solution:   Insert a slash and remove a dot.
Files:      Filelist

Patch 7.4.502
Problem:    Language mapping also applies to mapped characters.
Solution:   Add the 'langnoremap' option, when on 'langmap' does not apply to
            mapped characters. (Christian Brabandt)
Files:      runtime/doc/options.txt, runtime/vimrc_example.vim, src/macros.h,
            src/option.c, src/option.h

Patch 7.4.503
Problem:    Cannot append a list of lines to a file.
Solution:   Add the append option to writefile(). (Yasuhiro Matsumoto)
Files:      runtime/doc/eval.txt, src/Makefile, src/eval.c,
            src/testdir/test_writefile.in, src/testdir/test_writefile.ok

Patch 7.4.504
Problem:    Restriction of the MS-Windows installer that the path must end in
            "Vim" prevents installing more than one version.
Solution:   Remove the restriction. (Tim Lebedkov)
Files:      nsis/gvim.nsi

Patch 7.4.505
Problem:    On MS-Windows when 'encoding' is a double-byte encoding a file
            name longer than MAX_PATH bytes but shorter than that in
            characters causes problems.
Solution:   Fail on file names longer than MAX_PATH bytes. (Ken Takata)
Files:      src/os_win32.c

Patch 7.4.506
Problem:    MS-Windows: Cannot open a file with 259 characters.
Solution:   Fix off-by-one error. (Ken Takata)
Files:      src/os_mswin.c

Patch 7.4.507 (after 7.4.496)
Problem:    Building with MingW and Perl.
Solution:   Remove quotes. (Ken Takata)
Files:      src/Make_cyg_ming.mak

Patch 7.4.508
Problem:    When generating ja.sjis.po the header is not correctly adjusted.
Solution:   Check for the right header string. (Ken Takata)
Files:      src/po/sjiscorr.c

Patch 7.4.509
Problem:    Users are not aware their encryption is weak.
Solution:   Give a warning when prompting for the key.
Files:      src/crypt.c, src/ex_docmd.c, src/fileio.c, src/main.c,
            src/proto/crypt.pro

Patch 7.4.510
Problem:    "-fwrapv" argument breaks use of cproto.
```

```
Solution:   Remove the alphabetic arguments in a drastic way.
Files:      src/Makefile

Patch 7.4.511
Problem:    Generating proto for if_ruby.c uses type not defined elsewhere.
Solution:   Do not generate a prototype for
            rb_gc_writebarrier_unprotect_promoted()
Files:      src/if_ruby.c

Patch 7.4.512
Problem:    Cannot generate prototypes for Win32 files and VMS.
Solution:   Add typedefs and #ifdef
Files:      src/os_win32.c, src/gui_w32.c, src/os_vms.c

Patch 7.4.513
Problem:    Crash because reference count is wrong for list returned by
            getreg().
Solution:   Increment the reference count. (Kimmy Lindvall)
Files:      src/eval.c

Patch 7.4.514 (after 7.4.492)
Problem:    Memory access error. (Dominique Pelle)
Solution:   Update tpos. (Christian Brabandt)
Files:      src/edit.c

Patch 7.4.515
Problem:    In a help buffer the global 'foldmethod' is used.  (Paul Marshall)
Solution:   Reset 'foldmethod' when starting to edit a help file.  Move the
            code to a separate function.
Files:      src/ex_cmds.c

Patch 7.4.516
Problem:    Completing a function name containing a # does not work.  Issue
            253.
Solution:   Recognize the # character. (Christian Brabandt)
Files:      src/eval.c

Patch 7.4.517
Problem:    With a wrapping line the cursor may not end up in the right place.
            (Nazri Ramliy)
Solution:   Adjust n_extra for a Tab that wraps. (Christian Brabandt)
Files:      src/screen.c

Patch 7.4.518
Problem:    Using status line height in width computations.
Solution:   Use one instead. (Hirohito Higashi)
Files:      src/window.c

Patch 7.4.519 (after 7.4.497)
Problem:    Crash when using syntax highlighting.
Solution:   When regprog is freed and replaced, store the result.
Files:      src/buffer.c, src/regexp.c, src/syntax.c, src/spell.c,
            src/ex_cmds2.c, src/fileio.c, src/proto/fileio.pro,
            src/proto/regexp.pro, src/os_unix.c
```

Patch 7.4.520
Problem: Sun PCK locale is not recognized.
Solution: Add PCK in the table. (Keiichi Oono)
Files: src/mbyte.c

Patch 7.4.521
Problem: When using "vep" a mark is moved to the next line. (Maxi Padulo,
            Issue 283)
Solution: Decrement the line number. (Christian Brabandt)
Files: src/ops.c

Patch 7.4.522
Problem: Specifying wrong buffer size for GetLongPathName().
Solution: Use the actual size. (Ken Takata)
Files: src/eval.c

Patch 7.4.523
Problem: When the X11 server is stopped and restarted, while Vim is kept in
            the background, copy/paste no longer works. (Issue 203)
Solution: Setup the clipboard again. (Christian Brabandt)
Files: src/os_unix.c

Patch 7.4.524
Problem: When using ":ownsyntax" spell checking is messed up. (Issue 78)
Solution: Use the window-local option values. (Christian Brabandt)
Files: src/option.c, src/syntax.c

Patch 7.4.525
Problem: map() leaks memory when there is an error in the expression.
Solution: Call clear_tv(). (Christian Brabandt)
Files: src/eval.c

Patch 7.4.526
Problem: matchstr() fails on long text. (Daniel Hahler)
Solution: Return NFA_TOO_EXPENSIVE from regexec_nl(). (Christian Brabandt)
Files: src/regexp.c

Patch 7.4.527
Problem: Still confusing regexp failure and NFA_TOO_EXPENSIVE.
Solution: NFA changes equivalent of 7.4.526.
Files: src/regexp_nfa.c

Patch 7.4.528
Problem: Crash when using matchadd() (Yasuhiro Matsumoto)
Solution: Copy the match regprog.
Files: src/screen.c

Patch 7.4.529
Problem: No test for what 7.4.517 fixes.
Solution: Adjust the tests for breakindent. (Christian Brabandt)
Files: src/testdir/test_breakindent.in, src/testdir/test_breakindent.ok

Patch 7.4.530

```
Problem:    Many commands take a count or range that is not using line
            numbers.
Solution:   For each command specify what kind of count it uses.  For windows,
            buffers and arguments have "$" and "." have a relevant meaning.
            (Marcin Szamotulski)
Files:      runtime/doc/editing.txt, runtime/doc/tabpage.txt,
            runtime/doc/windows.txt, src/Makefile, src/ex_cmds.h,
            src/ex_docmd.c, src/testdir/Make_amiga.mak
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile, src/testdir/test_argument_count.in,
            src/testdir/test_argument_count.ok,
            src/testdir/test_close_count.in, src/testdir/test_close_count.ok,
            src/window.c

Patch 7.4.531
Problem:    Comments about parsing an Ex command are wrong.
Solution:   Correct the step numbers.
Files:      src/ex_docmd.c

Patch 7.4.532
Problem:    When using 'incsearch' "2/pattern/e" highlights the first match.
Solution:   Move the code to set extra_col inside the loop for count.  (Ozaki
            Kiichi)
Files:      src/search.c

Patch 7.4.533
Problem:    ":hardcopy" leaks memory in case of errors.
Solution:   Free memory in all code paths. (Christian Brabandt)
Files:      src/hardcopy.c

Patch 7.4.534
Problem:    Warnings when compiling if_ruby.c.
Solution:   Avoid the warnings. (Ken Takata)
Files:      src/if_ruby.c

Patch 7.4.535 (after 7.4.530)
Problem:    Can't build with tiny features.
Solution:   Add #ifdefs and skip a test.
Files:      src/ex_docmd.c, src/testdir/test_argument_count.in

Patch 7.4.536
Problem:    Test 63 fails when using a black&white terminal.
Solution:   Add attributes for a non-color terminal. (Christian Brabandt)
Files:      src/testdir/test63.in

Patch 7.4.537
Problem:    Value of v:hlsearch reflects an internal variable.
Solution:   Make the value reflect whether search highlighting is actually
            displayed. (Christian Brabandt)
Files:      runtime/doc/eval.txt, src/testdir/test101.in,
            src/testdir/test101.ok, src/vim.h

Patch 7.4.538
```

Problem: Tests fail with small features plus Python.
Solution: Disallow weird combination of options. Do not set "fdm" when
            folding is disabled.
Files: src/option.c, src/ex_cmds.c, src/configure.in, src/auto/configure,
            src/feature.h

Patch 7.4.539 (after 7.4.530)
Problem: Crash when computing buffer count. Problem with range for user
            commands. Line range wrong in Visual area.
Solution: Avoid segfault in compute_buffer_local_count(). Check for
            CMD_USER when checking type of range. (Marcin Szamotulski)
Files: runtime/doc/windows.txt, src/ex_docmd.c

Patch 7.4.540 (after 7.4.539)
Problem: Cannot build with tiny and small features. (Taro Muraoka)
Solution: Add #ifdef around CMD_USER.
Files: src/ex_docmd.c

Patch 7.4.541
Problem: Crash when doing a range assign.
Solution: Check for NULL pointer. (Yukihiro Nakadaira)
Files: src/eval.c, src/testdir/test55.in, src/testdir/test55.ok

Patch 7.4.542
Problem: Using a range for window and buffer commands has a few problems.
            Cannot specify the type of range for a user command.
Solution: Add the -addr argument for user commands. Fix problems. (Marcin
            Szamotulski)
Files: src/testdir/test_command_count.in,
            src/testdir/test_command_count.ok src/testdir/Make_amiga.mak
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile, runtime/doc/map.txt, src/Makefile,
            src/ex_cmds.h, src/ex_docmd.c, src/ex_getln.c,
            src/proto/ex_docmd.pro, src/vim.h,

Patch 7.4.543
Problem: Since patch 7.4.232 "1,3s/\n//" joins two lines instead of three.
            (Eliseo Martínez) Issue 287
Solution: Correct the line count. (Christian Brabandt)
            Also set the last used search pattern.
Files: src/ex_cmds.c, src/search.c, src/proto/search.pro

Patch 7.4.544
Problem: Warnings for unused arguments when compiling with a combination of
            features.
Solution: Add "UNUSED".
Files: src/if_cscope.c

Patch 7.4.545
Problem: Highlighting for multi-line matches is not correct.
Solution: Stop highlight at the end of the match. (Hirohito Higashi)
Files: src/screen.c

```
Patch 7.4.546
Problem:    Repeated use of vim_snprintf() with a number.
Solution:   Move these vim_snprintf() calls into a function.
Files:      src/window.c

Patch 7.4.547
Problem:    Using "vit" does not select a multi-byte character at the end
            correctly.
Solution:   Advance the cursor over the multi-byte character. (Christian
            Brabandt)
Files:      src/search.c

Patch 7.4.548
Problem:    Compilation fails with native version of MinGW-w64, because
            it doesn't have x86_64-w64-mingw32-windres.exe.
Solution:   Use windres instead. (Ken Takata)
Files:      src/Make_cyg_ming.mak

Patch 7.4.549
Problem:    Function name not recognized correctly when inside a function.
Solution:   Don't check for an alpha character. (Ozaki Kiichi)
Files:      src/eval.c, src/testdir/test_nested_function.in,
            src/testdir/test_nested_function.ok, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile

Patch 7.4.550
Problem:    curs_rows() function is always called with the second argument
            false.
Solution:   Remove the argument. (Christian Brabandt)
            validate_botline_win() can then also be removed.
Files:      src/move.c

Patch 7.4.551
Problem:    "ygn" may yank too much. (Fritzophrenic)  Issue 295.
Solution:   Check the width of the next match. (Christian Brabandt)
Files:      src/search.c, src/testdir/test53.in, src/testdir/test53.ok

Patch 7.4.552
Problem:    Langmap applies to Insert mode expression mappings.
Solution:   Check for Insert mode. (Daniel Hahler)
Files:      src/getchar.c, src/testdir/test_mapping.in,
            src/testdir/test_mapping.ok

Patch 7.4.553
Problem:    Various small issues.
Solution:   Fix those issues.
Files:      src/ex_cmds.h, src/gui.h, src/message.c, src/testdir/test39.in,
            src/proto/eval.pro, src/proto/misc1.pro, src/proto/ops.pro,
            src/proto/screen.pro, src/proto/window.pro. src/os_unix.c,
            src/Make_vms.mms, src/proto/os_vms.pro, src/INSTALL

Patch 7.4.554
```

```
Problem:    Missing part of patch 7.4.519.
Solution:   Copy back regprog after calling vim_regexec.
Files:      src/quickfix.c

Patch 7.4.555
Problem:    test_close_count may fail for some combination of features.
Solution:   Require normal features.
Files:      src/testdir/test_close_count.in

Patch 7.4.556
Problem:    Failed commands in Python interface not handled correctly.
Solution:   Restore window and buffer on failure.
Files:      src/if_py_both.h

Patch 7.4.557
Problem:    One more small issue.
Solution:   Update function proto.
Files:      src/proto/window.pro

Patch 7.4.558
Problem:    When the X server restarts Vim may get stuck.
Solution:   Destroy the application context and create it again.  (Issue 203)
Files:      src/os_unix.c

Patch 7.4.559
Problem:    Appending a block in the middle of a tab does not work correctly
            when virtualedit is set.
Solution:   Decrement spaces and count, don't reset them. (James McCoy)
Files:      src/ops.c, src/testdir/test39.in, src/testdir/test39.ok

Patch 7.4.560
Problem:    Memory leak using :wviminfo. Issue 296.
Solution:   Free memory when needed. (idea by Christian Brabandt)
Files:      src/ops.c

Patch 7.4.561
Problem:    Ex range handling is wrong for buffer-local user commands.
Solution:   Check for CMD_USER_BUF. (Marcin Szamotulski)
Files:      src/ex_docmd.c, src/testdir/test_command_count.in,
            src/testdir/test_command_count.ok

Patch 7.4.562
Problem:    Segfault with wide screen and error in 'rulerformat'. (Ingo Karkat)
Solution:   Check there is enough space. (Christian Brabandt)
Files:      src/buffer.c, src/screen.c

Patch 7.4.563
Problem:    No test for replacing on a tab in Virtual replace mode.
Solution:   Add a test. (Elias Diem)
Files:      src/testdir/test48.in, src/testdir/test48.ok

Patch 7.4.564
Problem:    FEAT_OSFILETYPE is used even though it's never defined.
Solution:   Remove the code. (Christian Brabandt)
```

```
Files:      src/fileio.c

Patch 7.4.565
Problem:    Ranges for arguments, buffers, tabs, etc. are not checked to be
            valid but limited to the maximum.  This can cause the wrong thing
            to happen.
Solution:   Give an error for an invalid value. (Marcin Szamotulski)
            Use windows range for ":wincmd".
Files:      src/ex_docmd.c, src/ex_cmds.h, src/testdir/test62.in,
            src/testdir/test_argument_count.in,
            src/testdir/test_argument_count.ok,
            src/testdir/test_close_count.in,
            src/testdir/test_command_count.in,
            src/testdir/test_command_count.ok

Patch 7.4.566
Problem:    :argdo, :bufdo, :windo and :tabdo don't take a range.
Solution:   Support the range. (Marcin Szamotulski)
Files:      runtime/doc/editing.txt, runtime/doc/tabpage.txt,
            runtime/doc/windows.txt, src/ex_cmds.h, src/ex_cmds2.c,
            src/testdir/test_command_count.in,
            src/testdir/test_command_count.ok

Patch 7.4.567
Problem:    Non-ascii vertical separator characters are always redrawn.
Solution:   Compare only the one byte that's stored. (Thiago Padilha)
Files:      src/screen.c

Patch 7.4.568
Problem:    Giving an error for ":0wincmd w" is a problem for some plugins.
Solution:   Allow the zero in the range. (Marcin Szamotulski)
Files:      src/ex_docmd.c, src/testdir/test_command_count.ok

Patch 7.4.569 (after 7.4.468)
Problem:    Having CTRL-C interrupt or not does not check the mode of the
            mapping. (Ingo Karkat)
Solution:   Use a bitmask with the map mode. (Christian Brabandt)
Files:      src/getchar.c, src/structs.h, src/testdir/test_mapping.in,
            src/testdir/test_mapping.ok, src/ui.c, src/globals.h

Patch 7.4.570
Problem:    Building with dynamic library does not work for Ruby 2.2.0
Solution:   Change #ifdefs and #defines. (Ken Takata)
Files:      src/if_ruby.c

Patch 7.4.571 (after 7.4.569)
Problem:    Can't build with tiny features. (Ike Devolder)
Solution:   Add #ifdef.
Files:      src/getchar.c

Patch 7.4.572
Problem:    Address type of :wincmd depends on the argument.
Solution:   Check the argument.
Files:      src/ex_docmd.c, src/window.c, src/proto/window.pro
```

Patch 7.4.573 (after 7.4.569)
Problem: Mapping CTRL-C in Visual mode doesn't work. (Ingo Karkat)
Solution: Call get_real_state() instead of using State directly.
Files: src/ui.c, src/testdir/test_mapping.in, src/testdir/test_mapping.ok

Patch 7.4.574
Problem: No error for eval('$').
Solution: Check for empty name. (Yasuhiro Matsumoto)
Files: src/eval.c

Patch 7.4.575
Problem: Unicode character properties are outdated.
Solution: Update the tables with the latest version.
Files: src/mbyte.c

Patch 7.4.576
Problem: Redrawing problem with 'relativenumber' and 'linebreak'.
Solution: Temporarily reset 'linebreak' and restore it in more places.
            (Christian Brabandt)
Files: src/normal.c

Patch 7.4.577
Problem: Matching with a virtual column has a lot of overhead on very long
            lines. (Issue 310)
Solution: Bail out early if there can't be a match. (Christian Brabandt)
            Also check for CTRL-C at every position.
Files: src/regexp_nfa.c

Patch 7.4.578
Problem: Using getcurpos() after "$" in an empty line returns a negative
            number.
Solution: Don't add one when this would overflow. (Hirohito Higashi)
Files: src/eval.c

Patch 7.4.579
Problem: Wrong cursor positioning when 'linebreak' is set and lines wrap.
Solution: Fix it. (Christian Brabandt)
Files: src/charset.c, src/screen.c

Patch 7.4.580
Problem: ":52wincmd v" still gives an invalid range error. (Charles
            Campbell)
Solution: Skip over white space.
Files: src/ex_docmd.c

Patch 7.4.581
Problem: Compiler warnings for uninitialized variables. (John Little)
Solution: Initialize the variables.
Files: src/ops.c

Patch 7.4.582 (after 7.4.577)
Problem: Can't match "%>80v" properly. (Axel Bender)
Solution: Correctly handle ">". (Christian Brabandt)

```
Files:      src/regexp_nfa.c, src/testdir/test64.in, src/testdir/test64.ok

Patch 7.4.583
Problem:    With tiny features test 16 may fail.
Solution:   Source small.vim. (Christian Brabandt)
Files:      src/testdir/test16.in

Patch 7.4.584
Problem:    With tiny features test_command_count may fail.
Solution:   Source small.vim. (Christian Brabandt)
Files:      src/testdir/test_command_count.in

Patch 7.4.585
Problem:    Range for :bdelete does not work. (Ronald Schild)
Solution:   Also allow unloaded buffers.
Files:      src/ex_cmds.h, src/testdir/test_command_count.in,
            src/testdir/test_command_count.ok

Patch 7.4.586
Problem:    Parallel building of the documentation html files is not reliable.
Solution:   Remove a cyclic dependency. (Reiner Herrmann)
Files:      runtime/doc/Makefile

Patch 7.4.587
Problem:    Conceal does not work properly with 'linebreak'. (cs86661)
Solution:   Save and restore boguscols. (Christian Brabandt)
Files:      src/screen.c, src/testdir/test_listlbr_utf8.in,
            src/testdir/test_listlbr_utf8.ok

Patch 7.4.588
Problem:    ":0argedit foo" puts the new argument in the second place instead
            of the first.
Solution:   Adjust the range type. (Ingo Karkat)
Files:      src/ex_cmds.h, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile, src/testdir/test_argument_0count.in,
            src/testdir/test_argument_0count.ok

Patch 7.4.589
Problem:    In the MS-Windows console Vim can't handle greek characters when
            encoding is utf-8.
Solution:   Escape K_NUL. (Yasuhiro Matsumoto)
Files:      src/os_win32.c

Patch 7.4.590
Problem:    Using ctrl_x_mode as if it contains flags.
Solution:   Don't use AND with CTRL_X_OMNI. (Hirohito Higashi)
Files:      src/edit.c

Patch 7.4.591 (after 7.4.587)
Problem:    test_listlbr_utf8 fails when the conceal feature is not available.
Solution:   Check for the conceal feature. (Kazunobu Kuriyama)
Files:      src/testdir/test_listlbr_utf8.in
```

```
Patch 7.4.592
Problem:    When doing ":e foobar" when already editing "foobar" and 'buftype'
            is "nofile" the buffer is cleared. (Xavier de Gaye)
Solution:   Do no clear the buffer.
Files:      src/ex_cmds.c

Patch 7.4.593
Problem:    Crash when searching for "x\{0,90000}". (Dominique Pelle)
Solution:   Bail out from the NFA engine when the max limit is much higher
            than the min limit.
Files:      src/regexp_nfa.c, src/regexp.c, src/vim.h

Patch 7.4.594
Problem:    Using a block delete while 'breakindent' is set does not work
            properly.
Solution:   Use "line" instead of "prev_pend" as the first argument to
            lbr_chartabsize_adv().  (Hirohito Higashi)
Files:      src/ops.c, src/testdir/test_breakindent.in,
            src/testdir/test_breakindent.ok

Patch 7.4.595
Problem:    The test_command_count test fails when using Japanese.
Solution:   Force the language to C. (Hirohito Higashi)
Files:      src/testdir/test_command_count.in

Patch 7.4.596 (after 7.4.592)
Problem:    Tiny build doesn't compile.  (Ike Devolder)
Solution:   Add #ifdef.
Files:      src/ex_cmds.c

Patch 7.4.597
Problem:    Cannot change the result of systemlist().
Solution:   Initialize v_lock. (Yukihiro Nakadaira)
Files:      src/eval.c

Patch 7.4.598
Problem:    ":tabdo windo echo 'hi'" causes "* register not to be changed.
            (Salman Halim)
Solution:   Change how clip_did_set_selection is used and add
            clipboard_needs_update and global_change_count.  (Christian
            Brabandt)
Files:      src/main.c, src/ui.c, src/testdir/test_eval.in,
            src/testdir/test_eval.ok

Patch 7.4.599
Problem:    Out-of-memory error.
Solution:   Avoid trying to allocate a negative amount of memory, use size_t
            instead of int. (Dominique Pelle)
Files:      src/regexp_nfa.c

Patch 7.4.600
Problem:    Memory wasted in struct because of aligning.
Solution:   Split pos in lnum and col. (Dominique Pelle)
```

```
Files:      src/regexp_nfa.c

Patch 7.4.601
Problem:    It is not possible to have feedkeys() insert characters.
Solution:   Add the 'i' flag.
Files:      src/eval.c, runtime/doc/eval.txt

Patch 7.4.602
Problem:    ":set" does not accept hex numbers as documented.
Solution:   Use vim_str2nr(). (ZyX)
Files:      src/option.c, runtime/doc/options.txt

Patch 7.4.603
Problem:    'foldcolumn' may be set such that it fills the whole window, not
            leaving space for text.
Solution:   Reduce the foldcolumn width when there is not sufficient room.
            (idea by Christian Brabandt)
Files:      src/screen.c

Patch 7.4.604
Problem:    Running tests changes viminfo.
Solution:   Disable viminfo.
Files:      src/testdir/test_breakindent.in

Patch 7.4.605
Problem:    The # register is not writable, it cannot be restored after
            jumping around.
Solution:   Make the # register writable. (Marcin Szamotulski)
Files:      runtime/doc/change.txt, src/ops.c, src/buffer.c, src/globals.h

Patch 7.4.606
Problem:    May crash when using a small window.
Solution:   Avoid dividing by zero. (Christian Brabandt)
Files:      src/normal.c

Patch 7.4.607 (after 7.4.598)
Problem:    Compiler warnings for unused variables.
Solution:   Move them inside #ifdef. (Kazunobu Kuriyama)
Files:      src/ui.c

Patch 7.4.608 (after 7.4.598)
Problem:    test_eval fails when the clipboard feature is missing.
Solution:   Skip part of the test. Reduce the text used.
Files:      src/testdir/test_eval.in, src/testdir/test_eval.ok

Patch 7.4.609
Problem:    For complicated list and dict use the garbage collector can run
            out of stack space.
Solution:   Use a stack of dicts and lists to be marked, thus making it
            iterative instead of recursive. (Ben Fritz)
Files:      src/eval.c, src/if_lua.c, src/if_py_both.h, src/if_python.c,
            src/if_python3.c, src/proto/eval.pro, src/proto/if_lua.pro,
            src/proto/if_python.pro, src/proto/if_python3.pro, src/structs.h
```

```
Patch 7.4.610
Problem:    Some function headers may be missing from generated .pro files.
Solution:   Add PROTO to the #ifdef.
Files:      src/option.c, src/syntax.c

Patch 7.4.611 (after 7.4.609)
Problem:    Syntax error.
Solution:   Change statement to return.
Files:      src/if_python3.c

Patch 7.4.612
Problem:    test_eval fails on Mac.
Solution:   Use the * register instead of the + register. (Jun Takimoto)
Files:      src/testdir/test_eval.in, src/testdir/test_eval.ok

Patch 7.4.613
Problem:    The NFA engine does not implement the 'redrawtime' time limit.
Solution:   Implement the time limit.
Files:      src/regexp_nfa.c

Patch 7.4.614
Problem:    There is no test for what patch 7.4.601 fixes.
Solution:   Add a test. (Christian Brabandt)
Files:      src/testdir/test_mapping.in, src/testdir/test_mapping.ok

Patch 7.4.615
Problem:    Vim hangs when freeing a lot of objects.
Solution:   Do not go back to the start of the list every time.  (Yasuhiro
            Matsumoto and Ariya Mizutani)
Files:      src/eval.c

Patch 7.4.616
Problem:    Cannot insert a tab in front of a block.
Solution:   Correctly compute aop->start. (Christian Brabandt)
Files:      src/ops.c, src/testdir/test39.in, src/testdir/test39.ok

Patch 7.4.617
Problem:    Wrong ":argdo" range does not cause an error.
Solution:   Reset "cmd" to NULL. (Marcin Szamotulski, Ingo Karkat)
Files:      src/ex_docmd.c

Patch 7.4.618 (after 7.4.609)
Problem:    luaV_setref() is missing a return statement. (Ozaki Kiichi)
Solution:   Put the return statement back.
Files:      src/if_lua.c

Patch 7.4.619 (after 7.4.618)
Problem:    luaV_setref() not returning the correct value.
Solution:   Return one.
Files:      src/if_lua.c

Patch 7.4.620
Problem:    Compiler warning for uninitialized variable. (Tony Mechelynck)
Solution:   Initialize "did_free". (Ben Fritz)
```

```
Files:      src/eval.c

Patch 7.4.621 (after 7.4.619)
Problem:    Returning 1 in the wrong function. (Raymond Ko)
Solution:   Return 1 in the right function (hopefully).
Files:      src/if_lua.c

Patch 7.4.622
Problem:    Compiler warning for unused argument.
Solution:   Add UNUSED.
Files:      src/regexp_nfa.c

Patch 7.4.623
Problem:    Crash with pattern: \(\)\{80000}  (Dominique Pelle)
Solution:   When the max limit is large fall back to the old engine.
Files:      src/regexp_nfa.c

Patch 7.4.624
Problem:    May leak memory or crash when vim_realloc() returns NULL.
Solution:   Handle a NULL value properly. (Mike Williams)
Files:      src/if_cscope.c, src/memline.c, src/misc1.c, src/netbeans.c

Patch 7.4.625
Problem:    Possible NULL pointer dereference.
Solution:   Check for NULL before using it. (Mike Williams)
Files:      src/if_py_both.h

Patch 7.4.626
Problem:    MSVC with W4 gives useless warnings.
Solution:   Disable more warnings. (Mike Williams)
Files:      src/vim.h

Patch 7.4.627
Problem:    The last screen cell is not updated.
Solution:   Respect the "tn" termcap feature. (Hayaki Saito)
Files:      runtime/doc/term.txt, src/option.c, src/screen.c, src/term.c,
            src/term.h

Patch 7.4.628
Problem:    Compiler warning for variable might be clobbered by longjmp.
Solution:   Add volatile. (Michael Jarvis)
Files:      src/main.c

Patch 7.4.629
Problem:    Coverity warning for Out-of-bounds read.
Solution:   Increase MAXWLEN to 254. (Eliseo Martínez)
Files:      src/spell.c

Patch 7.4.630
Problem:    When using Insert mode completion combined with autocommands the
            redo command may not work.
Solution:   Do not save the redo buffer when executing autocommands. (Yasuhiro
            Matsumoto)
Files:      src/fileio.c
```

```
Patch 7.4.631
Problem:    The default conceal character is documented to be a space but it's
            initially a dash. (Christian Brabandt)
Solution:   Make the initial value a space.
Files:      src/globals.h

Patch 7.4.632 (after 7.4.592)
Problem:    7.4.592 breaks the netrw plugin, because the autocommands are
            skipped.
Solution:   Roll back the change.
Files:      src/ex_cmds.c

Patch 7.4.633
Problem:    After 7.4.630 the problem persists.
Solution:   Also skip redo when calling a user function.
Files:      src/eval.c

Patch 7.4.634
Problem:    Marks are not restored after redo + undo.
Solution:   Fix the way marks are restored. (Olaf Dabrunz)
Files:      src/undo.c, src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
            src/testdir/test_marks.in, src/testdir/test_marks.ok

Patch 7.4.635
Problem:    If no NL or CR is found in the first block of a file then the
            'fileformat' may be set to "mac". (Issue 77)
Solution:   Check if a CR was found. (eswald)
Files:      src/fileio.c

Patch 7.4.636
Problem:    A search with end offset gets stuck at end of file. (Gary Johnson)
Solution:   When a search doesn't move the cursor repeat it with a higher
            count. (Christian Brabandt)
Files:      src/normal.c, src/testdir/test44.in, src/testdir/test44.ok

Patch 7.4.637
Problem:    Incorrectly read the number of buffer for which an autocommand
            should be registered.
Solution:   Reverse check for "<buffer=abuf>". (Lech Lorens)
Files:      src/fileio.c

Patch 7.4.638
Problem:    Can't build with Lua 5.3 on Windows.
Solution:   use luaL_optinteger() instead of LuaL_optlong(). (Ken Takata)
Files:      src/if_lua.c

Patch 7.4.639
Problem:    Combination of linebreak and conceal doesn't work well.
Solution:   Fix the display problems. (Christian Brabandt)
Files:      src/screen.c, src/testdir/test88.in, src/testdir/test88.ok,
            src/testdir/test_listlbr_utf8.in, src/testdir/test_listlbr_utf8.ok
```

```
Patch 7.4.640
Problem:    After deleting characters in Insert mode such that lines are
            joined undo does not work properly. (issue 324)
Solution:   Use Insstart instead of Insstart_orig. (Christian Brabandt)
Files:      src/edit.c

Patch 7.4.641
Problem:    The tabline menu was using ":999tabnew" which is now invalid.
Solution:   Use ":$tabnew" instead. (Florian Degner)
Files:      src/normal.c

Patch 7.4.642
Problem:    When using "gf" escaped spaces are not handled.
Solution:   Recognize escaped spaces.
Files:      src/vim.h, src/window.c, src/misc2.c

Patch 7.4.643
Problem:    Using the default file format for Mac files. (Issue 77)
Solution:   Reset the try_mac counter in the right place. (Oswald)
Files:      src/fileio.c, src/testdir/test30.in, src/testdir/test30.ok

Patch 7.4.644
Problem:    Stratus VOS doesn't have sync().
Solution:   Use fflush(). (Karli Aurelia)
Files:      src/memfile.c

Patch 7.4.645
Problem:    When splitting the window in a BufAdd autocommand while still in
            the first, empty buffer the window count is wrong.
Solution:   Do not reset b_nwindows to zero and don't increment it.
Files:      src/buffer.c, src/ex_cmds.c

Patch 7.4.646
Problem:    ":bufdo" may start at a deleted buffer.
Solution:   Find the first not deleted buffer. (Shane Harper)
Files:      src/ex_cmds2.c, src/testdir/test_command_count.in,
            src/testdir/test_command_count.ok

Patch 7.4.647
Problem:    After running the tests on MS-Windows many files differ from their
            originals as they were checked out.
Solution:   Use a temp directory for executing the tests. (Ken Takata, Taro
            Muraoka)
Files:      src/testdir/Make_dos.mak

Patch 7.4.648 (after 7.4.647)
Problem:    Tests broken on MS-Windows.
Solution:   Delete wrong copy line. (Ken Takata)
Files:      src/testdir/Make_dos.mak

Patch 7.4.649
Problem:    Compiler complains about ignoring return value of fwrite().
            (Michael Jarvis)
```

```
Solution:   Add (void).
Files:      src/misc2.c

Patch 7.4.650
Problem:    Configure check may fail because the dl library is not used.
Solution:   Put "-ldl" in LIBS rather than LDFLAGS. (Ozaki Kiichi)
Files:      src/configure.in, src/auto/configure

Patch 7.4.651 (after 7.4.582)
Problem:    Can't match "%>80v" properly for multi-byte characters.
Solution:   Multiply the character number by the maximum number of bytes in a
            character. (Yasuhiro Matsumoto)
Files:      src/regexp_nfa.c

Patch 7.4.652
Problem:    Xxd lacks a few features.
Solution:   Use 8 characters for the file position.  Add the -e and -o
            arguments. (Vadim Vygonets)
Files:      src/xxd/xxd.c, runtime/doc/xxd.1

Patch 7.4.653
Problem:    Insert mode completion with complete() may have CTRL-L work like
            CTRL-P.
Solution:   Handle completion with complete() differently. (Yasuhiro
            Matsumoto, Christian Brabandt, Hirohito Higashi)
Files:      src/edit.c

Patch 7.4.654
Problem:    glob() and globpath() cannot include links to non-existing files.
            (Charles Campbell)
Solution:   Add an argument to include all links with glob(). (James McCoy)
            Also for globpath().
Files:      src/vim.h, src/eval.c, src/ex_getln.c

Patch 7.4.655
Problem:    Text deleted by "dit" depends on indent of closing tag.
            (Jan Parthey)
Solution:   Do not adjust oap->end in do_pending_operator(). (Christian
            Brabandt)
Files:      src/normal.c, src/search.c, src/testdir/test53.in,
            src/testdir/test53.ok

Patch 7.4.656 (after 7.4.654)
Problem:    Missing changes for glob() in one file.
Solution:   Add the missing changes.
Files:      src/misc1.c

Patch 7.4.657 (after 7.4.656)
Problem:    Compiler warnings for pointer mismatch.
Solution:   Add a typecast. (John Marriott)
Files:      src/misc1.c

Patch 7.4.658
Problem:    'formatexpr' is evaluated too often.
```

```
Solution:   Only invoke it when beyond the 'textwidth' column, as it is
            documented. (James McCoy)
Files:      src/edit.c

Patch 7.4.659
Problem:    When 'ruler' is set the preferred column is reset. (Issue 339)
Solution:   Don't set curswant when redrawing the status lines.
Files:      src/option.c

Patch 7.4.660
Problem:    Using freed memory when g:colors_name is changed in the colors
            script. (oni-link)
Solution:   Make a copy of the variable value.
Files:      src/syntax.c

Patch 7.4.661
Problem:    Using "0 CTRL-D" in Insert mode may have CursorHoldI interfere.
            (Gary Johnson)
Solution:   Don't store K_CURSORHOLD as the last character. (Christian
            Brabandt)
Files:      src/edit.c

Patch 7.4.662
Problem:    When 'M' is in the 'cpo' option then selecting a text object in
            parentheses does not work correctly.
Solution:   Keep 'M' in 'cpo' when finding a match. (Hirohito Higashi)
Files:      src/search.c, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile, src/testdir/test_textobjects.in,
            src/testdir/test_textobjects.ok

Patch 7.4.663
Problem:    When using netbeans a buffer is not found in another tab.
Solution:   When 'switchbuf' is set to "usetab" then switch to another tab
            when possible. (Xavier de Gaye)
Files:      src/netbeans.c

Patch 7.4.664
Problem:    When 'compatible' is reset 'numberwidth' is set to 4, but the
            effect doesn't show until a change is made.
Solution:   Check if 'numberwidth' changed. (Christian Brabandt)
Files:      src/screen.c, src/structs.h

Patch 7.4.665
Problem:    'linebreak' does not work properly with multi-byte characters.
Solution:   Compute the pointer offset with mb_head_off().  (Yasuhiro
            Matsumoto)
Files:      src/screen.c

Patch 7.4.666
Problem:    There is a chance that Vim may lock up.
Solution:   Handle timer events differently. (Aaron Burrow)
Files:      src/os_unix.c
```

```
Patch 7.4.667
Problem:    'colorcolumn' isn't drawn in a closed fold while 'cursorcolumn'
            is. (Carlos Pita)
Solution:   Make it consistent. (Christian Brabandt)
Files:      src/screen.c

Patch 7.4.668
Problem:    Can't use a glob pattern as a regexp pattern.
Solution:   Add glob2regpat(). (Christian Brabandt)
Files:      src/eval.c, runtime/doc/eval.txt

Patch 7.4.669
Problem:    When netbeans is active the sign column always shows up.
Solution:   Only show the sign column once a sign has been added. (Xavier de
            Gaye)
Files:      src/buffer.c, src/edit.c, src/move.c, src/netbeans.c,
            src/screen.c, src/structs.h

Patch 7.4.670
Problem:    Using 'cindent' for Javascript is less than perfect.
Solution:   Improve indenting of continuation lines. (Hirohito Higashi)
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.4.671 (after 7.4.665)
Problem:    Warning for shadowing a variable.
Solution:   Rename off to mb_off. (Kazunobu Kuriyama)
Files:      src/screen.c

Patch 7.4.672
Problem:    When completing a shell command, directories in the current
            directory are not listed.
Solution:   When "." is not in $PATH also look in the current directory for
            directories.
Files:      src/ex_getln.c, src/vim.h, src/misc1.c, src/eval.c,
            src/os_amiga.c, src/os_msdos.c, src/os_unix.c, src/os_vms.c,
            src/proto/os_amiga.pro, src/proto/os_msdos.pro,
            src/proto/os_unix.pro, src/proto/os_win32.pro

Patch 7.4.673
Problem:    The first syntax entry gets sequence number zero, which doesn't
            work. (Clinton McKay)
Solution:   Start at number one. (Bjorn Linse)
Files:      src/syntax.c

Patch 7.4.674 (after 7.4.672)
Problem:    Missing changes in one file.
Solution:   Also change the win32 file.
Files:      src/os_win32.c

Patch 7.4.675
Problem:    When a FileReadPost autocommand moves the cursor inside a line it
            gets moved back.
Solution:   When checking whether an autocommand moved the cursor store the
```

```
            column as well. (Christian Brabandt)
Files:      src/ex_cmds.c

Patch 7.4.676
Problem:    On Mac, when not using the default Python framework configure
            doesn't do the right thing.
Solution:   Use a linker search path. (Kazunobu Kuriyama)
Files:      src/configure.in, src/auto/configure

Patch 7.4.677 (after 7.4.676)
Problem:    Configure fails when specifying a python-config-dir. (Lcd)
Solution:   Check if PYTHONFRAMEWORKPREFIX is set.
Files:      src/configure.in, src/auto/configure

Patch 7.4.678
Problem:    When using --remote the directory may end up being wrong.
Solution:   Use localdir() to find out what to do. (Xaizek)
Files:      src/main.c

Patch 7.4.679
Problem:    Color values greater than 255 cause problems on MS-Windows.
Solution:   Truncate to 255 colors. (Yasuhiro Matsumoto)
Files:      src/os_win32.c

Patch 7.4.680
Problem:    CTRL-W in Insert mode does not work well for multi-byte
            characters.
Solution:   Use mb_get_class(). (Yasuhiro Matsumoto)
Files:      src/edit.c, src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
            src/testdir/test_erasebackword.in,
            src/testdir/test_erasebackword.ok,

Patch 7.4.681
Problem:    MS-Windows: When Vim is minimized the window height is computed
            incorrectly.
Solution:   When minimized use the previously computed size. (Ingo Karkat)
Files:      src/gui_w32.c

Patch 7.4.682
Problem:    The search highlighting and match highlighting replaces the
            cursorline highlighting, this doesn't look good.
Solution:   Combine the highlighting. (Yasuhiro Matsumoto)
Files:      src/screen.c

Patch 7.4.683
Problem:    Typo in the vimtutor command.
Solution:   Fix the typo. (Corey Farwell, github pull 349)
Files:      vimtutor.com

Patch 7.4.684
Problem:    When starting several Vim instances in diff mode, the temp files
            used may not be unique. (Issue 353)
```

```
Solution:   Add an argument to vim_tempname() to keep the file.
Files:      src/diff.c, src/eval.c, src/ex_cmds.c, src/fileio.c,
            src/hardcopy.c, src/proto/fileio.pro, src/if_cscope.c,
            src/memline.c, src/misc1.c, src/os_unix.c, src/quickfix.c,
            src/spell.c

Patch 7.4.685
Problem:    When there are illegal utf-8 characters the old regexp engine may
            go past the end of a string.
Solution:   Only advance to the end of the string. (Dominique Pelle)
Files:      src/regexp.c

Patch 7.4.686
Problem:    "zr" and "zm" do not take a count.
Solution:   Implement the count, restrict the fold level to the maximum
            nesting depth.  (Marcin Szamotulski)
Files:      runtime/doc/fold.txt, src/normal.c

Patch 7.4.687
Problem:    There is no way to use a different in Replace mode for a terminal.
Solution:   Add t_SR. (Omar Sandoval)
Files:      runtime/doc/options.txt, runtime/doc/term.txt,
            runtime/syntax/vim.vim, src/option.c, src/term.c, src/term.h

Patch 7.4.688
Problem:    When "$" is in 'cpo' the popup menu isn't undrawn correctly.
            (Issue 166)
Solution:   When using the popup menu remove the "$".
Files:      src/edit.c

Patch 7.4.689
Problem:    On MS-Windows, when 'autochdir' is set, diff mode with files in
            different directories does not work. (Axel Bender)
Solution:   Remember the current directory and use it where needed. (Christian
            Brabandt)
Files:      src/main.c

Patch 7.4.690
Problem:    Memory access errors when changing indent in Ex mode. Also missing
            redraw when using CTRL-U. (Knil Ino)
Solution:   Update pointers after calling ga_grow().
Files:      src/ex_getln.c

Patch 7.4.691 (after 7.4.689)
Problem:    Can't build with MzScheme.
Solution:   Change "cwd" into the global variable "start_dir".
Files:      src/main.c

Patch 7.4.692
Problem:    Defining SOLARIS for no good reason. (Danek Duvall)
Solution:   Remove it.
Files:      src/os_unix.h

Patch 7.4.693
```

```
Problem:    Session file is not correct when there are multiple tab pages.
Solution:   Reset the current window number for each tab page. (Jacob Niehus)
Files:      src/ex_docmd.c

Patch 7.4.694
Problem:    Running tests changes the .viminfo file.
Solution:   Disable viminfo in the text objects test.
Files:      src/testdir/test_textobjects.in

Patch 7.4.695
Problem:    Out-of-bounds read, detected by Coverity.
Solution:   Remember the value of cmap for the first matching encoding.  Reset
            cmap to that value if first matching encoding is going to be used.
            (Eliseo Martínez)
Files:      src/hardcopy.c

Patch 7.4.696
Problem:    Not freeing memory when encountering an error.
Solution:   Free the stack before returning. (Eliseo Martínez)
Files:      src/regexp_nfa.c

Patch 7.4.697
Problem:    The filename used for ":profile" must be given literally.
Solution:   Expand "~" and environment variables. (Marco Hinz)
Files:      src/ex_cmds2.c

Patch 7.4.698
Problem:    Various problems with locked and fixed lists and dictionaries.
Solution:   Disallow changing locked items, fix a crash, add tests. (Olaf
            Dabrunz)
Files:      src/structs.h, src/eval.c, src/testdir/test55.in,
            src/testdir/test55.ok

Patch 7.4.699
Problem:    E315 when trying to delete a fold. (Yutao Yuan)
Solution:   Make sure the fold doesn't go beyond the last buffer line.
            (Christian Brabandt)
Files:      src/fold.c

Patch 7.4.700
Problem:    Fold can't be opened after ":move". (Ein Brown)
Solution:   Delete the folding information and update it afterwards.
            (Christian Brabandt)
Files:      src/ex_cmds.c, src/fold.c, src/testdir/test45.in,
            src/testdir/test45.ok

Patch 7.4.701
Problem:    Compiler warning for using uninitialized variable. (Yasuhiro
            Matsumoto)
Solution:   Initialize it.
Files:      src/hardcopy.c

Patch 7.4.702
Problem:    Joining an empty list does unnecessary work.
```

```
Solution:   Let join() return early. (Marco Hinz)
Files:      src/eval.c

Patch 7.4.703
Problem:    Compiler warning for start_dir unused when building unittests.
Solution:   Move start_dir inside the #ifdef.
Files:      src/main.c

Patch 7.4.704
Problem:    Searching for a character matches an illegal byte and causes
            invalid memory access. (Dominique Pelle)
Solution:   Do not match an invalid byte when search for a character in a
            string.  Fix equivalence classes using negative numbers, which
            result in illegal bytes.
Files:      src/misc2.c, src/regexp.c, src/testdir/test44.in

Patch 7.4.705
Problem:    Can't build with Ruby 2.2.
Solution:   Add #ifdefs to handle the incompatible change. (Andrei Olsen)
Files:      src/if_ruby.c

Patch 7.4.706
Problem:    Window drawn wrong when 'laststatus' is zero and there is a
            command-line window. (Yclept Nemo)
Solution:   Set the status height a bit later. (Christian Brabandt)
Files:      src/window.c

Patch 7.4.707
Problem:    Undo files can have their executable bit set.
Solution:   Strip of the executable bit. (Mikael Berthe)
Files:      src/undo.c

Patch 7.4.708
Problem:    gettext() is called too often.
Solution:   Do not call gettext() for messages until they are actually used.
            (idea by Yasuhiro Matsumoto)
Files:      src/eval.c

Patch 7.4.709
Problem:    ":tabmove" does not work as documented.
Solution:   Make it work consistently.  Update documentation and add tests.
            (Hirohito Higashi)
Files:      src/window.c, runtime/doc/tabpage.txt, src/ex_docmd.c,
            src/testdir/test62.in, src/testdir/test62.ok

Patch 7.4.710
Problem:    It is not possible to make spaces visible in list mode.
Solution:   Add the "space" item to 'listchars'. (David Bürgin, issue 350)
Files:      runtime/doc/options.txt, src/globals.h, src/message.h,
            src/screen.c, src/testdir/test_listchars.in,
            src/testdir/test_listchars.ok, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile
```

```
Patch 7.4.711 (after 7.4.710)
Problem:    Missing change in one file.
Solution:   Also change option.c
Files:      src/option.c

Patch 7.4.712 (after 7.4.710)
Problem:    Missing change in another file.
Solution:   Also change message.c
Files:      src/message.c

Patch 7.4.713
Problem:    Wrong condition for #ifdef.
Solution:   Change USR_EXRC_FILE2 to USR_VIMRC_FILE2. (Mikael Fourrier)
Files:      src/os_unix.h

Patch 7.4.714
Problem:    Illegal memory access when there are illegal bytes.
Solution:   Check the byte length of the character. (Dominique Pelle)
Files:      src/regexp.c

Patch 7.4.715
Problem:    Invalid memory access when there are illegal bytes.
Solution:   Get the length from the text, not from the character. (Dominique
            Pelle)
Files:      src/regexp_nfa.c

Patch 7.4.716
Problem:    When using the 'c' flag of ":substitute" and selecting "a" or "l"
            at the prompt the flags are not remembered for ":&&". (Ingo
            Karkat)
Solution:   Save the flag values and restore them. (Hirohito Higashi)
Files:      src/ex_cmds.c

Patch 7.4.717
Problem:    ":let list += list" can change a locked list.
Solution:   Check for the lock earlier. (Olaf Dabrunz)
Files:      src/eval.c, src/testdir/test55.in, src/testdir/test55.ok

Patch 7.4.718
Problem:    Autocommands triggered by quickfix cannot get the current title
            value.
Solution:   Set w:quickfix_title earlier. (Yannick)
            Also move the check for a title into the function.
Files:      src/quickfix.c

Patch 7.4.719
Problem:    Overflow when adding MAXCOL to a pointer.
Solution:   Subtract pointers instead. (James McCoy)
Files:      src/screen.c

Patch 7.4.720
Problem:    Can't build with Visual Studio 2015.
Solution:   Recognize the "version 14" numbers and omit /nodefaultlib when
```

```
            appropriate. (Paul Moore)
Files:      src/Make_mvc.mak

Patch 7.4.721
Problem:    When 'list' is set Visual mode does not highlight anything in
            empty lines. (mgaleski)
Solution:   Check the value of lcs_eol in another place. (Christian Brabandt)
Files:      src/screen.c

Patch 7.4.722
Problem:    0x202f is not recognized as a non-breaking space character.
Solution:   Add 0x202f to the list. (Christian Brabandt)
Files:      runtime/doc/options.txt, src/message.c, src/screen.c

Patch 7.4.723
Problem:    For indenting, finding the C++ baseclass can be slow.
Solution:   Cache the result. (Hirohito Higashi)
Files:      src/misc1.c

Patch 7.4.724
Problem:    Vim icon does not show in Windows context menu. (issue 249)
Solution:   Load the icon in GvimExt.
Files:      src/GvimExt/gvimext.cpp, src/GvimExt/gvimext.h

Patch 7.4.725
Problem:    ":call setreg('"', [])" reports an internal error.
Solution:   Make the register empty. (Yasuhiro Matsumoto)
Files:      src/ops.c

Patch 7.4.726 (after 7.4.724)
Problem:    Cannot build GvimExt.
Solution:   Set APPVER to 5.0.  (KF Leong)
Files:      src/GvimExt/Makefile

Patch 7.4.727 (after 7.4.724)
Problem:    Cannot build GvimExt with MingW.
Solution:   Add -lgdi32.  (KF Leong)
Files:      src/GvimExt/Make_ming.mak

Patch 7.4.728
Problem:    Can't build with some version of Visual Studio 2015.
Solution:   Recognize another version 14 number. (Sinan)
Files:      src/Make_mvc.mak

Patch 7.4.729 (after 7.4.721)
Problem:    Occasional crash with 'list' set.
Solution:   Fix off-by-one error. (Christian Brabandt)
Files:      src/screen.c

Patch 7.4.730
Problem:    When setting the crypt key and using a swap file, text may be
            encrypted twice or unencrypted text remains in the swap file.
            (Issue 369)
Solution:   Call ml_preserve() before re-encrypting.  Set correct index for
```

            next pointer block.
Files: src/memfile.c, src/memline.c, src/proto/memline.pro, src/option.c

Patch 7.4.731
Problem: The tab menu shows "Close tab" even when it doesn't work.
Solution: Don't show "Close tab" for the last tab. (John Marriott)
Files: src/gui_w48.c, src/gui_gtk_x11.c, src/gui_mac.c, src/gui_motif.c

Patch 7.4.732
Problem: The cursor line is not always updated for the "O" command.
Solution: Reset the VALID_CROW flag. (Christian Brabandt)
Files: src/normal.c

Patch 7.4.733
Problem: test_listchars breaks on MS-Windows. (Kenichi Ito)
Solution: Set fileformat to "unix". (Christian Brabandt)
Files: src/testdir/test_listchars.in

Patch 7.4.734
Problem: ml_get error when using "p" in a Visual selection in the last
            line.
Solution: Change the behavior at the last line. (Yukihiro Nakadaira)
Files: src/normal.c, src/ops.c, src/testdir/test94.in,
            src/testdir/test94.ok

Patch 7.4.735
Problem: Wrong argument for sizeof().
Solution: Use a pointer argument. (Chris Hall)
Files: src/eval.c

Patch 7.4.736
Problem: Invalid memory access.
Solution: Avoid going over the end of a NUL terminated string. (Dominique
            Pelle)
Files: src/regexp.c

Patch 7.4.737
Problem: On MS-Windows vimgrep over arglist doesn't work (Issue 361)
Solution: Only escape backslashes in ## expansion when it is not used as the
            path separator. (James McCoy)
Files: src/ex_docmd.c

Patch 7.4.738 (after 7.4.732)
Problem: Can't compile without the syntax highlighting feature.
Solution: Add #ifdef around use of w_p_cul. (Hirohito Higashi)
Files: src/normal.c, src/screen.c

Patch 7.4.739
Problem: In a string "\U" only takes 4 digits, while after CTRL-V U eight
            digits can be used.
Solution: Make "\U" also take eight digits. (Christian Brabandt)
Files: src/eval.c

Patch 7.4.740

```
Problem:    ":1quit" works like ":.quit". (Bohr Shaw)
Solution:   Don't exit Vim when a range is specified. (Christian Brabandt)
Files:      src/ex_docmd.c, src/testdir/test13.in, src/testdir/test13.ok

Patch 7.4.741
Problem:    When using += with ":set" a trailing comma is not recognized.
            (Issue 365)
Solution:   Don't add a second comma. Add a test. (partly by Christian
            Brabandt)
Files:      src/option.c, src/testdir/test_set.in, src/testdir/test_set.ok,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile

Patch 7.4.742
Problem:    Cannot specify a vertical split when loading a buffer for a
            quickfix command.
Solution:   Add the "vsplit" value to 'switchbuf'. (Brook Hong)
Files:      runtime/doc/options.txt, src/buffer.c, src/option.h

Patch 7.4.743
Problem:    "p" in Visual mode causes an unexpected line split.
Solution:   Advance the cursor first. (Yukihiro Nakadaira)
Files:      src/ops.c, src/testdir/test94.in, src/testdir/test94.ok

Patch 7.4.744
Problem:    No tests for Ruby and Perl.
Solution:   Add minimal tests. (Ken Takata)
Files:      src/testdir/test_perl.in, src/testdir/test_perl.ok,
            src/testdir/test_ruby.in, src/testdir/test_ruby.ok,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile

Patch 7.4.745
Problem:    The entries added by matchaddpos() are returned by getmatches()
            but can't be set with setmatches(). (Lcd)
Solution:   Fix setmatches(). (Christian Brabandt)
Files:      src/eval.c, src/testdir/test63.in, src/testdir/test63.ok

Patch 7.4.746
Problem:    ":[count]tag" is not always working. (cs86661)
Solution:   Set cur_match a bit later. (Hirohito Higashi)
Files:      src/tag.c,

Patch 7.4.747
Problem:    ":cnext" may jump to the wrong column when setting
            'virtualedit=all' (cs86661)
Solution:   Reset the coladd field. (Hirohito Higashi)
Files:      src/quickfix.c

Patch 7.4.748 (after 7.4.745)
Problem:    Buffer overflow.
Solution:   Make the buffer larger. (Kazunobu Kuriyama)
```

```
Files:      src/eval.c

Patch 7.4.749 (after 7.4.741)
Problem:    For some options two consecutive commas are OK. (Nikolai Pavlov)
Solution:   Add the P_ONECOMMA flag.
Files:      src/option.c

Patch 7.4.750
Problem:    Cannot build with clang 3.5 on Cygwin with perl enabled.
Solution:   Strip "-fdebug-prefix-map" in configure. (Ken Takata)
Files:      src/configure.in, src/auto/configure

Patch 7.4.751
Problem:    It is not obvious how to enable the address sanitizer.
Solution:   Add commented-out flags in the Makefile. (Dominique Pelle)
            Also add missing test targets.
Files:      src/Makefile

Patch 7.4.752
Problem:    Unicode 8.0 not supported.
Solution:   Update tables for Unicode 8.0.  Avoid E36 when running the script.
            (James McCoy)
Files:      runtime/tools/unicode.vim, src/mbyte.c

Patch 7.4.753
Problem:    Appending in Visual mode with 'linebreak' set does not work
            properly.  Also when 'selection' is "exclusive". (Ingo Karkat)
Solution:   Recalculate virtual columns. (Christian Brabandt)
Files:      src/normal.c, src/testdir/test_listlbr.in,
            src/testdir/test_listlbr.ok, src/testdir/test_listlbr_utf8.in,
            src/testdir/test_listlbr_utf8.ok

Patch 7.4.754
Problem:    Using CTRL-A in Visual mode does not work well. (Gary Johnson)
Solution:   Make it increment all numbers in the Visual area. (Christian
            Brabandt)
Files:      runtime/doc/change.txt, src/normal.c, src/ops.c,
            src/proto/ops.pro, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile, src/testdir/test_increment.in,
            src/testdir/test_increment.ok

Patch 7.4.755
Problem:    It is not easy to count the number of characters.
Solution:   Add the skipcc argument to strchars(). (Hirohito Higashi, Ken
            Takata)
Files:      runtime/doc/eval.txt, src/eval.c, src/testdir/test_utf8.in,
            src/testdir/test_utf8.ok

Patch 7.4.756
Problem:    Can't use strawberry Perl 5.22 x64 on MS-Windows.
Solution:   Add new defines and #if. (Ken Takata)
Files:      src/Make_cyg_ming.mak, src/Make_mvc.mak, src/if_perl.xs
```

Patch 7.4.757
Problem: Cannot detect the background color of a terminal.
Solution: Add T_RBG to request the background color if possible. (Lubomir
            Rintel)
Files: src/main.c, src/term.c, src/term.h, src/proto/term.pro

Patch 7.4.758
Problem: When 'conceallevel' is 1 and quitting the command-line window with
            CTRL-C the first character ':' is erased.
Solution: Reset 'conceallevel' in the command-line window. (Hirohito
            Higashi)
Files: src/ex_getln.c

Patch 7.4.759
Problem: Building with Lua 5.3 doesn't work, symbols have changed.
Solution: Use the new names for the new version. (Felix Schnizlein)
Files: src/if_lua.c

Patch 7.4.760
Problem: Spelling mistakes are not displayed after ":syn spell".
Solution: Force a redraw after ":syn spell" command. (Christian Brabandt)
Files: src/syntax.c

Patch 7.4.761 (after 7.4.757)
Problem: The request-background termcode implementation is incomplete.
Solution: Add the missing pieces.
Files: src/option.c, src/term.c

Patch 7.4.762 (after 7.4.757)
Problem: Comment for may_req_bg_color() is wrong. (Christ van Willegen)
Solution: Rewrite the comment.
Files: src/term.c

Patch 7.4.763 (after 7.4.759)
Problem: Building with Lua 5.1 doesn't work.
Solution: Define lua_replace and lua_remove. (KF Leong)
Files: src/if_lua.c

Patch 7.4.764 (after 7.4.754)
Problem: test_increment fails on MS-Windows. (Ken Takata)
Solution: Clear Visual mappings. (Taro Muraoka)
Files: src/testdir/test_increment.in

Patch 7.4.765 (after 7.4.754)
Problem: CTRL-A and CTRL-X in Visual mode do not always work well.
Solution: Improvements for increment and decrement. (Christian Brabandt)
Files: src/normal.c, src/ops.c, src/testdir/test_increment.in,
            src/testdir/test_increment.ok

Patch 7.4.766 (after 7.4.757)
Problem: Background color check does not work on Tera Term.
Solution: Also recognize ST as a termination character. (Hirohito Higashi)
Files: src/term.c

```
Patch 7.4.767
Problem:    --remote-tab-silent can fail on MS-Windows.
Solution:   Use single quotes to avoid problems with backslashes. (Idea by
            Weiyong Mao)
Files:      src/main.c

Patch 7.4.768
Problem:    :diffoff only works properly once.
Solution:   Also make :diffoff work when used a second time. (Olaf Dabrunz)
Files:      src/diff.c

Patch 7.4.769 (after 7.4 768)
Problem:    Behavior of :diffoff is not tested.
Solution:   Add a bit of testing. (Olaf Dabrunz)
Files:      src/testdir/test47.in, src/testdir/test47.ok

Patch 7.4.770 (after 7.4.766)
Problem:    Background color response with transparency is not ignored.
Solution:   Change the way escape sequences are recognized. (partly by
            Hirohito Higashi)
Files:      src/ascii.h, src/term.c

Patch 7.4.771
Problem:    Search does not handle multi-byte character at the start position
            correctly.
Solution:   Take byte size of character into account. (Yukihiro Nakadaira)
Files:      src/search.c, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile, src/testdir/test_search_mbyte.in,
            src/testdir/test_search_mbyte.ok

Patch 7.4.772
Problem:    Racket 6.2 is not supported on MS-Windows.
Solution:   Check for the "racket" subdirectory. (Weiyong Mao)
Files:      src/Make_mvc.mak, src/if_mzsch.c

Patch 7.4.773
Problem:    'langmap' is used in command-line mode when checking for mappings.
            Issue 376.
Solution:   Do not use 'langmap' in command-line mode. (Larry Velazquez)
Files:      src/getchar.c, src/testdir/test_mapping.in,
            src/testdir/test_mapping.ok

Patch 7.4.774
Problem:    When using the CompleteDone autocommand event it's difficult to
            get to the completed items.
Solution:   Add the v:completed_items variable. (Shougo Matsu)
Files:      runtime/doc/autocmd.txt, runtime/doc/eval.txt, src/edit.c,
            src/eval.c, src/macros.h, src/proto/eval.pro, src/vim.h

Patch 7.4.775
Problem:    It is not possible to avoid using the first item of completion.
```

```
Solution:   Add the "noinsert" and "noselect" values to 'completeopt'. (Shougo
            Matsu)
Files:      runtime/doc/options.txt, src/edit.c, src/option.c

Patch 7.4.776
Problem:    Equivalence class for 'd' does not work correctly.
Solution:   Fix 0x1e0f and 0x1d0b. (Dominique Pelle)
Files:      src/regexp.c, src/regexp_nfa.c

Patch 7.4.777
Problem:    The README file doesn't look nice on github.
Solution:   Add a markdown version of the README file.
Files:      Filelist, README.md

Patch 7.4.778
Problem:    Coverity warns for uninitialized variable.
Solution:   Change condition of assignment.
Files:      src/ops.c

Patch 7.4.779
Problem:    Using CTRL-A in a line without a number moves the cursor. May
            cause a crash when at the start of the line. (Urtica Dioica)
Solution:   Do not move the cursor if no number was changed.
Files:      src/ops.c

Patch 7.4.780
Problem:    Compiler complains about uninitialized variable and clobbered
            variables.
Solution:   Add Initialization.  Make variables static.
Files:      src/ops.c, src/main.c

Patch 7.4.781
Problem:    line2byte() returns one less when 'bin' and 'noeol' are set.
Solution:   Only adjust the size for the last line. (Rob Wu)
Files:      src/memline.c

Patch 7.4.782
Problem:    Still a few problems with CTRL-A and CTRL-X in Visual mode.
Solution:   Fix the reported problems. (Christian Brabandt)
Files:      src/charset.c, src/eval.c, src/ex_cmds.c, src/ex_getln.c,
            src/misc2.c, src/normal.c, src/ops.c, src/option.c,
            src/proto/charset.pro, src/testdir/test_increment.in,
            src/testdir/test_increment.ok

Patch 7.4.783
Problem:    copy_chars() and copy_spaces() are inefficient.
Solution:   Use memset() instead. (Dominique Pelle)
Files:      src/ex_getln.c, src/misc2.c, src/ops.c, src/proto/misc2.pro,
            src/screen.c

Patch 7.4.784
Problem:    Using both "noinsert" and "noselect" in 'completeopt' does not
            work properly.
Solution:   Change the ins_complete() calls. (Ozaki Kiichi)
```

```
Files:      src/edit.c

Patch 7.4.785
Problem:    On some systems automatically adding the missing EOL causes
            problems. Setting 'binary' has too many side effects.
Solution:   Add the 'fixeol' option, default on. (Pavel Samarkin)
Files:      src/buffer.c, src/fileio.c, src/memline.c, src/netbeans.c,
            src/ops.c, src/option.c, src/option.h, src/os_unix.c,
            src/os_win32.c, src/structs.h, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile, src/testdir/test_fixeol.in,
            src/testdir/test_fixeol.ok, runtime/doc/options.txt,
            runtime/optwin.vim

Patch 7.4.786
Problem:    It is not possible for a plugin to adjust to a changed setting.
Solution:   Add the OptionSet autocommand event. (Christian Brabandt)
Files:      runtime/doc/autocmd.txt, runtime/doc/eval.txt, src/eval.c,
            src/fileio.c, src/option.c, src/proto/eval.pro,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
            src/testdir/test_autocmd_option.in,
            src/testdir/test_autocmd_option.ok, src/vim.h

Patch 7.4.787 (after 7.4.786)
Problem:    snprintf() isn't available everywhere.
Solution:   Use vim_snprintf(). (Ken Takata)
Files:      src/option.c

Patch 7.4.788 (after 7.4.787)
Problem:    Can't build without the crypt feature. (John Marriott)
Solution:   Add #ifdef's.
Files:      src/option.c

Patch 7.4.789 (after 7.4.788)
Problem:    Using freed memory and crash. (Dominique Pelle)
Solution:   Correct use of pointers. (Hirohito Higashi)
Files:      src/option.c

Patch 7.4.790 (after 7.4.786)
Problem:    Test fails when the autochdir feature is not available.  Test
            output contains the test script.
Solution:   Check for the autochdir feature. (Kazunobu Kuriyama)  Only write
            the relevant test output.
Files:      src/testdir/test_autocmd_option.in,
            src/testdir/test_autocmd_option.ok

Patch 7.4.791
Problem:    The buffer list can be very long.
Solution:   Add an argument to ":ls" to specify the type of buffer to list.
            (Marcin Szamotulski)
Files:      runtime/doc/windows.txt, src/buffer.c, src/ex_cmds.h
```

```
Patch 7.4.792
Problem:    Can only conceal text by defining syntax items.
Solution:   Use matchadd() to define concealing. (Christian Brabandt)
Files:      runtime/doc/eval.txt, src/eval.c, src/ex_docmd.c,
            src/proto/window.pro, src/screen.c, src/structs.h,
            src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile, src/testdir/test_match_conceal.in,
            src/testdir/test_match_conceal.ok, src/window.c

Patch 7.4.793
Problem:    Can't specify when not to ring the bell.
Solution:   Add the 'belloff' option. (Christian Brabandt)
Files:      runtime/doc/options.txt, src/edit.c, src/ex_getln.c,
            src/hangulin.c, src/if_lua.c, src/if_mzsch.c, src/if_tcl.c,
            src/message.c, src/misc1.c, src/normal.c, src/option.c,
            src/option.h, src/proto/misc1.pro, src/search.c, src/spell.c

Patch 7.4.794
Problem:    Visual Studio 2015 is not recognized.
Solution:   Add the version numbers to the makefile. (Taro Muraoka)
Files:      src/Make_mvc.mak

Patch 7.4.795
Problem:    The 'fixeol' option is not copied to a new window.
Solution:   Copy the option value. (Yasuhiro Matsumoto)
Files:      src/option.c

Patch 7.4.796
Problem:    Warning from 64 bit compiler.
Solution:   Add type cast. (Mike Williams)
Files:      src/ops.c

Patch 7.4.797
Problem:    Crash when using more lines for the command line than
            'maxcombine'.
Solution:   Use the correct array index.  Also, do not try redrawing when
            exiting.  And use screen_Columns instead of Columns.
Files:      src/screen.c

Patch 7.4.798 (after 7.4.753)
Problem:    Repeating a change in Visual mode does not work as expected.
            (Urtica Dioica)
Solution:   Make redo in Visual mode work better. (Christian Brabandt)
Files:      src/normal.c, src/testdir/test_listlbr.in,
            src/testdir/test_listlbr.ok

Patch 7.4.799
Problem:    Accessing memory before an allocated block.
Solution:   Check for not going before the start of a pattern. (Dominique
            Pelle)
Files:      src/fileio.c
```

```
Patch 7.4.800
Problem:    Using freed memory when triggering CmdUndefined autocommands.
Solution:   Set pointer to NULL. (Dominique Pelle)
Files:      src/ex_docmd.c

Patch 7.4.801 (after 7.4.769)
Problem:    Test for ":diffoff" doesn't catch all potential problems.
Solution:   Add a :diffthis and a :diffoff command. (Olaf Dabrunz)
Files:      src/testdir/test47.in

Patch 7.4.802
Problem:    Using "A" in Visual mode while 'linebreak' is set is not tested.
Solution:   Add a test for this, verifies the problem is fixed. (Ingo Karkat)
Files:      src/testdir/test39.in, src/testdir/test39.ok

Patch 7.4.803
Problem:    C indent does not support C11 raw strings. (Mark Lodato)
Solution:   Do not change indent inside the raw string.
Files:      src/search.c, src/misc1.c, src/edit.c, src/ops.c,
            src/testdir/test3.in, src/testdir/test3.ok

Patch 7.4.804
Problem:    Xxd doesn't have a license notice.
Solution:   Add license as indicated by Juergen.
Files:      src/xxd/xxd.c

Patch 7.4.805
Problem:    The ruler shows "Bot" even when there are only filler lines
            missing. (Gary Johnson)
Solution:   Use "All" when the first line and one filler line are visible.
Files:      src/buffer.c

Patch 7.4.806
Problem:    CTRL-A in Visual mode doesn't work properly with "alpha" in
            'nrformats'.
Solution:   Make it work. (Christian Brabandt)
Files:      src/ops.c, src/testdir/test_increment.in,
            src/testdir/test_increment.ok

Patch 7.4.807 (after 7.4.798)
Problem:    After CTRL-V CTRL-A mode isn't updated. (Hirohito Higashi)
Solution:   Clear the command line or update the displayed command.
Files:      src/normal.c

Patch 7.4.808
Problem:    On MS-Windows 8 IME input doesn't work correctly.
Solution:   Read console input before calling MsgWaitForMultipleObjects().
            (vim-jp, Nobuhiro Takasaki)
Files:      src/os_win32.c

Patch 7.4.809 (after 7.4.802)
Problem:    Test is duplicated.
Solution:   Roll back 7.4.802.
```

```
Files:      src/testdir/test39.in, src/testdir/test39.ok

Patch 7.4.810
Problem:    With a sequence of commands using buffers in diff mode E749 is
            given. (itchyny)
Solution:   Skip unloaded buffer. (Hirohito Higashi)
Files:      src/diff.c

Patch 7.4.811
Problem:    Invalid memory access when using "exe 'sc'".
Solution:   Avoid going over the end of the string. (Dominique Pelle)
Files:      src/ex_docmd.c

Patch 7.4.812
Problem:    Gcc sanitizer complains about using a NULL pointer to memmove().
Solution:   Only call memmove when there is something to move. (Vittorio
            Zecca)
Files:      src/memline.c

Patch 7.4.813
Problem:    It is not possible to save and restore character search state.
Solution:   Add getcharsearch() and setcharsearch().  (James McCoy)
Files:      runtime/doc/eval.txt, src/eval.c, src/proto/search.pro,
            src/search.c, src/testdir/test_charsearch.in,
            src/testdir/test_charsearch.ok, src/testdir/Makefile,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms

Patch 7.4.814
Problem:    Illegal memory access with "sy match a fold".
Solution:   Check for empty string. (Dominique Pelle)
Files:      src/syntax.c

Patch 7.4.815
Problem:    Invalid memory access when doing ":call g:".
Solution:   Check for an empty name. (Dominique Pelle)
Files:      src/eval.c

Patch 7.4.816
Problem:    Invalid memory access when doing ":fun X(".
Solution:   Check for missing ')'. (Dominique Pelle)
Files:      src/eval.c

Patch 7.4.817
Problem:    Invalid memory access in file_pat_to_reg_pat().
Solution:   Use vim_isspace() instead of checking for a space only. (Dominique
            Pelle)
Files:      src/fileio.c

Patch 7.4.818
Problem:    'linebreak' breaks c% if the last Visual selection was block.
            (Chris Morganiser, Issue 389)
Solution:   Handle Visual block mode differently. (Christian Brabandt)
```

```
Files:      src/normal.c, src/testdir/test_listlbr.in,
            src/testdir/test_listlbr.ok

Patch 7.4.819
Problem:    Beeping when running the tests.
Solution:   Fix 41 beeps. (Roland Eggner)
Files:      src/testdir/test17.in, src/testdir/test29.in,
            src/testdir/test4.in, src/testdir/test61.in,
            src/testdir/test82.in, src/testdir/test83.in,
            src/testdir/test90.in, src/testdir/test95.in,
            src/testdir/test_autoformat_join.in

Patch 7.4.820
Problem:    Invalid memory access in file_pat_to_reg_pat.
Solution:   Avoid looking before the start of a string. (Dominique Pelle)
Files:      src/fileio.c

Patch 7.4.821
Problem:    Coverity reports a few problems.
Solution:   Avoid the warnings. (Christian Brabandt)
Files:      src/ex_docmd.c, src/option.c, src/screen.c

Patch 7.4.822
Problem:    More problems reported by coverity.
Solution:   Avoid the warnings. (Christian Brabandt)
Files:      src/os_unix.c, src/eval.c, src/ex_cmds.c, src/ex_cmds2.c,
            src/ex_getln.c, src/fold.c, src/gui.c, src/gui_w16.c,
            src/gui_w32.c, src/if_cscope.c, src/if_xcmdsrv.c, src/move.c,
            src/normal.c, src/regexp.c, src/syntax.c, src/ui.c, src/window.c

Patch 7.4.823
Problem:    Cursor moves after CTRL-A on alphabetic character.
Solution:   (Hirohito Higashi, test by Christian Brabandt)
Files:      src/testdir/test_increment.in, src/testdir/test_increment.ok,
            src/ops.c

Patch 7.4.824 (after 7.4.813)
Problem:    Can't compile without the multi-byte feature. (John Marriott)
Solution:   Add #ifdef.
Files:      src/eval.c

Patch 7.4.825
Problem:    Invalid memory access for ":syn keyword x a[".
Solution:   Do not skip over the NUL. (Dominique Pelle)
Files:      src/syntax.c

Patch 7.4.826
Problem:    Compiler warnings and errors.
Solution:   Make it build properly without the multi-byte feature.
Files:      src/eval.c, src/search.c

Patch 7.4.827
Problem:    Not all test targets are in the Makefile.
Solution:   Add the missing targets.
```

```
Files:      src/Makefile

Patch 7.4.828
Problem:    Crash when using "syn keyword x c". (Dominique Pelle)
Solution:   Initialize the keyword table. (Raymond Ko, PR 397)
Files:      src/syntax.c

Patch 7.4.829
Problem:    Crash when clicking in beval balloon. (Travis Lebsock)
Solution:   Use PostMessage() instead of DestroyWindow(). (Raymond Ko, PR 298)
Files:      src/gui_w32.c

Patch 7.4.830
Problem:    Resetting 'encoding' when doing ":set all&" causes problems.
            (Bjorn Linse) Display is not updated.
Solution:   Do not reset 'encoding'. Do a full redraw.
Files:      src/option.c

Patch 7.4.831
Problem:    When expanding `=expr` on the command line and encountering an
            error, the command is executed anyway.
Solution:   Bail out when an error is detected.
Files:      src/misc1.c

Patch 7.4.832
Problem:    $HOME in `=$HOME . '/.vimrc'` is expanded too early.
Solution:   Skip over `=expr` when expanding environment names.
Files:      src/misc1.c

Patch 7.4.833
Problem:    More side effects of ":set all&" are missing. (Björn Linse)
Solution:   Call didset_options() and add didset_options2() to collect more
            side effects to take care of.  Still not everything...
Files:      src/option.c

Patch 7.4.834
Problem:    gettabvar() doesn't work after Vim start. (Szymon Wrozynski)
Solution:   Handle first window in tab still being NULL. (Christian Brabandt)
Files:      src/eval.c, src/testdir/test91.in, src/testdir/test91.ok

Patch 7.4.835
Problem:    Comparing utf-8 sequences does not handle different byte sizes
            correctly.
Solution:   Get the byte size of each character. (Dominique Pelle)
Files:      src/misc2.c

Patch 7.4.836
Problem:    Accessing uninitialized memory.
Solution:   Add missing calls to init_tv(). (Dominique Pelle)
Files:      src/eval.c

Patch 7.4.837
Problem:    Compiler warning with MSVC compiler when using +sniff.
Solution:   Use Sleep() instead of _sleep(). (Tux)
```

```
Files:      src/if_sniff.c

Patch 7.4.838 (after 7.4.833)
Problem:    Can't compile without the crypt feature. (John Marriott)
Solution:   Add #ifdef.
Files:      src/option.c

Patch 7.4.839
Problem:    Compiler warning on 64-bit system.
Solution:   Add cast to int. (Mike Williams)
Files:      src/search.c

Patch 7.4.840 (after 7.4.829)
Problem:    Tooltip window stays open.
Solution:   Send a WM_CLOSE message. (Jurgen Kramer)
Files:      src/gui_w32.c

Patch 7.4.841
Problem:    Can't compile without the multi-byte feature. (John Marriott)
Solution:   Add more #ifdef's.
Files:      src/option.c

Patch 7.4.842 (after 7.4.840)
Problem:    Sending too many messages to close the balloon.
Solution:   Only send a WM_CLOSE message. (Jurgen Kramer)
Files:      src/gui_w32.c

Patch 7.4.843 (after 7.4.835)
Problem:    Still possible to go beyond the end of a string.
Solution:   Check for NUL also in second string. (Dominique Pelle)
Files:      src/misc2.c

Patch 7.4.844
Problem:    When '#' is in 'isident' the is# comparator doesn't work.
Solution:   Don't use vim_isIDc(). (Yasuhiro Matsumoto)
Files:      src/eval.c, src/testdir/test_comparators.in,
            src/testdir/test_comparators.ok, src/testdir/Makefile,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms

Patch 7.4.845
Problem:    Compiler warning for possible loss of data.
Solution:   Add a type cast. (Erich Ritz)
Files:      src/misc1.c

Patch 7.4.846
Problem:    Some GitHub users don't know how to use issues.
Solution:   Add a file that explains the basics of contributing.
Files:      Filelist, CONTRIBUTING.md

Patch 7.4.847
Problem:    "vi)d" may leave a character behind.
Solution:   Skip over multi-byte character. (Christian Brabandt)
```

```
Files:      src/search.c

Patch 7.4.848
Problem:    CTRL-A on hex number in Visual block mode is incorrect.
Solution:   Account for the "0x". (Hirohito Higashi)
Files:      src/charset.c, src/testdir/test_increment.in,
            src/testdir/test_increment.ok

Patch 7.4.849
Problem:    Moving the cursor in Insert mode starts new undo sequence.
Solution:   Add CTRL-G U to keep the undo sequence for the following cursor
            movement command. (Christian Brabandt)
Files:      runtime/doc/insert.txt, src/edit.c, src/testdir/test_mapping.in,
            src/testdir/test_mapping.ok

Patch 7.4.850 (after 7.4.846)
Problem:    <Esc> does not show up.
Solution:   Use &gt; and &lt;. (Kazunobu Kuriyama)
Files:      CONTRIBUTING.md

Patch 7.4.851
Problem:    Saving and restoring the console buffer does not work properly.
Solution:   Instead of ReadConsoleOutputA/WriteConsoleOutputA use
            CreateConsoleScreenBuffer and SetConsoleActiveScreenBuffer.
            (Ken Takata)
Files:      src/os_win32.c

Patch 7.4.852
Problem:    On MS-Windows console Vim uses ANSI APIs for keyboard input and
            console output, it cannot input/output Unicode characters.
Solution:   Use Unicode APIs for console I/O. (Ken Takata, Yasuhiro Matsumoto)
Files:      src/os_win32.c, src/ui.c, runtime/doc/options.txt

Patch 7.4.853
Problem:    "zt" in diff mode does not always work properly. (Gary Johnson)
Solution:   Don't count filler lines twice. (Christian Brabandt)
Files:      src/move.c

Patch 7.4.854 (after 7.4.850)
Problem:    Missing information about runtime files.
Solution:   Add section about runtime files. (Christian Brabandt)
Files:      CONTRIBUTING.md

Patch 7.4.855
Problem:    GTK: font glitches for combining characters
Solution:   Use pango_shape_full() instead of pango_shape(). (luchr, PR #393)
Files:      src/gui_gtk_x11.c

Patch 7.4.856
Problem:    "zt" still doesn't work well with filler lines. (Gary Johnson)
Solution:   Check for filler lines above the cursor. (Christian Brabandt)
Files:      src/move.c

Patch 7.4.857
```

```
Problem:    Dragging the current tab with the mouse doesn't work properly.
Solution:   Take the current tabpage index into account. (Hirohito Higashi)
Files:      src/normal.c

Patch 7.4.858
Problem:    It's a bit clumsy to execute a command on a list of matches.
Solution:   Add the ":ldo", ":lfdo", ":cdo" and ":cfdo" commands. (Yegappan
            Lakshmanan)
Files:      runtime/doc/cmdline.txt, runtime/doc/editing.txt,
            runtime/doc/index.txt, runtime/doc/quickfix.txt,
            runtime/doc/tabpage.txt, runtime/doc/windows.txt, src/ex_cmds.h,
            src/ex_cmds2.c, src/ex_docmd.c, src/proto/quickfix.pro,
            src/quickfix.c, src/testdir/Make_amiga.mak,
            src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_os2.mak, src/testdir/Make_vms.mms,
            src/testdir/Makefile, src/testdir/test_cdo.in,
            src/testdir/test_cdo.ok

Patch 7.4.859
Problem:    Vim doesn't recognize all htmldjango files.
Solution:   Recognize a comment. (Daniel Hahler, PR #410)
Files:      runtime/filetype.vim

Patch 7.4.860
Problem:    Filetype detection is outdated.
Solution:   Include all recent and not-so-recent changes.
Files:      runtime/filetype.vim

Patch 7.4.861 (after 7.4.855)
Problem:    pango_shape_full() is not always available.
Solution:   Add a configure check.
Files:      src/configure.in, src/auto/configure, src/config.h.in,
            src/gui_gtk_x11.c

Patch 7.4.862 (after 7.4.861)
Problem:    Still problems with pango_shape_full() not available.
Solution:   Change AC_TRY_COMPILE to AC_TRY_LINK.
Files:      src/configure.in, src/auto/configure

Patch 7.4.863 (after 7.4.856)
Problem:    plines_nofill() used without the diff feature.
Solution:   Define PLINES_NOFILL().
Files:      src/macros.h, src/move.c

Patch 7.4.864 (after 7.4.858)
Problem:    Tiny build fails.
Solution:   Put qf_ items inside #ifdef.
Files:      src/ex_docmd.c

Patch 7.4.865
Problem:    Compiler warning for uninitialized variable.
Solution:   Initialize.
Files:      src/ex_cmds2.c
```

```
Patch 7.4.866
Problem:    Crash when changing the 'tags' option from a remote command.
            (Benjamin Fritz)
Solution:   Instead of executing messages immediately, use a queue, like for
            netbeans. (James Kolb)
Files:      src/ex_docmd.c, src/getchar.c, src/gui_gtk_x11.c, src/gui_w48.c,
            src/gui_x11.c, src/if_xcmdsrv.c, src/misc2.c, src/os_unix.c,
            src/proto/if_xcmdsrv.pro, src/proto/misc2.pro, src/macros.h

Patch 7.4.867 (after 7.4.866)
Problem:    Can't build on MS-Windows. (Taro Muraoka)
Solution:   Adjust #ifdef.
Files:      src/misc2.c

Patch 7.4.868
Problem:    'smarttab' is also effective when 'paste' is enabled. (Alexander
            Monakov)
Solution:   Disable 'smarttab' when 'paste' is set. (Christian Brabandt)
            Do the same for 'expandtab'.
Files:      src/option.c, src/structs.h

Patch 7.4.869
Problem:    MS-Windows: scrolling may cause text to disappear when using an
            Intel GPU.
Solution:   Call GetPixel(). (Yohei Endo)
Files:      src/gui_w48.c

Patch 7.4.870
Problem:    May get into an invalid state when using getchar() in an
            expression mapping.
Solution:   Anticipate mod_mask to change. (idea by Yukihiro Nakadaira)
Files:      src/getchar.c

Patch 7.4.871
Problem:    Vim leaks memory, when 'wildignore' filters out all matches.
Solution:   Free the files array when it becomes empty.
Files:      src/misc1.c

Patch 7.4.872
Problem:    Not using CI services available.
Solution:   Add configuration files for travis and appveyor. (Ken Takata,
            vim-jp, PR #401)
Files:      .travis.yml, appveyor.yml, Filelist

Patch 7.4.873 (after 7.4.866)
Problem:    Compiler warning for unused variable. (Tony Mechelynck)
Solution:   Remove the variable.  Also fix int vs long_u mixup.
Files:      src/if_xcmdsrv.c

Patch 7.4.874
Problem:    MS-Windows: When Vim runs inside another application, the size
            isn't right.
Solution:   When in child mode compute the size differently. (Agorgianitis
            Loukas)
```

```
Files:      src/gui_w48.c

Patch 7.4.875
Problem:    Not obvious how to contribute.
Solution:   Add a remark about CONTRIBUTING.md to README.md
Files:      README.md

Patch 7.4.876
Problem:    Windows7: when using vim.exe with msys or msys2, conhost.exe
            (console window provider on Windows7) will freeze or crash.
Solution:   Make original screen buffer active, before executing external
            program.  And when the program is finished, revert to vim's one.
            (Taro Muraoka)
Files:      src/os_win32.c

Patch 7.4.877 (after 7.4.843)
Problem:    ":find" sometimes fails. (Excanoe)
Solution:   Compare current characters instead of previous ones.
Files:      src/misc2.c

Patch 7.4.878
Problem:    Coverity error for clearing only one byte of struct.
Solution:   Clear the whole struct. (Dominique Pelle)
Files:      src/ex_docmd.c

Patch 7.4.879
Problem:    Can't see line numbers in nested function calls.
Solution:   Add line number to the file name. (Alberto Fanjul)
Files:      src/eval.c

Patch 7.4.880
Problem:    No build and coverage status.
Solution:   Add links to the README file. (Christian Brabandt)
Files:      README.md

Patch 7.4.881 (after 7.4.879)
Problem:    Test 49 fails.
Solution:   Add line number to check of call stack.
Files:      src/testdir/test49.vim

Patch 7.4.882
Problem:    When leaving the command line window with CTRL-C while a
            completion menu is displayed the menu isn't removed.
Solution:   Force a screen update. (Hirohito Higashi)
Files:      src/edit.c

Patch 7.4.883 (after 7.4.818)
Problem:    Block-mode replace works characterwise instead of blockwise after
            column 147. (Issue #422)
Solution:   Set Visual mode. (Christian Brabandt)
Files:      src/normal.c, src/testdir/test_listlbr.in,
            src/testdir/test_listlbr.ok

Patch 7.4.884
```

```
Problem:    Travis also builds on a tag push.
Solution:   Filter out tag pushes. (Kenichi Ito)
Files:      .travis.yml

Patch 7.4.885
Problem:    When doing an upwards search without wildcards the search fails if
            the initial directory doesn't exist.
Solution:   Fix the non-wildcard case. (Stefan Kempf)
Files:      src/misc2.c

Patch 7.4.886 (after 7.4.876)
Problem:    Windows7: Switching screen buffer causes flicker when using
            system().
Solution:   Instead of actually switching screen buffer, duplicate the handle.
            (Yasuhiro Matsumoto)
Files:      src/os_win32.c

Patch 7.4.887
Problem:    Using uninitialized memory for regexp with back reference.
            (Dominique Pelle)
Solution:   Initialize end_lnum.
Files:      src/regexp_nfa.c

Patch 7.4.888
Problem:    The OptionSet autocommands are not triggered from setwinvar().
Solution:   Do not use switch_win() when not needed. (Hirohito Higashi)
Files:      src/eval.c

Patch 7.4.889
Problem:    Triggering OptionSet from setwinvar() isn't tested.
Solution:   Add a test. (Christian Brabandt)
Files:      src/testdir/test_autocmd_option.in,
            src/testdir/test_autocmd_option.ok

Patch 7.4.890
Problem:    Build failure when using dynamic python but not python3.
Solution:   Adjust the #if to also include DYNAMIC_PYTHON3 and UNIX.
Files:      src/if_python3.c

Patch 7.4.891
Problem:    Indentation of array initializer is wrong.
Solution:   Avoid that calling find_start_rawstring() changes the position
            returned by find_start_comment(), add a test. (Hirohito Higashi)
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.4.892
Problem:    On MS-Windows the iconv DLL may have a different name.
Solution:   Also try libiconv2.dll and libiconv-2.dll. (Yasuhiro Matsumoto)
Files:      src/mbyte.c

Patch 7.4.893
Problem:    C indenting is wrong below a "case (foo):" because it is
            recognized as a C++ base class construct.  Issue #38.
Solution:   Check for the case keyword.
```

```
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.4.894
Problem:    vimrun.exe is picky about the number of spaces before -s.
Solution:   Skip all spaces. (Cam Sinclair)
Files:      src/vimrun.c

Patch 7.4.895
Problem:    Custom command line completion does not work for a command
            containing digits.
Solution:   Skip over the digits. (suggested by Yasuhiro Matsumoto)
Files:      src/ex_docmd.c

Patch 7.4.896
Problem:    Editing a URL, which netrw should handle, doesn't work.
Solution:   Avoid changing slashes to backslashes. (Yasuhiro Matsumoto)
Files:      src/fileio.c, src/os_mswin.c

Patch 7.4.897
Problem:    Freeze and crash when there is a sleep in a remote command.
            (Karl Yngve Lervåg)
Solution:   Remove a message from the queue before dealing with it. (James
            Kolb)
Files:      src/if_xcmdsrv.c

Patch 7.4.898
Problem:    The 'fixendofline' option is set on with ":edit".
Solution:   Don't set the option when clearing a buffer. (Yasuhiro Matsumoto)
Files:      src/buffer.c

Patch 7.4.899
Problem:    README file is not optimal.
Solution:   Move buttons, update some text. (closes #460)
Files:      README.txt, README.md

Patch 7.4.900 (after 7.4.899)
Problem:    README file can still be improved
Solution:   Add a couple of links. (Christian Brabandt)
Files:      README.md

Patch 7.4.901
Problem:    When a BufLeave autocommand changes folding in a way it syncs
            undo, undo can be corrupted.
Solution:   Prevent undo sync. (Jacob Niehus)
Files:      src/popupmnu.c

Patch 7.4.902
Problem:    Problems with using the MS-Windows console.
Solution:   Revert patches 7.4.851, 7.4.876 and 7.4.886 until we find a better
            solution. (suggested by Ken Takata)
Files:      src/os_win32.c

Patch 7.4.903
Problem:    MS-Windows: When 'encoding' differs from the current code page,
```

```
            expanding wildcards may cause illegal memory access.
Solution:   Allocate a longer buffer. (Ken Takata)
Files:      src/misc1.c

Patch 7.4.904
Problem:    Vim does not provide .desktop files.
Solution:   Include and install .desktop files. (James McCoy, closes #455)
Files:      Filelist, runtime/vim.desktop, runtime/gvim.desktop, src/Makefile

Patch 7.4.905
Problem:    Python interface can produce error "vim.message' object has no
            attribute 'isatty'".
Solution:   Add dummy isatty(), readable(), etc. (closes #464)
Files:      src/if_py_both.h, src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok

Patch 7.4.906
Problem:    On MS-Windows the viminfo file is (always) given the hidden
            attribute. (raulnac)
Solution:   Check the hidden attribute in a different way. (Ken Takata)
Files:      src/ex_cmds.c, src/os_win32.c, src/os_win32.pro

Patch 7.4.907
Problem:    Libraries for dynamically loading interfaces can only be defined
            at compile time.
Solution:   Add options to specify the dll names. (Kazuki Sakamoto,
            closes #452)
Files:      runtime/doc/if_lua.txt, runtime/doc/if_perl.txt,
            runtime/doc/if_pyth.txt, runtime/doc/if_ruby.txt,
            runtime/doc/options.txt, src/if_lua.c, src/if_perl.xs,
            src/if_python.c, src/if_python3.c, src/if_ruby.c, src/option.c,
            src/option.h

Patch 7.4.908 (after 7.4.907)
Problem:    Build error with MingW compiler. (Cesar Romani)
Solution:   Change #if into #ifdef.
Files:      src/if_perl.xs

Patch 7.4.909 (after 7.4.905)
Problem:    "make install" fails.
Solution:   Only try installing desktop files if the destination directory
            exists.
Files:      src/Makefile

Patch 7.4.910 (after 7.4.905)
Problem:    Compiler complains about type punned pointer.
Solution:   Use another way to increment the ref count.
Files:      src/if_py_both.h

Patch 7.4.911
Problem:    t_Ce and t_Cs are documented but not supported. (Hirohito Higashi)
Solution:   Define the options.
Files:      src/option.c
```

```
Patch 7.4.912
Problem:    Wrong indenting for C++ constructor.
Solution:   Recognize ::.  (Anhong)
Files:      src/misc1.c, src/testdir/test3.in, src/testdir/test3.ok

Patch 7.4.913
Problem:    No utf-8 support for the hangul input feature.
Solution:   Add utf-8 support. (Namsh)
Files:      src/gui.c, src/hangulin.c, src/proto/hangulin.pro, src/screen.c,
            src/ui.c, runtime/doc/hangulin.txt, src/feature.h

Patch 7.4.914
Problem:    New compiler warning: logical-not-parentheses
Solution:   Silence the warning.
Files:      src/term.c

Patch 7.4.915
Problem:    When removing from 'path' and then adding, a comma may go missing.
            (Malcolm Rowe)
Solution:   Fix the check for P_ONECOMMA. (closes #471)
Files:      src/option.c, src/testdir/test_options.in,
            src/testdir/test_options.ok

Patch 7.4.916
Problem:    When running out of memory while copying a dict memory may be
            freed twice. (ZyX)
Solution:   Do not call the garbage collector when running out of memory.
Files:      src/misc2.c

Patch 7.4.917
Problem:    Compiler warning for comparing signed and unsigned.
Solution:   Add a type cast.
Files:      src/hangulin.c

Patch 7.4.918
Problem:    A digit in an option name has problems.
Solution:   Rename 'python3dll' to 'pythonthreedll'.
Files:      src/option.c, src/option.h, runtime/doc/options.txt

Patch 7.4.919
Problem:    The dll options are not in the options window.
Solution:   Add the dll options.  And other fixes.
Files:      runtime/optwin.vim

Patch 7.4.920
Problem:    The rubydll option is not in the options window.
Solution:   Add the rubydll option.
Files:      runtime/optwin.vim

Patch 7.4.921 (after 7.4.906)
Problem:    Missing proto file update. (Randall W. Morris)
Solution:   Add the missing line for mch_ishidden.
Files:      src/proto/os_win32.pro
```

```
Patch 7.4.922
Problem:    Leaking memory with ":helpt {dir-not-exists}".
Solution:   Free dirname. (Dominique Pelle)
Files:      src/ex_cmds.c

Patch 7.4.923
Problem:    Prototypes not always generated.
Solution:   Change #if to OR with PROTO.
Files:      src/window.c

Patch 7.4.924
Problem:    DEVELOPER_DIR gets reset by configure.
Solution:   Do not reset DEVELOPER_DIR when there is no --with-developer-dir
            argument. (Kazuki Sakamoto, closes #482)
Files:      src/configure.in, src/auto/configure

Patch 7.4.925
Problem:    User may yank or put using the register being recorded in.
Solution:   Add the recording register in the message. (Christian Brabandt,
            closes #470)
Files:      runtime/doc/options.txt, runtime/doc/repeat.txt, src/ops.c,
            src/option.h, src/screen.c

Patch 7.4.926
Problem:    Completing the longest match doesn't work properly with multi-byte
            characters.
Solution:   When using multi-byte characters use another way to find the
            longest match. (Hirohito Higashi)
Files:      src/ex_getln.c, src/testdir/test_utf8.in, src/testdir/test_utf8.ok

Patch 7.4.927
Problem:    Ruby crashes when there is a runtime error.
Solution:   Use ruby_options() instead of ruby_process_options(). (Damien)
Files:      src/if_ruby.c

Patch 7.4.928
Problem:    A clientserver message interrupts handling keys of a mapping.
Solution:   Have mch_inchar() send control back to WaitForChar when it is
            interrupted by server message. (James Kolb)
Files:      src/os_unix.c

Patch 7.4.929
Problem:    "gv" after paste selects one character less if 'selection' is
            "exclusive".
Solution:   Increment the end position. (Christian Brabandt)
Files:      src/normal.c, src/testdir/test94.in, src/testdir/test94.ok

Patch 7.4.930
Problem:    MS-Windows: Most users appear not to like the window border.
Solution:   Remove WS_EX_CLIENTEDGE. (Ian Halliday)
Files:      src/gui_w32.c

Patch 7.4.931 (after 7.4.929)
Problem:    Test 94 fails on some systems.
```

```
Solution:   Set 'encoding' to utf-8.
Files:      src/testdir/test94.in

Patch 7.4.932 (after 7.4.926)
Problem:    test_utf8 has confusing dummy command.
Solution:   Use a real command instead of a colon.
Files:      src/testdir/test_utf8.in

Patch 7.4.933 (after 7.4.926)
Problem:    Crash when using longest completion match.
Solution:   Fix array index.
Files:      src/ex_getln.c

Patch 7.4.934
Problem:    Appveyor also builds on a tag push.
Solution:   Add a skip_tags line. (Kenichi Ito, closes #489)
Files:      appveyor.yml

Patch 7.4.935 (after 7.4.932)
Problem:    test_utf8 fails on MS-Windows when executed with gvim.
Solution:   Use the insert flag on feedkeys() to put the string before the
            ":" that was already read when checking for available chars.
Files:      src/testdir/test_utf8.in

Patch 7.4.936
Problem:    Crash when dragging with the mouse.
Solution:   Add safety check for NULL pointer. Check mouse position for valid
            value. (Hirohito Higashi)
Files:      src/window.c, src/term.c

Patch 7.4.937
Problem:    Segfault reading uninitialized memory.
Solution:   Do not read match \z0, it does not exist. (Marius Gedminas, closes
            #497)
Files:      src/regexp_nfa.c

Patch 7.4.938
Problem:    X11 and GTK have more mouse buttons than Vim supports.
Solution:   Recognize more mouse buttons. (Benoit Pierre, closes #498)
Files:      src/gui_gtk_x11.c, src/gui_x11.c

Patch 7.4.939
Problem:    Memory leak when encountering a syntax error.
Solution:   Free the memory. (Dominique Pelle)
Files:      src/ex_docmd.c

Patch 7.4.940
Problem:    vt52 terminal codes are not correct.
Solution:   Move entries outside of #if. (Random)  Adjustments based on
            documented codes.
Files:      src/term.c

Patch 7.4.941
Problem:    There is no way to ignore case only for tag searches.
```

```
Solution:   Add the 'tagcase' option. (Gary Johnson)
Files:      runtime/doc/options.txt, runtime/doc/quickref.txt,
            runtime/doc/tagsrch.txt, runtime/doc/usr_29.txt,
            runtime/optwin.vim, src/Makefile, src/buffer.c, src/option.c,
            src/option.h, src/structs.h, src/tag.c,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
            src/testdir/test_tagcase.in, src/testdir/test_tagcase.ok

Patch 7.4.942 (after 7.4.941)
Problem:    test_tagcase breaks for small builds.
Solution:   Bail out of the test early. (Hirohito Higashi)
Files:      src/testdir/test_tagcase.in

Patch 7.4.943
Problem:    Tests are not run.
Solution:   Add test_writefile to makefiles. (Ken Takata)
Files:      src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile

Patch 7.4.944
Problem:    Writing tests for Vim script is hard.
Solution:   Add assertEqual(), assertFalse() and assertTrue() functions.  Add
            the v:errors variable.  Add the runtest script. Add a first new
            style test script.
Files:      src/eval.c, src/vim.h, src/misc2.c, src/testdir/Makefile,
            src/testdir/runtest.vim, src/testdir/test_assert.vim,
            runtime/doc/eval.txt

Patch 7.4.945 (after 7.4.944)
Problem:    New style testing is incomplete.
Solution:   Add the runtest script to the list of distributed files.
            Add the new functions to the function overview.
            Rename the functions to match Vim function style.
            Move undolevels testing into a new style test script.
Files:      Filelist, runtime/doc/usr_41.txt, runtime/doc/eval.txt,
            src/testdir/test_assert.vim, src/testdir/Makefile,
            src/testdir/test_undolevels.vim, src/testdir/test100.in,
            src/testdir/test100.ok

Patch 7.4.946 (after 7.4.945)
Problem:    Missing changes in source file.
Solution:   Include changes to the eval.c file.
Files:      src/eval.c

Patch 7.4.947
Problem:    Test_listchars fails with MingW. (Michael Soyka)
Solution:   Add the test to the ones that need the fileformat fixed.
            (Christian Brabandt)
Files:      src/testdir/Make_ming.mak

Patch 7.4.948
```

```
Problem:    Can't build when the insert_expand feature is disabled.
Solution:   Add #ifdefs. (Dan Pasanen, closes #499)
Files:      src/eval.c, src/fileio.c

Patch 7.4.949
Problem:    When using 'colorcolumn' and there is a sign with a fullwidth
            character the highlighting is wrong. (Andrew Stewart)
Solution:   Only increment vcol when in the right state. (Christian Brabandt)
Files:      src/screen.c, src/testdir/test_listlbr_utf8.in,
            src/testdir/test_listlbr_utf8.ok

Patch 7.4.950
Problem:    v:errors is not initialized.
Solution:   Initialize it to an empty list. (Thinca)
Files:      src/eval.c

Patch 7.4.951
Problem:    Sorting number strings does not work as expected. (Luc Hermitte)
Solution:   Add the "N" argument to sort()
Files:      src/eval.c, runtime/doc/eval.txt, src/testdir/test_alot.vim,
            src/testdir/test_sort.vim, src/testdir/Makefile

Patch 7.4.952
Problem:    'lispwords' is tested in the old way.
Solution:   Make a new style test for 'lispwords'.
Files:      src/testdir/test_alot.vim, src/testdir/test_lispwords.vim,
            src/testdir/test100.in, src/testdir/test100.ok,
            src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile

Patch 7.4.953
Problem:    When a test script navigates to another buffer the .res file is
            created with the wrong name.
Solution:   Use the "testname" for the .res file. (Damien)
Files:      src/testdir/runtest.vim

Patch 7.4.954
Problem:    When using Lua there may be a crash. (issue #468)
Solution:   Avoid using an uninitialized tv. (Yukihiro Nakadaira)
Files:      src/if_lua.c

Patch 7.4.955
Problem:    Vim doesn't recognize .pl6 and .pod6 files.
Solution:   Recognize them as perl6 and pod6. (Mike Eve, closes #511)
Files:      runtime/filetype.vim

Patch 7.4.956
Problem:    A few more file name extensions not recognized.
Solution:   Add .asciidoc, .bzl, .gradle, etc.
Files:      runtime/filetype.vim

Patch 7.4.957
Problem:    Test_tagcase fails when using another language than English.
```

```
Solution:   Set the messages language to C. (Kenichi Ito)
Files:      src/testdir/test_tagcase.in

Patch 7.4.958
Problem:    Vim checks if the directory "$TMPDIR" exists.
Solution:   Do not check if the name starts with "$".
Files:      src/fileio.c

Patch 7.4.959
Problem:    When setting 'term' the clipboard ownership is lost.
Solution:   Do not call clip_init(). (James McCoy)
Files:      src/term.c

Patch 7.4.960
Problem:    Detecting every version of nmake is clumsy.
Solution:   Use a tiny C program to get the version of _MSC_VER. (Ken Takata)
Files:      src/Make_mvc.mak

Patch 7.4.961
Problem:    Test107 fails in some circumstances.
Solution:   When using "zt", "zb" and "z=" recompute the fraction.
Files:      src/normal.c, src/window.c, src/proto/window.pro

Patch 7.4.962
Problem:    Cannot run the tests with gvim.  Cannot run individual new tests.
Solution:   Add the -f flag. Add new test targets in Makefile.
Files:      src/Makefile, src/testdir/Makefile

Patch 7.4.963
Problem:    test_listlbr_utf8 sometimes fails.
Solution:   Don't use a literal multibyte character but <C-V>uXXXX. Do not
            dump the screen highlighting. (Christian Brabandt, closes #518)
Files:      src/testdir/test_listlbr_utf8.in, src/testdir/test_listlbr_utf8.ok

Patch 7.4.964
Problem:    Test 87 doesn't work in a shadow directory.
Solution:   Handle the extra subdirectory. (James McCoy, closes #515)
Files:      src/testdir/test87.in

Patch 7.4.965
Problem:    On FreeBSD /dev/fd/ files are special.
Solution:   Use is_dev_fd_file() also for FreeBSD. (Derek Schrock, closes #521)
Files:      src/fileio.c

Patch 7.4.966
Problem:    Configure doesn't work with a space in a path.
Solution:   Put paths in quotes. (James McCoy, closes #525)
Files:      src/configure.in, src/auto/configure

Patch 7.4.967
Problem:    Cross compilation on MS-windows doesn't work well.
Solution:   Tidy up cross compilation across architectures with Visual Studio.
            (Mike Williams)
Files:      src/Make_mvc.mak
```

```
Patch 7.4.968
Problem:    test86 and test87 are flaky in Appveyor.
Solution:   Reduce the count from 8 to 7. (suggested by ZyX)
Files:      src/testdir/test86.in, src/testdir/test87.in

Patch 7.4.969
Problem:    Compiler warnings on Windows x64 build.
Solution:   Add type casts. (Mike Williams)
Files:      src/option.c

Patch 7.4.970
Problem:    Rare crash in getvcol(). (Timo Mihaljov)
Solution:   Check for the buffer being NULL in init_preedit_start_col.
            (Hirohito Higashi, Christian Brabandt)
Files:      src/mbyte.c

Patch 7.4.971
Problem:    The asin() function can't be used.
Solution:   Sort the function table properly. (Watiko)
Files:      src/eval.c

Patch 7.4.972
Problem:    Memory leak when there is an error in setting an option.
Solution:   Free the saved value (Christian Brabandt)
Files:      src/option.c

Patch 7.4.973
Problem:    When pasting on the command line line breaks result in literal
            <CR> characters. This makes pasting a long file name difficult.
Solution:   Skip the characters.
Files:      src/ex_getln.c, src/ops.c

Patch 7.4.974
Problem:    When using :diffsplit the cursor jumps to the first line.
Solution:   Put the cursor on the line related to where the cursor was before
            the split.
Files:      src/diff.c

Patch 7.4.975
Problem:    Using ":sort" on a very big file sometimes causes text to be
            corrupted. (John Beckett)
Solution:   Copy the line into a buffer before calling ml_append().
Files:      src/ex_cmds.c

Patch 7.4.976
Problem:    When compiling Vim for MSYS2 (linked with msys-2.0.dll), the Win32
            clipboard is not enabled.
Solution:   Recognize MSYS like CYGWIN. (Ken Takata)
Files:      src/configure.in, src/auto/configure

Patch 7.4.977
Problem:    'linebreak' does not work properly when using "space" in
            'listchars'.
```

```
Solution:   (Hirohito Higashi, Christian Brabandt)
Files:      src/screen.c, src/testdir/test_listlbr.in,
            src/testdir/test_listlbr.ok

Patch 7.4.978
Problem:    test_cdo fails when using another language than English.
Solution:   Set the language to C. (Dominique Pelle, Kenichi Ito)
Files:      src/testdir/test_cdo.in

Patch 7.4.979
Problem:    When changing the crypt key the blocks read from disk are not
            decrypted.
Solution:   Also call ml_decrypt_data() when mf_old_key is set. (Ken Takata)
Files:      src/memfile.c

Patch 7.4.980
Problem:    Tests for :cdo, :ldo, etc. are outdated.
Solution:   Add new style tests for these commands. (Yegappan Lakshmanan)
Files:      src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
            src/testdir/test_cdo.in, src/testdir/test_cdo.ok,
            src/testdir/test_cdo.vim

Patch 7.4.981
Problem:    An error in a test script goes unnoticed.
Solution:   Source the test script inside try/catch. (Hirohito Higashi)
Files:      src/testdir/runtest.vim

Patch 7.4.982
Problem:    Keeping the list of tests updated is a hassle.
Solution:   Move the list to a separate file, so that it only needs to be
            updated in one place.
Files:      src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
            src/testdir/Make_all.mak

Patch 7.4.983
Problem:    Executing one test after "make testclean" doesn't work.
Solution:   Add a dependency on test1.out.
Files:      src/testdir/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile,
            src/testdir/Make_all.mak

Patch 7.4.984
Problem:    searchpos() always starts searching in the first column, which is
            not what some people expect. (Brett Stahlman)
Solution:   Add the 'z' flag: start at the specified column.
Files:      src/vim.h, src/eval.c, src/search.c,
            src/testdir/test_searchpos.vim, src/testdir/test_alot.vim,
            runtime/doc/eval.txt
```

```
Patch 7.4.985
Problem:    Can't build with Ruby 2.3.0.
Solution:   Use the new TypedData_XXX macro family instead of Data_XXX. Use
            TypedData. (Ken Takata)
Files:      src/if_ruby.c

Patch 7.4.986
Problem:    Test49 doesn't work on MS-Windows.  test70 is listed twice.
Solution:   Move test49 to the group not used on Amiga and MS-Windows.
            Remove test70 from SCRIPTS_WIN32.
Files:      src/testdir/Make_all.mak, src/testdir/Make_dos.mak

Patch 7.4.987 (after 7.4.985)
Problem:    Can't build with Ruby 1.9.2.
Solution:   Require Rub 2.0 for defining USE_TYPEDDATA.
Files:      src/if_ruby.c

Patch 7.4.988 (after 7.4.982)
Problem:    Default test target is test49.out.
Solution:   Add a build rule before including Make_all.mak.
Files:      src/testdir/Make_dos.mak, src/testdir/Make_amiga.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_os2.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile

Patch 7.4.989
Problem:    Leaking memory when hash_add() fails. Coverity error 99126.
Solution:   When hash_add() fails free the memory.
Files:      src/eval.c

Patch 7.4.990
Problem:    Test 86 fails on AppVeyor.
Solution:   Do some registry magic. (Ken Takata)
Files:      appveyor.yml

Patch 7.4.991
Problem:    When running new style tests the output is not visible.
Solution:   Add the testdir/messages file and show it.  Update the list of
            test names.
Files:      src/Makefile, src/testdir/Makefile, src/testdir/runtest.vim

Patch 7.4.992
Problem:    Makefiles for MS-Windows in src/po are outdated.
Solution:   Make them work. (Ken Takata, Taro Muraoka)
Files:      src/po/Make_cyg.mak, src/po/Make_ming.mak, src/po/Make_mvc.mak,
            src/po/README_mingw.txt, src/po/README_mvc.txt

Patch 7.4.993
Problem:    Test 87 is flaky on AppVeyor.
Solution:   Reduce the minimum background thread count.
Files:      src/testdir/test86.in, src/testdir/test87.in

Patch 7.4.994
Problem:    New style tests are not run on MS-Windows.
Solution:   Add the new style tests.
```

```
Files:      src/testdir/Make_dos.mak

Patch 7.4.995
Problem:    gdk_pixbuf_new_from_inline() is deprecated.
Solution:   Generate auto/gui_gtk_gresources.c. (Kazunobu Kuriyama,
            closes #507)
Files:      src/Makefile, src/auto/configure, src/config.h.in,
            src/config.mk.in, src/configure.in, src/gui_gtk.c,
            src/gui_gtk_gresources.xml, src/gui_gtk_x11.c,
            src/proto/gui_gtk_gresources.pro,
            pixmaps/stock_vim_build_tags.png, pixmaps/stock_vim_find_help.png,
            pixmaps/stock_vim_save_all.png,
            pixmaps/stock_vim_session_load.png,
            pixmaps/stock_vim_session_new.png,
            pixmaps/stock_vim_session_save.png, pixmaps/stock_vim_shell.png,
            pixmaps/stock_vim_window_maximize.png,
            pixmaps/stock_vim_window_maximize_width.png,
            pixmaps/stock_vim_window_minimize.png,
            pixmaps/stock_vim_window_minimize_width.png,
            pixmaps/stock_vim_window_split.png,
            pixmaps/stock_vim_window_split_vertical.png

Patch 7.4.996
Problem:    New GDK files and testdir/Make_all.mak missing from distribution.
            PC build instructions are outdated.
Solution:   Add the file to the list.  Update PC build instructions.
Files:      Filelist, Makefile

Patch 7.4.997
Problem:    "make shadow" was sometimes broken.
Solution:   Add a test for it. (James McCoy, closes #520)
Files:      .travis.yml

Patch 7.4.998
Problem:    Running tests in shadow directory fails.  Test 49 fails.
Solution:   Link more files for the shadow directory. Make test 49 ends up in
            the right buffer.
Files:      src/Makefile, src/testdir/test49.in

Patch 7.4.999
Problem:    "make shadow" creates a broken link. (Tony Mechelynck)
Solution:   Remove vimrc.unix from the list.
Files:      src/Makefile

Patch 7.4.1000
Problem:    Test 49 is slow and doesn't work on MS-Windows.
Solution:   Start moving parts of test 49 to test_viml.
Files:      src/Makefile, src/testdir/runtest.vim, src/testdir/test_viml.vim,
            src/testdir/test49.vim, src/testdir/test49.ok

Patch 7.4.1001 (after 7.4.1000)
Problem:    test_viml isn't run.
Solution:   Include change in makefile.
Files:      src/testdir/Make_all.mak
```

```
Patch 7.4.1002
Problem:    Cannot run an individual test on MS-Windows.
Solution:   Move the rule to run test1 downwards. (Ken Takata)
Files:      src/testdir/Make_dos.mak

Patch 7.4.1003
Problem:    Travis could check a few more things.
Solution:   Run autoconf on one of the builds. (James McCoy, closes #510)
            Also build with normal features.
Files:      .travis.yml

Patch 7.4.1004
Problem:    Using Makefile when auto/config.mk does not exist results in
            warnings.
Solution:   Use default values for essential variables.
Files:      src/Makefile

Patch 7.4.1005
Problem:    Vim users are not always happy.
Solution:   Make them happy.
Files:      src/ex_cmds.h, src/ex_cmds.c, src/proto/ex_cmds.pro

Patch 7.4.1006
Problem:    The fix in patch 7.3.192 is not tested.
Solution:   Add a test, one for each regexp engine. (Elias Diem)
Files:      src/testdir/test44.in, src/testdir/test44.ok,
            src/testdir/test99.in, src/testdir/test99.ok

Patch 7.4.1007
Problem:    When a symbolic link points to a file in the root directory, the
            swapfile is not correct.
Solution:   Do not try getting the full name of a file in the root directory.
            (Milly, closes #501)
Files:      src/os_unix.c

Patch 7.4.1008
Problem:    The OS/2 code pollutes the source while nobody uses it these days.
Solution:   Drop the support for OS/2.
Files:      src/feature.h, src/globals.h, src/macros.h, src/option.h,
            src/os_unix.c, src/os_unix.h, src/proto/os_unix.pro, src/vim.h,
            src/digraph.c, src/eval.c, src/ex_cmds.c, src/ex_docmd.c,
            src/ex_getln.c, src/fileio.c, src/getchar.c, src/memline.c,
            src/misc1.c, src/misc2.c, src/netbeans.c, src/option.c,
            src/term.c, src/ui.c, src/window.c, src/os_os2_cfg.h,
            src/Make_os2.mak, src/testdir/Make_os2.mak, src/testdir/os2.vim,
            src/INSTALL, runtime/doc/os_os2.txt

Patch 7.4.1009
Problem:    There are still #ifdefs for ARCHIE.
Solution:   Remove references to ARCHIE, the code was removed in Vim 5.
Files:      src/ex_cmds.c, src/ex_docmd.c, src/fileio.c, src/main.c,
            src/memline.c, src/option.c, src/term.c
```

```
Patch 7.4.1010
Problem:    Some developers are unhappy while running tests.
Solution:   Add a test and some color.
Files:      src/ex_cmds.c, src/testdir/test_assert.vim

Patch 7.4.1011
Problem:    Can't build with Strawberry Perl.
Solution:   Include stdbool.h. (Ken Takata, closes #328)
Files:      Filelist, src/Make_mvc.mak, src/if_perl_msvc/stdbool.h

Patch 7.4.1012
Problem:    Vim overwrites the value of $PYTHONHOME.
Solution:   Do not set $PYTHONHOME if it is already set. (Kazuki Sakamoto,
            closes #500)
Files:      src/if_python.c, src/if_python3.c

Patch 7.4.1013
Problem:    The local value of 'errorformat' is not used for ":lexpr" and
            ":cexpr".
Solution:   Use the local value if it exists. (Christian Brabandt) Adjust the
            help for this.
Files:      runtime/doc/quickfix.txt, src/quickfix.c

Patch 7.4.1014
Problem:    `fnamemodify('.', ':.')` returns an empty string in Cygwin.
Solution:   Use CCP_RELATIVE in the call to cygwin_conv_path. (Jacob Niehus,
            closes #505)
Files:      src/os_unix.c

Patch 7.4.1015
Problem:    The column is not restored properly when the matchparen plugin is
            used in Insert mode and the cursor is after the end of the line.
Solution:   Set the curswant flag. (Christian Brabandt).  Also fix
            highlighting the match of the character before the cursor.
Files:      src/eval.c, runtime/plugin/matchparen.vim

Patch 7.4.1016
Problem:    Still a few OS/2 pieces remain.
Solution:   Delete more.
Files:      Filelist, README_os2.txt, testdir/todos.vim, src/xxd/Make_os2.mak

Patch 7.4.1017
Problem:    When there is a backslash in an option ":set -=" doesn't work.
Solution:   Handle a backslash better. (Jacob Niehus)  Add a new test, merge
            in old test.
Files:      src/testdir/test_cdo.vim, src/testdir/test_set.vim,
            src/testdir/test_alot.vim, src/option.c, src/testdir/test_set.in,
            src/testdir/test_set.ok, src/Makefile

Patch 7.4.1018 (after 7.4.1017)
Problem:    Failure running tests.
Solution:   Add missing change to list of old style tests.
Files:      src/testdir/Make_all.mak
```

```
Patch 7.4.1019
Problem:    Directory listing of "src" is too long.
Solution:   Rename the resources file to make it shorter.
Files:      src/gui_gtk_gresources.xml, src/gui_gtk_res.xml, src/Makefile,
            Filelist

Patch 7.4.1020
Problem:    On MS-Windows there is no target to run tests with gvim.
Solution:   Add the testgvim target.
Files:      src/Make_mvc.mak

Patch 7.4.1021
Problem:    Some makefiles are outdated.
Solution:   Add a note to warn developers.
Files:      src/Make_manx.mak, src/Make_bc3.mak, src/Make_bc5.mak,
            src/Make_djg.mak, src/Make_w16.mak

Patch 7.4.1022
Problem:    The README file contains some outdated information.
Solution:   Update the information about supported systems.
Files:      README.txt, README.md

Patch 7.4.1023
Problem:    The distribution files for MS-Windows use CR-LF, which is
            inconsistent with what one gets from github.
Solution:   Use LF in the distribution files.
Files:      Makefile

Patch 7.4.1024
Problem:    Interfaces for MS-Windows are outdated.
Solution:   Use Python 2.7.10, Python 3.4.4, Perl 5.22, TCL 8.6.
Files:      src/bigvim.bat

Patch 7.4.1025
Problem:    Version in installer needs to be updated manually.
Solution:   Generate a file with the version number. (Guopeng Wen)
Files:      Makefile, nsis/gvim.nsi, nsis/gvim_version.nsh

Patch 7.4.1026
Problem:    When using MingW the tests do not clean up all files.  E.g. test
            17 leaves Xdir1 behind. (Michael Soyka)
Solution:   Also delete directories, like Make_dos.mak.  Delete files after
            directories to reduce warnings.
Files:      src/testdir/Make_ming.mak, src/testdir/Make_dos.mak

Patch 7.4.1027
Problem:    No support for binary numbers.
Solution:   Add "bin" to 'nrformats'. (Jason Schulz)
Files:      runtime/doc/change.txt, runtime/doc/eval.txt,
            runtime/doc/version7.txt, src/charset.c, src/eval.c,
            src/ex_cmds.c, src/ex_getln.c, src/misc2.c, src/ops.c,
            src/option.c, src/proto/charset.pro, src/spell.c,
            src/testdir/test57.in, src/testdir/test57.ok,
            src/testdir/test58.in, src/testdir/test58.ok,
```

```
            src/testdir/test_increment.in, src/testdir/test_increment.ok,
            src/vim.h

Patch 7.4.1028
Problem:    Nsis version file missing from the distribution.
Solution:   Add the file to the list.
Files:      Filelist

Patch 7.4.1029 (after 7.4.1027)
Problem:    test_increment fails on systems with 32 bit long.
Solution:   Only test with 32 bits.
Files:      src/testdir/test_increment.in, src/testdir/test_increment.ok

Patch 7.4.1030
Problem:    test49 is still slow.
Solution:   Move more tests from old to new style.
Files:      src/testdir/test_viml.vim, src/testdir/test49.vim,
            src/testdir/test49.ok, src/testdir/runtest.vim

Patch 7.4.1031
Problem:    Can't build with Python interface using MingW.
Solution:   Update the Makefile. (Yasuhiro Matsumoto)
Files:      src/INSTALLpc.txt, src/Make_cyg_ming.mak

Patch 7.4.1032
Problem:    message from assert_false() does not look nice.
Solution:   Handle missing sourcing_name. Use right number of spaces. (Watiko)
            Don't use line number if it's zero.
Files:      src/eval.c

Patch 7.4.1033
Problem:    Memory use on MS-Windows is very conservative.
Solution:   Use the global memory status to estimate amount of memory.
            (Mike Williams)
Files:      src/os_win32.c, src/os_win32.h, src/proto/os_win32.pro

Patch 7.4.1034
Problem:    There is no test for the 'backspace' option behavior.
Solution:   Add a test. (Hirohito Higashi)
Files:      src/testdir/test_alot.vim, src/testdir/test_backspace_opt.vim

Patch 7.4.1035
Problem:    An Ex range gets adjusted for folded lines even when the range is
            not using line numbers.
Solution:   Only adjust line numbers for folding. (Christian Brabandt)
Files:      runtime/doc/fold.txt, src/ex_docmd.c

Patch 7.4.1036
Problem:    Only terminals with up to 256 colors work properly.
Solution:   Use the 256 color behavior for all terminals with 256 or more
            colors. (Robert de Bath, closes #504)
Files:      src/syntax.c

Patch 7.4.1037
```

```
Problem:    Using "q!" when there is a modified hidden buffer does not unload
            the current buffer, resulting in the need to abandon it again.
Solution:   When using "q!" unload the current buffer when needed. (Yasuhiro
            Matsumoto, Hirohito Higashi)
Files:      src/testdir/test31.in, src/testdir/test31.ok,
            runtime/doc/editing.txt, src/ex_cmds2.c, src/ex_docmd.c,
            src/gui.c, src/gui_gtk_x11.c, src/os_unix.c,
            src/proto/ex_cmds2.pro

Patch 7.4.1038
Problem:    Still get a warning for a deprecated function with gdk-pixbuf
            2.31.
Solution:   Change minimum minor version from 32 to 31.
Files:      src/configure.in, src/auto/configure

Patch 7.4.1039 (after 7.4.1037)
Problem:    Test 31 fails with small build.
Solution:   Bail out for small build. (Hirohito Higashi)
Files:      src/testdir/test31.in

Patch 7.4.1040
Problem:    The tee command is not available on MS-Windows.
Solution:   Adjust tee.c for MSVC and add a makefile. (Yasuhiro Matsumoto)
Files:      src/tee/tee.c, src/tee/Make_mvc.mak, src/Make_mvc.mak

Patch 7.4.1041
Problem:    Various small things.
Solution:   Add file to list of distributed files.  Adjust README.  Fix typo.
Files:      Filelist, src/testdir/README.txt, src/testdir/test_charsearch.in,
            src/INSTALLmac.txt

Patch 7.4.1042
Problem:    g-CTRL-G shows the word count, but there is no way to get the word
            count in a script.
Solution:   Add the wordcount() function. (Christian Brabandt)
Files:      runtime/doc/editing.txt, runtime/doc/eval.txt,
            runtime/doc/usr_41.txt, src/eval.c, src/normal.c, src/ops.c,
            src/proto/ops.pro, src/testdir/test_wordcount.in,
            src/testdir/test_wordcount.ok, src/testdir/Make_all.mak

Patch 7.4.1043
Problem:    Another small thing.
Solution:   Now really update the Mac install text.
Files:      src/INSTALLmac.txt

Patch 7.4.1044 (after 7.4.1042)
Problem:    Can't build without the +eval feature.
Solution:   Add #ifdef.
Files:      src/ops.c

Patch 7.4.1045
Problem:    Having shadow and coverage on the same build results in the source
            files not being available in the coverage view.
Solution:   Move using shadow to the normal build.
```

```
Files:      .travis.yml

Patch 7.4.1046
Problem:    No test coverage for menus.
Solution:   Load the standard menus and check there is no error.
Files:      src/testdir/test_menu.vim, src/testdir/test_alot.vim

Patch 7.4.1047 (after patch 7.4.1042)
Problem:    Tests fail on MS-Windows.
Solution:   Set 'selection' to inclusive.
Files:      src/testdir/test_wordcount.in

Patch 7.4.1048 (after patch 7.4.1047)
Problem:    Wordcount test still fail on MS-Windows.
Solution:   Set 'fileformat' to "unix".
Files:      src/testdir/test_wordcount.in

Patch 7.4.1049 (after patch 7.4.1048)
Problem:    Wordcount test still fails on MS-Windows.
Solution:   Set 'fileformats' to "unix".
Files:      src/testdir/test_wordcount.in

Patch 7.4.1050
Problem:    Warning for unused var with tiny features. (Tony Mechelynck)
Solution:   Add #ifdef.  Use vim_snprintf().  Reduce number of statements.
Files:      src/ops.c

Patch 7.4.1051
Problem:    Segfault when unletting "count".
Solution:   Check for readonly and locked first. (Dominique Pelle)
            Add a test.
Files:      src/eval.c, src/testdir/test_alot.vim, src/testdir/test_unlet.vim

Patch 7.4.1052
Problem:    Illegal memory access with weird syntax command. (Dominique Pelle)
Solution:   Check for column past end of line.
Files:      src/syntax.c

Patch 7.4.1053
Problem:    Insufficient testing for quickfix commands.
Solution:   Add a new style quickfix test. (Yegappan Lakshmanan)
Files:      src/testdir/Make_all.mak, src/testdir/test_quickfix.vim

Patch 7.4.1054
Problem:    Illegal memory access.
Solution:   Check for missing pattern. (Dominique Pelle)
Files:      src/syntax.c

Patch 7.4.1055
Problem:    Running "make newtests" in src/testdir has no output.
Solution:   List the messages file when a test fails. (Christian Brabandt)
            Update the list of tests.
Files:      src/Makefile, src/testdir/Makefile
```

```
Patch 7.4.1056
Problem:    Don't know why finding spell suggestions is slow.
Solution:   Add some code to gather profiling information.
Files:      src/spell.c

Patch 7.4.1057
Problem:    Typos in the :options window.
Solution:   Fix the typos. (Dominique Pelle)
Files:      runtime/optwin.vim

Patch 7.4.1058
Problem:    It is not possible to test code that is only reached when memory
            allocation fails.
Solution:   Add the alloc_fail() function.  Try it out with :vimgrep.
Files:      runtime/doc/eval.txt, src/globals.h, src/eval.c, src/quickfix.c,
            src/misc2.c, src/proto/misc2.pro, src/testdir/test_quickfix.vim

Patch 7.4.1059
Problem:    Code will never be executed.
Solution:   Remove the code.
Files:      src/quickfix.c

Patch 7.4.1060
Problem:    Instructions for writing tests are outdated.
Solution:   Mention Make_all.mak.  Add steps for new style tests.
Files:      src/testdir/README.txt

Patch 7.4.1061
Problem:    Compiler warning for ignoring return value of fwrite().
Solution:   Do use the return value. (idea: Charles Campbell)
Files:      src/misc2.c, src/proto/misc2.pro

Patch 7.4.1062
Problem:    Building with Ruby on MS-Windows requires a lot of arguments.
Solution:   Make it simpler. (Ken Takata)
Files:      src/Make_cyg_ming.mak, src/Make_mvc.mak

Patch 7.4.1063
Problem:    TCL_VER_LONG and DYNAMIC_TCL_VER are not set when building with
            Cygwin and MingW.
Solution:   Add TCL_VER_LONG and DYNAMIC_TCL_VER to the makefile. (Ken Takata)
Files:      src/Make_cyg_ming.mak

Patch 7.4.1064
Problem:    When a spell file has single letter compounding creating
            suggestions takes an awful long time.
Solution:   Add the NOCOMPOUNDSUGS flag.
Files:      runtime/doc/spell.txt, src/spell.c

Patch 7.4.1065
Problem:    Cannot use the "dll" options on MS-Windows.
Solution:   Support the options on all platforms.  Use the built-in name as
            the default, so that it's clear what Vim is looking for.
Files:      src/if_python.c, src/if_python3.c, src/if_lua.c, src/if_perl.xs,
```

```
            src/if_ruby.c, src/option.c, runtime/doc/options.txt, src/Makefile

Patch 7.4.1066 (after 7.4.1065)
Problem:    Build fails on MS-Windows.
Solution:   Adjust the #ifdefs for "dll" options.
Files:      src/option.h

Patch 7.4.1067 (after 7.4.1065)
Problem:    Can't build with MingW and Python on MS-Windows.
Solution:   Move the build flags to CFLAGS.
Files:      src/Make_cyg_ming.mak

Patch 7.4.1068
Problem:    Wrong way to check for unletting internal variables.
Solution:   Use a better way. (Olaf Dabrunz)
Files:      src/testdir/test_unlet.c, src/eval.c

Patch 7.4.1069
Problem:    Compiler warning for unused argument.
Solution:   Add UNUSED.
Files:      src/misc2.c

Patch 7.4.1070
Problem:    The Tcl interface can't be loaded dynamically on Unix.
Solution:   Make it possible to load it dynamically. (Ken Takata)
Files:      runtime/doc/if_tcl.txt, runtime/doc/options.txt,
            runtime/doc/quickref.txt, runtime/optwin.vim, src/Makefile,
            src/config.h.in, src/configure.in, src/auto/configure,
            src/if_tcl.c, src/option.c, src/option.h

Patch 7.4.1071
Problem:    New style tests are executed in arbitrary order.
Solution:   Sort the test function names. (Hirohito Higashi)
            Fix the quickfix test that depended on the order.
Files:      src/testdir/runtest.vim, src/testdir/test_quickfix.vim

Patch 7.4.1072
Problem:    Increment test is old style.
Solution:   Make the increment test a new style test. (Hirohito Higashi)
Files:      src/Makefile, src/testdir/Make_all.mak,
            src/testdir/test_increment.in, src/testdir/test_increment.ok,
            src/testdir/test_increment.vim

Patch 7.4.1073
Problem:    Alloc_id depends on numbers, may use the same one twice.  It's not
            clear from the number what it's for.
Solution:   Use an enum.  Add a function to lookup the enum value from the
            name.
Files:      src/misc2.c, src/vim.h, src/alloc.h, src/globals.h,
            src/testdir/runtest.vim, src/proto/misc2.pro,
            src/testdir/test_quickfix.vim

Patch 7.4.1074
Problem:    Warning from VC2015 compiler.
```

Solution: Add a type cast. (Mike Williams)
Files: src/gui_dwrite.cpp

Patch 7.4.1075
Problem: Crash when using an invalid command.
Solution: Fix generating the error message. (Dominique Pelle)
Files: src/ex_docmd.c

Patch 7.4.1076
Problem: CTRL-A does not work well in right-left mode.
Solution: Remove reversing the line, add a test. (Hirohito Higashi)
Files: src/ops.c, src/testdir/test_increment.vim

Patch 7.4.1077
Problem: The build instructions for MS-Windows are incomplete.
Solution: Add explanations for how to build with various interfaces. (Ken
            Takata)
Files: src/INSTALLpc.txt

Patch 7.4.1078
Problem: MSVC: "make clean" doesn't cleanup in the tee directory.
Solution: Add the commands to cleanup tee. (Erich Ritz)
Files: src/Make_mvc.mak

Patch 7.4.1079 (after 7.4.1073)
Problem: New include file missing from distribution. Missing changes to
            quickfix code.
Solution: Add alloc.h to the list of distributed files. Use the enum in
            quickfix code.
Files: Filelist, src/quickfix.c

Patch 7.4.1080
Problem: VS2015 has a function HandleToLong() that is shadowed by the macro
            that Vim defines.
Solution: Do not define HandleToLong() for MSVC version 1400 and later.
            (Mike Williams)
Files: src/gui_w32.c

Patch 7.4.1081
Problem: No test for what previously caused a crash.
Solution: Add test for unletting errmsg.
Files: src/testdir/test_unlet.vim

Patch 7.4.1082
Problem: The Tcl interface is always skipping memory free on exit.
Solution: Only skip for dynamically loaded Tcl.
Files: src/if_tcl.c

Patch 7.4.1083
Problem: Building GvimExt with VS2015 may fail.
Solution: Adjust the makefile. (Mike Williams)
Files: src/GvimExt/Makefile

Patch 7.4.1084

```
Problem:    Using "." to repeat CTRL-A in Visual mode increments the wrong
            numbers.
Solution:   Append right size to the redo buffer. (Ozaki Kiichi)
Files:      src/normal.c, src/testdir/test_increment.vim

Patch 7.4.1085
Problem:    The CTRL-A and CTRL-X commands do not update the '[ and '] marks.
Solution:   (Yukihiro Nakadaira)
Files:      src/ops.c, src/testdir/test_marks.in, src/testdir/test_marks.ok

Patch 7.4.1086
Problem:    Crash with an extremely long buffer name.
Solution:   Limit the return value of vim_snprintf(). (Dominique Pelle)
Files:      src/buffer.c

Patch 7.4.1087
Problem:    CTRL-A and CTRL-X do not work properly with blockwise visual
            selection if there is a mix of Tab and spaces.
Solution:   Add OP_NR_ADD and OP_NR_SUB. (Hirohito Higashi)
Files:      src/testdir/test_increment.vim, src/normal.c, src/ops.c,
            src/proto/ops.pro, src/vim.h

Patch 7.4.1088
Problem:    Coverity warns for uninitialized variables.  Only one is an actual
            problem.
Solution:   Move the conditions.  Don't use endpos if handling an error.
Files:      src/ops.c

Patch 7.4.1089
Problem:    Repeating CTRL-A doesn't work.
Solution:   Call prep_redo_cmd(). (Hirohito Higashi)
Files:      src/normal.c, src/testdir/test_increment.vim

Patch 7.4.1090
Problem:    No tests for :hardcopy and related options.
Solution:   Add test_hardcopy.
Files:      src/testdir/test_hardcopy.vim, src/Makefile,
            src/testdir/Make_all.mak

Patch 7.4.1091
Problem:    When making a change while need_wait_return is set there is a two
            second delay.
Solution:   Do not assume the ATTENTION prompt was given when need_wait_return
            was set already.
Files:      src/misc1.c

Patch 7.4.1092
Problem:    It is not simple to test for an exception and give a proper error
            message.
Solution:   Add assert_exception().
Files:      src/eval.c, runtime/doc/eval.txt

Patch 7.4.1093
Problem:    Typo in test goes unnoticed.
```

```
Solution:   Fix the typo. Give error for wrong arguments to cursor().
            (partly by Hirohito Higashi) Add a test for cursor().
Files:      src/testdir/test_searchpos.vim, src/testdir/test_cursor_func.vim,
            src/eval.c, src/testdir/test_alot.vim

Patch 7.4.1094
Problem:    Test for :hardcopy fails on MS-Windows.
Solution:   Check for the +postscript feature.
Files:      src/testdir/test_hardcopy.vim

Patch 7.4.1095
Problem:    Can't build GvimExt with SDK 7.1.
Solution:   Support using setenv.bat instead of vcvars32.bat. (Ken Takata)
Files:      src/Make_mvc.mak, src/GvimExt/Makefile

Patch 7.4.1096
Problem:    Need several lines to verify a command produces an error.
Solution:   Add assert_fails(). (suggested by Nikolai Pavlov)
            Make the quickfix alloc test actually work.
Files:      src/testdir/test_quickfix.vim, src/eval.c, runtime/doc/eval.txt,
            src/misc2.c, src/alloc.h

Patch 7.4.1097
Problem:    Looking up the alloc ID for tests fails.
Solution:   Fix the line computation.  Use assert_fails() for unlet test.
Files:      src/testdir/runtest.vim, src/testdir/test_unlet.vim

Patch 7.4.1098
Problem:    Still using old style C function declarations.
Solution:   Always define __ARGS() to include types.  Turn a few functions
            into ANSI style to find out if this causes problems for anyone.
Files:      src/vim.h, src/os_unix.h, src/eval.c, src/main.c

Patch 7.4.1099
Problem:    It's not easy to know if Vim supports blowfish. (Smu Johnson)
Solution:   Add has('crypt-blowfish') and has('crypt-blowfish2').
Files:      src/eval.c

Patch 7.4.1100
Problem:    Cygwin makefiles are unused.
Solution:   Remove them.
Files:      src/GvimExt/Make_ming.mak, src/GvimExt/Make_cyg.mak,
            src/xxd/Make_ming.mak, src/xxd/Make_cyg.mak

Patch 7.4.1101
Problem:    With 'rightleft' and concealing the cursor may move to the wrong
            position.
Solution:   Compute the column differently when 'rightleft' is set. (Hirohito
            Higashi)
Files:      src/screen.c

Patch 7.4.1102
Problem:    Debugger has no stack backtrace support.
Solution:   Add "backtrace", "frame", "up" and "down" commands. (Alberto
```

            Fanjul, closes #433)
Files: runtime/doc/repeat.txt, src/eval.c, src/ex_cmds2.c, src/globals.h,
            src/testdir/Make_all.mak, src/testdir/test108.in,
            src/testdir/test108.ok

Patch 7.4.1103 (after 7.4.1100)
Problem: Removed file still in distribution.
Solution: Remove Make_cyg.mak from the list of files.
Files: Filelist

Patch 7.4.1104
Problem: Various problems building with MzScheme/Racket.
Solution: Make it work with new versions of Racket. (Yukihiro Nakadaira, Ken
            Takata)
Files: runtime/doc/if_mzsch.txt, src/INSTALLpc.txt,
            src/Make_cyg_ming.mak, src/Make_mvc.mak, src/auto/configure,
            src/configure.in, src/if_mzsch.c

Patch 7.4.1105
Problem: When using slices there is a mixup of variable name and namespace.
Solution: Recognize variables that can't be a namespace. (Hirohito Higashi)
Files: src/eval.c, src/testdir/test_eval.in, src/testdir/test_eval.ok

Patch 7.4.1106
Problem: The nsis script can't be used from the appveyor build.
Solution: Add "ifndef" to allow for variables to be set from the command
            line. Remove duplicate SetCompressor command. Support using other
            gettext binaries. (Ken Takata) Update build instructions to use
            libintl-8.dll.
Files: Makefile, nsis/gvim.nsi, src/os_win32.c, src/proto/os_win32.pro,
            src/main.c, os_w32exe.c

Patch 7.4.1107
Problem: Vim can create a directory but not delete it.
Solution: Add an argument to delete() to make it possible to delete a
            directory, also recursively.
Files: src/fileio.c, src/eval.c, src/proto/fileio.pro,
            src/testdir/test_delete.vim, src/testdir/test_alot.vim,
            runtime/doc/eval.txt

Patch 7.4.1108
Problem: Expanding "~" halfway a file name.
Solution: Handle the file name as one name. (Marco Hinz) Add a test.
            Closes #564.
Files: src/testdir/test27.in, src/testdir/test27.ok,
            src/testdir/test_expand.vim, src/testdir/test_alot.vim,
            src/Makefile, src/misc2.c

Patch 7.4.1109 (after 7.4.1107)
Problem: MS-Windows doesn't have rmdir().
Solution: Add mch_rmdir().
Files: src/os_win32.c, src/proto/os_win32.pro

Patch 7.4.1110

```
Problem:    Test 108 fails when language is French.
Solution:   Force English messages. (Dominique Pelle)
Files:      src/testdir/test108.in

Patch 7.4.1111
Problem:    test_expand fails on MS-Windows.
Solution:   Always use forward slashes.  Remove references to test27.
Files:      src/testdir/runtest.vim, src/testdir/test_expand.vim,
            src/testdir/Make_dos.mak, src/testdir/Make_all.mak,
            src/testdir/Make_amiga.mak, src/testdir/Make_ming.mak

Patch 7.4.1112
Problem:    When using ":next" with an illegal file name no error is reported.
Solution:   Give an error message.
Files:      src/ex_cmds2.c

Patch 7.4.1113 (after 7.4.1105)
Problem:    Using {ns} in variable name does not work. (lilydjwg)
Solution:   Fix recognizing colon.  Add a test.
Files:      src/eval.c, src/testdir/test_viml.vim

Patch 7.4.1114 (after 7.4.1107)
Problem:    delete() does not work well with symbolic links.
Solution:   Recognize symbolic links.
Files:      src/eval.c, src/fileio.c, src/os_unix.c, src/proto/os_unix.pro,
            src/testdir/test_delete.vim, runtime/doc/eval.txt

Patch 7.4.1115
Problem:    MS-Windows: make clean in testdir doesn't clean everything.
Solution:   Add command to delete X* directories. (Ken Takata)
Files:      src/testdir/Make_dos.mak

Patch 7.4.1116
Problem:    delete(x, 'rf') does not delete files starting with a dot.
Solution:   Also delete files starting with a dot.
Files:      src/misc1.c, src/fileio.c, src/vim.h

Patch 7.4.1117 (after 7.4.1116)
Problem:    No longer get "." and ".." in directory list.
Solution:   Do not skip "." and ".." unless EW_DODOT is set.
Files:      src/misc1.c

Patch 7.4.1118
Problem:    Tests hang in 24 line terminal.
Solution:   Set the 'more' option off.
Files:      src/testdir/runtest.vim

Patch 7.4.1119
Problem:    argidx() has a wrong value after ":%argdelete". (Yegappan
            Lakshmanan)
Solution:   Correct the value of w_arg_idx.  Add a test.
Files:      src/ex_cmds2.c, src/testdir/test_arglist.vim,
            src/testdir/Make_all.mak
```

```
Patch 7.4.1120
Problem:    delete(x, 'rf') fails if a directory is empty. (Lcd)
Solution:   Ignore not finding matches in an empty directory.
Files:      src/fileio.c, src/misc1.c, src/vim.h, src/testdir/test_delete.vim

Patch 7.4.1121
Problem:    test_expand leaves files behind.
Solution:   Edit another file before deleting, otherwise the swap file
            remains.
Files:      src/testdir/test_expand.vim

Patch 7.4.1122
Problem:    Test 92 and 93 fail when using gvim on a system with a non utf-8
            locale.
Solution:   Avoid using .gvimrc by adding -U NONE. (Yukihiro Nakadaira)
Files:      src/testdir/Make_dos.mak, src/testdir/Make_ming.mak,
            src/testdir/Make_vms.mms, src/testdir/Makefile

Patch 7.4.1123
Problem:    Using ":argadd" when there are no arguments results in the second
            argument to be the current one. (Yegappan Lakshmanan)
Solution:   Correct the w_arg_idx value.
Files:      src/ex_cmds2.c, src/testdir/test_arglist.vim

Patch 7.4.1124
Problem:    MS-Windows: dead key behavior is not ideal.
Solution:   Handle dead keys differently when not in Insert or Select mode.
            (John Wellesz, closes #399)
Files:      src/gui_w48.c

Patch 7.4.1125
Problem:    There is no perleval().
Solution:   Add perleval(). (Damien)
Files:      runtime/doc/eval.txt, runtime/doc/usr_41.txt, src/eval.c,
            src/if_perl.xs, src/proto/if_perl.pro, src/testdir/Make_all.mak,
            src/testdir/test_perl.vim

Patch 7.4.1126
Problem:    Can only get the directory of the current window.
Solution:   Add window and tab arguments to getcwd() and haslocaldir().
            (Thinca, Hirohito Higashi)
Files:      src/Makefile, src/testdir/Make_all.mak,
            src/testdir/test_getcwd.in, src/testdir/test_getcwd.ok,
            runtime/doc/eval.txt, patching file src/eval.c

Patch 7.4.1127
Problem:    Both old and new style tests for Perl.
Solution:   Merge the old tests with the new style tests.
Files:      src/Makefile, src/testdir/Make_all.mak, src/testdir/test_perl.in,
            src/testdir/test_perl.ok, src/testdir/test_perl.vim

Patch 7.4.1128
Problem:    MS-Windows: delete() does not recognize junctions.
Solution:   Add mch_isrealdir() for MS-Windows. Update mch_is_symbolic_link().
```

```
            (Ken Takata)
Files:      src/fileio.c, src/os_win32.c, src/proto/os_win32.pro

Patch 7.4.1129
Problem:    Python None value can't be converted to a Vim value.
Solution:   Just use zero. (Damien)
Files:      src/if_py_both.h, src/testdir/test86.in, src/testdir/test86.ok,
            src/testdir/test87.in, src/testdir/test87.ok,

Patch 7.4.1130
Problem:    Memory leak in :vimgrep.
Solution:   Call FreeWild(). (Yegappan Lakshmanan)
Files:      src/quickfix.c

Patch 7.4.1131
Problem:    New lines in the viminfo file are dropped.
Solution:   Copy lines starting with "|".  Fix that when using :rviminfo in a
            function global variables were restored as function-local
            variables.
Files:      src/eval.c, src/structs.h, src/ex_cmds.c, src/misc2.c,
            src/proto/misc2.pro, src/testdir/test_viminfo.vim,
            src/testdir/Make_all.mak, src/testdir/test74.in,
            src/testdir/test74.ok

Patch 7.4.1132
Problem:    Old style tests for the argument list.
Solution:   Add more new style tests. (Yegappan Lakshmanan)
Files:      src/testdir/test_arglist.vim, src/testdir/test_argument_0count.in,
            src/testdir/test_argument_0count.ok,
            src/testdir/test_argument_count.in, src/Makefile,
            src/testdir/test_argument_count.ok, src/testdir/Make_all.mak

Patch 7.4.1133
Problem:    Generated function prototypes still have __ARGS().
Solution:   Generate function prototypes without __ARGS().
Files:      src/Makefile, src/if_ruby.c, src/os_win32.c,
            src/proto/blowfish.pro, src/proto/buffer.pro,
            src/proto/charset.pro, src/proto/crypt.pro,
            src/proto/crypt_zip.pro, src/proto/diff.pro,
            src/proto/digraph.pro, src/proto/edit.pro, src/proto/eval.pro,
            src/proto/ex_cmds2.pro, src/proto/ex_cmds.pro,
            src/proto/ex_docmd.pro, src/proto/ex_eval.pro,
            src/proto/ex_getln.pro, src/proto/fileio.pro, src/proto/fold.pro,
            src/proto/getchar.pro, src/proto/gui_athena.pro,
            src/proto/gui_beval.pro, src/proto/gui_gtk_gresources.pro,
            src/proto/gui_gtk.pro, src/proto/gui_gtk_x11.pro,
            src/proto/gui_mac.pro, src/proto/gui_motif.pro,
            src/proto/gui_photon.pro, src/proto/gui.pro,
            src/proto/gui_w16.pro, src/proto/gui_w32.pro,
            src/proto/gui_x11.pro, src/proto/gui_xmdlg.pro,
            src/proto/hangulin.pro, src/proto/hardcopy.pro,
            src/proto/hashtab.pro, src/proto/if_cscope.pro,
            src/proto/if_lua.pro, src/proto/if_mzsch.pro,
            src/proto/if_ole.pro, src/proto/if_perl.pro,
```

```
            src/proto/if_perlsfio.pro, src/proto/if_python3.pro,
            src/proto/if_python.pro, src/proto/if_ruby.pro,

            src/proto/sha256.pro, src/proto/spell.pro, src/proto/syntax.pro,
            src/proto/tag.pro, src/proto/termlib.pro, src/proto/term.pro,
            src/proto/ui.pro, src/proto/undo.pro, src/proto/version.pro,
            src/proto/winclip.pro, src/proto/window.pro,
            src/proto/workshop.pro

Patch 7.4.1134
Problem:    The arglist test fails on MS-Windows.
Solution:   Only check for failure of argedit on Unix.
Files:      src/testdir/test_arglist.vim

Patch 7.4.1135
Problem:    One more arglist test fails on MS-Windows.
Solution:   Don't edit "Y" after editing "y".
Files:      src/testdir/test_arglist.vim

Patch 7.4.1136
Problem:    Wrong argument to assert_exception() causes a crash. (reported by
            Coverity)
Solution:   Check for NULL pointer.  Add a test.
Files:      src/eval.c, src/testdir/test_assert.vim

Patch 7.4.1137
Problem:    Illegal memory access when using :copen and :cclose.
Solution:   Avoid that curbuf is invalid. (suggestion by Justin M. Keyes)
            Add a test.
Files:      src/window.c, src/testdir/test_quickfix.vim

Patch 7.4.1138
Problem:    When running gvim in the foreground some icons are missing.
            (Taylor Venable)
Solution:   Move the call to gui_gtk_register_resource(). (Kazunobu Kuriyama)
Files:      src/gui_gtk_x11.c

Patch 7.4.1139
Problem:    MS-Windows: getftype() returns "file" for symlink to directory.
Solution:   Make it return "dir". (Ken Takata)
Files:      src/os_mswin.c

Patch 7.4.1140
```

```
Problem:    Recognizing <sid> does not work when the language is Turkish.
            (Christian Brabandt)
Solution:   Use MB_STNICMP() instead of STNICMP().
Files:      src/eval.c

Patch 7.4.1141
Problem:    Using searchpair() with a skip expression that uses syntax
            highlighting sometimes doesn't work. (David Fishburn)
Solution:   Reset next_match_idx. (Christian Brabandt)
Files:      src/syntax.c

Patch 7.4.1142
Problem:    Cannot define keyword characters for a syntax file.
Solution:   Add the ":syn iskeyword" command. (Christian Brabandt)
Files:      runtime/doc/options.txt, runtime/doc/syntax.txt, src/buffer.c,
            src/option.c, src/structs.h, src/syntax.c,
            src/testdir/Make_all.mak, src/testdir/test_syntax.vim

Patch 7.4.1143
Problem:    Can't sort on floating point numbers.
Solution:   Add the "f" flag to ":sort".  (Alex Jakushev)  Also add the "f"
            flag to sort().
Files:      runtime/doc/change.txt, src/ex_cmds.c, src/testdir/test_sort.vim,
            src/testdir/test57.in, src/testdir/test57.ok, src/eval.c

Patch 7.4.1144 (after 7.4.1143)
Problem:    Can't build on several systems.
Solution:   Include float.h. (Christian Robinson, closes #570 #571)
Files:      src/ex_cmds.c

Patch 7.4.1145
Problem:    Default features are conservative.
Solution:   Make the default feature set for most of today's systems "huge".
Files:      src/feature.h, src/configure.in, src/auto/configure

Patch 7.4.1146
Problem:    Can't build with Python 3 interface using MingW.
Solution:   Update the Makefile. (Yasuhiro Matsumoto, Ken Takata)
Files:      src/Make_cyg_ming.mak

Patch 7.4.1147
Problem:    Conflict for "chartab". (Kazunobu Kuriyama)
Solution:   Rename the global one to something less obvious.  Move it into
            src/chartab.c.
Files:      src/macros.h, src/globals.h, src/charset.c, src/main.c,
            src/option.c, src/screen.c, src/vim.h

Patch 7.4.1148
Problem:    Default for MingW and Cygwin is still "normal".
Solution:   Use "huge" as default. (Ken Takata)
Files:      src/Make_cyg_ming.mak, src/Make_mvc.mak

Patch 7.4.1149 (after 7.4.1013)
Problem:    Using the local value of 'errorformat' causes more problems than
```

```
            it solves.
Solution:   Revert 7.4.1013.
Files:      runtime/doc/quickfix.txt, src/quickfix.c

Patch 7.4.1150
Problem:    'langmap' applies to the first character typed in Select mode.
            (David Watson)
Solution:   Check for SELECTMODE. (Christian Brabandt, closes #572)
            Add the 'x' flag to feedkeys().
Files:      src/getchar.c, src/normal.c, src/testdir/test_langmap.vim,
            src/ex_docmd.c, src/proto/ex_docmd.pro, src/testdir/Make_all.mak,
            runtime/doc/eval.txt

Patch 7.4.1151 (after 7.4.1150)
Problem:    Missing change to eval.c
Solution:   Also change feedkeys().
Files:      src/eval.c

Patch 7.4.1152
Problem:    Langmap test fails with normal build.
Solution:   Check for +langmap feature.
Files:      src/testdir/test_langmap.vim

Patch 7.4.1153
Problem:    Autocommands triggered by quickfix cannot always get the current
            title value.
Solution:   Call qf_fill_buffer() later. (Christian Brabandt)
Files:      src/quickfix.c, src/testdir/test_quickfix.vim

Patch 7.4.1154
Problem:    No support for JSON.
Solution:   Add jsonencode() and jsondecode().  Also add v:false, v:true,
            v:null and v:none.
Files:      src/json.c, src/eval.c, src/proto.h, src/structs.h, src/vim.h,
            src/if_lua.c, src/if_mzsch.c, src/if_ruby.c, src/if_py_both.h,
            src/globals.h, src/Makefile, src/Make_bc3.mak, src/Make_bc5.mak,
            src/Make_cyg_ming.mak, src/Make_dice.mak, src/Make_ivc.mak,
            src/Make_manx.mak, src/Make_morph.mak, src/Make_mvc.mak,
            src/Make_sas.mak, src/Make_vms.mms, src/proto/json.pro,
            src/proto/eval.pro, src/testdir/test_json.vim,
            src/testdir/test_alot.vim, Filelist, runtime/doc/eval.txt

Patch 7.4.1155
Problem:    Build with normal features fails.
Solution:   Always define dict_lookup().
Files:      src/eval.c

Patch 7.4.1156
Problem:    Coverity warns for NULL pointer and ignoring return value.
Solution:   Check for NULL pointer. When dict_add() returns FAIL free the item.
Files:      src/json.c

Patch 7.4.1157
Problem:    type() does not work for v:true, v:none, etc.
```

```
Solution:   Add new type numbers.
Files:      src/eval.c, src/testdir/test_json.vim, src/testdir/test_viml.vim

Patch 7.4.1158
Problem:    Still using __ARGS().
Solution:   Remove __ARGS() from eval.c
Files:      src/eval.c

Patch 7.4.1159
Problem:    Automatically generated function prototypes use __ARGS.
Solution:   Remove __ARGS from osdef.sh.
Files:      src/osdef.sh, src/osdef1.h.in, src/osdef2.h.in

Patch 7.4.1160
Problem:    No error for jsondecode('"').
Solution:   Give an error message for missing double quote.
Files:      src/json.c

Patch 7.4.1161
Problem:    ":argadd" without argument is supposed to add the current buffer
            name to the arglist.
Solution:   Make it work as documented. (Coot, closes #577)
Files:      src/ex_cmds.h, src/ex_cmds2.c, src/testdir/test_arglist.vim

Patch 7.4.1162
Problem:    Missing error number in MzScheme. (Dominique Pelle)
Solution:   Add a proper error number.
Files:      src/if_mzsch.c

Patch 7.4.1163
Problem:    Expressions "0 + v:true" and "'' . v:true" cause an error.
Solution:   Return something sensible when using a special variable as a
            number or as a string. (suggested by Damien)
Files:      src/eval.c, src/testdir/test_viml.vim

Patch 7.4.1164
Problem:    No tests for comparing special variables.  Error in jsondecode()
            not reported.  test_json does not work with Japanese system.
Solution:   Set scriptencoding. (Ken Takata) Add a few more tests. Add error.
Files:      src/json.c, src/testdir/test_viml.vim, src/testdir/test_json.vim

Patch 7.4.1165
Problem:    When defining DYNAMIC_ICONV_DLL in the makefile, the build fails.
Solution:   Add #ifdef's. (Taro Muraoka)  Try the newer version first.
Files:      src/mbyte.c, src/os_win32.c

Patch 7.4.1166
Problem:    Can't encode a Funcref into JSON.  jsonencode() doesn't handle the
            same list or dict twice properly.  (Nikolai Pavlov)
Solution:   Give an error.  Reset copyID when the list or dict is finished.
Files:      src/json.c, src/proto/json.pro, src/testdir/test_json.vim

Patch 7.4.1167
Problem:    No tests for "is" and "isnot" with the new variables.
```

```
Solution:   Add tests.
Files:      src/testdir/test_viml.vim

Patch 7.4.1168
Problem:    This doesn't give the right result: eval(string(v:true)). (Nikolai
            Pavlov)
Solution:   Make the string "v:true" instead of "true".
Files:      src/eval.c, src/testdir/test_viml.vim

Patch 7.4.1169
Problem:    The socket I/O is intertwined with the netbeans code.
Solution:   Start refactoring the netbeans communication to split off the
            socket I/O.  Add the +channel feature.
Files:      src/channel.c, src/netbeans.c, src/proto/channel.pro,
            src/proto/netbeans.pro, src/proto/gui_w32.pro, src/gui_w32.c,
            src/eval.c, src/os_mswin.c, src/ui.c, src/macros.h, Makefile,
            src/proto.h, src/feature.h, src/os_unix.c, src/vim.h,
            src/configure.in, src/auto/configure, src/config.mk.in,
            src/config.aap.in, src/config.h.in, src/Make_bc5.mak,
            src/Make_cyg_ming.mak, src/Make_mvc.mak

Patch 7.4.1170 (after 7.4.1169)
Problem:    Missing changes in src/Makefile, Filelist.
Solution:   Add the missing changes.
Files:      Filelist, src/Makefile

Patch 7.4.1171
Problem:    Makefile dependencies are outdated.
Solution:   Run "make depend". Add GTK resource dependencies.
Files:      src/Makefile

Patch 7.4.1172 (after 7.4.1169)
Problem:    Configure is overly positive.
Solution:   Insert "test".
Files:      src/configure.in, src/auto/configure

Patch 7.4.1173 (after 7.4.1168)
Problem:    No test for new behavior of v:true et al.
Solution:   Add a test.
Files:      src/testdir/test_viml.vim

Patch 7.4.1174
Problem:    Netbeans contains dead code inside #ifndef INIT_SOCKETS.
Solution:   Remove the dead code.
Files:      src/netbeans.c

Patch 7.4.1175 (after 7.4.1169)
Problem:    Can't build with Mingw and Cygwin.
Solution:   Remove extra "endif". (Christian J. Robinson)
Files:      src/Make_cyg_ming.mak

Patch 7.4.1176
Problem:    Missing change to proto file.
Solution:   Update the proto file. (Charles Cooper)
```

```
Files:      src/proto/gui_w32.pro

Patch 7.4.1177
Problem:    The +channel feature is not in :version output. (Tony Mechelynck)
Solution:   Add the feature string.
Files:      src/version.c

Patch 7.4.1178
Problem:    empty() doesn't work for the new special variables.
Solution:   Make empty() work. (Damien)
Files:      src/eval.c, src/testdir/test_viml.vim

Patch 7.4.1179
Problem:    test_writefile and test_viml do not delete the tempfile.
Solution:   Delete the tempfile. (Charles Cooper)  Add DeleteTheScript().
Files:      src/testdir/test_writefile.in, src/testdir/test_viml.vim

Patch 7.4.1180
Problem:    Crash with invalid argument to glob2regpat().
Solution:   Check for NULL. (Justin M. Keyes, closes #596)  Add a test.
Files:      src/eval.c, src/testdir/test_glob2regpat.vim,
            src/testdir/test_alot.vim

Patch 7.4.1181
Problem:    free_tv() can't handle special variables. (Damien)
Solution:   Add the variable type.
Files:      src/eval.c, src/testdir/test_viml.vim

Patch 7.4.1182
Problem:    Still socket code intertwined with netbeans.
Solution:   Move code from netbeans.c to channel.c
Files:      src/channel.c, src/netbeans.c, src/proto/channel.pro,
            src/proto/netbeans.pro, src/gui.c, src/gui_w48.c

Patch 7.4.1183 (after 7.4.1182)
Problem:    MS-Windows build is broken.
Solution:   Remove init in wrong place.
Files:      src/channel.c

Patch 7.4.1184 (after 7.4.1182)
Problem:    MS-Windows build is still broken.
Solution:   Change nbsock to ch_fd.
Files:      src/channel.c

Patch 7.4.1185
Problem:    Can't build with TCL on some systems.
Solution:   Rename the channel_ functions.
Files:      src/if_tcl.c

Patch 7.4.1186
Problem:    Error messages for security context are hard to translate.
Solution:   Use one string with %s. (Ken Takata)
Files:      src/os_unix.c
```

```
Patch 7.4.1187
Problem:    MS-Windows channel code only supports one channel.  Doesn't build
            without netbeans support.
Solution:   Get the channel index from the socket in the message. Closes #600.
Files:      src/channel.c, src/netbeans.c, src/gui_w48.c,
            src/proto/channel.pro, src/proto/netbeans.pro

Patch 7.4.1188
Problem:    Using older JSON standard.
Solution:   Update the link.  Adjust the text a bit.
Files:      src/json.c, runtime/doc/eval.txt

Patch 7.4.1189 (after 7.4.1165)
Problem:    Using another language on MS-Windows does not work. (Yongwei Wu)
Solution:   Undo the change to try loading libintl-8.dll first.
Files:      src/os_win32.c

Patch 7.4.1190
Problem:    On OSX the default flag for dlopen() is different.
Solution:   Add RTLD_LOCAL in the configure check. (sv99, closes #604)
Files:      src/configure.in, src/auto/configure

Patch 7.4.1191
Problem:    The channel feature isn't working yet.
Solution:   Add the connect(), disconnect(), sendexpr() and sendraw()
            functions.  Add initial documentation.  Add a demo server.
Files:      src/channel.c, src/eval.c, src/proto/channel.pro,
            src/proto/eval.pro, runtime/doc/channel.txt, runtime/doc/eval.txt,
            runtime/doc/Makefile, runtime/tools/demoserver.py

Patch 7.4.1192
Problem:    Can't build with FEAT_EVAL but without FEAT_MBYTE. (John
            Marriott)
Solution:   Add #ifdef for FEAT_MBYTE.
Files:      src/json.c

Patch 7.4.1193
Problem:    Can't build the channel feature on MS-Windows.
Solution:   Add #ifdef HAVE_POLL.
Files:      src/channel.c

Patch 7.4.1194
Problem:    Compiler warning for not using return value of fwrite().
Solution:   Return OK/FAIL. (Charles Campbell)
Files:      src/channel.c, src/proto/channel.pro

Patch 7.4.1195
Problem:    The channel feature does not work in the MS-Windows console.
Solution:   Add win32 console support. (Yasuhiro Matsumoto)
Files:      src/channel.c, src/gui_w32.c, src/os_mswin.c, src/os_win32.c,
            src/proto/gui_w32.pro, src/proto/os_mswin.pro, src/vim.h

Patch 7.4.1196
Problem:    Still using __ARGS.
```

```
Solution:   Remove __ARGS in several files. (script by Hirohito Higashi)
Files:      src/arabic.c, src/buffer.c, src/charset.c, src/crypt_zip.c,
            src/diff.c, src/digraph.c, src/edit.c, src/ex_cmds.c,
            src/ex_cmds2.c, src/ex_docmd.c

Patch 7.4.1197
Problem:    Still using __ARGS.
Solution:   Remove __ARGS in several files. (script by Hirohito Higashi)
Files:      src/ex_eval.c, src/ex_getln.c, src/farsi.c, src/fileio.c,
            src/fold.c, src/getchar.c, src/gui.c, src/gui_at_fs.c,
            gui_at_sb.c, src/gui_athena.c, src/gui_beval.c, src/gui_motif.c,
            src/gui_w32.c, src/gui_w48.c

Patch 7.4.1198
Problem:    Still using __ARGS.
Solution:   Remove __ARGS in several files. (script by Hirohito Higashi)
            Also remove use of HAVE_STDARG_H.
Files:      src/gui_x11.c, src/hangulin.c, src/hardcopy.c, src/hashtab.c,
            src/if_cscope.c, src/if_python3.c, src/if_sniff.c,
            src/if_xcmdsrv.c, src/main.c, src/mark.c, src/mbyte.c,
            src/memfile.c, src/memfile_test.c, src/memline.c, src/menu.c,
            src/message.c, src/misc1.c, src/misc2.c, src/move.c,
            src/netbeans.c, src/normal.c

Patch 7.4.1199
Problem:    Still using __ARGS.
Solution:   Remove __ARGS in several files. (script by Hirohito Higashi)
Files:      src/ops.c, src/option.c, src/os_amiga.c, src/os_mac_conv.c,
            src/os_unix.c, src/os_vms.c, src/os_w32exe.c, src/popupmnu.c,
            src/pty.c, src/quickfix.c, src/regexp.c, src/regexp_nfa.c,
            src/screen.c, src/search.c, src/sha256.c, src/spell.c,
            src/syntax.c, src/tag.c, src/term.c, src/termlib.c, src/ui.c,
            src/undo.c, src/version.c, src/window.c

Patch 7.4.1200
Problem:    Still using __ARGS.
Solution:   Remove __ARGS in several files. (script by Hirohito Higashi)
Files:      src/blowfish.c, src/ex_cmds2.c, src/ex_getln.c, src/fold.c,
            src/gui_beval.c, src/gui_w32.c, src/os_unix.c, src/os_win16.c,
            src/pty.c, src/regexp.c, src/syntax.c, src/xpm_w32.c,
            src/ex_cmds.h, src/globals.h, src/gui_at_sb.h, src/gui_beval.h,
            src/if_cscope.h, src/if_sniff.h, src/nbdebug.h, src/os_unix.h,
            src/proto.h, src/structs.h, src/vim.h, src/xpm_w32.h,
            src/if_perl.xs, src/proto/if_lua.pro, src/proto/pty.pro,
            runtime/tools/xcmdsrv_client.c,
            src/Makefile

Patch 7.4.1201
Problem:    One more file still using __ARGS.
Solution:   Remove __ARGS in the last file. (script by Hirohito Higashi)
Files:      src/gui_at_sb.c

Patch 7.4.1202
Problem:    Still one more file still using __ARGS.
```

```
Solution:   Remove __ARGS in the last file. (script by Hirohito Higashi)
            (closes #612)
Files:      src/proto/os_mac_conv.pro, src/os_mac_conv.c, src/Makefile

Patch 7.4.1203
Problem:    Still more files still using __ARGS.
Solution:   Remove __ARGS in really the last files.
Files:      src/proto/if_mzsch.pro, src/if_mzsch.c, src/vim.h,
            src/proto/gui_gtk_gresources.pro, src/proto/gui_mac.pro,
            src/proto/if_ole.pro, src/proto/os_qnx.pro, src/Makefile

Patch 7.4.1204
Problem:    Latin1 characters cause encoding conversion.
Solution:   Remove the characters.
Files:      src/gui_motif.c

Patch 7.4.1205
Problem:    Using old style function declarations.
Solution:   Change to new style function declarations. (script by Hirohito
            Higashi)
Files:      src/arabic.c, src/blowfish.c, src/buffer.c, src/channel.c,
            src/charset.c, src/crypt.c, src/crypt_zip.c, src/diff.c,
            src/digraph.c, src/edit.c, src/eval.c

Patch 7.4.1206
Problem:    Using old style function declarations.
Solution:   Change to new style function declarations. (script by Hirohito
            Higashi)
Files:      src/ex_cmds.c, src/ex_cmds2.c, src/ex_docmd.c, src/ex_eval.c,
            src/ex_getln.c, src/farsi.c, src/fileio.c

Patch 7.4.1207
Problem:    Using old style function declarations.
Solution:   Change to new style function declarations. (script by Hirohito
            Higashi)
Files:      src/fold.c, src/getchar.c, src/gui_at_fs.c, src/gui_athena.c,
            src/gui_at_sb.c, src/gui_beval.c, src/gui.c, src/gui_gtk.c,
            src/gui_gtk_x11.c, src/gui_mac.c, src/gui_motif.c

Patch 7.4.1208
Problem:    Using old style function declarations.
Solution:   Change to new style function declarations. (script by Hirohito
            Higashi)
Files:      src/gui_photon.c, src/gui_w32.c, src/gui_w48.c, src/gui_x11.c,
            src/hangulin.c, src/hardcopy.c, src/hashtab.c, src/if_cscope.c,
            src/if_mzsch.c, src/if_perlsfio.c, src/if_python.c,
            src/if_python3.c, src/if_ruby.c, src/if_sniff.c, src/if_tcl.c,
            src/if_xcmdsrv.c, src/integration.c

Patch 7.4.1209 (after 7.4.1207)
Problem:    Can't build with Athena. (Elimar Riesebieter)
Solution:   Fix function declarations.
Files:      src/gui_athena.c, src/gui_x11.c, src/gui_at_sb.c, src/gui_at_fs.c
```

```
Patch 7.4.1210
Problem:    Using old style function declarations.
Solution:   Change to new style function declarations. (script by Hirohito
            Higashi)
Files:      src/main.c, src/mark.c, src/mbyte.c, src/memfile.c,
            src/memfile_test.c, src/memline.c, src/menu.c, src/message.c

Patch 7.4.1211
Problem:    Using old style function declarations.
Solution:   Change to new style function declarations. (script by Hirohito
            Higashi)
Files:      src/misc1.c, src/misc2.c, src/move.c, src/netbeans.c,
            src/normal.c, src/ops.c, src/option.c

Patch 7.4.1212 (after 7.4.1207)
Problem:    Can't build with Motif.
Solution:   Fix function declaration.(Dominique Pelle)
Files:      src/gui_motif.c

Patch 7.4.1213
Problem:    Using old style function declarations.
Solution:   Change to new style function declarations. (script by Hirohito
            Higashi)
Files:      src/os_amiga.c, src/os_mac_conv.c, src/os_msdos.d, src/os_mswin.c,
            src/os_qnx.c, src/os_unix.c, src/os_vms.c, src/os_win16.c,
            src/os_win32.c, src/popupmnu.c, src/pty.c, src/quickfix.c,
            src/regexp.c, src/regexp_nfa.c, src/screen.c

Patch 7.4.1214
Problem:    Using old style function declarations.
Solution:   Change to new style function declarations. (script by Hirohito
            Higashi)
Files:      src/search.c, src/sha256.c, src/spell.c, src/syntax.c, src/tag.c,
            src/term.c, src/termlib.c, src/ui.c, src/undo.c

Patch 7.4.1215
Problem:    Using old style function declarations.
Solution:   Change to new style function declarations. (script by Hirohito
            Higashi)
Files:      src/version.c, src/winclip.c, src/window.c, src/workshop.c,
            src/xpm_w32.c, runtime/doc/doctags.c,
            runtime/tools/xcmdsrv_client.c, src/po/sjiscorr.c, src/xxd/xxd.c

Patch 7.4.1216
Problem:    Still using HAVE_STDARG_H.
Solution:   Assume it's always defined.
Files:      src/eval.c, src/misc2.c, src/vim.h, src/proto.h, src/configure.in,
            src/auto/configure, config.h.in, src/os_amiga.h, src/os_msdos.h,
            src/os_vms_conf.h, src/os_win32.h

Patch 7.4.1217
Problem:    Execution of command on channel doesn't work yet.
Solution:   Implement the "ex" and "normal" commands.
Files:      src/channel.c, src/proto/channel.pro, src/misc2.c, src/eval.c,
```

```
            src/ex_docmd.c, src/proto/ex_docmd.pro, src/feature.h

Patch 7.4.1218
Problem:    Missing change in configure.  More changes for function style.
Solution:   Avoid the typos.
Files:      src/configure.in, src/config.h.in, runtime/tools/ccfilter.c,
            src/os_msdos.c

Patch 7.4.1219
Problem:    Build fails with +channel but without +float.
Solution:   Add #ifdef.
Files:      src/ex_cmds.c

Patch 7.4.1220
Problem:    Warnings for unused variables in tiny build. (Tony Mechelynck)
Solution:   Move declarations inside #ifdef. (Hirohito Higashi)
Files:      src/ex_cmds.c

Patch 7.4.1221
Problem:    Including netbeans and channel support in small and tiny builds.
            Build fails with some interfaces.
Solution:   Only include these features in small build and above.  Let
            configure fail if trying to enable an interface that won't build.
Files:      src/configure.in, src/auto/configure

Patch 7.4.1222
Problem:    ":normal" command and others missing in tiny build.
Solution:   Graduate FEAT_EX_EXTRA.
Files:      src/feature.h, src/charset.c, src/eval.c, src/ex_cmds.c,
            src/ex_cmds2.c, src/ex_docmd.c, src/ex_getln.c, src/getchar.c,
            src/normal.c, src/ui.c, src/version.c, src/globals.h

Patch 7.4.1223
Problem:    Crash when setting v:errors to a number.
Solution:   Free the typval without assuming its type. (Yasuhiro Matsumoto)
Files:      src/eval.c, src/testdir/test_assert.vim

Patch 7.4.1224
Problem:    Build problems with GTK on BSD. (Mike Williams)
Solution:   Don't use "$<". Skip building gui_gtk_gresources.h when it doesn't
            work. (Kazunobu Kuriyama)
Files:      src/Makefile

Patch 7.4.1225
Problem:    Still a few old style function declarations.
Solution:   Make them new style. (Hirohito Higashi)
Files:      runtime/tools/blink.c, src/eval.c, src/ex_cmds2.c, src/ex_getln.c,
            src/fileio.c, src/gui_w32.c, src/gui_x11.c, src/if_perl.xs,
            src/os_unix.c, src/po/sjiscorr.c, src/pty.c

Patch 7.4.1226
Problem:    GRESOURCE_HDR is unused.
Solution:   Remove it. (Kazunobu Kuriyama)
Files:      src/configure.in, src/auto/configure, src/config.mk.in
```

```
Patch 7.4.1227
Problem:    Compiler warnings.
Solution:   Add UNUSED.  Add type cast. (Yegappan Lakshmanan)
Files:      src/getchar.c, src/os_macosx.m

Patch 7.4.1228
Problem:    copy() and deepcopy() fail with special variables. (Nikolai
            Pavlov)
Solution:   Make it work.  Add a test.  Closes #614.
Files:      src/eval.c, src/testdir/test_viml.vim

Patch 7.4.1229
Problem:    "eval" and "expr" channel commands don't work yet.
Solution:   Implement them.  Update the error numbers.  Also add "redraw".
Files:      src/channel.c, src/eval.c, src/json.c, src/ex_docmd.c,
            src/proto/channel.pro, src/proto/json.pro, src/proto/ex_docmd.pro,
            runtime/doc/channel.txt

Patch 7.4.1230
Problem:    Win32: opening a channel may hang.  Not checking for messages
            while waiting for characters.
Solution:   Add a zero timeout.  Call parse_queued_messages(). (Yasuhiro
            Matsumoto)
Files:      src/os_win32.c

Patch 7.4.1231
Problem:    JSON messages are not parsed properly.
Solution:   Queue received messages.
Files:      src/eval.c src/channel.c, src/json.c, src/proto/eval.pro,
            src/proto/channel.pro, src/proto/json.pro, src/structs.h

Patch 7.4.1232
Problem:    Compiler warnings when the Sniff feature is enabled.
Solution:   Add UNUSED.
Files:      src/gui_gtk_x11.c

Patch 7.4.1233
Problem:    Channel command may cause a crash.
Solution:   Check for NULL argument. (Damien)
Files:      src/channel.c

Patch 7.4.1234
Problem:    Demo server only runs with Python 2.
Solution:   Make it run with Python 3 as well. (Ken Takata)
Files:      runtime/tools/demoserver.py

Patch 7.4.1235 (after 7.4.1231)
Problem:    Missing change to eval.c.
Solution:   Include that change.
Files:      src/eval.c

Patch 7.4.1236
Problem:    When "syntax manual" was used switching between buffers removes
```

```
            the highlighting.
Solution:   Set the syntax option without changing the value. (Anton
            Lindqvist)
Files:      runtime/syntax/manual.vim

Patch 7.4.1237
Problem:    Can't translate message without adding a line break.
Solution:   Join the two parts of the message.
Files:      src/memline.c

Patch 7.4.1238
Problem:    Can't handle two messages right after each other.
Solution:   Find the end of the JSON.  Read more when incomplete.  Add a C
            test for the JSON decoding.
Files:      src/channel.c, src/json.c, src/proto/json.pro, src/eval.c,
            src/Makefile, src/json_test.c, src/memfile_test.c, src/structs.h

Patch 7.4.1239
Problem:    JSON message after the first one is dropped.
Solution:   Put remainder of message back in the queue.
Files:      src/channel.c

Patch 7.4.1240
Problem:    Visual studio tools are noisy.
Solution:   Suppress startup info. (Mike Williams)
Files:      src/GvimExt/Makefile, src/Make_mvc.mak, src/tee/Make_mvc.mak

Patch 7.4.1241 (after 7.4.1238)
Problem:    Missing change in Makefile due to diff mismatch
Solution:   Update the list of object files.
Files:      src/Makefile

Patch 7.4.1242 (after 7.4.1238)
Problem:    json_test fails without the eval feature.
Solution:   Add #ifdef.
Files:      src/json_test.c

Patch 7.4.1243
Problem:    Compiler warning for uninitialized variable.
Solution:   Initialize it. (Elias Diem)
Files:      src/json.c

Patch 7.4.1244
Problem:    The channel functions don't sort together.
Solution:   Use a common "ch_" prefix.
Files:      src/eval.c, runtime/doc/eval.txt, runtime/tools/demoserver.py

Patch 7.4.1245
Problem:    File missing from distribution.
Solution:   Add json_test.c.
Files:      Filelist

Patch 7.4.1246
Problem:    The channel functionality isn't tested.
```

```
Solution:   Add a test using a Python test server.
Files:      src/channel.c, src/proto/channel.pro,
            src/testdir/test_channel.vim, src/testdir/test_channel.py,
            src/testdir/Make_all.mak

Patch 7.4.1247
Problem:    The channel test doesn't run on MS-Windows.
Solution:   Make it work on the MS-Windows console. (Ken Takata)
Files:      src/testdir/test_channel.py, src/testdir/test_channel.vim

Patch 7.4.1248
Problem:    Can't reliably stop the channel test server.  Can't start the
            server if the python file is not executable.
Solution:   Use "pkill" instead of "killall".  Run the python file as an
            argument instead of as an executable.
Files:      src/testdir/test_channel.vim

Patch 7.4.1249
Problem:    Crash when the process a channel is connected to exits.
Solution:   Use the file descriptor properly.  Add a test. (Damien)
            Also add a test for eval().
Files:      src/channel.c, src/testdir/test_channel.py,
            src/testdir/test_channel.vim

Patch 7.4.1250
Problem:    Running tests in shadow directory fails.
Solution:   Also link testdir/*.py
Files:      src/Makefile

Patch 7.4.1251
Problem:    New test file missing from distribution.
Solution:   Add src/testdir/*.py.
Files:      Filelist

Patch 7.4.1252
Problem:    The channel test server may receive two messages concatenated.
Solution:   Split the messages.
Files:      src/testdir/test_channel.py

Patch 7.4.1253
Problem:    Python test server not displaying second of two commands.
            Solaris doesn't have "pkill --full".
Solution:   Also echo the second command. Use "pkill -f".
Files:      src/testdir/test_channel.py, src/testdir/test_channel.vim

Patch 7.4.1254
Problem:    Opening a second channel causes a crash. (Ken Takata)
Solution:   Don't re-allocate the array with channels.
Files:      src/channel.c, src/testdir/test_channel.vim,
            src/testdir/test_channel.py

Patch 7.4.1255
Problem:    Crash for channel "eval" command without third argument.
Solution:   Check for missing argument.
```

```
Files:      src/channel.c, src/testdir/test_channel.vim,
            src/testdir/test_channel.py

Patch 7.4.1256
Problem:    On Mac sys.exit(0) doesn't kill the test server.
Solution:   Use self.server.shutdown(). (Jun Takimoto)
Files:      src/testdir/test_channel.py

Patch 7.4.1257
Problem:    Channel test fails in some configurations.
Solution:   Add check for the +channel feature.
Files:      src/testdir/test_channel.vim

Patch 7.4.1258
Problem:    The channel test can fail if messages arrive later.
Solution:   Add a short sleep. (Jun Takimoto)
Files:      src/testdir/test_channel.vim

Patch 7.4.1259
Problem:    No test for what patch 7.3.414 fixed.
Solution:   Add a test. (Elias Diem)
Files:      src/testdir/test_increment.vim

Patch 7.4.1260
Problem:    The channel feature doesn't work on Win32 GUI.
Solution:   Use WSAGetLastError(). (Ken Takata)
Files:      src/channel.c, src/testdir/test_channel.vim, src/vim.h

Patch 7.4.1261
Problem:    Pending channel messages are garbage collected. Leaking memory in
            ch_sendexpr().  Leaking memory for a decoded JSON string.
Solution:   Mark the message list as used. Free the encoded JSON.  Don't save
            the JSON string.
Files:      src/eval.c, src/channel.c, src/json.c, src/proto/channel.pro

Patch 7.4.1262
Problem:    The channel callback is not invoked.
Solution:   Make a list of pending callbacks.
Files:      src/eval.c, src/channel.c, src/proto/channel.pro,
            src/testdir/test_channel.vim

Patch 7.4.1263
Problem:    ch_open() hangs when the server isn't running.
Solution:   Add a timeout. Use a dict to pass arguments. (Yasuhiro Matsumoto)
Files:      runtime/doc/eval.txt, runtime/doc/channel.txt, src/channel.c,
            src/eval.c, src/netbeans.c, src/os_win32.c, src/proto/channel.pro,
            src/testdir/test_channel.vim

Patch 7.4.1264
Problem:    Crash when receiving an empty array.
Solution:   Check for array with wrong number of arguments. (Damien)
Files:      src/channel.c, src/eval.c, src/testdir/test_channel.py,
            src/testdir.test_channel.vim
```

```
Patch 7.4.1265
Problem:    Not all channel commands are tested.
Solution:   Add a test for "normal", "expr" and "redraw".
Files:      src/testdir/test_channel.py, src/testdir/test_channel.vim

Patch 7.4.1266
Problem:    A BufAdd autocommand may cause an ml_get error (Christian
            Brabandt)
Solution:   Increment RedrawingDisabled earlier.
Files:      src/ex_cmds.c

Patch 7.4.1267
Problem:    Easy to miss handling all types of variables.
Solution:   Change the variable type into an enum.
Files:      src/structs.h, src/eval.c

Patch 7.4.1268
Problem:    Waittime is used as seconds instead of milliseconds. (Hirohito
            Higashi)
Solution:   Divide by 1000.
Files:      src/channel.c

Patch 7.4.1269
Problem:    Encoding {'key':v:none} to JSON doesn't give an error (Tyru)
Solution:   Give an error.
Files:      src/json.c, src/testdir/test_json.vim

Patch 7.4.1270
Problem:    Warnings for missing values in switch.
Solution:   Change switch to if-else or add values.
Files:      src/if_py_both.h, src/if_python.c, src/if_python3.c

Patch 7.4.1271
Problem:    assert_false(v:false) reports an error. (Nikolai Pavlov)
Solution:   Recognize v:true and v:false. (Closes #625)
Files:      src/eval.c, src/testdir/test_assert.vim

Patch 7.4.1272 (after 7.4.1270)
Problem:    Using future enum value.
Solution:   Remove it.
Files:      src/if_python.c, src/if_python3.c

Patch 7.4.1273 (after 7.4.1271)
Problem:    assert_false(v:false) still fails.
Solution:   Fix the typo.
Files:      src/eval.c

Patch 7.4.1274
Problem:    Cannot run a job.
Solution:   Add job_start(), job_status() and job_stop(). Currently only works
            for Unix.
Files:      src/eval.c, src/structs.h, runtime/doc/eval.txt, src/os_unix.c,
            src/proto/os_unix.pro, src/feature.h, src/version.c,
            src/testdir/test_channel.vim
```

```
Patch 7.4.1275 (after 7.4.1274)
Problem:    Build fails on MS-Windows.
Solution:   Fix wrong #ifdef.
Files:      src/eval.c

Patch 7.4.1276
Problem:    Warning for not using return value of fcntl().
Solution:   Explicitly ignore the return value.
Files:      src/fileio.c, src/channel.c, src/memfile.c, src/memline.c

Patch 7.4.1277
Problem:    Compiler can complain about missing enum value in switch with some
            combination of features.
Solution:   Remove #ifdefs around case statements.
Files:      src/eval.c

Patch 7.4.1278
Problem:    When jsonencode() fails it still returns something.
Solution:   Return an empty string on failure.
Files:      src/json.c, src/channel.c, src/testdir/test_json.vim,
            src/testdir/test_channel.vim, src/testdir/test_channel.py

Patch 7.4.1279
Problem:    jsonencode() is not producing strict JSON.
Solution:   Add jsencode() and jsdecode().  Make jsonencode() and jsondecode()
            strict.
Files:      src/json.c, src/json_test.c, src/proto/json.pro, src/channel.c,
            src/proto/channel.pro, src/eval.c, src/vim.h, src/structs.h,
            runtime/doc/eval.txt, runtime/doc/channel.txt,
            src/testdir/test_json.vim

Patch 7.4.1280
Problem:    Missing case value.
Solution:   Add VAR_JOB.
Files:      src/if_python.c, src/if_python3.c

Patch 7.4.1281
Problem:    No test for skipping over code that isn't evaluated.
Solution:   Add a test with code that would fail when not skipped.
Files:      src/testdir/test_viml.vim

Patch 7.4.1282
Problem:    Crash when evaluating the pattern of ":catch" causes an error.
            (Dominique Pelle)
Solution:   Block error messages at this point.
Files:      src/ex_eval.c

Patch 7.4.1283
Problem:    The job feature isn't available on MS-Windows.
Solution:   Add the job feature.  Fix argument of job_stop(). (Yasuhiro
            Matsumoto)
Files:      src/eval.c, src/feature.h, src/os_win32.c, src/proto/os_win32.pro
```

```
Patch 7.4.1284 (after 7.4.1282)
Problem:    Test 49 fails.
Solution:   Check for a different error message.
Files:      src/testdir/test49.vim

Patch 7.4.1285
Problem:    Cannot measure elapsed time.
Solution:   Add reltimefloat().
Files:      src/ex_cmds2.c, src/eval.c, src/proto/ex_cmds2.pro,
            src/testdir/test_reltime.vim, src/testdir/test_alot.vim

Patch 7.4.1286
Problem:    ch_open() with a timeout doesn't work correctly.
Solution:   Change how select() is used.  Don't give an error on timeout.
            Add a test for ch_open() failing.
Files:      src/channel.c, src/testdir/test_channel.vim

Patch 7.4.1287 (after 7.4.1286)
Problem:    Channel test fails.
Solution:   Use reltimefloat().
Files:      src/testdir/test_channel.vim

Patch 7.4.1288
Problem:    ch_sendexpr() does not use JS encoding.
Solution:   Use the encoding that fits the channel mode.  Refuse using
            ch_sendexpr() on a raw channel.
Files:      src/channel.c, src/proto/channel.pro, src/eval.c

Patch 7.4.1289
Problem:    Channel test fails on MS-Windows, connect() takes too long.
Solution:   Adjust the test for MS-Windows using "waittime".
Files:      src/channel.c, src/testdir/test_channel.vim

Patch 7.4.1290
Problem:    Coverity complains about unnecessary check for NULL.
Solution:   Remove the check.
Files:      src/eval.c

Patch 7.4.1291
Problem:    On MS-Windows the channel test server doesn't quit.
Solution:   Use return instead of break. (Ken Takata)
Files:      src/testdir/test_channel.py

Patch 7.4.1292
Problem:    Some compilers complain about uninitialized variable, even though
            all possible cases are handled. (Dominique Pelle)
Solution:   Add a default initialization.
Files:      src/eval.c

Patch 7.4.1293
Problem:    Sometimes a channel may hang waiting for a message that was
            already discarded. (Ken Takata)
Solution:   Store the ID of the message blocking on in the channel.
Files:      src/channel.c
```

Patch 7.4.1294
Problem: job_stop() only kills the started process.
Solution: Send the signal to the process group. (Olaf Dabrunz)
Files: src/os_unix.c

Patch 7.4.1295
Problem: string(job) doesn't work well on MS-Windows.
Solution: Use the process ID. (Yasuhiro Matsumoto)
Files: src/eval.c

Patch 7.4.1296
Problem: Cursor changes column with up motion when the matchparen plugin
            saves and restores the cursor position. (Martin Kunev)
Solution: Make sure curswant is updated before invoking the autocommand.
Files: src/edit.c

Patch 7.4.1297
Problem: On Mac test_channel leaves python instances running.
Solution: Use a small waittime to make ch_open() work. (Ozaki Kiichi)
Files: src/testdir/test_channel.vim

Patch 7.4.1298
Problem: When the channel test fails in an unexpected way the server keeps
            running.
Solution: Use try/catch. (Ozaki Kiichi)
Files: src/testdir/test_channel.vim

Patch 7.4.1299
Problem: When the server sends a message with ID zero the channel handler
            is not invoked. (Christian J. Robinson)
Solution: Recognize zero value for the request ID. Add a test for invoking
            the channel handler.
Files: src/channel.c, src/testdir/test_channel.vim,
            src/testdir/test_channel.py

Patch 7.4.1300
Problem: Cannot test CursorMovedI because there is typeahead.
Solution: Add disable_char_avail_for_testing().
Files: src/eval.c, src/getchar.c, src/globals.h,
            src/testdir/test_cursor_func.vim, src/testdir/README.txt

Patch 7.4.1301
Problem: Missing options in ch_open().
Solution: Add s:chopt like in the other calls. (Ozaki Kiichi)
Files: src/testdir/test_channel.vim

Patch 7.4.1302
Problem: Typo in struct field name. (Ken Takata)
Solution: Rename jf_pi to jv_pi.
Files: src/eval.c, src/os_win32.c, src/structs.h

Patch 7.4.1303
Problem: A Funcref is not accepted as a callback.

```
Solution:   Make a Funcref work. (Damien)
Files:      src/eval.c, src/testdir/test_channel.vim

Patch 7.4.1304
Problem:    Function names are difficult to read.
Solution:   Rename jsonencode to json_encode, jsondecode to json_decode,
            jsencode to js_encode and jsdecode to js_decode.
Files:      src/eval.c, runtime/doc/eval.txt, src/testdir/test_json.vim

Patch 7.4.1305
Problem:    "\%1l^#.*" does not match on a line starting with "#".
Solution:   Do not clear the start-of-line flag. (Christian Brabandt)
Files:      src/regexp.c, src/regexp_nfa.c, src/testdir/test36.in,
            src/testdir/test36.ok

Patch 7.4.1306
Problem:    Job control doesn't work well on MS-Windows.
Solution:   Various fixes. (Ken Takata, Ozaki Kiichi, Yukihiro Nakadaira,
            Yasuhiro Matsumoto)
Files:      src/Make_mvc.mak, src/eval.c, src/os_unix.c, src/os_win32.c,
            src/proto/os_unix.pro, src/proto/os_win32.pro, src/structs.h

Patch 7.4.1307
Problem:    Some channel tests fail on MS-Windows.
Solution:   Disable the failing tests temporarily.
Files:      src/testdir/test_channel.vim

Patch 7.4.1308 (after 7.4.1307)
Problem:    Typo in test.
Solution:   Change endf to endif.
Files:      src/testdir/test_channel.vim

Patch 7.4.1309
Problem:    When a test fails not all relevant info is listed.
Solution:   Add the errors to the messages.
Files:      src/testdir/runtest.vim

Patch 7.4.1310
Problem:    Jobs don't open a channel.
Solution:   Create pipes and add them to the channel.  Add ch_logfile().
            Only Unix for now.
Files:      src/channel.c, src/eval.c, src/os_unix.c, src/structs.h,
            src/gui_w48.c, src/proto/channel.pro, src/testdir/test_channel.vim,
            src/testdir/test_channel_pipe.py, runtime/doc/eval.txt

Patch 7.4.1311 (after 7.4.1310)
Problem:    sock_T is defined too late.
Solution:   Move it up.
Files:      src/vim.h

Patch 7.4.1312 (after 7.4.1311)
Problem:    sock_T is not defined without the +channel feature.
Solution:   Always define it.
Files:      src/vim.h
```

Patch 7.4.1313
Problem: MS-Windows: Using socket after it was closed causes an exception.
Solution: Don't give an error when handling WM_NETBEANS. Re-enable tests
            for MS-Windows.
Files: src/gui_w48.c, src/testdir/test_channel.vim

Patch 7.4.1314
Problem: Warning for uninitialized variable.
Solution: Initialize it. (Dominique Pelle)
Files: src/channel.c

Patch 7.4.1315
Problem: Using a channel handle does not allow for freeing it when unused.
Solution: Add the Channel variable type.
Files: src/structs.h, src/channel.c, src/misc2.c, src/eval.c,
            src/if_python.c, src/if_python3.c, src/json.c, src/gui_w48.c,
            src/netbeans.c, src/proto/channel.pro, src/os_unix.c,
            src/testdir/test_channel.py, src/testdir/test_channel.vim

Patch 7.4.1316
Problem: Can't build MS-Windows console version. (Tux)
Solution: Add #ifdefs.
Files: src/eval.c

Patch 7.4.1317
Problem: MS-Windows: channel test fails.
Solution: Temporarily disable Test_connect_waittime().
Files: src/testdir/test_channel.vim

Patch 7.4.1318
Problem: Channel with pipes doesn't work in GUI.
Solution: Register input handlers for pipes.
Files: src/structs.h, src/feature.h, src/channel.c, src/eval.c,
            src/os_unix.c, src/os_win32.c, src/gui_w48.c, src/proto/channel.pro

Patch 7.4.1319 (after 7.4.1318)
Problem: Tests fail on MS-Windows and on Unix with GUI.
Solution: Fix unregistering.
Files: src/structs.h, src/channel.c, src/os_unix.c, src/os_win32.c,
            src/proto/channel.pro

Patch 7.4.1320
Problem: Building with Cygwin or MingW with channel but without Netbeans
            doesn't work.
Solution: Set NETBEANS to "no" when not used.
Files: src/Make_cyg_ming.mak

Patch 7.4.1321
Problem: Compiler complains about missing statement.
Solution: Add an empty statement. (Andrei Olsen)
Files: src/os_win32.c

Patch 7.4.1322

```
Problem:    Crash when unletting the variable that holds the channel in a
            callback function.  (Christian Robinson)
Solution:   Increase the reference count while invoking the callback.
Files:      src/eval.c, src/channel.c, src/proto/eval.pro,
            src/testdir/test_channel.vim

Patch 7.4.1323
Problem:    Do not get warnings when building with MingW.
Solution:   Remove the -w flag. (Ken Takata)
Files:      src/Make_cyg_ming.mak

Patch 7.4.1324
Problem:    Channels with pipes don't work on MS-Windows.
Solution:   Add pipe I/O support. (Yasuhiro Matsumoto)
Files:      src/channel.c, src/os_win32.c, src/proto/channel.pro,
            src/structs.h, src/vim.h, src/testdir/test_channel.vim

Patch 7.4.1325
Problem:    Channel test fails on difference between Unix and DOS line endings.
Solution:   Strip off CR.  Make assert show difference better.
Files:      src/eval.c, src/channel.c

Patch 7.4.1326
Problem:    Build rules are bit too complicated.
Solution:   Remove -lwsock32 from Netbeans, it's already added for the channel
            feature that it depends on. (Tony Mechelynck)
Files:      src/Make_cyg_ming.mak

Patch 7.4.1327
Problem:    Channel test doesn't work if Python executable is python.exe.
Solution:   Find py.exe or python.exe. (Ken Takata)
Files:      src/testdir/test_channel.vim

Patch 7.4.1328
Problem:    Can't compile with +job but without +channel. (John Marriott)
Solution:   Add more #ifdefs.
Files:      src/os_unix.c

Patch 7.4.1329
Problem:    Crash when using channel that failed to open.
Solution:   Check for NULL.  Update messages. (Yukihiro Nakadaira)
Files:      src/channel.c, src/eval.c, src/testdir/test_channel.vim

Patch 7.4.1330
Problem:    fd_read() has an unused argument.
Solution:   Remove the timeout. (Yasuhiro Matsumoto)
Files:      src/channel.c

Patch 7.4.1331
Problem:    Crash when closing the channel in a callback. (Christian J.
            Robinson)
Solution:   Take the callback out of the list before invoking it.
Files:      src/channel.c, src/testdir/test_channel.vim
```

```
Patch 7.4.1332
Problem:    Problem using Python3 when compiled with MingW.
Solution:   Define PYTHON3_HOME as a wide character string. (Yasuhiro
            Matsumoto)
Files:      src/Make_cyg_ming.mak

Patch 7.4.1333
Problem:    Channel test fails on non-darwin builds.
Solution:   Add the "osx" feature and test for that. (Kazunobu Kuriyama)
Files:      runtime/doc/eval.txt, src/eval.c, src/testdir/test_channel.vim

Patch 7.4.1334
Problem:    Many compiler warnings with MingW.
Solution:   Add type casts. (Yasuhiro Matsumoto)
Files:      src/channel.c, src/dosinst.h, src/eval.c, src/ex_cmds2.c,
            src/ex_getln.c, src/fileio.c, src/if_cscope.c, src/if_perl.xs,
            src/if_python.c, src/if_python3.c, src/if_ruby.c, src/main.c,
            src/mbyte.c, src/misc1.c, src/option.c, src/os_mswin.c,
            src/os_win32.c

Patch 7.4.1335
Problem:    Can't build on MS-Windows with +job but without +channel. (Cesar
            Romani)
Solution:   Add #ifdefs. (Yasuhiro Matsumoto)
Files:      src/os_win32.c

Patch 7.4.1336
Problem:    Channel NL mode is not supported yet.
Solution:   Add NL mode support to channels.
Files:      src/channel.c, src/netbeans.c, src/structs.h, src/os_unix.d,
            src/os_win32.c, src/proto/channel.pro, src/proto/os_unix.pro,
            src/proto/os_win32.pro, src/testdir/test_channel.vim,
            src/testdir/test_channel_pipe.py

Patch 7.4.1337 (after 7.4.1336)
Problem:    Part of the change is missing.
Solution:   Add changes to eval.c
Files:      src/eval.c

Patch 7.4.1338 (after 7.4.1336)
Problem:    Another part of the change is missing.
Solution:   Type os_unix.c right this time.
Files:      src/os_unix.c

Patch 7.4.1339
Problem:    Warnings when building the GUI with MingW. (Cesar Romani)
Solution:   Add type casts. (Yasuhiro Matsumoto)
Files:      src/edit.c, src/gui_w32.c, src/gui_w48.c, src/os_mswin.c,
            src/os_win32.c

Patch 7.4.1340 (after 7.4.1339)
Problem:    Merge left extra #endif behind.
Solution:   Remove the #endif
```

```
Files:      src/os_win32.c

Patch 7.4.1341
Problem:    It's difficult to add more arguments to ch_sendraw() and
            ch_sendexpr().
Solution:   Make the third option a dictionary.
Files:      src/eval.c, src/structs.h, src/channel.c, src/os_unix.c,
            src/os_win32.c, src/proto/channel.pro,
            src/testdir/test_channel.vim, runtime/doc/eval.txt

Patch 7.4.1342
Problem:    On Mac OS/X the waittime must be > 0 for connect to work.
Solution:   Use select() in a different way. (partly by Kazunobu Kuriyama)
            Always use a waittime of 1 or more.
Files:      src/eval.c, src/channel.c, src/testdir/test_channel.vim

Patch 7.4.1343
Problem:    Can't compile with +job but without +channel. (Andrei Olsen)
Solution:   Move get_job_options up and adjust #ifdef.
Files:      src/eval.c

Patch 7.4.1344
Problem:    Can't compile Win32 GUI with tiny features.
Solution:   Add #ifdef. (Christian Brabandt)
Files:      src/gui_w32.c

Patch 7.4.1345
Problem:    A few more compiler warnings. (Axel Bender)
Solution:   Add type casts.
Files:      src/gui_w32.c, src/gui_w48.c

Patch 7.4.1346
Problem:    Compiler warnings in build with -O2.
Solution:   Add initializations.
Files:      src/eval.c

Patch 7.4.1347
Problem:    When there is any error Vim will use a non-zero exit code.
Solution:   When using ":silent!" do not set the exit code. (Yasuhiro
            Matsumoto)
Files:      src/message.c

Patch 7.4.1348
Problem:    More compiler warnings. (John Marriott)
Solution:   Add type casts, remove unused variable.
Files:      src/gui_w32.c

Patch 7.4.1349
Problem:    And some more MingW compiler warnings. (Cesar Romani)
Solution:   Add type casts.
Files:      src/if_mzsch.c

Patch 7.4.1350
Problem:    When the test server fails to start Vim hangs.
```

```
Solution:   Check that there is actually something to read from the tty fd.
Files:      src/os_unix.c

Patch 7.4.1351
Problem:    When the port isn't opened yet when ch_open() is called it may
            fail instead of waiting for the specified time.
Solution:   Loop when select() succeeds but when connect() failed. Also use
            channel logging for jobs.  Add ch_log().
Files:      src/channel.c, src/eval.c, src/netbeans.c, src/proto/channel.pro,
            src/testdir/test_channel.vim, src/testdir/test_channel.py

Patch 7.4.1352
Problem:    The test script lists all functions before executing them.
Solution:   Only list the function currently being executed.
Files:      src/testdir/runtest.vim

Patch 7.4.1353
Problem:    Test_connect_waittime is skipped for MS-Windows.
Solution:   Add the test back, it works now.
Files:      src/testdir/test_channel.vim

Patch 7.4.1354
Problem:    MS-Windows: Mismatch between default compile options and what the
            code expects.
Solution:   Change the default WINVER from 0x0500 to 0x0501. (Ken Takata)
Files:      src/Make_cyg_ming.mak, src/Make_mvc.mak

Patch 7.4.1355
Problem:    Win32 console and GUI handle channels differently.
Solution:   Consolidate code between Win32 console and GUI.
Files:      src/channel.c, src/eval.c, src/gui_w48.c, src/os_win32.c,
            src/proto/channel.pro

Patch 7.4.1356
Problem:    Job and channel options parsing is scattered.
Solution:   Move all option value parsing to get_job_options();
Files:      src/channel.c, src/eval.c, src/structs.h, src/proto/channel.pro,
            src/testdir/test_channel.vim

Patch 7.4.1357 (after 7.4.1356)
Problem:    Error for returning value from void function.
Solution:   Don't do that.
Files:      src/eval.c

Patch 7.4.1358
Problem:    Compiler warning when not building with +crypt.
Solution:   Add #ifdef. (John Marriott)
Files:      src/undo.c

Patch 7.4.1359 (after 7.4.1356)
Problem:    Channel test ch_sendexpr() times out.
Solution:   Increase the timeout
Files:      src/testdir/test_channel.vim
```

Patch 7.4.1360
Problem: Can't remove a callback with ch_setoptions().
Solution: When passing zero or an empty string remove the callback.
Files: src/channel.c, src/proto/channel.pro, src/testdir/test_channel.vim

Patch 7.4.1361
Problem: Channel test fails on Solaris.
Solution: Use the 1 msec waittime for all systems.
Files: src/channel.c

Patch 7.4.1362 (after 7.4.1356)
Problem: Using uninitialized value.
Solution: Initialize jo_set.
Files: src/eval.c

Patch 7.4.1363
Problem: Compiler warnings with tiny build.
Solution: Add #ifdefs.
Files: src/gui_w48.c, src/gui_w32.c

Patch 7.4.1364
Problem: The Win 16 code is not maintained and unused.
Solution: Remove the Win 16 support.
Files: src/gui_w16.c, src/gui_w32.c, src/gui_w48.c, src/Make_w16.mak,
            src/Makefile, src/Make_cyg_ming.mak, src/Make_mvc.mak,
            src/proto/gui_w16.pro, src/proto/os_win16.pro, src/guiw16rc.h,
            src/vim16.rc, src/vim16.def, src/tools16.bmp, src/eval.c,
            src/gui.c, src/misc2.c, src/option.c, src/os_msdos.c,
            src/os_mswin.c, src/os_win16.c, src/os_win16.h, src/version.c,
            src/winclip.c, src/feature.h, src/proto.h, src/vim.h, Filelist

Patch 7.4.1365
Problem: Cannot execute a single test function.
Solution: Add an argument to filter the functions with. (Yasuhiro Matsumoto)
Files: src/testdir/runtest.vim

Patch 7.4.1366
Problem: Typo in test and resulting error in test result.
Solution: Fix the typo and correct the result. (James McCoy, closes #650)
Files: src/testdir/test_charsearch.in, src/testdir/test_charsearch.ok

Patch 7.4.1367
Problem: Compiler warning for unreachable code.
Solution: Remove a "break". (Danek Duvall)
Files: src/json.c

Patch 7.4.1368
Problem: One more Win16 file remains.
Solution: Delete it.
Files: src/proto/os_win16.pro

Patch 7.4.1369
Problem: Channels don't have a queue for stderr.
Solution: Have a queue for each part of the channel.

```
Files:      src/channel.c, src/eval.c, src/structs.h, src/netbeans.c,
            src/gui_w32.c, src/proto/channel.pro

Patch 7.4.1370
Problem:    The Python test script may keep on running.
Solution:   Join the threads. (Yasuhiro Matsumoto)
Files:      src/testdir/test_channel.py

Patch 7.4.1371
Problem:    X11 GUI callbacks don't specify the part of the channel.
Solution:   Pass the fd instead of the channel ID.
Files:      src/channel.c

Patch 7.4.1372
Problem:    channel read implementation is incomplete.
Solution:   Add ch_read() and options for ch_readraw().
Files:      src/channel.c, src/eval.c, src/structs.h, src/proto/channel.pro,
            src/testdir/test_channel.vim

Patch 7.4.1373
Problem:    Calling a Vim function over a channel requires turning the
            arguments into a string.
Solution:   Add the "call" command. (Damien)  Also merge "expr" and "eval"
            into one.
Files:      src/channel.c, src/testdir/test_channel.py,
            src/testdir/test_channel.vim

Patch 7.4.1374
Problem:    Channel test hangs on MS-Windows.
Solution:   Disable the ch_read() that is supposed to time out.
Files:      src/testdir/test_channel.vim

Patch 7.4.1375
Problem:    Still some Win16 code.
Solution:   Remove FEAT_GUI_W16.(Hirohito Higashi)
Files:      src/eval.c, src/ex_cmds.h, src/feature.h, src/gui.h, src/menu.c,
            src/misc1.c, src/option.c, src/proto.h, src/structs.h, src/term.c,
            src/vim.h, runtime/doc/gui_w16.txt

Patch 7.4.1376
Problem:    ch_setoptions() cannot set all options.
Solution:   Support more options.
Files:      src/channel.c, src/eval.c, src/structs.h, runtime/doc/channel.txt,
            src/testdir/test_channel.vim

Patch 7.4.1377
Problem:    Test_connect_waittime() is flaky.
Solution:   Ignore the "Connection reset by peer" error.
Files:      src/testdir/test_channel.vim

Patch 7.4.1378
Problem:    Can't change job settings after it started.
Solution:   Add job_setoptions() with the "stoponexit" flag.
Files:      src/eval.c, src/main.c, src/structs.h, src/proto/eval.pro,
```

```
            src/testdir/test_channel.vim

Patch 7.4.1379
Problem:    Channel test fails on Win32 console.
Solution:   Don't sleep when timeout is zero. Call channel_wait() before
            channel_read(). Channels are not polled during ":sleep". (Yukihiro
            Nakadaira)
Files:      src/channel.c, src/misc2.c, src/gui_w32.c, src/os_win32.c

Patch 7.4.1380
Problem:    The job exit callback is not implemented.
Solution:   Add the "exit-cb" option.
Files:      src/structs.h, src/eval.c, src/channel.c, src/proto/eval.pro,
            src/misc2.c, src/macros.h, src/testdir/test_channel.vim

Patch 7.4.1381 (after 7.4.1380)
Problem:    Exit value not available on MS-Windows.
Solution:   Set the exit value.
Files:      src/structs.h, src/os_win32.c

Patch 7.4.1382
Problem:    Can't get the job of a channel.
Solution:   Add ch_getjob().
Files:      src/eval.c, runtime/doc/channel.txt, runtime/doc/eval.txt

Patch 7.4.1383
Problem:    GvimExt only loads the old libintl.dll.
Solution:   Also try loading libint-8.dll. (Ken Takata, closes #608)
Files:      src/GvimExt/gvimext.cpp, src/GvimExt/gvimext.h

Patch 7.4.1384
Problem:    It is not easy to use a set of plugins and their dependencies.
Solution:   Add packages, ":loadplugin", 'packpath'.
Files:      src/main.c, src/ex_cmds2.c, src/option.c, src/option.h,
            src/ex_cmds.h, src/eval.c, src/version.c, src/proto/ex_cmds2.pro,
            runtime/doc/repeat.txt, runtime/doc/options.txt,
            runtime/optwin.vim

Patch 7.4.1385
Problem:    Compiler warning for using array.
Solution:   Use the right member name. (Yegappan Lakshmanan)
Files:      src/eval.c

Patch 7.4.1386
Problem:    When the Job exit callback is invoked, the job may be freed too
            soon. (Yasuhiro Matsumoto)
Solution:   Increase refcount.
Files:      src/eval.c

Patch 7.4.1387
Problem:    Win16 docs still referenced.
Solution:   Remove Win16 files from the docs Makefile. (Kenichi Ito)
Files:      runtime/doc/Makefile
```

```
Patch 7.4.1388
Problem:    Compiler warning. (Cesar Romani)
Solution:   Initialize variable.
Files:      src/ex_cmds2.c

Patch 7.4.1389
Problem:    Incomplete function declaration.
Solution:   Add "void". (Yasuhiro Matsumoto)
Files:      src/eval.c

Patch 7.4.1390
Problem:    When building with GTK and glib-compile-resources cannot be found
            building Vim fails. (Michael Gehring)
Solution:   Make GLIB_COMPILE_RESOURCES empty instead of leaving it at "no".
            (nuko8, closes #655)
Files:      src/configure.in, src/auto/configure

Patch 7.4.1391
Problem:    Warning for uninitialized variable.
Solution:   Set it to zero. (Christian Brabandt)
Files:      src/eval.c

Patch 7.4.1392
Problem:    Some tests fail for Win32 console version.
Solution:   Move the tests to SCRIPTS_MORE2.  Pass VIMRUNTIME. (Christian
            Brabandt)
Files:      src/testdir/Make_all.mak

Patch 7.4.1393
Problem:    Starting a job hangs in the GUI. (Takuya Fujiwara)
Solution:   Don't check if ch_job is NULL when checking for an error.
            (Yasuhiro Matsumoto)
Files:      src/channel.c

Patch 7.4.1394
Problem:    Can't sort inside a sort function.
Solution:   Use a struct to store the sort parameters. (Jacob Niehus)
Files:      src/eval.c, src/testdir/test_sort.vim

Patch 7.4.1395
Problem:    Using DETACH in quotes is not compatible with the Netbeans
            interface. (Xavier de Gaye)
Solution:   Remove the quotes, only use them for JSON and JS mode.
Files:      src/netbeans.c, src/channel.c

Patch 7.4.1396
Problem:    Compiler warnings for conversions.
Solution:   Add type cast.
Files:      src/ex_cmds2.c

Patch 7.4.1397
Problem:    Sort test fails on MS-Windows.
Solution:   Correct the compare function.
Files:      src/testdir/test_sort.vim
```

```
Patch 7.4.1398
Problem:    The close-cb option is not implemented yet.
Solution:   Implement close-cb. (Yasuhiro Matsumoto)
Files:      src/channel.c, src/eval.c, src/structs.h, src/proto/channel.pro,
            src/testdir/test_channel.py, src/testdir/test_channel.vim

Patch 7.4.1399
Problem:    The MS-DOS code does not build.
Solution:   Remove the old MS-DOS code.
Files:      Filelist, src/Make_bc3.mak, src/Make_bc5.mak, src/Make_djg.mak,
            src/Makefile, src/blowfish.c, src/buffer.c, src/diff.c,
            src/digraph.c, src/dosinst.h, src/eval.c, src/ex_cmds.c,
            src/ex_cmds2.c, src/ex_docmd.c, src/ex_getln.c, src/feature.h,
            src/fileio.c, src/getchar.c, src/globals.h, src/macros.h,
            src/main.c, src/mbyte.c, src/memfile.c, src/memline.c,
            src/misc1.c, src/misc2.c, src/netbeans.c, src/option.c,
            src/option.h, src/os_msdos.c, src/os_msdos.h, src/proto.h,
            src/proto/os_msdos.pro, src/regexp.c, src/screen.c, src/structs.h,
            src/syntax.c, src/term.c, src/undo.c, src/uninstal.c,
            src/version.c, src/vim.h, src/window.c, src/xxd/Make_bc3.mak,
            src/xxd/Make_djg.mak

Patch 7.4.1400
Problem:    Perl eval doesn't work properly on 64-bit big-endian machine.
Solution:   Use 32 bit type for the key. (Danek Duvall)
Files:      src/if_perl.xs

Patch 7.4.1401
Problem:    Having 'autochdir' set during startup and using diff mode doesn't
            work. (Axel Bender)
Solution:   Don't use 'autochdir' while still starting up. (Christian
            Brabandt)
Files:      src/buffer.c

Patch 7.4.1402
Problem:    GTK 3 is not supported.
Solution:   Add GTK 3 support. (Kazunobu Kuriyama)
Files:      runtime/doc/eval.txt, runtime/doc/gui.txt,
            runtime/doc/gui_x11.txt, src/auto/configure, src/channel.c,
            src/config.h.in, src/configure.in, src/eval.c, src/gui.h,
            src/gui_beval.c, src/gui_beval.h, src/gui_gtk.c, src/gui_gtk_f.c,
            src/gui_gtk_f.h, src/gui_gtk_x11.c, src/if_mzsch.c, src/mbyte.c,
            src/netbeans.c, src/structs.h, src/version.c

Patch 7.4.1403
Problem:    Can't build without the quickfix feature.
Solution:   Add #ifdefs. Call ex_ni() for unimplemented commands. (Yegappan
            Lakshmanan)
Files:      src/ex_cmds2.c, src/popupmnu.c

Patch 7.4.1404
Problem:    ch_read() doesn't time out on MS-Windows.
```

```
Solution:   Instead of WM_NETBEANS use select(). (Yukihiro Nakadaira)
Files:      src/channel.c, src/gui_w32.c, src/os_win32.c, src/structs.h,
            src/testdir/test_channel.vim, src/vim.h

Patch 7.4.1405
Problem:    Completion menu flickers.
Solution:   Delay showing the popup menu. (Shougo Matsu, Justin M. Keyes,
            closes #656)
Files:      src/edit.c

Patch 7.4.1406
Problem:    Leaking memory in cs_print_tags_priv().
Solution:   Free tbuf. (idea by Forrest Fleming)
Files:      src/if_cscope.c

Patch 7.4.1407
Problem:    json_encode() does not handle NaN and inf properly. (David
            Barnett)
Solution:   For JSON turn them into "null".  For JS use "NaN" and "Infinity".
            Add isnan().
Files:      src/eval.c, src/json.c, src/testdir/test_json.vim

Patch 7.4.1408
Problem:    MS-Windows doesn't have isnan() and isinf().
Solution:   Use _isnan() and _isinf().
Files:      src/eval.c, src/json.c

Patch 7.4.1409 (after 7.4.1402)
Problem:    Configure includes GUI despite --disable-gui flag.
Solution:   Add SKIP_GTK3. (Kazunobu Kuriyama)
Files:      src/configure.in, src/auto/configure

Patch 7.4.1410
Problem:    Leaking memory in cscope interface.
Solution:   Free memory when no tab is found. (Christian Brabandt)
Files:      src/if_cscope.c

Patch 7.4.1411
Problem:    Compiler warning for indent. (Ajit Thakkar)
Solution:   Indent normally.
Files:      src/ui.c

Patch 7.4.1412
Problem:    Compiler warning for indent. (Dominique Pelle)
Solution:   Fix the indent.
Files:      src/farsi.c

Patch 7.4.1413
Problem:    When calling ch_close() the close callback is invoked, even though
            the docs say it isn't. (Christian J. Robinson)
Solution:   Don't call the close callback.
Files:      src/eval.c, src/channel.c, src/netbeans.c, src/proto/channel.pro

Patch 7.4.1414
```

```
Problem:    Appveyor only builds one feature set.
Solution:   Build a combination of features and GUI/console. (Christian
            Brabandt)
Files:      appveyor.yml, src/appveyor.bat

Patch 7.4.1415 (after 7.4.1414)
Problem:    Dropped the skip-tags setting.
Solution:   Put it back.
Files:      appveyor.yml

Patch 7.4.1416
Problem:    Using "u_char" instead of "char_u", which doesn't work everywhere.
            (Jörg Plate)
Solution:   Use "char_u" always.
Files:      src/integration.c, src/macros.h

Patch 7.4.1417 (after 7.4.1414)
Problem:    Missing appveyor.bat from the distribution.
Solution:   Add it to the list of files.
Files:      Filelist

Patch 7.4.1418
Problem:    job_stop() on MS-Windows does not really stop the job.
Solution:   Make the default to stop the job forcefully. (Ken Takata)
            Make MS-Windows and Unix more similar.
Files:      src/os_win32.c, src/os_unix.c, runtime/doc/eval.txt

Patch 7.4.1419
Problem:    Tests slowed down because of the "not a terminal" warning.
Solution:   Add the --not-a-term command line argument.
Files:      src/main.c, src/testdir/Makefile, src/Make_all.mak,
            src/Make_amiga.mak, src/testdir/Make_dos.mak,
            src/testdir/Make_ming.mak, src/testdir/Make_vms.mms,
            runtime/doc/starting.txt

Patch 7.4.1420 (after 7.4.1419)
Problem:    Missing makefile.
Solution:   Type the path correctly.
Files:      src/testdir/Make_all.mak

Patch 7.4.1421
Problem:    May free a channel when a callback may need to be invoked.
Solution:   Keep the channel when refcount is zero.
Files:      src/eval.c, src/channel.c, src/proto/channel.pro

Patch 7.4.1422
Problem:    Error when reading fails uses wrong errno.  Keeping channel open
            after job stops results in test failing.
Solution:   Move the error up.  Add ch_job_killed.
Files:      src/channel.c, src/eval.c, src/structs.h

Patch 7.4.1423
Problem:    Channel test fails on MS-Windows.
Solution:   Do not give an error message when reading fails, assume the other
```

```
            end exited.
Files:      src/channel.c

Patch 7.4.1424
Problem:    Not using --not-a-term when running tests on MS-Windows.
Solution:   Use NO_PLUGIN. (Christian Brabandt)
Files:      src/testdir/Make_dos.mak

Patch 7.4.1425
Problem:    There are still references to MS-DOS support.
Solution:   Remove most of the help txt and install instructions. (Ken Takata)
Files:      src/INSTALLpc.txt, runtime/doc/os_msdos.txt, csdpmi4b.zip,
            Filelist

Patch 7.4.1426
Problem:    The "out-io" option for jobs is not implemented yet.
Solution:   Implement the "buffer" value: append job output to a buffer.
Files:      src/eval.c, src/channel.c, src/structs.h, src/netbeans.c,
            runtime/doc/channel.txt

Patch 7.4.1427
Problem:    Trailing comma in enums is not ANSI C.
Solution:   Remove the trailing commas.
Files:      src/alloc.h, src/gui_mac.c

Patch 7.4.1428
Problem:    Compiler warning for non-virtual destructor.
Solution:   Make it virtual. (Yasuhiro Matsumoto)
Files:      src/gui_dwrite.cpp

Patch 7.4.1429
Problem:    On MS-Windows, when not use renderoptions=type:directx, drawing
            emoji will be broken.
Solution:   Fix usage of unicodepdy. (Yasuhiro Matsumoto)
Files:      src/gui_w32.c

Patch 7.4.1430
Problem:    When encoding JSON, turning NaN and Infinity into null without
            giving an error is not useful.
Solution:   Pass NaN and Infinity on.  If the receiver can't handle them it
            will generate the error.
Files:      src/json.c, src/testdir/test_json.vim, runtime/doc/eval.txt

Patch 7.4.1431
Problem:    Including header files twice.
Solution:   Remove the extra includes.
Files:      src/if_cscope.h

Patch 7.4.1432
Problem:    Typo in button text.
Solution:   Fix the typo. (Dominique Pelle)
Files:      src/gui_gtk.c

Patch 7.4.1433
```

```
Problem:    The Sniff interface is no longer useful, the tool has not been
            available for may years.
Solution:   Delete the Sniff interface and related code.
Files:      src/if_sniff.c, src/if_sniff.h, src/charset.c, src/edit.c,
            src/eval.c, src/ex_cmds2.c, src/ex_docmd.c, src/ex_getln.c,
            src/gui_gtk_x11.c, src/gui_w32.c, src/gui_x11.c, src/normal.c,
            src/os_unix.c, src/os_win32.c, src/term.c, src/ui.c,
            src/version.c, src/ex_cmds.h, src/feature.h, src/keymap.h,
            src/structs.h, src/vim.h, src/Make_mvc.mak, src/Make_vms.mms,
            src/Makefile, src/configure.in, src/auto/configure,
            src/config.h.in, src/config.mk.in, runtime/doc/if_sniff.txt,
            src/config.aap.in, src/main.aap

Patch 7.4.1434
Problem:    JSON encoding doesn't handle surrogate pair.
Solution:   Improve multi-byte handling of JSON. (Yasuhiro Matsumoto)
Files:      src/json.c, src/testdir/test_json.vim

Patch 7.4.1435
Problem:    It is confusing that ch_sendexpr() and ch_sendraw() wait for a
            response.
Solution:   Add ch_evalexpr() and ch_evalraw().
Files:      src/eval.c, runtime/doc/channel.txt, runtime/doc/eval.txt,
            src/testdir/test_channel.vim

Patch 7.4.1436 (after 7.4.1433)
Problem:    Sniff files still referenced in distribution.
Solution:   Remove sniff files from distribution.
Files:      Filelist

Patch 7.4.1437
Problem:    Old system doesn't have isinf() and NAN. (Ben Fritz)
Solution:   Adjust #ifdefs.  Detect isnan() and isinf() functions with
            configure. Use a replacement when missing. (Kazunobu Kuriyama)
Files:      src/eval.c, src/json.c, src/macros.h, src/message.c,
            src/config.h.in, src/configure.in, src/auto/configure

Patch 7.4.1438
Problem:    Can't get buffer number of a channel.
Solution:   Add ch_getbufnr().
Files:      src/eval.c, src/channel.c, src/testdir/test_channel.vim,
            runtime/doc/channel.txt, runtime/doc/eval.txt

Patch 7.4.1439 (after 7.4.1434)
Problem:    Using uninitialized variable.
Solution:   Initialize vc_type.
Files:      src/json.c

Patch 7.4.1440 (after 7.4.1437)
Problem:    Can't build on Windows.
Solution:   Change #ifdefs.  Only define isnan when used.
Files:      src/macros.h, src/eval.c, src/json.c

Patch 7.4.1441
```

```
Problem:    Using empty name instead of no name for channel buffer.
Solution:   Remove the empty name.
Files:      src/channel.c

Patch 7.4.1442
Problem:    MS-Windows: more compilation warnings for destructor.
Solution:   Add "virtual". (Ken Takata)
Files:      src/if_ole.cpp

Patch 7.4.1443
Problem:    Can't build GTK3 with small features.
Solution:   Use gtk_widget_get_window().  Fix typos. (Dominique Pelle)
Files:      src/gui_gtk_x11.c

Patch 7.4.1444
Problem:    Can't build with JSON but without multi-byte.
Solution:   Fix pointer name.
Files:      src/json.c

Patch 7.4.1445
Problem:    Memory corruption when 'encoding' is not utf-8.
Solution:   Convert decoded string later.
Files:      src/json.c

Patch 7.4.1446
Problem:    Crash when using json_decode().
Solution:   Terminate string with a NUL byte.
Files:      src/json.c

Patch 7.4.1447
Problem:    Memory leak when using ch_read(). (Dominique Pelle)
            No log message when stopping a job and a few other situations.
            Too many "Nothing to read" messages.  Channels are not freed.
Solution:   Free the listtv.  Add more log messages. Remove "Nothing to read"
            message.  Remove the channel from the job when its refcount
            becomes zero.
Files:      src/eval.c, src/channel.c

Patch 7.4.1448
Problem:    JSON tests fail if 'encoding' is not utf-8.
Solution:   Force encoding to utf-8.
Files:      src/testdir/test_json.vim

Patch 7.4.1449
Problem:    Build fails with job feature but without channel feature.
Solution:   Add #ifdef.
Files:      src/eval.c

Patch 7.4.1450
Problem:    Json encoding still fails when encoding is not utf-8.
Solution:   Set 'encoding' before :scriptencoding.  Run the json test
            separately to avoid affecting other tests.
Files:      src/testdir/test_json.vim, src/testdir/Make_all.mak,
            src/testdir/test_alot.vim
```

```
Patch 7.4.1451
Problem:    Vim hangs when a channel has a callback but isn't referenced.
Solution:   Have channel_unref() only return TRUE when the channel was
            actually freed.
Files:      src/eval.c, src/channel.c, src/proto/channel.pro

Patch 7.4.1452
Problem:    When a callback adds a syntax item either the redraw doesn't
            happen right away or in the GUI the cursor is in the wrong
            position for a moment. (Jakson Alves de Aquino)
Solution:   Redraw after the callback was invoked.
Files:      src/channel.c

Patch 7.4.1453
Problem:    Missing --not-a-term.
Solution:   Add the argument.
Files:      src/testdir/Make_amiga.mak

Patch 7.4.1454
Problem:    The exit callback test is flaky.
Solution:   Loop to wait for a short time up to a second.
Files:      src/testdir/test_channel.vim

Patch 7.4.1455
Problem:    JSON decoding test for surrogate pairs is in the wrong place.
Solution:   Move the test lines. (Ken Takata)
Files:      src/testdir/test_json.vim

Patch 7.4.1456
Problem:    Test 87 fails with Python 3.5.
Solution:   Work around difference. (Taro Muraoka)
Files:      src/testdir/test87.in

Patch 7.4.1457
Problem:    Opening a channel with select() is not done properly.
Solution:   Also used read-fds. Use getsockopt() to check for errors. (Ozaki
            Kiichi)
Files:      src/channel.c

Patch 7.4.1458
Problem:    When a JSON channel has a callback it may never be cleared.
Solution:   Do not write "DETACH" into a JS or JSON channel.
Files:      src/channel.c

Patch 7.4.1459 (after 7.4.1457)
Problem:    MS-Windows doesn't know socklen_t.
Solution:   Use previous method for WIN32.
Files:      src/channel.c

Patch 7.4.1460
Problem:    Syntax error in rarely used code.
Solution:   Fix the mch_rename() declaration. (Ken Takata)
Files:      src/os_unix.c, src/proto/os_unix.pro
```

Patch 7.4.1461
Problem: When starting job on MS-Windows all parts of the command are put
            in quotes.
Solution: Only use quotes when needed. (Yasuhiro Matsumoto)
Files: src/eval.c

Patch 7.4.1462
Problem: Two more rarely used functions with errors.
Solution: Add proper argument types. (Dominique Pelle)
Files: src/misc2.c, src/termlib.c

Patch 7.4.1463
Problem: Configure doesn't find isinf() and isnan() on some systems.
Solution: Use a configure check that includes math.h.
Files: src/configure.in, src/auto/configure

Patch 7.4.1464
Problem: When the argument of sort() is zero or empty it fails.
Solution: Make zero work as documented. (suggested by Yasuhiro Matsumoto)
Files: src/eval.c, src/testdir/test_sort.vim

Patch 7.4.1465
Problem: Coverity reported possible use of NULL pointer when using buffer
            output with JSON mode.
Solution: Make it actually possible to use JSON mode with a buffer.
            Re-encode the JSON to append it to the buffer.
Files: src/channel.c, src/testdir/test_channel.vim

Patch 7.4.1466
Problem: Coverity reports dead code.
Solution: Remove the two lines.
Files: src/channel.c

Patch 7.4.1467
Problem: Can't build without the float feature.
Solution: Add #ifdefs. (Nick Owens, closes #667)
Files: src/eval.c, src/json.c

Patch 7.4.1468
Problem: Sort test doesn't test with "1" argument.
Solution: Also test ignore-case sorting. (Yasuhiro Matsumoto)
Files: src/testdir/test_sort.vim

Patch 7.4.1469
Problem: Channel test sometimes fails, especially on OS/X. (Kazunobu
            Kuriyama)
Solution: Change the && into ||, call getsockopt() in more situations.
            (Ozaki Kiichi)
Files: src/channel.c

Patch 7.4.1470
Problem: Coverity reports missing restore.
Solution: Move json_encode() call up.

```
Files:      src/channel.c

Patch 7.4.1471
Problem:    Missing out-of-memory check.  And Coverity warning.
Solution:   Bail out when msg is NULL.
Files:      src/channel.c

Patch 7.4.1472
Problem:    Coverity warning for not using return value.
Solution:   Add "(void)".
Files:      src/os_unix.c

Patch 7.4.1473
Problem:    Can't build without the autocommand feature.
Solution:   Add #ifdefs. (Yegappan Lakshmanan)
Files:      src/edit.c, src/main.c, src/syntax.c

Patch 7.4.1474
Problem:    Compiler warnings without the float feature.
Solution:   Move #ifdefs. (John Marriott)
Files:      src/eval.c

Patch 7.4.1475
Problem:    When using hangulinput with utf-8 a CSI character is
            misinterpreted.
Solution:   Convert CSI to K_CSI. (SungHyun Nam)
Files:      src/ui.c

Patch 7.4.1476
Problem:    Function arguments marked as unused while they are not.
Solution:   Remove UNUSED. (Yegappan Lakshmanan)
Files:      src/diff.c, src/eval.c, src/ex_cmds2.c, src/ex_docmd.c,
            src/window.c

Patch 7.4.1477
Problem:    Test_reltime is flaky, it depends on timing.
Solution:   When it fails run it a second time.
Files:      src/testdir/runtest.vim

Patch 7.4.1478
Problem:    ":loadplugin" doesn't take care of ftdetect files.
Solution:   Also load ftdetect scripts when appropriate.
Files:      src/ex_cmds2.c

Patch 7.4.1479
Problem:    No testfor ":loadplugin".
Solution:   Add a test.  Fix how option is being set.
Files:      src/ex_cmds2.c, src/testdir/test_loadplugin.vim,
            src/testdir/Make_all.mak

Patch 7.4.1480
Problem:    Cannot add a pack directory without loading a plugin.
Solution:   Add the :packadd command.
Files:      src/ex_cmds.h, src/ex_cmds2.c, src/proto/ex_cmds2.pro,
```

```
            src/testdir/test_loadplugin.vim, runtime/doc/repeat.txt

Patch 7.4.1481
Problem:    Can't build with small features.
Solution:   Add #ifdef.
Files:      src/ex_cmds2.c

Patch 7.4.1482
Problem:    "timeout" option not supported on ch_eval*().
Solution:   Get and use the timeout option from the argument.
Files:      src/eval.c, src/testdir/test_channel.vim

Patch 7.4.1483
Problem:    A one-time callback is not used for a raw channel.
Solution:   Use a one-time callback when it exists.
Files:      src/channel.c, src/testdir/test_channel.vim,
            src/testdir/test_channel.py

Patch 7.4.1484
Problem:    Channel "err-io" value "out" is not supported.
Solution:   Connect stderr to stdout if wanted.
Files:      src/os_unix.c, src/os_win32.c, src/testdir/test_channel.vim,
            src/testdir/test_channel_pipe.py

Patch 7.4.1485
Problem:    Job input from buffer is not implemented.
Solution:   Implement it.  Add "in-top" and "in-bot" options.
Files:      src/structs.h, src/eval.c, src/channel.c, src/proto/channel.pro,
            src/os_unix.c, src/os_win32.c, src/testdir/test_channel.vim

Patch 7.4.1486
Problem:    ":loadplugin" is not optimal, some people find it confusing.
Solution:   Only use ":packadd" with an optional "!".
Files:      src/ex_cmds.h, src/ex_cmds2.c, src/testdir/test_loadplugin.vim,
            src/testdir/test_packadd.vim, src/testdir/Make_all.mak,
            runtime/doc/repeat.txt

Patch 7.4.1487
Problem:    For WIN32 isinf() is defined as a macro.
Solution:   Define it as an inline function. (ZyX)
Files:      src/macros.h

Patch 7.4.1488 (after 7.4.1475)
Problem:    Not using key when result from hangul_string_convert() is NULL.
Solution:   Fall back to not converted string.
Files:      src/ui.c

Patch 7.4.1489 (after 7.4.1487)
Problem:    "inline" is not supported by old MSVC.
Solution:   use "__inline". (Ken Takata)
Files:      src/macros.h

Patch 7.4.1490
Problem:    Compiler warning for unused function.
```

```
Solution:   Add #ifdef. (Dominique Pelle)
Files:      src/gui_gtk_x11.c

Patch 7.4.1491
Problem:    Visual-block shift breaks multi-byte characters.
Solution:   Compute column differently. (Yasuhiro Matsumoto) Add a test.
Files:      src/ops.c, src/testdir/test_visual.vim, src/testdir/Make_all.mak

Patch 7.4.1492
Problem:    No command line completion for ":packadd".
Solution:   Implement completion. (Hirohito Higashi)
Files:      src/ex_docmd.c, src/ex_getln.c, src/testdir/test_packadd.vim,
            src/vim.h

Patch 7.4.1493
Problem:    Wrong callback invoked for zero-id messages.
Solution:   Don't use the first one-time callback when the sequence number
            doesn't match.
Files:      src/channel.c, src/testdir/test_channel.vim,
            src/testdir/test_channel.py

Patch 7.4.1494
Problem:    clr_history() does not work properly.
Solution:   Increment hisptr. Add a test. (Yegappan Lakshmanan)
Files:      src/ex_getln.c, src/testdir/test_history.vim,
            src/testdir/Make_all.mak

Patch 7.4.1495
Problem:    Compiler warnings when building on Unix with the job feature but
            without the channel feature.
Solution:   Move #ifdefs. (Dominique Pelle)
Files:      src/os_unix.c

Patch 7.4.1496
Problem:    Crash when built with GUI but it's not active. (Dominique Pelle)
Solution:   Check gui.in_use.
Files:      src/channel.c

Patch 7.4.1497
Problem:    Cursor drawing problem with GTK 3.
Solution:   Handle blinking differently. (Kazunobu Kuriyama)
Files:      src/gui_gtk_x11.c

Patch 7.4.1498
Problem:    Error for locked item when using json_decode(). (Shougo Matsu)
Solution:   Initialize v_lock.
Files:      src/json.c

Patch 7.4.1499
Problem:    No error message when :packadd does not find anything.
Solution:   Add an error message. (Hirohito Higashi)
Files:      runtime/doc/repeat.txt, src/ex_cmds.h, src/ex_cmds2.c,
            src/globals.h, src/testdir/test_packadd.vim
```

```
Patch 7.4.1500
Problem:    Should_free flag set to FALSE.
Solution:   Set it to TRUE. (Neovim 4415)
Files:      src/ex_eval.c

Patch 7.4.1501
Problem:    Garbage collection with an open channel is not tested.
Solution:   Call garbagecollect() in the test.
Files:      src/testdir/test_channel.vim

Patch 7.4.1502
Problem:    Writing last-but-one line of buffer to a channel isn't implemented
            yet.
Solution:   Implement it.  Fix leaving a swap file behind.
Files:      src/channel.c, src/structs.h, src/memline.c, src/proto/channel.pro

Patch 7.4.1503
Problem:    Crash when using ch_getjob(). (Damien)
Solution:   Check for a NULL job.
Files:      src/eval.c, src/testdir/test_channel.vim

Patch 7.4.1504 (after 7.4.1502)
Problem:    No test for reading last-but-one line.
Solution:   Add a test.
Files:      src/testdir/test_channel.vim

Patch 7.4.1505
Problem:    When channel log is enabled get too many "looking for messages"
            log entries.
Solution:   Only give the message after another message.
Files:      src/channel.c

Patch 7.4.1506
Problem:    Job cannot read from a file.
Solution:   Implement reading from a file for Unix.
Files:      src/eval.c, src/os_unix.c, src/os_win32.c,
            src/testdir/test_channel.vim

Patch 7.4.1507
Problem:    Crash when starting a job fails.
Solution:   Check for the channel to be NULL.  (idea by Yasuhiro Matsumoto)
Files:      src/eval.c

Patch 7.4.1508
Problem:    Can't build GvimExt with MingW.
Solution:   Adjust the makefile. (Ben Fritz)
Files:      src/GvimExt/Make_ming.mak

Patch 7.4.1509
Problem:    Keeping both a variable for a job and the channel it refers to is
            a hassle.
Solution:   Allow passing the job where a channel is expected. (Damien)
Files:      src/eval.c, src/testdir/test_channel.vim
```

```
Patch 7.4.1510
Problem:    Channel test fails on AppVeyor.
Solution:   Wait longer than 10 msec if needed.
Files:      src/testdir/test_channel.vim

Patch 7.4.1511
Problem:    Statusline highlighting is sometimes wrong.
Solution:   Check for Highlight type. (Christian Brabandt)
Files:      src/buffer.c

Patch 7.4.1512
Problem:    Channel input from file not supported on MS-Windows.
Solution:   Implement it. (Yasuhiro Matsumoto)
Files:      src/os_win32.c, src/testdir/test_channel.vim

Patch 7.4.1513
Problem:    "J" fails if there are not enough lines. (Christian Neukirchen)
Solution:   Reduce the count, only fail on the last line.
Files:      src/normal.c, src/testdir/test_join.vim, src/testdir/test_alot.vim

Patch 7.4.1514
Problem:    Channel output to file not implemented yet.
Solution:   Implement it for Unix.
Files:      src/os_unix.c, src/testdir/test_channel.vim,
            src/testdir/test_channel_pipe.py

Patch 7.4.1515
Problem:    Channel test is a bit flaky.
Solution:   Instead of a fixed sleep time wait until an expression evaluates
            to true.
Files:      src/testdir/test_channel.vim

Patch 7.4.1516
Problem:    Cannot change file permissions.
Solution:   Add setfperm().
Files:      src/eval.c, runtime/doc/eval.txt, src/testdir/test_alot.vim,
            src/testdir/test_file_perm.vim

Patch 7.4.1517
Problem:    Compiler warning with 64bit compiler.
Solution:   Add typecast. (Mike Williams)
Files:      src/channel.c

Patch 7.4.1518
Problem:    Channel with disconnected in/out/err is not supported.
Solution:   Implement it for Unix.
Files:      src/eval.c, src/os_unix.c, src/structs.h,
            src/testdir/test_channel.vim, src/testdir/test_channel_pipe.py

Patch 7.4.1519 (after 7.4.1514)
Problem:    Channel output to file not implemented for MS-Windows.
Solution:   Implement it. (Yasuhiro Matsumoto)
Files:      src/os_win32.c, src/testdir/test_channel.vim
```

Patch 7.4.1520
Problem: Channel test: Waiting for a file to appear doesn't work.
Solution: In waitFor() ignore errors.
Files: src/testdir/test_channel.vim

Patch 7.4.1521 (after 7.4.1516)
Problem: File permission test fails on MS-Windows.
Solution: Expect a different permission.
Files: src/testdir/test_file_perm.vim

Patch 7.4.1522
Problem: Cannot write channel err to a buffer.
Solution: Implement it.
Files: src/channel.c, src/testdir/test_channel.vim

Patch 7.4.1523
Problem: Writing channel to a file fails on MS-Windows.
Solution: Disable it for now.
Files: src/testdir/test_channel.vim

Patch 7.4.1524
Problem: Channel test fails on BSD.
Solution: Break out of the loop when connect() succeeds. (Ozaki Kiichi)
Files: src/channel.c

Patch 7.4.1525
Problem: On a high resolution screen the toolbar icons are too small.
Solution: Add "huge" and "giant" to 'toolbariconsize'. (Brian Gix)
Files: src/gui_gtk_x11.c, src/option.h

Patch 7.4.1526
Problem: Writing to file and not connecting a channel doesn't work for
            MS-Windows.
Solution: Make it work. (Yasuhiro Matsumoto)
Files: src/os_win32.c, src/testdir/test_channel.vim

Patch 7.4.1527
Problem: Channel test is flaky on MS-Windows.
Solution: Limit the select() timeout to 50 msec and try with a new socket if
            it fails.
Files: src/channel.c

Patch 7.4.1528
Problem: Using "ever" for packages is confusing.
Solution: Use "start", as it's related to startup.
Files: src/ex_cmds2.c, runtime/doc/repeat.txt

Patch 7.4.1529
Problem: Specifying buffer number for channel not implemented yet.
Solution: Implement passing a buffer number.
Files: src/structs.h, src/channel.c, src/eval.c,
            src/testdir/test_channel.vim

Patch 7.4.1530

```
Problem:    MS-Windows job_start() closes wrong handle.
Solution:   Close hThread on the process info. (Ken Takata)
Files:      src/os_win32.c

Patch 7.4.1531
Problem:    Compiler warning for uninitialized variable. (Dominique Pelle)
Solution:   Always give the variable a value.
Files:      src/channel.c

Patch 7.4.1532
Problem:    MS-Windows channel leaks file descriptor.
Solution:   Use CreateFile with the right options. (Yasuhiro Matsumoto)
Files:      src/os_win32.c

Patch 7.4.1533
Problem:    Using feedkeys() with an empty string disregards 'x' option.
Solution:   Make 'x' work with an empty string. (Thinca)
Files:      src/eval.c, src/testdir/test_alot.vim,
            src/testdir/test_feedkeys.vim

Patch 7.4.1534
Problem:    Compiler warning for shadowed variable. (Kazunobu Kuriyama)
Solution:   Rename it.
Files:      src/eval.c

Patch 7.4.1535
Problem:    The feedkeys test has a one second delay.
Solution:   Avoid need_wait_return() to delay. (Hirohito Higashi)
Files:      src/eval.c

Patch 7.4.1536
Problem:    Cannot re-use a channel for another job.
Solution:   Add the "channel" option to job_start().
Files:      src/channel.c, src/eval.c, src/structs.h, src/os_unix.c,
            src/os_win32.c, src/proto/channel.pro,
            src/testdir/test_channel.vim

Patch 7.4.1537
Problem:    Too many feature flags for pipes, jobs and channels.
Solution:   Only use FEAT_JOB_CHANNEL.
Files:      src/structs.h, src/feature.h, src/configure.in,
            src/auto/configure, src/config.h.in, src/channel.c, src/eval.c,
            src/gui.c, src/main.c, src/memline.c, src/misc2.c, src/os_mswin.c,
            src/os_unix.c, src/os_win32.c, src/ui.c, src/version.c,
            src/macros.h, src/proto.h, src/vim.h, src/Make_cyg_ming.mak,
            src/Make_bc5.mak, src/Make_mvc.mak

Patch 7.4.1538
Problem:    Selection with the mouse does not work in command line mode.
Solution:   Use cairo functions. (Kazunobu Kuriyama)
Files:      src/gui_gtk_x11.c

Patch 7.4.1539
Problem:    Too much code in eval.c.
```

```
Solution:   Move job and channel code to channel.c.
Files:      src/eval.c, src/channel.c, src/proto/channel.pro,
            src/proto/eval.pro

Patch 7.4.1540
Problem:    Channel test is a bit flaky.
Solution:   Increase expected wait time.
Files:      src/testdir/test_channel.vim

Patch 7.4.1541
Problem:    Missing job_info().
Solution:   Implement it.
Files:      src/eval.c, src/channel.c, src/proto/channel.pro,
            src/testdir/test_channel.vim, runtime/doc/eval.txt

Patch 7.4.1542
Problem:    job_start() with a list is not tested.
Solution:   Call job_start() with a list.
Files:      src/testdir/test_channel.vim

Patch 7.4.1543
Problem:    Channel log methods are not tested.
Solution:   Log job activity and check it.
Files:      src/testdir/test_channel.vim

Patch 7.4.1544
Problem:    On Win32 escaping the command does not work properly.
Solution:   Reset 'ssl' when escaping the command. (Yasuhiro Matsumoto)
Files:      src/channel.c

Patch 7.4.1545
Problem:    GTK3: horizontal cursor movement in Visual selection not good.
Solution:   Make it work better. (Kazunobu Kuriyama)
Files:      src/gui_gtk_x11.c

Patch 7.4.1546
Problem:    Sticky type checking is more annoying than useful.
Solution:   Remove the error for changing a variable type.
Files:      src/eval.c, src/testdir/test_assign.vim,
            src/testdir/test_alot.vim, runtime/doc/eval.txt

Patch 7.4.1547
Problem:    Getting a cterm highlight attribute that is not set results in the
            string "-1".
Solution:   Return an empty string. (Taro Muraoka)
Files:      src/syntax.c, src/testdir/test_alot.vim,
            src/testdir/test_syn_attr.vim

Patch 7.4.1548 (after 7.4.1546)
Problem:    Two tests fail.
Solution:   Adjust the expected error number. Remove check for type.
Files:      src/testdir/test101.ok, src/testdir/test55.in,
            src/testdir/test55.ok
```

```
Patch 7.4.1549 (after 7.4.1547)
Problem:    Test for syntax attributes fails in Win32 GUI.
Solution:   Use an existing font name.
Files:      src/testdir/test_syn_attr.vim

Patch 7.4.1550
Problem:    Cannot load packages early.
Solution:   Add the ":packloadall" command.
Files:      src/ex_cmds.h, src/ex_cmds2.c, src/main.c,
            src/proto/ex_cmds2.pro, src/testdir/test_packadd.vim

Patch 7.4.1551
Problem:    Cannot generate help tags in all doc directories.
Solution:   Make ":helptags ALL" work.
Files:      src/ex_cmds2.c, src/proto/ex_cmds2.pro, src/ex_cmds.c, src/vim.h
            src/testdir/test_packadd.vim

Patch 7.4.1552
Problem:    ":colorscheme" does not use 'packpath'.
Solution:   Also use in "start" and "opt" directories in 'packpath'.
Files:      src/ex_cmds2.c, src/gui.c, src/hardcopy.c, src/os_mswin.c,
            src/spell.c, src/tag.c, src/if_py_both.h, src/vim.h,
            src/digraph.c, src/eval.c, src/ex_docmd.c, src/main.c,
            src/option.c, src/syntax.c, src/testdir/test_packadd.vim

Patch 7.4.1553
Problem:    ":runtime" does not use 'packpath'.
Solution:   Add "what" argument.
Files:      src/ex_cmds2.c, src/vim.h, runtime/doc/repeat.txt,
            src/testdir/test_packadd.vim

Patch 7.4.1554
Problem:    Completion for :colorscheme does not use 'packpath'.
Solution:   Make it work, add a test. (Hirohito Higashi)
Files:      src/ex_getln.c, src/testdir/test_packadd.vim

Patch 7.4.1555
Problem:    List of test targets incomplete.
Solution:   Add newly added tests.
Files:      src/Makefile

Patch 7.4.1556
Problem:    "make install" changes the help tags file, causing it to differ
            from the repository.
Solution:   Move it aside and restore it.
Files:      src/Makefile

Patch 7.4.1557
Problem:    Windows cannot be identified.
Solution:   Add a unique window number to each window and functions to use it.
Files:      src/structs.h, src/window.c, src/eval.c, src/proto/eval.pro,
            src/proto/window.pro, src/testdir/test_window_id.vim,
            src/testdir/Make_all.mak, runtime/doc/eval.txt
```

```
Patch 7.4.1558
Problem:    It is not easy to find out what windows display a buffer.
Solution:   Add win_findbuf().
Files:      src/eval.c, src/window.c, src/proto/window.pro,
            src/testdir/test_window_id.vim, runtime/doc/eval.txt

Patch 7.4.1559
Problem:    Passing cookie to a callback is clumsy.
Solution:   Change function() to take arguments and return a partial.
Files:      src/structs.h, src/channel.c, src/eval.c, src/if_python.c,
            src/if_python3.c, src/if_py_both.h, src/json.c,
            src/proto/eval.pro, src/testdir/test_partial.vim,
            src/testdir/test_alot.vim, runtime/doc/eval.txt

Patch 7.4.1560
Problem:    Dict options with a dash are more difficult to use.
Solution:   Use an underscore, so that dict.err_io can be used.
Files:      src/channel.c, src/structs.h, src/testdir/test_channel.vim,
            runtime/doc/channel.txt

Patch 7.4.1561 (after 7.4.1559)
Problem:    Missing update to proto file.
Solution:   Change the proto file.
Files:      src/proto/channel.pro

Patch 7.4.1562
Problem:    ":helptags ALL" crashes. (Lcd)
Solution:   Don't free twice.
Files:      src/ex_cmds.c

Patch 7.4.1563
Problem:    Partial test fails on windows.
Solution:   Return 1 or -1 from compare function.
Files:      src/testdir/test_partial.vim

Patch 7.4.1564
Problem:    An empty list in function() causes an error.
Solution:   Handle an empty list like there is no list of arguments.
Files:      src/eval.c, src/testdir/test_partial.vim

Patch 7.4.1565
Problem:    Crash when assert_equal() runs into a NULL string.
Solution:   Check for NULL. (Dominique) Add a test.
Files:      src/eval.c, src/testdir/test_assert.vim

Patch 7.4.1566
Problem:    Compiler warning for shadowed variable. (Kazunobu Kuriyama)
Solution:   Remove the inner one.
Files:      src/eval.c

Patch 7.4.1567
Problem:    Crash in assert_fails().
Solution:   Check for NULL. (Dominique Pelle)  Add a test.
Files:      src/eval.c, src/testdir/test_assert.vim
```

```
Patch 7.4.1568
Problem:    Using CTRL-] in help on option in parentheses doesn't work.
Solution:   Skip the "(" in "('". (Hirohito Higashi)
Files:      src/ex_cmds.c

Patch 7.4.1569
Problem:    Using old style tests for quickfix.
Solution:   Change them to new style tests. (Yegappan Lakshmanan)
Files:      src/testdir/Make_all.mak, src/testdir/test106.in,
            src/testdir/test106.ok, src/testdir/test_qf_title.in,
            src/testdir/test_qf_title.ok, src/testdir/test_quickfix.vim

Patch 7.4.1570
Problem:    There is no way to avoid the message when editing a file.
Solution:   Add the "F" flag to 'shortmess'. (Shougo Matsu, closes #686)
Files:      runtime/doc/options.txt, src/buffer.c, src/ex_cmds.c,
            src/option.h

Patch 7.4.1571
Problem:    No test for ":help".
Solution:   Add a test for what 7.4.1568 fixed. (Hirohito Higashi)
Files:      src/testdir/test_alot.vim, src/testdir/test_help_tagjump.vim

Patch 7.4.1572
